These rivers have their sources at very great elevations. That of the Macquarrie is 2,569 ft. above the sea; of the Gwydir, 3,000; of the Dumaresq, 2,970; of the Lachlan, 2,399. The source of the Castlereagh cannot be much lower; and the sources of the Morumbidgee and Murray, lying in the Wirrarras, are probably considerably higher. The descent of the country is however so rapid that the river-beds sink more in the first few miles than in all their subsequent course; that of the Macquarrie falls 2,800 ft. in 200 m.; that of the Lachlan, 1,789 ft. in less than 100 m.; while the united waters of the Dumaresq, Gwydir, &c. have fallen at least 2,000 ft. before their junction with the Castlereagh. (*Sturt*, i. 156., ii. 118.; *Ozley*, 9.; *Currie*, in *Field*, 378.; *Mitchell*, i. 312.) In consequence of this formation of the country, falls and rapids are extremely numerous in the higher parts of the rivers. Becket and Bathurst Falls, in the Apsley (though this is a mountain stream of no great importance), are exceedingly magnificent; the former has a pitch of 150 ft., the latter, one of 285 ft. perpendicular height. (*Ozley*, 297, 299.)

Lakes are abundant in Australia, as might indeed be inferred from the level nature of the plain country, but none of them are very large, and few appear to be permanent. Lake Alexandrina, the recipient of the Murray, has by far the largest surface; but, as before observed, it is extremely shallow; and Lake George (lat. 36° 57' long. 149° 15'), which, in 1828, was a sheet of water 17 m. long and 7 wide, was said, by an old native female, to have been a thick forest within her memory; and in 1836 it had dried up to a grassy plain. (*Mitchell*, ii. 313.) The lakes of the interior are subject to the same variation (*Ozley*, 120—130.; *Mitchell*, ii. 34—37.), and when excited curiosity has drawn the traveller from his road, to inspect one of these reservoirs, more than commonly famous, the result of his examination is almost sure to be disappointment. (*Sturt*, i. 15.) These lakes, such as they are, abound along the banks of the Lachlan and the Murray, as far as the junction of the Darling; they are so far from yielding any supplies to the rivers, that their own waters seem, in part, to depend upon the latter overflowing their banks. Some of them are, however, quite isolated, and none have any outlet. Many, and those the largest, are salt; and small salt-lakes, or rather brine-pits, appear to be common in the dead levels of the interior both E. & W. (*Mitchell*, ii. 66, 82, 91, 140, &c.; *Cross's Journ. Dale*, 162.)

Soil — Were the soil of Australia merely extremely various in different parts of the continent, it would be no more than what is seen in every other part of the world. But the Australian soil varies according to laws of its own, apparently unknown in any other region. In other countries, rivers are the great fertilizers, and their influence is the greater the longer their course. In Australia, fertility is confined to the higher parts of streams; and, as has been shown, those which promise fairest at their outset from their mountain sources, invariably and quickly either dry in their beds, leaving the country an arid desert, or spread into marshes, rendering it an uninhabitable swamp, equally destructive of animal and vegetable life. Thus situated, it is not wonderful that productive soil should be found only on the sides and summits of considerable elevations; or that the explorers of the interior should look for the indications of mountain land with a feverish anxiety, which it is difficult for a native of the fertile plains of Europe and Asia to comprehend. "Had we picked up a stone," says *Sturt*, speaking of his abandonment of the investigation of the Darling (i. 144.), "as indicating our approach to high land, I would have gone on. But this seemed a desert, that not even a bird inhabited—the vegetable kingdom was almost annihilated; and the native dog, so thin that he could scarcely walk, seemed to implore some merciful hand to despatch him." This was during a dry season, and the consequent failure of the streams. "There was not the smallest eminence," says *Ozley* (p. 89.), under circumstances diametrically opposite, "whence a view might be obtained, the country appearing a dead level; and although we could see for some distance all round, yet there was not a rising ground in any direction. The

margin of the stream was a wet bog, full of water-holes, and covered with marsh plants. It was only on the very edge of the bank, and in the bottoms of the bights, that any eucalypti grew. There was not the least appearance of natives; nor was bird or animal of any description seen during the day, except a solitary native dog;—we seemed, indeed, the sole living creatures in these vast deserts." "From a tree near the camp," says *Mitchell* (ii. 148.), "Burnett described a goodly hill, distant 22 m. It was indeed (p. 185.) a welcome sight to us, after traversing for several months so much of the dead levels of the interior; and I accordingly named this hill, Mount Hope."—"Within the water line," (of Regent's Lake, now a grassy plain) observes the same authority, "stood dead trees, of a full-grown size, apparently killed by too much water, too plainly showing to what long periods the extremes of drought and moisture may extend in this singular country." (ii. 34.) Again (ii. 157.) he speaks of a row of bare poles, the remnants of yarra trees, 8 or 10 years old, which occupy the very middle of a stream, though they must have attained their growth while the bed of the river was dry. The soil of these desolate and extensive plains is various; in some places red tenacious clay; in others, a dark hazel-coloured loam, rotten and full of holes: sand is not very abundant, but it is found; and whatever the composition, one unvarying appearance of dreariness and desolation marks the scene. Exceptions must be made, however, to some portions of land on the Murray and Morumbidgee (*Mitchell*, ii. 136, &c.), but these are both permanent streams, their floods restrained by outer banks or *bergs*, so that the neighbouring country is in some degree preserved from the fierce extremes of drought and inundation. Yet this more favourable description must be taken in a restricted sense; about the meridian, where the other known rivers (the Lachlan, Macquarrie, and Darling) cease to flow, the country on the banks of the Morumbidgee begins to deteriorate; and the river, though it does not fail, contracts soon after both in breadth and volume, till, at its junction with the Murray, it has all the appearance of an ordinary creek. (*Sturt*, ii. 51, 87.) Compared with the gloomy sterility of these flats, no contrast can be stronger than the abundant fertility of the elevated terraces. A rich, dry, volcanic soil, broken into gentle undulations, and watered with the various streams that form the abundant sources of the internal rivers, is the general characteristic of Bathurst Plains, Liverpool Plains, Yap Plains, and the other districts that stretch away upon the summits and N. sides of the Blue Mountains, and N. of the Liverpool Range. The W. valleys of the same mountains partake also of the same character; and a similar description will apply to the corresponding country on the E. faces of the Darling range. (*Ozley*, 186, 267, 278, &c.; *A. Cunningham*, in *Field*, 131—151.; *Sturt*, i. 6—14., ii. 11—36.; *Mitchell*, i. 27, *Interim*, 6.; *Dale*, in *Cross*, 51—72, &c.) But the best land hitherto found in Australia, is that discovered lately (1836) by Major Mitchell, near the S. coast, and called by him Australia Felix. It lies among the Grampians and Pyrenees; and, though surrounded and intersected by mud and swamps, its high levels and valleys, abundantly, but not excessively watered, are so prolific, that the discoverer congratulates himself on "being the harbinger of mighty changes, since his steps would soon be followed by the men and animals for whom this fertile region seems to have been prepared." (ii. 187—280.)

So many theories have been hazarded to account for the host of anomalies in this S. world, and each in succession found to be erroneous, that great circumspection is necessary in offering even a surmise as to the causes of physical arrangements and appearances, so much at variance with all former experience. One fact, however, forces itself on our notice: the fertile parts of Australia, confined to the higher regions, are as effectually separated from each other by apparently irreconcilable deserts, as though the ocean flowed between them. And how many centuries is it since the ocean did so flow? The different explorers unanimously declare the dead flats of the interior to be *new land*—new, that is, in comparison with the mountains by which they are bounded; while those mountains themselves, judging by their poverty in primitive formations, are apparently more recent than the similar elevations of the N. hemisphere. *Sturt* believes the Darling to have been the main channel which carried off the last waters of the ocean from the low land, and its bed, which he esteems an estuary rather than a valley, to have remained the natural and proper reservoir of the streams falling from the E. and W. (ii. 119.) None, however, fall into it in 660 m. (*Mitchell*, i. 295.); but the whole appearance of the country on its banks is strongly corroborative of *Sturt's* opinion. (*Mitchell*, i. 214, 307., ii. 109, 113—116.) But what then, was the condition of the country, previously to that convulsion or change, of whatever kind it might be, which

* See Col. Jackson's paper on "Geographical Arrangement and Nomenclature." (*Journ. Geog. Soc. iv. 31.*)

laid bare this extensive tract? Evidently that of island groups, at greater or less distances from each other, the surfaces of which (now the terraces and table-lands of the mountains) had remained exposed sufficiently long to enable mineral and vegetable decomposition to perform its work of creating a fertile soil. The rivers of these islands (now the sources of the anomalous internal streams) would, like other island rivers, run their short courses to the *thra sen*, and having performed their office of irrigating the tracts through which they flowed, be there absorbed. On the exposure of the interior, all this would be changed. The newly uncovered land, destitute of vegetation with the exception of marine plants, would of necessity remain sterile till the decomposition of these, gradually, though slowly, began to form a soil. (*Flinders*, ii. 116.) The rivers, no longer received into a sea, at no great distance from their sources, would begin to wear themselves channels in the new ground—a process which, while the descent was considerable, would be rapid in its operations; but which, when the stream, reaching a level flat, had lost much of its initial impetus, would decrease in energy; and, on the occurrence of a hollow, would wholly cease, at least for a season. Such a hollow is the Marsh of the Macquarrie (*Sturt*, ii. 134.), and a succession of such hollows seems to form the marshes of the Lachlan. (*Mitchell*, ii. 59.—*Fl.*) The water losing its flow, and spreading over these hollows, deposits in them the fertile debris from its native hills, and thus gives birth to marsh plants, the decomposition of which still further improves the soil; and, in the season of flood, the washing of this debris to the sides of the concavity, by gradually forming a channel, gives to the exhausted stream new strength to struggle, inch by inch, along its course. That some such process has been at work ever since this land was first explored, seems evident from the berge, or outer banks of the Murray, Murrumbidgee, &c.; and Mitchell could no otherwise account for the remarkable appearance of many of the lakes which he passed, than by supposing that their hollows existed *before the rivers began to flow* (ii. 34.). “We cannot doubt,” says Humboldt (*Pers. Nar.*, iv. 150.), “that in both continents (Africa and Australia) there are systems of interior rivers which may be considered as not yet fully developed, and which communicate with each other, either in the times of great rains, or by permanent bifurcations;” a sagacious remark, made more than 10 years before the discovery of the extensive connection between the channels of the Australian streams, by which it is so remarkably confirmed. (See, also, *Carl Rulver, Erdkunde*, i. 315.) But if *Sturt*’s surmise be founded in truth, the bed of the Darling, or its continuation, that of the Murray, should be the common drain of all the land between itself and the older mountains towards the E. and S.; and this it is, or is in progress of becoming. The union is effected for all the known streams except the Lachlan and Macquarrie; and of these the former has completed its bed (*Mitchell*, ii. 78.) though it has not yet been able to fill up the hollows which form its marshes in the wet season; and the latter, though much impeded by the extent and lowness of its swamp, is struggling to establish a permanent connection with the Castlereagh through Morrisett’s Ponds (*Sturt*, i. 146.) and with the Darling direct, through Dock Creek (*Mitchell*, ii. 32.). The great deficiency of springs and tributary streams is one great cause of the slowness of this operation; but the deficiency itself is only what might reasonably be looked for in a country of recent formation, especially in one where the eminences are so few and so little elevated as they appear to be in the interior of Australia. Springs can be formed only by the accumulation of moisture in the cavities and gullies of hills; and this accumulation must, in the first instance, proceed with extreme slowness. When overcharged, and not till then, these reservoirs will give forth their superfluous waters; at first, by a simple overflow, and, when the additional supply has given to the torrent thus first formed sufficient power to deepen its bed, in a continual stream. (See the very profound article *Rivers*, in the *Ency. Brit.*, xviii. 39—91., more especially at p. 70. *et seq.*) When this process has been long in operation, these streams will be numerous, and such is the case in the terraces and older mountains of Australia: where the land is comparatively new, they may be expected to be scarce, and they are scarce beyond parallel in the interior of the same continent. Even when become permanent, time must be allowed for them to cut their path to their final channel; and this is a most wise arrangement, since, did such new-born currents find their way directly to an extensive bed, the source from which they are supplied would be exhausted. Centuries, therefore, must probably elapse between the first appearance of the infant torrent and its final absorption into some river system. In the interval it will pursue its course surely, however slowly; and with a speed and direction varying according to the obstructions which it meets with, and the amount of its initial supply. Many of these incipient streams are found in the interior of Australia, making greater or less approaches to what Hum-

bold calls the “development of their system;” the beds of some of them, though dry during the summer heats, exhibiting unquestionable signs of floods at other seasons; while others appear to be permanent to the point to which they have already cut their way. (*Sturt*, i. 123.; *Mitchell*, i. 209, 249—253, 261., &c.; ii. 32., &c.) But, again, upon the surface of a new country, so singularly devoid of vegetable decay (*Sturt*, i. 108.), production will necessarily be limited to those spots where the rivers and floods have deposited their fertilizing slime. The barrenness of the districts remote from streams and swamps is, in fact, the universal theme of all travellers (*Ozley*, *Sturt*, and *Mitchell*, *passim*); while yarra trees so distinctly mark the bed of a river, that the course of the latter may be kept in view even at the distance of the visible horizon, and every flat subject to inundation is crowded with dense shrubs, box-trees, polygonum, kangaroo grass, reeds, and other native vegetation. (*Mitchell*, ii. 54. and *passim*; *Sturt*, i. 717. and *passim*; *Ozley*, 97—103. and *passim*.) Here, then, are abundant elements of a soil, the process of forming which is expedited by the remarkably prolonged and fierce extremes of drought and flood to which this region is subjected. (See CLIMATE.) The vegetation of interior Australia, such as it is, does not live its natural term, or die of natural decay; but when a flood has given birth to that race of trees and shrubs which draw their sustenance from excessive moisture, a long-continued drought destroys nearly the whole tribe (*Sturt*, i. 145., &c.); while such plants as delight in a dry soil spring from the earth formed from their decomposition, to be in their turn destroyed, after 10 or 12 years’ growth, by the constant exposure to too much water in a return of the season of floods. (*Mitchell*, ii. 34. 148. 313.) It is quite clear that this alternation must tend to fertilize the land much more rapidly than if either race of plants continued to draw their nourishment from the newly deposited and still meagre earth, till they perished from pure exhaustion, the more especially as deciduous trees are almost unknown*, and consequently one great source of supply, the scatterings of autumn in other regions, is wanting to the native soil of Australia.

It appears probable, then, that both the land and water are here still in a course of formation; that the various anomalies, in each, which fill the minds of Europeans with wonder, are only the natural appearances of an imperfect, or rather of an unfinished work; and that they will vanish when the causes, now in operation, shall have produced their full effect. These opinions are hazarded, however, with much diffidence; and only because they appear to result from the facts collected by actual observers.

Climate.—About a third part of the Australian continent, the N. part, together with the large island of New Guinea, and the other isles enumerated at the beginning of this article, with the exception of New Zealand, lie in the torrid zone. The other portion of the continent, the islands immediately adjacent, and New Zealand, are in the S. temperate zone. The proportion of inter-tropical to extra-tropical land is, therefore, altogether about as 5 to 13 (*Malac. Bras.* 766. xl. 270. 378.). Of the general climate in the former portion little is positively known, though it may be too probably inferred that it resembles generally those regions of the N. hemisphere, similarly situated, where running water is scarce; that is, that a considerable portion of it is burned up with intense heat. On the N. coast a wind from the S. raises the temperature with extreme suddenness (*King*, i. 398.), and a N. wind produces the same effect in the interior (*Mitchell*, i. 315.; *P. Cunningham*, ii. 174.; *Wentworth*, 49.); arguing, in both cases, a passage over a highly heated soil, and a hot atmosphere. In the range of the Indian monsoons, of which the N.W. sea is usually about the beginning of November, and that from the S.E. in the early part of April. There is, however, much irregularity in their recurrence, the variation sometimes amounting to more than a month. (*Campbell’s Geog. Journ.*, iv. 148.) In these regions the seasons can scarcely be divided into dry and rainy; for though the N.W. (or summer) monsoon be attended with very heavy falls, yet they seldom continue above 2 or 3 hours at a time, so that they rarely, if ever, put a complete stop to out-door labour. From June to September, no rain falls, though these are unquestionably the healthiest months of the year. A great quantity of moisture must, however, at all times be suspended in the atmosphere, though imperceptible to the senses, during the prevalence of the dry or S.E. monsoon: for iron articles are kept from rusting only by incessant care; and the exposed surface of the rocks, along the inter-tropical coasts, are so generally coloured by the oxide of iron, that the term red might without impropriety be adopted as descriptive of the N.E. and N.W. shores. (*Campbell’s G. J.*, iv. 149.; *King*, i. 396.) The average temperature at Melville Island, on the N. coast,

* One only is mentioned; namely, the white cedar (*Melia coconzab.* *Field*, 422.

from April, 1827, to March, 1828, was 88° Fah.; the winter average 80°; that of the summer 86°; and the extreme averages 76° (for July), and 87° (for Dec.). It may also be observed, that the coolest part of the day appears to be 6 A.M., the temperature of that hour being from 1° to 7° lower than that of midnight. (*Campbell's G. J.*, 152.) With regard to Extra-tropical Australia, it is a pretty common observation, that the climate of N. S. Wales assimilates very closely to that of S. Italy; but this must be taken with some limitations: first, the atmosphere is very considerably drier; secondly, the extremes of temperature are greater; thirdly, the average heat is rather less; and fourthly, the temperature appears to decrease more rapidly by elevation. The following is a statement of the extremes of temperature, and quantity of rain at Sidney in 1821-2, Parramatta in 1822-3, Perth (Swan River) in 1831, and K. George's Sound in 1831-2.

	Temperature.		Day's Rain.	Rain fallen, in Inches and Dec.
	Max.	Min.		
Sidney	89°	48°	107	
Parramatta	106	40		29.948
Perth	106	33		
K. George's Sound	67	52	159	30.7801

The mean temperature of the year is, from observations at Sidney, rather above 65°; from those at Parramatta, rather above 63°; from those at Perth, rather below 67°; from those at K. George's Sound, rather below 64°. (*Brisbane and Goodhouse*, in *Field*, 385-397; *J. v. n.*, 123, 124.) In these districts, though frost be not unknown, it occurs very rarely, and snow never lies upon the ground; but on the mountain terraces a mean temperature is met with about equal to that of England, though its extremes are much greater. Cunningham (*Field*, 133.) found his thermometer (varying from 66° to 83° E. of the Blue Mountains) sink suddenly to 59° on reaching Bathurst, an elevation of 1,970 ft. This was in April (corresponding to October in Europe), and warm winter clothing was necessary for the party who were proceeding to investigate the country towards Liverpool Plains. Heavy snows are common in these high lands; and though they do not lie in the valleys, the upper flats and downs remain covered for many days. (*Wentworth*, 53; *P. Cunningham*, 1. 184.) The low interior is hot, whether dry or flooded. (*Osley*, *Sturt*, and *Mitchell*, *passim*.) The variations of the seasons in Extra-tropical Australia occur, of course, in a reverse order to that observed N. of the equator; but it is to be noticed, that this regular succession is much more distinctly marked on the high than on the low lands. In the latter, indeed, some of the peculiarities of a tropical climate are observed as high as 35° or 36° of lat.; among others, something very much resembling periodical winds, and the division of the year into a dry and rainy season. The prevailing winds, in summer, are from N. E. to S. E.; in winter, from N. W. to S. W. (*Osley*, 144.) The showers, when any fall (see post), are generally confined to certain months, but differing on the different sides of the mountains; it being a remarkable but well-authenticated fact, that floods on the coast occur simultaneously with dry weather in the interior, and conversely. Winter is from March to August; May is the rainy season on the coast; in the interior the rains fall during the summer, or between September and February. (*Osley*, 146; *P. Cunningham*, 1. 182; *Wentworth*, 50.)

But a more important division of the Australian climate into wet and dry, is marked by periods or cycles of 10 or 12 years each. Once in such cycles, a year of unmitigated drought prevails, during which the rains, and the effects of which are equally intense on the coast and in the interior. Close upon this visitation follows a year of flood; but the rains, which are at first continuous and as general as the preceding drought, decrease with every succeeding year, till they again wholly fail for a time. It follows, therefore, that the 2 or 3 years following the great rains may be denominated the wet period, and that an equal space of time preceding the great droughts may be regarded as the long dry season of Australia. It is only in the intermediate years that the regular recurrence of seasons, noticed above, is observable. (*Osley*, vii., *Sturt*, 1. liv.) In reference to the reverse order of the seasons in Europe and Australia, it is worthy of remark, that a cold winter in the one appears to be coincident with a hot summer in the other; and conversely. (*P. Cunningham*, 1. 218.) For the rest, dews are very abundant, and, fortunately, fall the heaviest during the summer heats and the long-continued droughts. Hail-storms are very frequent, as are also thunder and lightning; the latter flashing frequently for a succession of days, wholly unaccompanied by the former or by a single drop of rain. Earthquakes are occasionally felt on the N. coast. (*P. Cunningham*, 1. 183; *Campbell's G. J.*, iv. 151.) The climate of Extra-tropical Australia is pecu-

liarily favourable to the human constitution, probably from the deficiency of vegetable decomposition, more than once before alluded to. Endemic diseases are almost unknown; even small-pox, measles, and hooping-cough are strangers; but the hot N. wind produces ophthalmia; and the teres, or round worm, is the common pest of childhood. Dysentery is the most prevalent disease; but one proof, and that a strong one, of the healthy nature of the atmosphere, is the facility with which all disorders, even the worst cases of venereal affection, yield to the simplest remedies. Deaths from disease are exceedingly rare. The N. coast is unhealthy, but certainly less so than most other tropical countries. Typhus and acute fevers are there prevalent in the wet monsoons; and during the period of variable winds, pectolopia (moon blindness) appears to supersede ophthalmia; and scurvy seems to be an endemic, exhibiting itself with peculiar virulence where the tropical heat is exercised upon a damp soil. Even here, however, sickness puts on a generally mild form; the number of deaths, from disease, in Melville Island was only 1 in 9 for 4 years, or 1 in 36 per annum. (*P. Cunningham*, 1. 171-173; *Campbell's G. J.*, iv. 149-151, 168; *Wentworth*, 55; *J. v. n.*, 124.)

Mineralogy. This, at present, is a very meagre topic: Iron is the only metal of which unequivocal evidences are found; and it appears to be spread in great profusion over all the continent and its adjacent islands. The immense extent of iron oxide on the N. coast (*King*, 1. 396.) has been already alluded to, and several of the mountains violently affect the magnetic needle. (*Osley*, 259; *Sturt*, 1. 115.) It is even said that the compasses of vessels approaching the shore feel a similar influence (*Picture of Australia*, 120.), but such statements should be received with much caution. Copper and lead (the latter mixed occasionally with silver and arsenic) are said to have been traced both in the Blue Mountains and the Darling range; but no attempt has yet been made to turn such discovery to account; and this, also, is the case with the abundant supply of Australian Iron. Under these circumstances, it would be rash to conclude that the mountainous strata in this region are not metalliferous; though the only ore that forces itself on the attention be iron. It must, however, be presumed, from the comparatively small amount of old formations in the mountains, that they are destitute of the precious metals*, and of gems, only rock crystals, garnets, and agates have yet been met with. (*Pict. Aust.* 120-124.) But the most useful of all the fossils exists here in profuse abundance. Immense coal-fields extend beneath the barren sandstone, and what enhances their value, they occur in strata much more horizontal than in the Old World, and rarely more than 18 fathoms below the surface. The Blue Mountain and Darling ranges are equally rich in this treasure, and there is reason to believe that it exists also in the only hitherto-explored regions of the N. and S. (*Rilton*, *King's Appen.* 584, &c.; *Mitchell*, i. 14, &c.; *Berry*, in *Field*, 223; *Pict. Aust.* 187.)

II. BOTANY. — It is well known that Botany Bay received its name from the abundant vegetation which Capt. Cook and Sir J. Banks found flourishing on its coasts. It is scarcely less well known that the first attempt at colonization was made at that bay, and almost immediately abandoned by Governor Phillip, under the conviction that its soil was unprofitable and barren. (*Hautekorth*, iii. 504; *Phillip*, 51.) Such opposite conclusions, by able men, seem at first sight rather startling; but, on further examination, they are found to grow naturally out of the character of the Australian botany, which is as peculiar as most of the things in this region of peculiarities. "Pictureque and pleasing" Govr. Phillip allows the place to be; but justly adds (p. 52.) that "something more than beauty of appearance must be sought in a place where the permanent residence of multitudes was to be established."

The first great division of plants is into two great classes: the Cryptogamous, which have no blossoms nor visible means of fructification; such are mosses, ferns, fungi, &c.; and the Phanerogamous, which are reproduced by visible organs. This class includes, of course, all the higher orders of vegetables, but is subdivided into Monocotyledonous plants, such as have but one seed lobe; and Dicotyledonous plants, which are possessed of two or more; the former comprises the grasses, cyperaceae, &c.; the latter, those productions of the earth, the organization of which is most complicated, as the trees, superior shrubs, &c. The following table exhibits an outline of the arrangement of these primary orders in Australia. It is offered merely as an approximation, for knowledge on this subject is yet but scanty; but it has been constructed with much care from Brown's "Botany of Terra Australis" (*Appendix to Flinders*, 533-513.), the botanical papers of A. CUNNINGHAM (*Appendix to King*, 497-565; &c.)

* Gold is found at Timor, only three days' sail from the N. coast of Australia (*King*, 1. 183.); but the much greater elevation of the Timorese Mountains implies a different cause from that observed in Australia. (*Flinders*, ii. 254; *King*, i. 121.)

Field's Memoirs, 325-365.), P. CUNNINGHAM (l. 186-206.); OXLEY, *passim*; STURT, *passim*; MITCHELL (l. xx. et *passim*.)

Orders.	Whole No. of known Species.	Whole No. of A. Spec.	No. of Spec. com. to other Regions.	No. of Spec. peculiar to Aust.
Cryptogamous -	6,000	700	210	490
Emacocytogenous -	5,809	1,144	40	1,069
Blechnogamous -	11,721	5,866	20	3,446
Total -	41,600	6,710	270	5,441

So profound were the early investigations of Brown in this newly-opened region of strange vegetation, that his name was given to it as a distinct botanical kingdom. (*Lindley*, 522.) In his day the known plants of all the world amounted to 33,000 species, those of Australia to 4,300. (*Flinders' Appen.* 536.) The labours of succeeding botanists have done little more than enlarge the list, without at all affecting the arrangement, and only in a very trifling degree altering the various proportions. The first fact which strikes the observer in the foregoing table is the very great number of peculiar Australian species, amounting to nearly 1/4th part of those at present known. This is a proportion much greater than has been looked for from the relative magnitude of the region, and which, were the individuals of each species in any thing like a similar ratio, or were the species themselves of a kind highly useful to man, would render Australia a paradise. Unfortunately, neither is the case. Ferns, nettles, flowers, and even grasses, having the form, bulk, and habits of trees, are some of the distinguishing features in Australian vegetation; for the rest, the timber is generally of the hard wood kind, consisting of all the varieties of Eucalyptus and Casuarina, with some varieties of the rose-wood, sandal-wood, &c. Most of the eucalypti are called gum trees, though the exudations of many of them are properly resins, being insoluble in water; while others yield a manna as fine and as pure as any of Arabia. Another species yields the purest gum Arabic. There is a tree here called the tea tree, the leaves of which are used by the colonists instead of those of the Chinese plant; and there are also some medicinal trees, as the sassafras and the castor oil tree. Palms are limited to the N. and E. shores, on the former of which the tropical mangrove grows in all its luxuriance, and, in fact, the peculiar aspect of Australian vegetation disappears in this part of the continent, being superseded by one assimilating more to that of India. It is in Tropical Australia that the greater number of those plants are found which are common alike to this and other continents. (*Brown, Flind. Ap.* 586.; *A. Cunningham, King's Ap.* 532.) It has been before observed, that, with one exception, the Australian trees are evergreens: many of them are remarkable also for the inverted position of their leaf; the margin, and not either surface, being directed towards the stem. An Australian grove has, consequently, a peculiar and gloomy appearance; nor is the timber that it yields of the highest utility to the architect, being liable to rot at the heart, and so contractile that it has been known to shrink upwards of two inches within a week. (*P. Cunningham, l.* 192.) It remains to be observed that the trees in Australia are rarely so numerous as to impede horse travelling; and as a remarkable fact, that they appear to be most abundant on inferior soils. (*Gov. Rep. Vic.* 368.) Flowering plants of very great beauty are found; but the lily, tulip, and honeysuckle exist in the form of standard trees of great size. There are also odoriferous plants, which scent the atmosphere to a great distance; and prickly shrubs, which grow upon sandy soils, and blind them down, thus preventing that drift which is the bane of the Arabian and African deserts. (*Mitchell, l.* 222. l. 106, &c.) Grasses are abundant and nutritious, but they grow in detached clumps, so that a heavy continuous sward, resembling an English meadow, is unknown. Flax, tobacco, and species of cotton, rare indigo, chicory, trefoil, and burnet (the last a capital substitute for tea), are among the natural productions; but there is an unparalleled deficiency of fruits and of vegetables fit for human food. The cerealia are totally absent; and the best substitute for them appears to be a species of reed, which, however, Mitchell found to make a very light cake. The only native fruits are raspberries, currants (more like cranberries), one or two tasteless figs, and a species of nut. The useful productions of other lands are now, however, extensively acclimatized, and corn crops and orchards are found in every fertile spot in the settled districts. Every species of corn, including maize, is cultivated with success; while of foreign fruits, the orange, lemon, citron, nectarine, apricot, peach, plum, cherry, fig, mulberry, quince, banana, guava, pine apple, grape, and many others, have long been a source of profit to the smaller settlers. The capabilities of the soil are thus attested; nor can there be a doubt that the sugar cane and other tropical productions would thrive in the lower latitudes of the N.; but at present the prejudice of the colonists is in favour

of pasturage, for which it must be owned that the extensive plains on the terraces afford much facility, though the keep of a sheep upon the native grasses requires three times the extent of ground that in a moderately fertile district in England would fatten an ox in summer, and keep two sheep in winter. (*P. Cunningham, l.* 262.)

III. ZOOLOGY.—Animal existence in Australia assumes a form more anomalous and peculiar than even that which marks its botany. The following tables have been constructed with every possible care from the "*Régne Animal*" of Cuvier, with the additions of Griffith, Gray, &c., the Zoology of Shaw, the Transactions of the Linnean Society, and the works of the various travellers in Australia.

CLASS MAMMALIA.*

Orders.	Whole No. of known Species.	Whole No. of Austra. Species.	No. of Spec. com. to A. and other Regions.	No. of Spec. peculiar to Australia.
Quadrumania	155	0	0	0
Cheiroptera -	126	2	1	1
Insectivora -	27	0	0	0
Carnivora -	177	87	6	37
Marsupialia -	59	33	0	33
Monotremata -	192	6	12	4
Edentata -	21	0	0	0
Pachydermata	142	0	0	0
Ruminantia	27	5	5	0
Cetacea -	27	5	5	0
Total -	960	58	12	46

AVES. (BIRDS.)

Orders.	Whole No. of known Species.	Whole No. of known Austra. Species.	Species common to Austra. and other Regions.	No. of Spec. peculiar to Australia.
Accipitres -	251	16	6	10
Dentirostres -	1,373	12	1	123
Fissirostres -	198	12	1	11
Columboides -	410	20	5	17
Cathartoides -	313	20	1	29
Synalaxis -	116	7	0	7
Alcedinæ -	482	34	0	34
Galinae -	175	50	5	17
Grallæ -	275	27	4	21
Palmipedes -	229	22	2	20
Total -	3,772	316	27	289

In these tables, Cuvier's great orders of Carnassiers and Passeres, are divided into their several families; the former into Cheiroptera, Insectivora, Carnivora, and Marsupialia; the latter into Dentirostres, Fissirostres, Columboides, and Cathartoides. For the following table the materials are by no means so abundant; and it has been found advisable to mark the number of genera only, not that of species. (*See Asia.*) For fish and insects it would have been impossible to construct a table in the least satisfactory.

REPTILIA.

Orders.	Whole No. of known Genera.	Whole No. of known A. Genera.	No. of Gen. com. to A. and other Regions.	No. of Gen. peculiar to Australia.
Chelonæ -	60	37	17	2
Sauria -	117	12	8	11
Ophidia -	83	8	0	8
Batrachiana -	35	0	0	0
Total -	305	57	25	21

* Professor Von Ritter has lately (1835), given to the British public a table, from which the above differs more than could be wished; but, after the most patient investigation, it has been found impossible to effect an agreement. As M. Von Ritter does not state his authorities, he may possibly have access to arrangements (*M. &c.* other), inaccessible in England; or it may be the custom of the German naturalists to consider as distinct species, animals which Cuvier and others regard only as varieties.

The following is Ritter's Table, as given in the *Penny Cyclopædia*, li. 135.

Orders.	Whole No. of known Species.	Whole No. of Austra. Species.	No. of Spec. peculiar to Australia.	No. of Spec. peculiar to other Countries.
Quadrumania -	186	0	0	0
Cheiroptera -	192	2	2	0
Carnivora -	320	10	5	5
Marsupialia -	67	43	43	0
Edentata -	295	6	6	0
Monotremata -	23	8	8	0
Pachydermata	30	0	0	0
Ruminantia	157	0	0	0
Cetacea -	76	13	4	9
Total -	1,246	75	61	14

It is not meant to question the general accuracy of this table, when it is remarked that one unquestionable error has crept into it. The Cheiroptera of Australia are marked as wholly peculiar, when the "Flying Fox" was described as early as 1750, under the name of the Great Bat of Madagascar, *Pteropus magnus Madagascarensis*. (*Edwards's Nat. Hist. of Birds*, li. 180-247.; *King*, li. 412.)

From these results it appears, first, that the native animals of Australia are few in number; and, secondly, that they are very peculiar in kind. Of all the known Mammalia in the world, but 58 species, little more than 1-17th part of the whole, belong originally to this region. Of these 58 species, 46 were never heard of till they were first met on this soil; and of the 12 species common to Australia and other regions, 5 are whales, and 4 (out of the 5 Carnivora) seals; so that, in truth, of the *terrestrial* Mammalia, only 3 species are common; of which 1 is the large and strong-winged bat of Madagascar, another (the single and questionable commoner) is regarded by Mr. Ogilby as connected generically only with the Jerboas of America and Asia (*Linnean Trans.* xviii. 129—132.*), and the third is the dog, of which it is a most remarkable fact, that he is never found out of the society of man, and very rarely absent from any spot which man inhabits! The authority just quoted (p. 121.) believes, indeed, that he is not an aboriginal inhabitant of this continent, but that he came to it with the first primitive settlers, in the same state of savage domestication in which he now exists. He was unknown in Tasmania (Van Diemen's Land) before the settlement of the British colonists there (p. 122.). The other 3 Carnivora (probably only 2 marked in the table as peculiar to Australia, are seals (*Griffith's Synopsis of Cuv.* 180. 183.); so that the whole of this important order, together with the numerous tribes of the Quadrumana, Pachydermata, and Ruminantia, are absolutely without any known land-representatives in this extensive portion of the globe. (*Ogilby, 1st M. Trans.* xviii. 121.) Of the Edentata, 4 species are marked in the table, after the arrangement of Cuvier (i. 253—265.); but that arrangement was made in the error of supposing that the Echidna and Ornithorhynchus are *distinct* of *teats*, and do not suckle their young. The former genus consists of 2 species of porcupines, one entirely covered with thick spines, the other clothed with hair, and with the spines half hidden. The Ornithorhynchus consists also of 2 species—*O. paradoxus* and *O. fuscus*. Possessing the body and habits of a mole, the feet and bill of a duck, and the internal formation of a reptile, these creatures lead a burrowing life amid the mud of rivers and swamps. They are extremely shy, and hence their mode of reproduction is yet unknown. Should they be oviparous, it would be perhaps more consistent to class them with the Reptilia than with the Mammalia; but, at present, their hot blood seems to forbid such an arrangement. The Ornithorhynchus has 2 cheek-teeth in each jaw; but they are without roots, and are merely fibrous. (*Cuvier, 1. 264.*)

Of the Rodentia, 2 species belong to the sub-genus Hydromys, and consist of creatures that seem to unite some of the peculiarities of the dormouse, rat, and beaver. (*Cuv.* iii. 72.) According to Griffith (*Synop. Cuv.* 222.), they are the only true Hydromys, are peculiar to Australia, and almost to Van Diemen's Land. A new genus of Rodentia was made known by Mitchell's expedition in 1845 (i. 305.), which is called by Ogilby (*1st M. Trans.* xxiii. 124.), CONILURUS, to mark its general resemblance to a rabbit. It is, however, a rat; and the species found by Mitchell (the only one at present known) is remarkable for the formidable defence which it builds for itself against the dingo (native dog), and birds of prey. From this habit it has been named Conilurus constructor. Two species of mice (both peculiar), and the Dipus Mitchellii (the Australian jerboa), discovered by Mitchell in 1846 (i. 143.), complete the list of Australian Rodentia, unless some animal be omitted in the table, from the uncertainty of its classification, belong to that order. Mitchell names it *Myrmecobius rufus*, but with considerable doubt, and says that it was generally called the "red shrew mouse" by his party. (i. 17.) Should it prove to belong to the genus Sorex, it is the first instance, in Australia, of the order Insectivora. With these few exceptions, the whole of the Australian Mammalia consist of the very peculiar order Marsupialia, of which order more than 4-7ths are absolutely limited to this continent and its adjacent islands. The leading peculiarity in animals of this order, is the birth of the young in an immature state; in such a state, in fact, as is scarcely comparable to the ordinary development at which other fœti arrive within a few days after conception. From the time of this premature birth, without limbs or other external organs, the little animal remains attached to the teat of its mother (which enlarges, so as completely to fill the mouth), and enclosed in a natural pouch formed by the

skin of the abdomen. It is this pouch which is the distinctive mark of the order; and its use induced Linneus to arrange such species of these animals as he knew, under his genus *Didelphis*, a word implying double matrix. At the period of full development, the young fall from the teat, and this may be regarded as the real moment of birth; but for a long time after the dam continues to carry her offspring in the same receptacle; and the latter, even after they can walk, constantly return thither on the approach of any danger. This remarkable conformation is observed in every marsupial animal, and the arrangement of bones and muscles, necessary to it, is found in the males as well as the females. In other respects, however, the several genera of the order differ so essentially, that the whole might be regarded as forming a distinct CLASS of Vertebrata, and divisible, like the other Mammalia, into various orders. (*Cuv.* ii. 61—63.) The kangaroo, the largest animal of this order and of Australian Mammalia, has been known since Cook's first voyage. (*Hawkesworth, 1st Voy.* ii. 376.) It is as large, in some of the species (at which Griffith enumerates 10), as a good-sized calf, is very large in its hind quarters, and disproportionately small in its fore-legs, and very short, and quite useless to the animal's motion, which is effected by a succession of springs, assisted materially by its long and powerful tail. The attitude is erect, except when feeding; the colour varies in the various species, but is generally of different shades of grey. One species (*K. rufus*), however, is red and white. The other animals are the Potorvus, Phalangers, (so named by Buffon, because the only species with which he was acquainted had 2 toes united by a membrane,) the Dasyuri, the Perameles, the Petaurista, the Phascogale, and the Phascalomys. The different species of these genera vary in size from that of a rat to that of a dog; the largest, the dog-faced Dasyurus (*Thylacynus harrisi*), and Dasyurus ursinus (the devil of the colonists), being confined to Van Diemen's Land. (*Ogilby, 1st M. Trans.* xviii. 122.) The former resembles closely an ill-made dog, but is marked with zebra-like stripes; the latter is represented as an extremely ugly and disgusting-looking animal, whence his colonial name. The other species of the Dasyuri approach in size and outward appearance to the wasel tribe. The Phalangers of Australia are not distinguished by united toes; on the contrary, some of them, as the Vulpine Phalanger, approach, in the formation of their extremities, to the Quadrumana. (*Shaw's Zoology*, i. 489.) Some of these, the instance taken, for one, are pretty and graceful animals. The Petaurista are a sub-genus of the Phalangers, and distinguished by an extension of the skin of the side, so as to form a kind of parachute; they are sometimes called flying Phalangers. Of this genus the *Didelphis Scuturus* (squirrel opossum) has so much the appearance of a squirrel, that a close inspection is necessary to detect its marsupial character. (*Shaw's Zool. N. Holl.* 29.) The Perameles approach in form and habits to the badgers, and indeed are called pouch badgers; they differ from the other Marsupialia in the weakness of their tail, that member being generally serviceable to this order, either by its strength or its prehensibility. (*Griffith's Notes Cuv.* iii. 39.) The Phascogale, or koala, as it is more commonly called, consists of only one known species; it has a clumsy body, about the size of a moderate dog, short legs and claws, adapted for both climbing and burrowing. The female carries her young, for a long time, on her shoulders, and not in her marsupial bag. Some naturalists have referred this animal to the Phalangers, and others have denominated it the New Holland sloth. It has, however, no resemblance to the Tardigrada, possesses cutting teeth, and is destitute of canines. (*Cuv.* ii. 76; see also iii. 252; and *Griffith's Synopsis*, 234.) The Phascalomys, like the last genus, contains at present but one species, the wombat of the colonists. It is a plantigrade animal, extremely slow in its motion, and is about the size of a badger. Shaw (i. 504.) mentions this creature under the name of Didelphis ursina, and a second species is suspected to have been seen by Bass. (*Cuv.* ii. 78.) The Potorvus is nothing but a diminutive kangaroo, of which there is only one species, called commonly the kangaroo rat. (*Phillip's Voy.* to Bot. Bay, 277.)

In habits the different genera of the Marsupialia differ as much as they do in form. There is scarcely, indeed, an order of the whole class Mammalia to which one or other of them does not assimilate. The Dasyuri are carnivorous, and have many of the habits of the Felina; the Phalangers are insectivorous, and it has been already stated that some of them approximate in form to the Quadrumana; a similar approach will, perhaps, be admitted of the Petaurista to the Cheiloptera; and the Phascalomys or wombat is a true rodent. (*Cuv.* ii. 61—78.)

The kangaroos, though strictly herbivorous, cannot be compared with any known genus but themselves; and the useful orders of Ruminantia and Pachydermata are unrepresented by any marsupial form. But these tribes,

* In the *very* able paper here cited, the whole number of Australian Mammalia agrees much more nearly with that given in the text than with that assigned in the *Penny Cyclopædia*.

comprising most of those animals that, by their strength, docility, docile, or hide, and the nutritious quality of their flesh, are the most useful to man, though only recently imported, are now pretty abundant in all the settled parts of Australia. On the 1st of May, 1788, there was a stock carried out by the first settlers, of 1 stallion, 3 mares, 3 colts, 49 hogs, 26 pigs; in all 81 Pachydermata: 2 bulls, 5 cows, 20 sheep, 19 goats; in all 55 Ruminantia. (Phillip, 110.) In 1813 the horses of N. S. Wales amounted to 1,861; and in 1821, to 4,014. (P. Cunningham, i. 277.) Leaving out of view the first period of 25 years, during which importation may be supposed to have aided the increase, it advanced during the second period, when importation certainly had ceased, at the rapid rate of nearly 11 per cent. per annum. At the same rate, the horses of the colony in 1838 must amount to nearly 21,000; and when the extent of pasture ground on the plains and terraces is taken into consideration, this number would not seem to be too high. The pigs have increased with equal rapidity. The horned cattle in 1813 were 21,513; in 1821, 68,149 (P. Cunningham, i. 269.); but the further increase of the latter cannot be surmised; they have wandered off from some of the distant stock stations, and returned to that wild state which they had long forgotten in the N. hemisphere; and Mitchell, besides seeing their tracks on various occasions in two instances surrounded by wild herds, amounting in one case to 800, in the other to 1,500 head. (ii. 271, 307.) Of sheep, the number in 1813 was 6,514; in 1821, 119,777 (P. Cunningham, i. 259.); showing an average annual increase of nearly 44 per cent.; and 3 tables, given by Sturt (i. 191.) of the increase on 2 breeding flocks for 4 years (1829—32), present a precisely identical result. Assuming, therefore, 40 per cent. as the general average increase, the number of these animals in New S. Wales will amount, in 1838, to nearly 5,000,000. Nor will this calculation appear exaggerated, when it is remembered that in 1837 there arrived in the ports of England 7,698,525 lbs. of wool from a region where, 50 years before, a single hoof would have been a marvel and a prodigy. (Mitchell, ii. 404.) Sheep are apt to stray in the wide pastures, but there is, perhaps, little probability that they will, like the horned cattle, return to a wild state; such stragglers being most likely destroyed by the dingos; especially if the surmise of Mr. Ogilby be true, that the absence of some of the native animals from Continental Australia is to be accounted for by the presence of this more powerful and fierce creature. (J. von Trauer, x. viii.) The goats have thriven and multiplied, though not to the extent of the other imported animals; and the same remark may be made as to the rabbits, of which 5 were landed in 1788. (Phillip, 110.) From these facts it may be concluded that the pasturage and climate of Australia are well adapted to the useful animals, so long strangers to its soil; it is, indeed, expressly stated, that the diseases of sheep and cattle are scarcely worth notice (P. Cunningham, i. 264.); and the beneficial changes which their introduction has effected in this new land, is one of the most interesting instances of the power possessed by man of modifying the physical peculiarities of the world which he inhabits.

The ornithology of Australia is less anomalous than its mammalogy: no order of birds is without its representative, and there are but two the Australian species of which are wholly peculiar. Yet the common species bear a very small proportion to those which are peculiar; and, for the most part, are common only to N. and E. Australia, and S. Asia, or the nearer Polynesian islands. Several genera are wanting in all the tribes of usual singing birds, for instance: and of the common species, the most numerous are, as might be expected, those of strong flight and comparatively light bodies; such as the Accepires (birds of prey) and the Dendrocygnes (shrikes, pies, &c.). Among the rapacious birds, the most singular is a white eagle, which Cuvier thought was only an albino of some other species (vi. 49.), and which Shaw referred to the list of hawks (vii. 93.), but which subsequent investigation has proved to be a true eagle. (Griffith's Notes, Cuv. vi. 50.) Among the order Dendrocygnes, are some species of great beauty; the superb warbler, a bird having the habits of the redbreast, is perhaps the most beautiful. There are also some variegated thrushes; but of these and other birds of this order, though very accurate descriptions be given of their appearance (Phillip, 157.; Shaw's N. Holl. Zoo. 2b.); nothing is said respecting their notes; and it may be inferred that, notwithstanding their names, they are songless. A species of thrush, called thunder bird (Cuv. vi. 434.), has obtained from the colonists the name of the *laughing jacks*, from his peculiarly loud and discordant cry. Swallows and goatsuckers, of the order Fissirostres, are numerous; and of the Coliostres, the most remarkable species are the beautiful birds of paradise, which are almost confined to New Guinea. There are also several crows and magpies of this order; but the larks (so called) are but poor imitations of those of Europe, and appear all to belong to Cuvier's genus of field larks (vi. 436.), and consequently to the order Dendrocygnes. Of the *Dendrocygnes*, the various species of the *Epimachus* are, like

the birds of paradise, confined to the N. parts of Australia; like them, their plumage ranks among the most beautiful; and like them, too, they have been the subjects of innumerable fables. (Cuv. vii. 382.) The *Syndactyles* give to Australia its kingfishers and bee-eaters, of which the sacred kindfisher of the first, and the variegated bee-eater of the other, are worthy of notice for the extreme beauty of their covering. (Phillip, 156.; Shaw's N. Holl. Zoo. 13.; Cuv. vii. 401, &c.) All the Australian species of this order are peculiar, as are also those of the *Scansores*, consisting of the parrots, paroquets, cockatoos, &c. These last are very numerous in the Australian woods, supplying there the place of the European songsters. (P. Cunningham, i. 216.) The pheasants, quails, and pigeons of the order Galline, are tolerably numerous; and, according to P. Cunningham, the mountain pheasant is a bird of song. The same gentleman makes the same remark upon one species of Australian magpie (i. 302.), and states further, that wild turkeys, of two varieties, are found; but these are, most probably, a species of bustard, and belong to the order Gallus, which yields also the emu or Australian cassowary, nearly equal in size to the ostrich, and resembling it in many important particulars. (Cuv. vii. 238.) Of this order, Australia has also some species of curlews, herons, avocets, rails, &c. (Cuv. vii. 342—354.) Lastly, of the order Anseres, there are in this region, pelicans, boobies so numerous as to have given name to an island on the N. coast, petrels, penguins, ducks of a peculiar kind, and swans which realize the *arva avis in terra* of the Latin poet, being coal black. (Cuv. vii. 541—624.) It remains to be observed, that the 18 turkeys, 29 geese, 35 ducks, and 87 chickens, which arrived here in 1788 (Phillip, 110.), have multiplied to an extent not surpassed by the sheep; and there can be little doubt, unless the deficiency of grain were fatal, that the songsters of Europe might be acclimatized to the woods, were the attempt made. (P. Cunningham, i. 307.)

The reptiles of Australia are comparatively more numerous than either the Mammalia or the Aves. They consist of 2 or 3 genera of turtles. (King, ii. 433.; Shaw's N. Holl. Zoo. 19.), as many varieties of alligators, a considerable number of lizards and serpents, both venomous and harmless. The land lizard and the Coluber porphyrius (crimson-sided snake) are represented as of extraordinary beauty. (Phillip, 279.; Shaw's N. Holl. Zoo. 27.) The seas and rivers "abound in fish, many of them peculiar; and the Watts' shark, the smallest of the species at present known, is a remarkable one, having the mouth near the end of the head, instead of underneath, as in other animals of this genus. The insect tribe are very numerous, but they appear to differ far less than the other animals from those in other countries similarly situated.

Fossil Zoology.—The old theory of the post-diluvial formation of the Australian continent was supposed to be strengthened by the absence of limestone, and consequently of fossil remains. But those evidences of former existence, though not very numerous, have, however, been found in Australia under circumstances precisely similar to those under which they occur in the Old World. In passing down the Murray, Sturt's attention was called to a remarkable change in the geology of the country: the sand and clay ceased, and were succeeded by a fossil formation, rising like an inclined plane, from 1 foot to 200 or 250 ft. in height. This formation proved to be a compact mass of shells, and it continued to the very coast. The shells were of various kinds, univalve and bivalve; 28 specimens were collected, and the traveller remarks that a closer examination would lead to the discovery of numberless species. (ii. 140.; Appen. 233—256.) Corals and marine shells of recent formation had before been seen in great abundance, and at considerable elevations, on the coast (Fitton, King's Appen. 553.); but Sturt's specimens were all ancient, though chiefly such as occur only in the tertiary formations. The basin of the Hunter yields also its fossil shells, of which 7 new species have been arranged by Sowerby from the specimens of Mitchell (i. xix. and 15.); and in 1830, the last-named gentleman made the first discovery of Australian fossil Mammalia in the limestone caves of Wellington valley and Burce. These remains consist of bones of marsupial animals of 9 species, none of which are referable to any now existing, either in Australia or beyond its limits. They consist, however, of kangaroos, dasyuri, phalangers, and wombats, but all larger than the largest of the existing species, though some of them, as the kangaroos, are exclusively the remains of young individuals. (Mitchell, i. 19. ii. 353—356.) From these remarkable data, it may perhaps be inferred, that, though not post-diluvial, Australia is geologically much more modern than other regions of the globe, and also that it has suffered less physical change in the convulsions to which it may have been subjected.

IV. RACES OF MEN IN AUSTRALIA.—If the division of the great human family, by Blumenbach,

into 5 varieties, be rigorously abided by, the Australian must be classed with the Ethiopian, or negro, as approaching, upon the whole, nearer to his conformation than to that of any other race. But Mr. Crawford (*Hist. Ind. Arch.* i. 24.), whose experience and intelligence are alike undoubted, says that the "east insular negro is a distinct variety of the human species;" and, indeed, he has peculiarities quite sufficient to make his classification with the African Ethiop one of considerable violence. "The skin is lighter; the woolly hair grows in small tufts, and each hair has a spiral twist; the forehead is higher, the nose much less depressed, and the buttocks are so much lower than in the African, as to form a striking mark of distinction." It is to this race, if any, that the Australian must be referred; and the inhabitant of the continent recedes still more from the true negro, by having straight, or at all events curling, hair. Captain Cook's description of this race has been verified by every succeeding observer. "The skin," says he, "is of the colour of wood soot, or what is commonly called chocolate colour. Their features are far from disagreeable; their noses are not flat, nor are their lips thick; their teeth are white and even, and their hair naturally long and black: it is, however, cropped short; in general it is straight, but sometimes it has a slight curl; we saw none that was not matted and filthy, though without grease, and to our great astonishment free from vermin. Their beards were of the same colour with their hair, bushy and thick; but they are not suffered to grow long." (*Hawkesworth*, iii. 632.) The colour of the Australian does not appear to be uniform; some, even when cleansed from their filth, are nearly as dark as the African, while others have a tint not deeper than that of the Malay. (*Prichard*, i. 390.) In form the Australian is generally tall and slender, with no great development of muscle, and more remarkable for agility than strength. It must be remarked, however, that the Tasmanians (inhabitants of Van Diemen's Land) are woolly headed, as are also the natives of New Caledonia, New Guinea, and the other islands considered in this article as constituting Australia, with the single exception of New Zealand, which, though more remote from the Polynesian islands than any of the others, is inhabited by the brown race of those groups described by Mr. Crawford (i. 18.) as exhibiting the same superiority over their sooty neighbours as the white men of the West have over the African negro. The physical distinction between the continental and insular Australians does not, however, appear to be one of importance; and this recently discovered region may with great propriety be regarded as the native home of a distinct, and, according to Crawford (i. 24.), a decidedly inferior variety of the human race, which has spread itself to a considerable distance N. and E. among the islands of Polynesia and the Indian archipelago, and even to the S. extremity of continental Asia. (*Prichard*, i. 390.) That this variety is, physically considered, the lowest in the scale of rational beings, is sufficiently evident. Puny and weak, in comparison with the African negro, the Australian is hunted down, without making any effectual opposition, whenever he is encountered by any of his fairer neighbours; while the African is subdued only by superior intelligence, and successfully resists mere physical force. As personal strength is one effect of superior physical structure, the following results may be interesting. They are the averages deduced from the power exhibited in the arms and loins of 39 Australians, 56 Tinnoreans, 17 Frenchmen, and 14 English-

men. These people were found capable of bearing respectively the following pressures:—

Strength	Of arms in Kilo-grammes.	Of loins in Myriagrammes.
12 Tasmanians, av.	50.6	
17 New Hollanders, av.	50.8	10.2
56 Timorians, av.	58.7	11.6
17 Frenchmen, av.	69.8	13.2
14 Englishmen, av.	71.4	16.3

(*Lawrence*, 404.) The Timorians, it should be observed, are of the brown race; and it may be seen that in strength of arm they exceed the Australians more than they fall short of the Europeans. Between these two, the *weakest* English arm was more powerful than the *strongest* Australian, and the most muscular of the latter could bear upon his loins only $\frac{1}{2}$ a myriagramme more than the weakest of the former.

But the physical character of the Australian is not more marked by a general inferiority than are his moral and intellectual attainments. His is the only race (at least the only one at present known) that goes completely naked. Of arts or manufactures he has scarcely an idea; of agriculture, even in its rudest form, he possesses not the smallest knowledge; nor does he seem to have the least idea of barter, except where intercourse with Europeans has taught him the convenience of giving his labour for a regular supply of food. He may be described rather as a gregarious than as a social animal; for though some personal respect is paid occasionally to a kind of chief among a tribe (*Mitchell*, i. 192.; ii. 322, &c.), it would seem that it is altogether *personal* (*Sturt*, ii. 105—202.), and independent of any right, either hereditary or elective.

The Australian is arraigned by the European as a thief; but, destitute of almost every form of social life, he has, of course, no notion of the rights of property. Excepting women, all things appear to be in common with a tribe; and accustomed to supply his wants as he best may, it would be unreasonable to suppose he should make distinctions between the food which he finds promiscuously on the earth, and the hatchet or nail which comes in his way, and which he knows will be of use to him. In short, this race, the last and lowest of the human species, appear to be as barbarous as can well be imagined; and in this state they have existed for centuries, without either the power or the wish to make the first step in civilisation. (*Hawkesworth*, iii. 506, 634, 657, &c.; *Prichard*, i. 370—411.; *Flinders*, i. 128.; ii. 212, &c.; *Oxley*, *Sturt*, and *Mitchell*, *passim*.) From these facts it has been concluded, that the Australians are incapable of civilisation (*Field*, 224.); that they are essentially, and not accidentally, inferior even to the negro. But, degraded as they are, this inference is perhaps hardly warranted, at least to its full extent.

Nature has been singularly unkind to the Australian, not in his conformation only, but in the circumstances by which he has been surrounded. The fertile spots fitted for the supply of his limited wants are separated by deserts as wild and inhospitable as the sands of Arabia; and to pass these, he had not, like the Arab, the assistance of patient, strong, and faithful servants of the brute creation. No rivers flow through his strangely constituted land; and thus communication, the great refiner and improver of man, was rendered difficult and of rare occurrence. His soil was destitute of those plants, which, though "eaten in the sweat of his brow," are the incentives to man's labour, and the reward of his toil; nor did it feed a single animal like those

which, in more favoured regions, have formed from time immemorial the shepherd's occupation and wealth. The Australian being thus shut out from the two grand primitive employments, his life could be neither pastoral nor agricultural. Under less adverse circumstances, the red man continued a hunter in the greater part of America, during the ages that preceded his discovery by the European; but even this resource was only very partially available to the Australian; for not only were the animals around him inferior in kind, but also remarkably few in number. Even the excitement of danger, which may be supposed to have roused the African to exertion, by making his life a constant struggle with the fierce and powerful tenants of the woods, was wanting here; for in Australia there was nothing dangerous, except some noxious reptiles, which do not, however, appear to have very fatal powers. The Australian has had nothing but hunger to contend with; and this he has endeavoured to appease by picking up the spontaneous products of his ungrateful soil, and the shell-fish found on the sea shore, with insects and reptiles; to which he occasionally added a kangaroo or bird, overtaken or destroyed by accident. And Mitchell mentions, that such is the scarcity of the latter kind of food, that young men are forbidden to eat it. (ii. 340.) Of superfluities, the Australian has had no knowledge; and the surmise of Cook, that it was impossible the inland country should subsist inhabitants at all seasons (*Hawkesworth*, iii. 631.), was found by Sturt to be fatally verified in the dry year of 1828. (i. 137.)

But the adverse circumstances now alluded to do not, as some suppose, fully explain the barbarous condition of the Australian. The stupidity of his nature, and the inertness of his faculties, are evinced by his having made few or no efforts to increase his supply of food, or to obviate those incessantly recurring attacks of famine to which he has always been exposed. His want of other things should have made him an expert fisher and hunter of such animals as are native to his country: but he is neither the one nor the other; and though it be probably going too far to say that the Australian is incapable of improvement, the fair presumption seems to be, that he is destined to remain for ever at the bottom of the scale of civilisation; and to be inferior in point of comfort, as he has hitherto hardly been superior in contrivance, to many of the lower animals.

Mitchell thinks, apparently with some probability, that the increase of wild cattle will materially improve both the comforts and the character of the natives (ii. 345.); but at present it is not possible to imagine a closer approximation to the least intelligent of the brutes, than the Australians. Their arts are confined to the erection of extremely rude huts (and these are not numerous in the warmer latitudes), spears and fish-hooks, stone hatchets, a kind of shield, and a wooden missile, thin and curved, which, when thrown by a skilful hand, rises with a rotatory motion in the air, strikes at a considerable distance, and returns to within a few yards of the thrower. A rude species of canoe serves to carry them across narrow creeks; but the greatest skill and taste is displayed in their burial mounds, which nearly resemble the barrows of the Celts, and, like them, have the corpse always disposed with the head towards the E. The Australians believe in good and evil spirits; but it does not satisfactorily appear that they offer either prayers to the one, or deprecations to the other. (*Hawkesworth*, iii. 631—645.; *Collins'*

Appen. pass.; *Ozley*, 138, &c.; *Sturt*, i. 129, &c.; *Mitchell*, i. 260. ii. 193. 335—346, &c.)

V. HISTORY AND DISCOVERY.—Some accidental discoveries were made by the Spaniards as early as 1526; but the first accurate knowledge that was gained in Europe of these S. lands, was by the voyage of the Dutch yacht *Duyfhen*, which, in 1605, explored a part of the coasts of New Guinea. In the following year, *Torres*, a Spaniard, passed through the straits, which now bear his name, between that island and continental Australia; and, under the name of an island, gives the first account of the N. part of the latter mass of land. The Dutch continued to be the chief discoverers for the next 40 years, chiefly from their possessions in the E. Indies; and between the years 1642 and 1644, *Tasman* completed the discovery of a great part of the Australian coast, together with the island of Van Diemen's Land, which is now pretty generally, and we think properly, called *TASMANIA*. During these 40 years, the Dutch navigators succeeded in surveying about half the continental coast line; and the names bestowed upon various parts of the land, as *Carpentaria*, *De Wit's Land*, *Arnhem's Land*, *Endracht's Land*, *Nuyt's Land*, *Leuwen's Land*, *Edel's Land*, &c., commemorate the names either of the discoverers themselves, or of the ships in which they sailed. It was late before the English entered on the career of discovery; but once entered, they prosecuted it with vigour. *Dampier*, between 1684 and 1690, explored a part of the W. and N. W. coasts; and in the remaining part of the 17th century, completed this survey, gave his name to the archipelago lying east of N. W. Cape, and pushed his inquiries to the islands of New Guinea, New Britain, and New Ireland; the straits between the first two being called by his name. Between 1763 and 1766, *Wallis* and *Carteret*, the latter miserably appointed, followed in the track of *Dampier*, and added to his discoveries the investigation of New Hanover and other islands. These were followed by *Cook*, who first made known the E. coast of continental Australia, the previous discoveries having been confined to the N. and W. This was in 1770; and this great navigator discovered, in the same voyage, the island of New Caledonia. It is scarcely too much to affirm, that *Cook's* survey of the E. coast did more for Australian discovery than the united labours of all who preceded him; nor should the name of *Bligh* be forgotten, who, after the mutiny of the *Bounty*, in 1789, though in an open boat, and devoid of almost every necessary, carried on a series of observations on the N. E. coast, which added considerably to the general stock of knowledge. The colonists had, however, arrived on the soil the year previously to this; and, simultaneously, home and colonial expeditions were set on foot for exploring the new land which had become the residence of Englishmen. It should be observed, however, that, previously to this, *France* entered on the task of southern discovery, but with no great success; *Navigators' Islands*, and the *Louisades*, explored by *Bougainville*, between 1768 and 1770, being the most important additions. *Edwards*, in 1791, *Bligh* (2d time), and *Portlock*, in 1792, and *Bampton* and *Alt*, in 1793, nearly completed the knowledge of *Torres' Straits* and a great part of the N. coast; but the greatest discoverers, towards the end of last century, were *Bass* and *Flinders*, who surveyed a great extent of coast, mostly in open boats. In 1798 they sailed through the strait between *Tasmania*, or *Van Diemen's Land*,

and the continent, these two being marked in Cook's chart as continuous, and their junction having been, down to this time, a subject of speculation. In the last year of the 18th century, Grant explored a portion of the S. coast, which bears his name; and, in the five following years, Flinders completed a survey of the S. and E. coasts, and the Gulph of Carpentaria, which may be regarded as nearly perfect. In the same years, Baudin's expedition was employed on the same coast and Van Diemen's Land, the French and English commanders having met in Encounter Bay, so named in consequence of that event. The unwarrantable detention of Flinders for 6 years in Mauritius, despite the letter of protection from the French government, is matter rather of political than of geographical history; but it is right to advert to the fact, that the French authorities made use of his discoveries, while they omitted his name. The present generation has, however, done him justice, and the extent and value of his labours are universally acknowledged.

The voyages of Captain King completed the survey of the Australian coast, except for about 500 m. between the lats. of 22° and 14° . The progress of inland discovery has been already noticed. (*Flinders' Introduction; Burney's Chron. Account of Discov. in S. Ocean; Sir J. Narborough, Hawkesworth, Dampier, Flinders, and King, passim.*)

Extent and Population. — The following table of the extent and population of the different portions of Australia, has been partly adopted from Malte-Brun; but with some material modifications: —

	Surface in sq. miles.	Colonial Population.	Native Population.	Total Population.
New Holland	2,941,820	110,000	60,000	170,000
V. Diemen's Land	12,909	50,000	5,000	55,000
N. Caledonia	6,106	-	40,000	40,000
N. Rhodes	2,291	-	150,000	150,000
U. Charl. Isles	1,257	-	50,000	50,000
Solomon's Isles	17,610	-	100,000	100,000
Louisaides	704	-	10,000	10,000
N. Bristol	24,453	-	65,000	65,000
N. Guinea	305,541	-	500,000	500,000
N. Zealand	-	-	250,000	250,000
Total	-	160,000	1,308,000	1,568,000

The number of native inhabitants, though a good deal less than that given by Malte-Brun, is probably overrated; every traveller speaks of the deserted nature of the interior; and Mitchell, whose travels extended over nearly 1-7th of the continent, does not estimate the aborigines at more than 6,000. The white population, on the other hand, is rapidly increasing. Four English settlements have been made — New S. Wales, established 1788; Van Diemen's Land, 1808; Swan River and K. George's Sound, 1829; and S. Australia, on Spencer's Gulph, 1834.

AUSTRIA (THE ARCHDUCHY OF), the nucleus and centre of the Austrian empire, is divided into the two provs. of Austria above the Enns, and Austria below the Enns, commonly termed Upper and Lower Austria. The lower prov. has for centuries experienced no alteration in its boundaries; but Upper Austria was enlarged in the present century by the incorporation of the archbishopric of Salzburg, with the exception of the lordship of Berchtesgaden, which fell to Bavaria, and of the district lying along the right bank of the Inn from the Salza to the mouth of that river. The Archduchy of Austria lies between lat. 45° $37'$ $25''$ and 49° $0'$ $30''$ N., and long. 12° $46'$ and 17° $7'$ E.; and, according to the measurement of the imperial engineers, contains 15,017 Eng. sq. m., of which 7,317 belong to the lower, and 7,700 to the upper prov. But Blumenbach estimates the area of Upper Austria at only 7,398 sq. m. The boundary of the archduchy is formed towards Tyrol and Carinthia by the central chain of the Noric Alps, in which the primitive formations predominate. The highest summits of these Alps are found within this short space; viz. the Gross Glockner, 11,782 ft., Sulzbach Kees, 11,470 ft., Krum-

horn, 11,104, &c. The Gross Glockner is the highest point of that range of the Alps which stretches from the Brenner pass to the Danube. Immense glaciers and beds of eternal snow fill the clefts and cover the higher declivities of these lofty summits, from which several important rivers derive their origin. The N. limestone range of the Alps runs parallel to this central chain, with which it is connected by a branch which abuts against it between Gerlos and Wald, at the sources of the Salzach and Valley of Zill. Between the Salza and the Inn these mountains cover the former archbishopric of Salzburg with a number of steep and extensive ranges. Such are the Tannen and Untersberg. From the right bank of the Salza this chain continues to run parallel to the central chains, and its highest summits form the frontier of Austria towards Styria. Near Hallstadt the highest summit rises in the Thor Steir, with several peaks, to the height of 9,448 ft. Near Eisenez the Enns traverses the chain which runs out, diminishing both in elevation and extent, towards the Danube near Vienna. Other remarkable hills of this line are the Gros Priet, 8,580 ft.; the Oetseher, 6,622 ft.; and the Schneberg, near Wiener Neustadt, 6,358 ft. To the N. of the Danube the Bohemian forest throws out its offshoots to that river's bed, whose banks offer, in consequence, highly picturesque scenery during its course from Passau to Vienna. Near Krems the highlands recede from the river, and the frontier between Moravia and the archduchy is marked by a row of insignificant heights, which run parallel to the Danube as far as the March. The lesser Carpathians and the Leitha hills mark the frontier towards Hungary on the S. The southern, or Innesow range, is traversed at several points by the Inn, Salza, Traun, and Enns, which are navigable along the greater part of their course, and fall into the Danube. Several smaller streams likewise unite with the Danube; such as the Yps, Erlaff, Trauen, and Wien. The Leitha falls into the Danube in Hungary, and the Morawa, or March, which rises in Moravia, unites with that river on its left bank, a little to the W. of Presburg, after having for some distance marked the Hungarian frontier. The Mur, which rises among the lofty summits of Lungau in Salzburg, flows into Styria.

The Danube enters the Austrian territory at Innstadt, opposite Passau, where it is joined by the Inn, which at that spot is almost larger than the stream into which it merges. The elevation of the surface of the united river under the bridge at Passau is, according to Lamont, 468 Paris feet above the sea; its breadth is 650 feet. The left bank, for some distance below Passau, belongs to Bavaria; but from Engelhard's cell the river belongs, on both sides, to Austria. At Linz the breadth of the Danube is 654 feet; and, as this place is looked upon as the key to the navigation of the river, strong fortifications have been erected to protect it, those on the left bank being quite independent of the works which surround the town. The navigation of the Danube between Passau and Vienna is accompanied with no difficulty except that of overcoming a strong current in mounting the stream. The high rocky banks confine the river in one bed, and its depth is considerable, with the exception of one spot near Grin, where reefs of rocks occasion a surf, which used formerly to be much dreaded. Under Maria Theresa and Joseph II. these rocks were, however, so far reduced by blasting, that they offer no serious obstacle to navigators. Between this point and Presburg the fall of the river is said to amount to 450 ft., and the rapidity of its current in the canal of Vienna to be 8 feet a second. This canal is an arm thrown off from the main stream a few miles above the city, under the walls of which it passes. The main stream is separated from it by the Prater island, and one or two small islets called *Auen*, and which together have a breadth of nearly 3 m. Between Vienna and the Hungarian frontier the river forms numerous islands; and, as its course lies through the plain, is apt to change its bed after floods. It is here only navigable at periods of drought, for vessels drawing but little water. The greatest breadth which its various arms embrace is now, near Gross Enzersdorf, where from shore to shore, including the island of Lobau, it measures 6,325 yards. It was near this spot that Napoleon erected his bridges; but the main stream runs now in a less favourable position for an enterprise of this kind. On the frontiers of Hungary the Danube is once more shut in between the fall of the Alps, which flatten down almost to its level on the S., and the rise of the lesser Carpathians on the N. bank. This passage divides the river into the Lower and the Upper Danube; and in antiquity the name Danubius, from this spot onwards, gave place to that of later.

Two canals unite with the Danube. One in Upper Austria, which connects the immense forests of Krumm- mauer, the property of prince Schwarzenberg in the Bohemian forest, by means of the little river Mühl, with the Danube; is 40,000 Vienna klafter (47 m.) in length; but is only used for floating down timber. The second leads from Wiener Neustadt, through the plain, to Vienna.

and is navigable for barges; but little traffic is at present carried on by its means, although coals are found in the neighbourhood of Wiener Neustadt. The lakes of Upper Austria are not only celebrated for their highly picturesque scenery, but are eminently useful as means of internal communication. The most remarkable are those of Gmunden or Traun, 7½ m. in length, and nearly 3 m. across in the broadest part; the lake of Hallstadt, 5 m. long, and about 1 m. broad; the lake of Aussee, which is much smaller, is connected with the other two by means of the river Traun, and the salt produced along the line it traverses, together with the produce of the extensive forests of the *Salzkammergut*, as this portion of the duchy of Salzburg is named, are forwarded by its means to the Danube. The Atter Lake is 1½ m. long, and ¾ m. broad. The Mondsee and Lake of St. Gilgen are also extensive, but are not connected with any navigable river, except for the purpose of floating down wood. The Traun circle alone, in which these are situated, is said to contain 27 mountain lakes, the greater part of which are very small. In Lower Austria some small lakes are found on the frontiers of Stiermark; the most considerable is that of Erlax, which is but 1,600 yards in length and about 600 in breadth. The number and variety of the waterfalls add greatly to the beauty of the mountain scenery. The cascades of Gaskin and of Galling, near Salzburg, the latter of which is nearly 300 feet in perpendicular descent; and the cataract of the Traun, where that fine river falls over a rocky ledge 55 feet in height, rank amongst the most picturesque in Europe.

Extensive morasses are found in Upper Austria, in the vale of Pukgau, or of the Salza. These marshes extend 15 m. in length by ¾ m. in breadth. In the Mühl circle, on the N. side of the Danube, and in the neighbourhood of the principal lakes, large tracts of marshy land also occur.

The climate of the archduchy varies according to the elevation of the ground. In Upper Austria the mean temperature at Linz has been found to be +7° 6 Reaumur's scale (=44° 28° Fahr.); at Salzburg it is 7° 4½ R.; at Kremsmünster, 7° 4'. In the year 1825 the mean temperature was 7° 4½ at Kremsmünster, the greatest heat +23° R. (=83° 45° Fahr.); the greatest cold, -10° 7 R. (=9° 15° Fahr.). At Vienna the mean heat is 8° 30° R. (=51° 7° Fahr.), in 1836 it reached +8° 55° R. The greatest heat in that year was +29° 8 R. (90° 48° Fahr.); the greatest cold, -14° 4' (=9° 21° Fahr.). The mean elevation of the barometer was 28° 2' 4". In 1837 the greatest cold was -15° 5' R. (= -5° 15° Fahr.). The elevation of Vienna is 954 feet, that of Salzburg 1250 feet, above the level of the sea. Baron Welden has fixed the limit of forest vegetation at 5,000 feet, that of eternal snow at 8,000 feet.

The surface of the country in Upper Austria presents a succession of mountain tracts, whose elevation, in the southern parts, admits of little cultivation, but which are extensively clothed with fine and valuable forests. As they subside towards the Danube, the country assumes a more cultivated appearance, but the effects of the cold winds from the snow-covered summits is detrimental to the growth of more delicate plants. The vine is first met with at Krems in Lower Austria, but follows thence the course of the Danube, and where the mountains open near the capital, both their sides and the plains are covered with vineyards, interspersed with fruit-trees of every description. The valley of the Enns is remarkable for its luxuriant growth of corn, as is the plain of Tulla on the Danube. The Marchfeld between the Moravian frontier and the Danube is also highly productive, although much exposed to drought.

The Archduchy of Austria is partitioned into ten Divisions.

Lower Austria.			Upper Austria.		
Provinces.	Germ. Sq. m.	Pop.	Provinces.	Germ. Sq. m.	Pop.
Capt. Generalship of Vienna	8	326,099	1. Traun circ.	77	177,000

The Specification of the Kinds of Death in the Archduchy is for 1836 and 1837, without the Capital.

Sickness.			Violent.					
Ordinary.	Local.	Epidemic.	Smallpox.	Suicides.	Hydrophobia.	Murdered.	Accident.	Executed.
1836	54,384	103	5,805	102	76	8	12	514
1837	58,634	67	3,381	33	80	3	20	532

The subjoined table gives a survey of the amount of cultivated land, and of the estimated produce, from official sources; but that of the produce must be considered as too low. The agriculture of the archduchy is in general good, although open to many improvements, especially in the cultivation of the vine. The best wines are produced near Vienna, and are the growths of Vaseau, Gumploskirchen, Closternburg, and Wedling. The produce of the vintages in the plain are inferior to those on the hills. Cyder is extensively made in Upper Austria. A remarkable circumstance is the low value of land in the neighbourhood of so large and rich a capital as Vienna; the common price of a Joch (= 1·4 acres), not exceeding 300 fl., or 30l. The price does not fall much in a circumference of several miles.

The official returns of the produce of the salt-pans of Aussee, Hall, Gailt, Ishl, Ebensee, and Hallein, in Upper Austria, are not published; but the *Nat. Encyclopedia* estimates it at 46,000 tons, and supposes that from 5,000 to 6,000 individuals are employed in the works. Owing to the great consumption of all articles in the capital, the province exports but little produce, while its imports are very great. For the trade of Vienna we refer to that article. As the high roads from Trieste and Hungary to the western and northern provinces pass through Vienna, the carrying business is very great, and in general well managed; and the communication between the capital and all the provinces is very brisk. The roads throughout the archduchy are excellent, and the communication between Vienna and the upper provinces, as well as with Hungary, is facilitated by steam navigation on the Danube, by means of which the journey from Linz to the capital is performed in a day, and that from Vienna to Pesth in 18 hours. In the spring of 1839 the iron railway, now forming, to Poland, will be opened as far as Brunn, in Moravia, a distance of 80 m.; and another leading from Vienna to Raab, in Hungary, will be commenced.

The inhabitants of the archduchy are all Germans, and are distinguished for their industry and quickness of apprehension. As the population is more sparingly distributed in the mountainous parts than in the plains and valleys, there is an appearance of well-doing throughout all classes of the inhabitants; and the schools for the lower classes are both numerous and well attended. The dress and manners of the inhabitants of the mountainous parts, especially of Salzburg, resemble those prevailing in Styria and Tyrol, as the manners and customs, as well as the occupations, of the Austrian mountaineer are nearly the same with those of the neighbouring provinces. The business of driving the cattle up to the Alpine pastures in summer, whence in the autumn they are brought down with festive parade, is the department of the women. Wood-cutting and mining are the occupations of the men. Hand-weaving and spinning of flax, cotton, and wool, are much carried on, especially during the winter. As many as 23,000 individuals are said to have been employed by the carpet manufactory at Linz, while it was carried on upon its largest scale. Along the Rains and the Yps the iron manufacturing district is situated; but agriculture is the chief employment of the inhabitants of the grand duchy, and is managed with considerable skill. The mountaineer is confined to more frugal fare than the inhabitant of the plain enjoys; oatmeal or barley puddings, prepared with the milk and butter of his cows, being his chief support. Whether this species of nourishment, or the quality of the water, or the nature of his occupations, be the cause of the *goitre* or swelling of the neck, which commences on the mountains on the Styrian frontier, is not known. The lowlanders' enjoyments are sought in the dance and in the wine-pot, of which his illusions, especially of the one-year-old liquor (*brander*), are both deep and frequent. The large earnings which a slight exertion of industry secures in a country whose climate and soil are highly adapted to furnish the blessings of plenty, give a cheerful appearance to a large portion of the lower classes, that is scarcely to be met with any where else; and the Lower Austrian deserves credit for both earning the good things of this life, and for enjoying them.

The Gubernia at Linz and Vienna are the chief provincial authorities for the provs. of Upper and Lower Austria. Under these is the captain of the circle, who unites the judicial and administrative powers, in as far as

the inhabitants of the country are concerned. In towns the administration of police is confided to a special commissary, and the magistracy performs the judicial functions. The manorial courts of the large proprietors are placed under the courts of the circle, and may be appealed from to the latter. The governor of Upper Austria resides at Linz; which, as the cap. of the prov., is the seat of the authorities. Those for Lower Austria reside at Vienna. The Archbishop of Vienna is the head of the clerical authorities in the Catholic church for Lower Austria; the Archbishop of Salzburg exercises the same functions for the upper prov. Superintendents at Linz and Vienna conduct the clerical affairs of the Protestants under the Consistory at Vienna. The command of the forces for both provinces resides at Vienna. The military conscripts of the provinces of Austria are enrolled in the 4th, 14th, 49th, and 59th regts. of infantry, in the 3d and 4th regts. of cuirassiers, the 2d regt. of dragoons, and the 1st light cavalry. They further supply two rifle corps and a regiment of artillery, amounting in all to 20,000 men.

AUSTRIA (EMPIRE OF), one of the largest, most populous, and most important of the European states.

Situation and Extent. — The empire of Austria is situated in central and southern Europe; and, with the exception of a narrow strip at its S. extremity, projecting along the coast of the Adriatic, its territory forms a very compact mass. It extends from about 42° to 51° N. lat., and from about 8° 30' to 26° 30' E. long. Its length, from Lake Maggiore, in Italy, to the E. frontier of Transylvania, is about 860 m., and its breadth (exclusive of Dalmatia), from the S. frontier of Croatia to the most N. point of Bohemia, about 492 m. The total area is estimated, in the map of the Austrian engineers, at 12,153 sq. Germ. or 257,368 sq. Eng. m. On the S. Austria is bounded by Turkey, the Adriatic Sea, and the independent states of Italy; W., by the states of the king of Sardinia, Switzerland, and Bavaria; N., by Prussia, the free city of Cracow, and Russian Poland; and E., by Russia and Moldavia. The extensive frontier of the empire, upwards of 4,250 m. in length, has the rare advantage of being advantageously defined by natural boundaries; such as mountains, large rivers, lakes, and the sea, offering favourable military positions for defence, with the exception of a portion of the frontier of Galicia, towards the Russian provinces, which is open.

Divisions, Population, &c. — The Austrian empire is composed of many states, differing widely in extent and population. As the far greater part of the provinces were united under the imperial sceptre by peaceable means — that is, by inheritance or by treaty* — the boundaries

* Galicia and a part of the military frontier were the only acquisitions by actual conquest.

of all remain as they existed whilst they formed independent states, with the exception of the Italian provinces, whose frontiers and divisions date only from 1815.

The following table shows the area and pop. of each prov. A division, of no less importance than the political one, is noticed in the margin; showing to what race the mass of the inhab. of each prov. belongs. The amount of pop., down

to the close of 1837, has been found, by adding the surplus of the births over the death, to the amount found by enumeration in all the provinces, except Hungary, in 1834. The pop. of Hungary and Transylvania—in which countries the nobles and the clergy make no returns of their number, and which are not subject to the military conscription—can only be found by approximation:—

Provinces.	Area in Germ. sq. m.	Population in 1838.	Pop. to a Germ. sq. m.	Chief Towns.	Population in 1838.

In S. Hungary the greater part of several counties, besides Croatia and Slavonia, are inhabited by Slavonians. On the N. side of the Danube, 11 counties of the prov., "on this side the Danube," and a great part of the prov. "beyond the Theiss," are Slavonian; the latter prov. containing the *Rusniaks*, or Red Russians; the former the *Slowaks*, or Slavonians of Moravian descent. The total number of Slavonians in Hungary is estimated at 5,800,000, inhabiting 5,789 towns and villages. The Magyars (Hungarians) are 4,500,000 in number, dwelling in 4,739 towns and villages; the Wallachians have 1,024, and the Germans 921 towns and villages. The various races of the inhabitants may be classed under the following divisions:—

SLAVONIANS in the N. prov. Bohemia, Silesia, Moravia, Gallcia, and N.E. part of Hungary	14,000,000
Ditto, in the S. prov. Illyria, Dalmatia, Croatia, Slavonia, and military frontier	4,500,000
MAGYARS in the plains of Hungary, on each side the Danube and the Theiss, and in Transylvania	4,500,000
GERMANS in the Germ. provs.	2,500,000
Ditto, scattered through the Empire	2,500,000
ITALIANS, in Lombardy, Venice, and N. Tyrol	4,400,000
WALLACHIANS in Hungary and Transylvania	921,000
ARMENIANS, Albanians, Zigeuners, &c.	150,000
Jews	600,000

Nearly every prov. differs from the others in the density and distribution of its population. In Gallcia and Hungary, both agricultural countries with comparatively little trade, the villages are usually very large and populous, but widely scattered. In Lombardy and Venice the inhabitants are so much scattered over the face of the country, that the inmates of towns form but a small proportion; and are almost exclusively the nobility and traders. The German and Slavonic provinces show a medium between the two. Czernig gives the following calculation respecting the density of the population in 1836:—

Provinces.	Number of Towns and Villages in German sq. m.	Number of Houses in German sq. m.	Number of Inhabitants.	
			To a Village.	To a House.
Hungary	5	391	931	7.1
Gallcia	4	485	712	6.8
Austria	11	308	302	7.6
Lombardy	26	751	320	8.4

Considerable difficulty attends the determination of the precise rate of increase of the pop. and of mortality in the Austrian empire, owing to the ravages occasioned by the cholera morbus. This disease visited every prov. twice within the last ten years, and caused, for the time, a serious decrease of pop. From the experience, however, of the years in which this epidemic did not prevail, it seems that the increase in the greater number of provs. is very rapid. The following tables have been calculated, expressly for this work, from the annual official returns published in the *Vienna Gazette*. No returns are given for Hungary or Transylvania:—

Annual Average of five Years, from 1833 to 1837 inclusive, for the under-mentioned Provinces.

Marriages.	Births.		Deaths.	Annual Increase of Births over Deaths.
	Legitimate.	Illegitimate.		
	Males - 377,684 Females - 355,282	Males - 422,087 Females - 402,230		
175,965	732,966	82,317	620,877	111,111

Table, showing the Increase of the Population, &c., calculated from the Returns of each Province for two Years, in which there was no Cholera.

Provinces.	Normal Years.	In proportion to 100 of the Population.			
		Per. Increase of Pop.	Deaths.	Marriages.	Births.
Austria - 1835. 1836.	11	3.4	.77	3.6	3.7 to 1
Styria - 1836. 1837.	.58	2.8	.69	3.3	1.1
Bohemia - 1833. 1834.	.97	3.0	.79	3.9	3.3
Moravia and - 1833. 1834.					
Gallcia - 1833. 1834.	.91	3.2	.85	4.5	6.0
Silesia - 1836. 1837.	1.42	3.5	1.09	5.0	12.0
Carinthia - 1833. 1837.	.7				
Carniola - 1833. 1837.	.78	2.0	.66	3.2	12.1
Illyrian coast - 1833. 1837.					
Lombardy - 1834. 1837.	.77	3.4	.87	4.2	24.0
Venice - 1834. 1837.	.75	3.3	.94	4.1	15.0
Dalmatia - 1834. 1836.	1.10	2.3	.91	3.4	7.1
Tyrol - 1835. 1837.	.49	2.6	.70	3.1	16.1
		.78	3.17	.90	5.97
					8.5 to 1

Among the different manners of death specified, we notice the following:—

Annual Average of five Years, from 1833 to 1837 inclusive, for the same Provinces.

Smalpos.	STILL-BORN.		Hydrophobia.	Measles.	Scalds.	Executed.
	Legitimate.	Illegitimate.				
	Male - 4,409 Female - 3,027	Male - 1,028 Female - 872				
4,369	Total - 7,426	1,900	66	499	765	35

From the extreme strictness of the Austrian prov. administration, these official returns, extending over a population of upwards of 20 millions, form a most valuable contribution to the statistics of European population and mortality. It will be observed, that, in Galicia, where the cheapness of provisions encourages early marriages, not only the increase of pop. is greatest, but the number of illegitimate births is remarkably small in proportion. A nearly similar result is given by the Italian provs., in which an unremitting industry and judicious distribution of labour afford a competence even where the prices of provisions are higher. For a comparison of the prices we refer to the head *Trade, &c.* In the calculation of the proportional longevity in the provs., the same order does not occur which is shown in the increase of the population. The average of six years, for the above-named provinces, gives 338 individuals in 10,000 who attain 80 years and upwards; of which number Dalmatia had the most (during the six years 669), and Galicia the fewest (208). Of 100,000 individuals 82 attained 100 years and upwards: here, again, Dalmatia stands first, with 196 in six years; Galicia and the other Slavonic provinces rank next; Lombardy (21), and Venice (14), show the fewest.

Face of the Country.—Mountains.—The Austrian empire exhibits every variety of surface. Two grand mountain ranges, branching from the central group of the Alps, traverse it in different directions, throwing out numerous and extensive dependent branches. The first of these, which has been termed the *Ulcyno-Carpathian* chain, divides the regions of the German Ocean and Baltic from those of the Black Sea and Mediterranean. Leaving the canton of Grisons, in Switzerland, this mountain range traverses Vorarlberg in a N. direction to the lake of Constance: thence it passes through Württemberg and Bavaria, separating the regions of the Rhine and Elbe from that of the Danube, and re-enters Austria on the N.E. frontier of Bohemia, where it throws off an extensive branch of the Erz (Ore) mountains, which stretch into that kingdom and into Saxony. Taking a S.E. direction from the sources of the Eyer, this chain runs, under the name of the "Bohemian Forest," nearly to the Danube, where it once more diverges to the N.E., and, dividing Moravia from Bohemia, sends out a branch into Prussian Silesia and Lusatia, named the Kiesen (Giant) mountains. On the frontiers of Galicia and Hungary it joins the Carpathians, which branch off to the Danube near Presburg. The central Carpathians form the boundary between the above-named provinces, as far as the sources of the Sau and Dniester, where a chain of low heights stretch from them into the Russian territories, separating the region of the Vistula from that of the Dniester. The eastern Carpathians cover the N.E. counties of Hungary, the Bukovina, and Transylvania, as far as the Danube.

The second mountain range, which has much more elevated summits, and covers a larger tract of country, divides the region of the Mediterranean from that of the Black Sea: it stretches from the frontiers of Switzerland and Piedmont in three chains, which, through Tyrol, run nearly parallel to each other. The central chain exhibits the primitive formations of granite and slate: its summits are covered with eternal snow, above the elevation of 8,000 feet. Following the right bank of the Inn, as far as the point of junction of Salzburg and Carinthia, it takes a N.E. direction through Styria into Hungary, and subsides in the Leitha chain near the Danube. The two accompanying chains are of limestone: that on the N. covers northern Tyrol, Salzburg,

and great part of the Archduchy of Austria, and is intersected by the numerous streams which flow from the central chain to the Danube. The S. parallel chain sends its ramifications from S. Tyrol into the kingdom of Lombardy; and, passing through Illyria and the Croatian frontier district, unites with the Balkan on the borders of Bosnia. Three important branches strike off from this chain, one of which stretches between the rivers Raab and Drave, under the name of the *Bakony* Forest, into Hungary; a second divides the region of the Drave from the valley of the Save; and the third, stretching along the Adriatic through Dalmatia, is called by the natives, from its dark colour, *Monte Nero*, or *Negro*.

The length of the different mountain chains in the empire, when added together, exceeds 3,000 miles. The principal valleys in Austria are situated in the southern provinces, and run parallel with the Alps, in the direction of W. to E. They are found in Tyrol, Salzburg, Styria, and Illyria. Croatia belongs, for the greater part, to the valley of the Save; and Slavonia to the fertile vale of the Drave.

Large plains are also found within the empire; they follow, for the most part, the course of the principal rivers. Of the plain of the Po, between the Adriatic Sea and the fall of the Apennines, the northern part belongs to Austria. The plain or basin of Vienna, which stretches from the Leitha mountains to the heights of Moravia, is traversed by the Danube and the March. In Hungary there are two very extensive plains; one in Upper Hungary, situated between the Carpathians and the Bakony forest; the second, extending from the E. fall of the last-named forest and the Matra hills to the rise of the Transylvanian mountains, and from the central Carpathian chain on the north, to the mountains of Slavonia on the south. This, the largest plain in central Europe, is traversed by the Danube, the March, Drave, and their tributaries. The plain of the Vistula and the Sau, in Galicia, is a portion of the great level which stretches from the fall of the Carpathians on the north to the Baltic Sea.

Rivers, Lakes, &c.—The Austrian empire belongs to the regions of the Rhine, Danube, Elbe, Oder, Vistula, Dniester, and Po. The Rhine forms part of the frontier of Vorarlberg, towards Switzerland from near Feldkirch, until it falls into the Lake of Constance. The Danube enters the Austrian territories at Engelhardt's Zell, near Passau, where its depth is 17 feet, and its breadth 650 feet: in its course through the provinces of Upper and Lower Austria and Hungary, it receives all the waters falling from the two grand mountain ranges, described above; the chief amongst which are, on its l. bank, the March, Waag, Gran, Theiss, &c.; on its r. bank, the Traun, Enns, Raab, Drave, Save, &c. All of these rivers, with many of their tributaries, are navigable, and with the gradual development of the resources of this vast empire, must afford facilities for commercial communication of the easiest kind, and on a gigantic scale. The Elbe has its source in Bohemia, which it traverses in a direction from N. to S., being navigable for barges from Prague after its junction with the Moldau, which is navigated from Budweis. Besides the Moldau, it receives the Adler, Sapawa, Wattawa, Eger, and other streams of inferior note, before it crosses the frontier of Saxony. The Oder has its source in the chain of hills which connects the Silesian Mountains with the Carpathians; it leaves the Austrian states without assuming the importance of a navigable river. The Vistula is formed by the junction of two mountain streams, which fall from the Carpathians, near Jablunka. It is navigable nearly along the whole of its course from Oswiecz to Zawychest, a distance of upwards of 200 miles, in which it forms the Austrian frontier. It receives the Dunajec, the Wisloka, and the Sau, the last of which is navigable from Przemyśl, along its course of 120 miles. The Dniester, which rises at the N. side of the Carpathians, where they branch off towards the Danube, through Transylvania, is navigable from the little town of Koniuszki, 24 miles S.W. of Lemberg. In its course through Galicia, it receives 14 streams upon its left, and 6 mountain-brooks upon its right bank. The sources of the Sau, which falls into the Vistula, are situated farther to the E. in the Carpathians than those of the Dniester; and where these two rivers are large enough to be navigated by boats, they are almost connected by a series of lakes or ponds stretching through the sandy plain which extends from Przemyśl and Jaroslaw to Jaworow and Komarno, thus offering a natural communication between the Black Sea and the Baltic. The Pruth rises in the same chain of hills, but soon enters to Moldavia. The main channel of communication for Lombardy is afforded by the Po, which, in its course through and along the borders of the Austrian territories, receives from the Alps the Ticino, Adda, Oglio, and Mincio, besides smaller streams. The Adige, the Tagliamento, and the Lisonzo, traverse the provinces of Venice and Illyria to the Adriatic.

Lakes, &c.—The Lake of Constance may be counted amongst the Austrian lakes, although only a portion of its E. shore belongs to Austria. On the S. side of the Alps, the Lakes Maggiore, Lugano, Como, Isco, and Garda, are the most considerable. On the N. side of the same mountains, the largest lakes are those of Atter, Gmünd, Traun, Hallstatt, and Aucee, which are connected together by the Traun, and the lakes of St. Gilgen and Monsee. The lake of Zirknitz, with others in the limestone hills of Illyria, although remarkable as natural curiosities, are of trifling extent. The Neusiedler and Balaton lakes, in Upper Hungary, are the largest in the empire; the water of the former is salish.

Climate.—Four distinct climates are found within the limits of this extensive empire. The most southerly part of Dalmatia produces the palm-tree, and at Ragusa, the mean elevation of the thermometer is stated by Blumenbach to be $+11^{\circ} 8' R.$, or $57^{\circ} 3' F.$; upon a line drawn along the S. foot of the Alps, the mean temperature at Milan is $+9^{\circ} 4'$; at Temeswar, $+9^{\circ} 2'$. On the N. side of that chain, in Linz, it is $+7^{\circ} 6'$; in Vienna, $+8^{\circ} 8'$, (nearly the climate of Strasburg); Buda, $8^{\circ} 8'$; in Klausenburg, $+7^{\circ} 3'$; in Prague, the mean heat is $+7^{\circ} 9'$; in Olmutz, $+7^{\circ} 3'$; in Trepan, $+7^{\circ} 3'$; in Lemberg, $+6^{\circ} 1' R.$ Wine and Indian corn do not thrive to the N. of the last drawn line, except in unusually favourable situations; but corn of all other descriptions, flax, hemp, and hardy fruits, attain perfection. The observations, at the observatory of Vienna, for 1837, give for the mean temperature only $+7^{\circ} 2' R.$; 26 days in that year were clear, 172 cloudy, with sunshine; 166 cloudy. Rainy days were 144, snow 54; and there were 139 fogs, 26 thunder storms, and 17 storms. In the northern provinces, the air is mostly clear and salubrious. The greatest quantity of rain falls in the kingdom of Lombardy, the smallest in the central districts of Hungary and in Dalmatia, which often suffer from excessive drought. In this last province, the fall of rain averages 12 inches; at Vienna the average was, for 1836, 15.99 inches; for 1837, 15.86. Tyrol has many varieties of climate, resulting from the elevation of its mountains in a southerly situation. The classification given by Franchi for Switzerland has been found to suit Tyrol with equal precision.—1. The region of the vine, from 700 ft. to 1,700 ft. above the level of the sea.—2. The region of the oak, from 1,700 ft. to 2,400 ft.—3. The region of the beech, 2,400 ft. to 4,100 ft.; the walnut only reaches 3,500 ft., the plum-tree, 3,720 ft.; pear and apple-trees, 4,100; but little wheat is grown in this region; but the meadows are excellent.—4. The region of fir, from 4,100 to 5,500 ft.—5. The lower Alpine region famous for its pastures, 5,500 ft. to 6,500 ft.—6. The Upper Alpine region, 6,500 ft. to 8,200 ft., above which is the region of eternal snow.

Natural Productions. Minerals, &c.—A statement of the produce of the mines in the Austrian empire is given under the head manufactures. We may here remark, that the amount produced is very far below the capacities of a country so highly endowed with mineral riches, that the extent of this source of wealth and industry is very imperfectly explored, and that what is worked neither attracts the amount of capital nor the degree of skill necessary to a successful result. In that statement, the amount of iron is not distinguished from the quantity of native steel obtained in Styria and Illyria; the only part of Europe in which the carbonated iron ore occurs, and where it is found in masses that require rather to be quarried than excavated. Platina is not found in Austria. Of the rarer metals, *Itan* is found near Roese, in Hungary; *arsen* in the Sudeten in Bohemia; *tellurium* in Hungary and Transylvania. Besides the opals of Hungary, the most beautiful that are known, an inferior kind is found in Moravia; carnelian, beryl, chalcodon, topaz, garnet, and anethyst, in Bohemia and Hungary, of superior quality.* Beds of coal have been found in nearly every province, but the cheapness and abundance of fire-wood have hitherto prevented much search from being made after them. Upwards of 100 descriptions of marble, quartz for the manufacture of glass, clays for porcelain and mineral dyes of all kinds, are also found in abundance. Of mineral springs, no country has so great a number; upwards of 100 are annually frequented, for the purposes of bathing and drinking the waters; amongst which Carlsbad, Toplitz, Marienbad, Ischl, Gastein, Baden, Pilsenau, Teutchen, Mehadia, and Roquero, attract visitors from all parts of the world.

Animals.—All the domestic animals found in England are met with in the Austrian empire. Exclusive of these the brown bear is indigenous in the Alps and the Carpathians, the wolf in both these mountain chains, and the lynx is found in all the provinces. The chamois, red and fallow deer, roebucks, wild boars, all descriptions of game

known in England, with the exception of grouse, and several kinds of birds unknown in our islands, are objects of chase. The urus and elk are sometimes found in the E. Carpathians, but only as stragglers. The ibex is nearly exterminated. Herds of wild horses of a diminutive size range the Hungarian plains; and even where the improvement of the breed is attended to, they are allowed to rove almost in a state of nature. The golden eagle inhabits Slavonia, and other large species are found in the Ithetan and Noric Alps. Herons of various kinds, some of the choicest plumage, abound in the morasses of Hungary; and there also the land tortoise is found in great numbers. The same morasses furnish an abundant supply of leeches, whence they are regularly transported by means of a series of ponds, that serve as so many stations, to Paris and the W. of Europe. Wax is an important product of the Bukowine and other S. provinces. Cantharides are found in several parts of Hungary; cochineal in Galicia; and pearls of a beautiful water are annually fished in the Moldau.

Products (Vegetable).—These comprise the different sorts of corn and of cultivated grasses found in Europe, with vines, flax and hemp, tobacco, hops, saffron, woad, some species of indigo, yellow woad or *flax colinus*, galls, and an immense variety of fruits, &c. The forests are of vast extent, and will, no doubt, come to be of great value. The mountain chains of the northern provinces and of the Alps are covered with fir, pine, beech, larch, &c. The low grounds, including the vast forest of Bukony in Hungary, with others in Transylvania, the Bukowine, Galicia, Slavonia, &c., produce oaks of a gigantic size, with beech, ash, alder, elm, &c. Every prov. is well supplied with wood, with the exception of Low Austria, (into which large quantities are imported from Tyrol and Up. Austria, to meet the great consumption of the capital.) Lombardy, Prager, and Hungary, where, from neglect of management and bad economy, the stock has in many parts been alarmingly reduced. In the other provs. the forests are well managed; and care is taken to supply the annual consumption by sowing and planting in proportion to the quantity felled. The proprietors of estates are obliged, in Austria, as all over Germany, to employ foresters, who have been educated in forest schools, and who have passed the necessary examination. Their business is to calculate exactly the quantity of timber that may be felled without diminishing the stock. The simple means at their command to buck ranges of mountains are generally applied with great ingenuity to forward the felled trees to the common channels of communication. A kind of hollow railroad of timber (*Riesen*), sloping down the side of a mountain, often several thousand yards in length, and down which the trunks of trees are precipitated, is one means of transport. The trunks are raised from a valley to the summit of a neighbouring chain, over which they have to be transported, by means of ropes and pulleys, worked by a rude water-wheel temporarily erected by the woodman on a little brook (*Holzsaug*); and the springs near the summits being let into a temporary reservoir on the ridge of the hill, the burden thus raised is received by it in order to be precipitated into the hollow on the other side, when the sluices confining the waters are opened (*Klausen*). But while this ingenuity is shown in the management of the mountain forest-tracts of fir, the fir richer wooded districts of Slavonia, the military frontier, and Upper Hungary, in which the more valuable forest trees attain a size unusual in Europe, are neglected, and but little known. The carriage, instrument, and cabinet-makers of Vienna (who furnish the cheapest goods of the kind in Europe), are supplied from the better known, and rather more accessible forests of Illyria and Lombardy; but the want of capital is equally visible in this branch of trade as in the mines, and but little management is displayed either in economising the stock or in seasonally the supply brought to market. The forests cover more than a third part of the productive soil of the empire, and are distributed in the following proportions, according to the statement of Becker (*Handel's Lexicon*, Vienna, 1837), who, we have been assured, had access to official sources of information:—

Provinces.	No. of Acres of Forest Land.	Produce in cubic Fathoms.	Average Produce per acre in cub. Fath.
Austria	5,919,561	94,551,131	61
Styria	2,525,008	14,201,234	72
Illyria	2,741,177	18,395,597	53
Do. coast	451,184	334,059	32
Tyrol	2,757,496	931,300	33
Lombardy	1,618,451	869,257	53
Venice	12,716,576		
Hungary	394,580	235,060	64
Transylvania	3,070,095	1,113,717	45
Galicia	6,016,115	2,100,000	36
Bohemia	3,393,215	2,116,092	63
Moravia	1,585,215	1,310,657	84

* Graphite, or black lead, occurs in Bohemia and in Lower Austria. Sulphur, vitriol, saltpetre, the latter especially, in Hungary, are extensively obtained.

We may remark, that André, a competent judge, estimates the annual produce (of 1 joch = 1.4 acres) of well managed forest, as averaging 3 cubic Vienna fathoms of timber and fire-wood. Becker does not give the probable annual produce of the Hungarian forests; and we do not think it necessary to supply the deficiency from other authors, without access to authentic information. Some idea of the extent of the oak forests may however be formed, from the fact that nearly 200,000 bushels of gall-apples are annually exported, besides what is used in the country. The distribution of the forests is however very irregular; and, while in the mountainous tracts they are of immeasurable extent, the want of fire-wood is so great in the plains, that dried dung is a common substitute for faggots. In Transylvania, especially, and the military frontier, the forests are both of great extent, and filled with trees of the finest quality, equally adapted for the use of the builder and the naval architect.

Facilities for Internal Communication and for Commerce.—We have already alluded to the laudable attention paid by the Austrian government to the means of communication throughout the empire. From Pavia, on the S.W. frontier, an uninterrupted *Macedonian* road conducts the traveller through fine provinces to Czernowitz in the Bukovina, a distance of upwards of 1,120 m. From Milan to Vienna there are three lines of road, and through Galicia the line is double. Three grand high-roads from Venice, one to Trieste, lead to Tyrol and Germany, and double lines run from each of these cities to the capital. Prague is connected with Vienna by numerous lines of communication, which are continued to the frontiers of Bavaria, Saxony, and Prussian Silesia. Materials for making roads abound in every province; and the art is well understood in Austria, where the roads are equal to those of Prussia. Upwards of 60 mountain passes, through the most extensive ranges of mountains that any single state possesses, have been made not only for traffic, but convenient for travelling and commercial purposes. The lowest of these, as measured from the level of the sea, is perhaps the road along the Danube from Drenkova to Orsova, in the Transylvanian military frontier. The most elevated is that of the Stelvio or Wörms Joch, in S. Tyrol. In length these passes vary from 10 to 70 miles. On the roads across the Alps from Tyrol and Illyria the greatest sums have been expended; their importance in a military point of view, and the necessity of facilitating the communication with a powerful and not very well affected province, rendering them indispensable. The roads across the Spilagen, the pass of Finstermünz, and the Wörms Joch to the Lake of Como, must be classed amongst the greatest undertakings of the kind. The road over the Wörms Joch passes over an elevation of 8,460 feet above the level of the sea, and is protected in dangerous parts by covered ways of solid stone, which receive the fall of the avalanches, and cause them to glide into the depths below. This undertaking has surpassed the passages of the Simplon and Mount Cenis, both in boldness and splendour of execution. The exertions of private industry have not remained far behind those of the state. In Hungary many nobles still consider it a *privilege* not to be obliged to contribute to the cost of making roads which tend so much to enhance the value of landed property. Individuals, however, have at no time been wanting amongst that respectable body who were sufficiently enlightened to set a laudable example on this point. A joint-stock company, chiefly composed of Hungarian nobles, undertook the execution of a road between Carlstadt in Croatia, and Fiume on the Adriatic Sea; it was carried over part of the Julian Alps in a very splendid manner. On that part, known by the name of the Karst, the porous nature of the rocks made it necessary to construct cisterns to catch the rain-water; and stout parapets have been added, which protect travellers and carriages against the furious blasts of the *Bora*, which, without this check, would sweep away every thing in its course. This road was commenced in 1803, and named after the Archduchess Maria Louisa. Two other lines, one between the same points, the other running from Carlstadt to Zeng and Carlopago, across the same mountain range, each of which was scarcely less expensive, although not so serviceable as the "*Louisenstrasse*," had been erected by, and called after, the emperors Charles VI and Joseph II. The iron railway between Budweis in Bohemia, and Linz in Upper Austria, finished in 1829, was executed at the cost of a private company, and has since been extended on the S. side of the Danube as far as Gmünd. It is 75 m. in length, but consists of one line only, and the carriages are drawn by horses. The line from Budweis to Linz was rendered unnecessarily expensive by ill-judged economy in the first instance, as it became necessary to exchange the original wooden rails, covered with metal plates, for others of cast-iron. The traffic has chiefly consisted hitherto in the salt conveyed from the mines of Upper Austria, to be consumed in Bohemia.

The report of the committee for 1837, shows the transport to have been,

Salt	-	291,826 cwt.	} Net revenue for the year, 8,130.
Merchandise	-	151,254	
Wood	-	2,538 cub. fath.	
Fish	-	157 loads	
Persons	-	3,438	

The number of shareholders is 13,133, at 50fl. per share; but owing to the increased expense attending the works, they have as yet divided no profit. The line from Linz to Gmünd being a part of the high-road from Vienna to Lach, which is much frequented as a watering-place, has a greater number of travellers, and was better managed from the beginning, as the experience of the first attempt was turned to good account. Its traffic, in 1837, was:

Salt	-	512,319 cwt.	} Net revenue for the year, 5,325.
Merchandise	-	130,324 cwt.	
Persons	-	77,905	

This left a profit to be divided amongst the new shareholders, to whom the first proceeds are guaranteed to a certain amount, beyond which the shareholders in general are to participate. The length of this line is 32 miles; and the cost, inclusive of magazines, station-houses, 45 carriages, and 230 waggons, did not exceed 65,000. The charge for transport of goods is 3 kr. (1½d.) per cwt. A second railway, upon a similar plan, was commenced about the same time between Prague and Pilsen in Bohemia, but was abandoned for want of funds, when only 39 miles of the distance had been completed. Prince C. K. Fürstenberg purchased it subsequently of the company, and let it to an enterprising individual, who keeps it in repair, and is said to derive some advantage from it. The railroad, now constructing by a joint-stock company, from Vienna to Bochnia in Galicia, for steam-carriages, will have a length of nearly 400 m. It follows the valley of the March or Morava, through Moravia, as far as Napagedl, with side branches; one to Preburg, along the Danube, another along the Thaya to Brünn, and a third following the March to Olmutz. From Napagedl the line follows the Beczwa, a tributary of the March, to Preau, where it crosses over the heights near Weisskirchen, into the valley of the Oder, passing the grand European water-shed, with a rise of 1 ft. in 400 ft. A branch here follows the Oder and the Oppa to Tropau, where it is to unite with the Prussian Silesian railway; while the main line crosses the heights near Seibersdorf into the valley of the Vistula, and throwing off another short branch to Biehlitz and Biala, follows that river to Cracow, whence, with a gentle undulation, it reaches Bochnia, leaving Wleczka a little to the S. This railroad is to be for steam-carriages; and the total estimate of its cost, with station houses, &c., amounts to 20,000, per German mile,—which was subscribed in 12,000 shares, of 1,000 fl. each. Of the probable importance of this spirited undertaking, not only for the internal, but also for the foreign trade of the empire, we shall have an opportunity of speaking under the head of *Trade, &c.* The sanction of the government was obtained, in the year 1834, for a railway between Vienna and Raab in Hungary; as, however, in granting the privilege, a reserve was made in favour of any company undertaking the establishment of a railroad from the capital to Trieste, there are grounds for supposing that it is in contemplation to give every possible aid to such an enterprise whenever it is undertaken. The face of the country through which a railroad from the Danube to Trieste has to pass, presents the greatest difficulties that have yet been encountered by a railroad company; but when we consider the means at the command of the Austrian government, the circumstance that the materials lie along the track itself, and the probable immense gain upon a line which should unite two such provinces as Galicia and Hungary with the sea, it is rather matter of surprise that it has not as yet been attempted, than that the difficulties should discourage from the undertaking. Between Venice and Milan the works have been already begun upon a railway, intended to be carried through Padua, Vicenza, Verona, Peschiera, on the Lake of Garda, Brescia, and Treviglio, to Milan. The length of this railway will be 300 kilometres, and the estimate of the outlay gives 1,800,000. per kilometre, including the cost of buildings and carriages.

We have seen that the river system of Austria is upon a grand scale, and it is likewise, to a great extent, made available for the purposes of internal navigation. In order to give an idea of the facilities for commerce which this immense empire possesses, we subjoin a rough estimate of the length of the navigable rivers, lakes, and canals, measured on the beautiful map drawn up from actual survey by the Imperial Engineer Corps and published in 1832. The length of each river is measured by straight lines, following the principal bends, but not the windings of the stream; and the result is, for

Provinces.	Length in Eng. Miles measured by Straight Lines.			Direction in which the Rivers flow.
	Rivers.	Lakes.	Canals.	
Austria	558	44	21	Danube and Black Sea.

Hungary & Transyl- vania	2,100	61	500	Danube and Black Sea.
Totals	4,332	229	851	

No allowance is made in this calculation (which is intended only to draw attention to so important a feature of these rising countries, and is offered in the absence of an authenticated statistical statement,) for the double beds or arms of the Danube, the Theiss, and other rivers in Hungary. If these be taken into account, the length of the navigable (or rather of the navigated) rivers might perhaps be trebled. It is remarkable that both the Danube and the Dniester are interrupted in their course to the Black Sea by rocky prominences in their beds, which impede their free navigation. It has however been proved, that although a difficult and expensive undertaking, it is by no means impracticable to free the bed of both rivers from rocks. The hint thus given by nature seems scarcely to have been required to point out the superior advantages of a communication with the Adriatic in the present state of European trade; and which is likewise nearly accomplished in a natural way by means of the little river Kulpa, a tributary of the Save, which, when its water is high, may be navigated to the heart of Croatia, to within 70 miles of Fiume, and which might with ease be transformed into a regular canal. A better line of communication might perhaps also be established between Carlsbad and the Adriatic near the fall of the Vilchit Mountains to the S. of Carlsbad, for which a part of the Josephine road might be used; but Astarja, instead of Carlsbad, might be chosen for a point from which coasters could keep up a communication with some of the numerous harbours on the Austrian coast. Another grand private undertaking was the introduction of steam boats on the Danube by a company at Pesth, under the direction of Count Stephen Szicheny, which has proved most successful; and companies have since been formed in Austria and Bavaria, who have established a steam communication from Ratibon to Vienna, and thence to Trebisond, Constantinople, and Smyrna. In 1838 these companies had 10 vessels plying on the Danube between Linz and Constantinople, two of which were used for towing ships of burden, one between Presburg and Drenkova, the other between Orsova and Brailoff on the Lower Danube. The journey from Vienna to Constan-

tinople is now performed in 12 days, including a day of rest at Pesth, and two days for disembarkation at Drenkova, and re-embarking at Orsova, where the rocks of the *Bieraces Thor* impede the steam navigation. This passage, which formerly was altogether impracticable, was opened for vessels of light draught in 1834, by a corps of engineers and miners, under the guidance of Count Szicheny: 1000 miners were employed for some time between Lyupkawa and Szvinitza, and removed upwards of 1,000 cubic fathoms of rock, after which the first barge floated in triumph down the stream. A close investigation of the spot (the result of which was published in the *Vienna Gazette*) showed that a renewal of those exertions would effect, without any extravagant outlay, the opening of the stream for navigation by all vessels downwards. But, until this can be effected, a road along the river has been constructed, which must be used for heavy goods brought up the river, even if the passage were improved, on account of the rapidity of the stream in this part.* Of the numerous rivers in Hungary, the Theiss and the Maros are the most extensively navigated. They carry barges of 300 to 400 tons; and 50,000 tons of salt alone are conveyed upon them from the Transylvanian mines to different parts of Hungary. Steam boats are likewise building for the navigation of the principal lakes; that intended for the picturesque lake of Gmünden will commence running in 1839. On the Lakes Maggiore, Como, and Garda, steam boats have been established for some time, and a steam boat communication is kept up between Venice and Turin on the Po. In the summer of 1838, a steam vessel, belonging to the Dresden Company, ascended the Elbe as far as Teschen in Bohemia, and demonstrated the possibility of introducing this species of navigation with vessels of light draught upon that river. Nearly at the same time the first attempt with a steamer was made upon the Save, which ascended from Semlin to Szissak in Croatia (at the mouth of the Kulpa) in 57 hours. In a few years we may therefore expect to find in Austria a most extensive and well-arranged system of internal steam navigation.

Ports and Harbours.—The principal commercial port belonging to Austria is Trieste upon the Adriatic, which has been declared a free port, and is accordingly shut out of the customs line as well as Venice, which has the same privilege; so that the duty on imported goods, instead of being paid on the landing of the wares, is not demanded until they are sent into the interior. Venice is the seat of the Admiralty, and has splendid dock-yards and naval arsenals; which, however, have long been left in unprofitable repose. Fiume is the port of Hungary; and though not a good place for vessels to lie at, is likely to attract a great deal of the attention of English traders, in consequence of the treaty recently concluded between England and Austria. Pola, in Istria, has one of the finest harbours on the Mediterranean; but it is so unhealthy from the prevalence of malaria, that it is almost uninhabited. Schenico, Cattaro, and Ragusa in Dalmatia are all good harbours. The merchant shipping of Austria in 1834, is stated by Becker, from official sources, to have been —

* The net profits of the boats on the Danube amounted, in 1837, to £6,250 d.; the proceeds of two vessels having left a loss. The expenses amounted to double the above-mentioned sum. The trade receipts of three vessels, running between Constantinople, Smyrna,

Trebisond, and Solonichi, amounted, in the same year, to £66,753 d. The total number of passengers in all vessels, in 1837, was 47,486; being 18,285 more than in 1836.

A very spirited company at Trieste has been established, within a few years, under the name *Lloyd's Austriaco*. They have had a number of steam boats built at Porto Rê, near Fiume, with which a communication is now kept up between Trieste and Venice, the Dalmatian harbours, Greece, Smyrna, and Alexandria. The tenth steam boat of this company was launched in 1838.

The post-office department published, in 1835, the following tariff for passengers by its diligences. The price is per German mile for 1 seat, in kretutzer (30 = 1s.):—

	Common 1911- gences inside.	Cabriolet.	Separate Carriages with post-horses, 4 seats, at per seat.
Lower Austria	kr. 28	kr. 35	kr. 35
Upper Austria	28	35	33
Tyrol Illyria	28	35	33
Bohemia, Moravia	30	35	31 1/2

Military Frontier	- 1	40
Transylvania	- 1	30

The manner of charging the postage of letters is peculiar to Austria. If the distance do not exceed 6 posts, the charge varies from 6 to 14 kr. for a single letter; 14 kr. is the highest charge made within the empire, whatever be the distance of the places. The Austrian post-office keeps no running account with foreign post-offices. All letters must, therefore, be franked to the frontier.

State of Agriculture.—The following tables, which we extract from *Becker's Handels-Lexicon*, printed at Vienna in 1836, (the statements in which, relative to Austria, are stated to be derived from official sources,) give a survey of the agricultural industry of the empire, which will be more fully detailed under the heads of the different provinces. These official sources appear to be the returns from the collectors of the land-tax, in which the amount of cultivated land is given for all the provinces, excepting Hungary and Transylvania, with the greatest exactness. The amount of produce, however, is considerably underrated, as it is calculated upon the worst description of tillage, and upon low averages, as is usual with calculations which form the basis of taxation:—

Table showing the Amount of Cultivated Land of each Province, reduced to English Acres, from *Becker's Handels-Lexicon*, Vienna, 1836.

Provinces.	Arable.	Vineyards.	Meadows and Gardens.	Commons.	Forests.	Total.

To the produce of the kingdom of Lombardy (provinces of Lomb. and Ven.), the following additions must be made:—Millet and buck-wheat, 184,000 qrs.; rice, 148,800 qrs.; oil, 124,000 cwt.; silk (cocoon), 288,000 cwt.; tobacco, 249,000 cwt.; besides fruit of all kinds, cultivated in great abundance. The Lombards devote more refined industry to agricultural pursuits than any other country in Europe; and perhaps no spot on the face of the globe is made to yield so much produce, in proportion to the quality of the soil, as the district extending from the fall of the Alps to the Po, and from the Ticino to the Adige. The water from the great Alpine lakes, and from the rivers through which they discharge it, is conducted by innumerable canals to a large portion of the fields, in which the most beautiful and effective system of irrigation has been introduced. It is common to mow these meadows three times in the year, and to graze them besides during the autumn.

* This calculation includes Transylvania and the Military Frontier.

Dr. Bürger estimates the average produce of these meadows at 8 tons of hay per Eng. acre, which he calculates is equivalent to 24 tons 16 cwt. of grass. It is the produce of these meadows which nourishes the cows that produce the beautiful Parmesan and Strachino cheeses, the preparation of which is attended with no further mystery; so that the author above cited supposes that, with equal care, these descriptions of produce might be raised in Hungary, or in any other country where the climate is mild. The greater part of these meadows are broken up every three years, and crops of wheat and maize taken; when they are again laid down with rye-grass. The acre yields, on these occasions, on an average taken for the four classes of soil, according to Bürger, — Wheat, 8 bushels; Maize, 41 bushels; but this is, undoubtedly, too low an average; a crop of 8 bushels of wheat would not pay the expense of labour.

These fields are further surrounded with plantations, and sometimes with a kind of hedge of mulberry trees, the leaves of which furnish food for the silkworms; the rearing of which, on its present extensive scale, is a benefit accruing to his country from the talents and unwearied exertions of the late Count Vincenz Dandolo. The extent to which the cultivation of silk has of late years been carried is shown by the fact that, in 1824, when the exports from Lombardy alone amounted, according to Bürger, to 956,608 lb. pic.: that province produced as much silk as sixteen years previously was raised in all Italy; whereas the average exports of the three years, 1825-6-7, for Lombardy, exhibit an amount of 4,958,880 lb. pic. of spun raw, and waste silk. Bürger reckons to 5 and 4-5ths Vienna lbs. of silk, 11oth of eggs, the worms from which consume 794 and 2-5ths lbs. of leaves; the mulberry trees in Lombardy produce between 20 lbs. and 60 lbs. leaves; so that if we estimate them at 40 lbs. all round, it gives nearly 10,000,000 of trees for that province. Although the mulberry tree is cultivated all over the north of Italy, yet it is more especially planted in the dry and stony districts near Verona. It would appear, too, that a cooler climate is more favourable to the rearing of the silkworm, as the attempts in the north of France have been eminently successful. Near Paris, M. Cam Beaumont produces 170 lbs. of cocoons from 11oth of eggs, whereas the calculation here given is based on a production of only 70 and 2-5ths lbs. In the south of France the production is only 50 lbs. This branch of industry is particularly valuable from the circumstance of its only occupying the partial labour of 6 weeks to 2 months in the year, which is over before the harvest commences. The production of oranges and lemons is confined chiefly to the neighbourhood of the Lago di Garda, where the trees are kept in covered gardens or terraces, against the sides of the hills. Blumenbach gives the number of these trees, in the neighbourhood of Salò alone, at from 15,000 to 16,000, many of which produce 800 fruit annually. The division of agricultural labour is curious in these provinces. Not only a number of persons occupy themselves with silk-growing, who have no land, and are obliged to purchase the leaves from others, but the greater part of the cheese is made by persons who purchase or farm the milk of the cows, and whose whole vested property consists in the pans and utensils. It will be supposed that profits are but small where such divisions exist, and the landowner's interests are those best considered. Land in these provinces is perfectly free from feudal services and contributions, but is most exorbitantly taxed. According to Bürger, the land-tax, which appears to be very unequally divided, amounted, in 1826, for Lombardy alone, to 22,280,480 lire; the extra expenses of excursions on dilatory contributors amounted to 84 per cent.; for Venice it produced 15,977,011 lire in the prov. of Venice the county rates amounted to 2,497,764 lire; in Lombardy, to 3,759,939 lire. These four sums added together give an impost of 7s. 4d. per English acre, on 560·2 sq. German miles, that being the estimated amount of cultivated land upon which these rates are levied. The practice of letting land prevails to a great extent in Lombardy; and the usual rent paid by the farmer (Colone) is large, being half the gross produce of the land. The stock and valuations, however, in such cases, generally belong to the landlord.

The statement, given in the Table, of the produce of Hungary, is one of the most moderate amongst the many varying estimates of the produce of that extraordinary country. If an approximative estimate be sought of what Hungary could produce, were more skill and industry introduced amongst her agricultural population, the statement given is exceedingly below the mark. The two great plains on the Upper and Lower Danube present not only an excellent soil, with the finest climate in Europe, to the farmer, but offer facilities for irrigation not inferior to those so admirably used by the Italians in the neighbouring province. The largest plain is 66 German m. long, from W. to E., in its greatest length, and nearly 60 in breadth from N. to S.; its area is upwards of 11,000 sq. English miles. In the greater part of this

plain the soil is of so rich a quality that no manure is required for the choicest crops, and the dung of the cattle is either thrown away into the rivers, or burned as fuel by the peasants. When excessive drought does not burn up the grass, its growth is so luxuriant that the descriptions given of it exceed belief. Owing, however, to the long contest which has been carried on, since the expulsion of the Turks, by the Hungarians against the Austrian emperors, for the support of their privileges, the policy of the government has hitherto shut up this valuable portion of Europe; and it is only since the conclusion of the Milan treaty in the last year that the expectations of the country have been roused to a state of confidence. Were the agricultural skill of the Lombards transferred to Hungary, this province would, in time of scarcity, (which in other lands is usually the result of cold and damp seasons,) supply food for all Europe; while the immense amount of produce in ordinary years will ultimately, no doubt, cause a great change in the value of many articles suited to this climate. Of these, wine is a principal object; and more care is annually bestowed both on the culture of the vineyards and the manufacture of the liquor. The king of wines, Tokay, owes its celebrity entirely to the care with which the ground is tilled and the grapes sorted. The process of dressing the vines is performed with as much care and at nearly the same expense that are bestowed on the celebrated vineyard of Johannisberg. Other good kinds are, the wines of *Mesch*, in the Banat, of *Carlowitz* and *Nessmühl*, *Ofen*, and *Oedenburg*. Silk is increasing rapidly in cultivation, and might be raised in every part of the kingdom. For fuller details respecting this we refer to the article Hungary; and, under the head *Trade*, we have offered some remarks on the best means of making its riches available to foreign countries. The great obstacle to a flourishing state of agriculture was removed by the Diet of 1836, when a law was passed for fixing the division of land. Down to that period the peasant only tilled his portion for three years, after which another was allotted to him by his lord, and the share he possessed was either given over to others or turned into grazing land. This arrangement alone must have proved the bane of all improvement; besides which, the unthriftiness habitual among the inhabitants of a highly productive soil exposes them constantly to the distress of famine, even in the year following a very abundant season. Hence the singularly contradictory accounts circulated respecting this highly favoured country. The want of a market for their corn has obliged the Hungarians to prosecute, on a large scale, the raising of sheep and wool. The number of sheep had been estimated by Lichtenstern at 6 millions, in 1805. How much this number must have increased since then is evident from the augmentation stated by Czaplowitz (in *Econom. Newgh.*) to have taken place in the amount of wool annually produced, and which he estimates at 400,000 cwt., produced by at least 20 millions of sheep. According to the official reports, the exports of wool from Hungary to the other provinces amounted, in

1832 — 1833, to 24,538,410 flors.

1833 — 1834, to 19,036,140 —

which would give an average of from 180,000 cwt. to 200,000 cwt. annually; a quantity which we may look to see yearly augmented: the internal consumption is estimated at about as much. Galicia, the second rich source of agricultural produce, has also been compelled to substitute wool-growing for the cultivation of corn. The increase in the number of sheep in this province, since 1816, was, in 1837, 728,120; the increase, since 1834, amounted to 279,791, of which number 90,000 belong to the circles of Zarnow and Bieczow with the Bukovina. The remarkably fertile part of this province begins to the E. of the Sau, and follows the course of the Dniester, being part of the great plain extending nearly from the Carpathians to the Black Sea, and embracing Podolia, the Ukraine, and Moldavia. The soil in this part of the province is nearly as rich as that of the great plain of Hungary, and produces the beautiful white Danzic wheat, so much prized in the London market. The cattle returns for 1837, however, show in the 4 circles which embrace this fertile district 492,456 head of sheep; while 63,830 oxen, besides cows and horses, with 156,413 head of sheep, are counted in the Bukovina only. The large portion of the land, which in all the provinces is held in small parcels by the peasants, in Galicia, particularly, is cultivated and unproductive. The large estates of the nobility are, however, in general well farmed, and may be classed with those of Bohemia, Moravia, Austria, and the provinces to the south of the Danube. On these estates regular rotations of crops, with artificial grasses, are now universal; and many of the machines in use in England, such as improved ploughs, sowing and threshing machines, &c. have been introduced. A gentleman, who farms his own estate in a part of Moravia, where the soil is of average quality and the climate has a mean

temperature, has furnished us with the following details:—

An estate of mean size contains from 850 to 1,400 Eng. acres of arable land, 140 to 420 acres of meadow land, and 1000 to 2,500, or more, acres of wood, according to the situation, that is, whether near the mountains or in the plain. The estates conferring the right of representation (*landesherrliche Güter*), and which are only held by knights or nobles, are of all sizes from a few acres to several German square miles. These estates can, strictly speaking, be held also by a commoner, but only on his paying a portion of the taxes twice over, and on his renouncing the right to all kinds of patronage and judicial authority. The estates of mean size may be estimated at two thirds of the whole. In Moravia about 30 are found to exceed 32 Eng. sq. miles in extent. In purchasing land, a profit of from 4 to 4½ per cent. per annum is generally looked for. The size of the peasant's holdings is also very various. In the plains a peasant's holding may be about 28 Eng. acres. In the hilly parts, where the population is thinner, and the soil less productive, it is 30, 40, and in some parts 70 acres. Half holdings, quarter holdings, as well as cottiers with small gardens, are also frequent. It is, however, supposed that of the peasant families 2-3ds hold land, and about 1-3d may be considered as mere labourers. The mode of cultivation adopted by the peasants in the low lands is a rotation of three crops, viz., wheat, rye, summer corn; fallow; the fallow being only partially used. In the hilly parts the fallows are more used for potatoes, turnips, flax, &c.; in the mountains tillage is more irregular. Oats, potatoes, and flax are grown; and in the more elevated spots oats and buckwheat. On the greater part of the small estates of the nobles a better rotation of crops, with clover, green food, and meadows, prevail, according as the soil or the local advantages of common grazing (which is very extensive everywhere) render it necessary. "I have found the following rotations do very well:—1. Potatoes, with manure; 2. Barley or oats, with clover; 3. Clover hay; 4. Clover, as pasture; 5. Rye; 6. Oats. In heavy soils:—1. Winter corn, with dung; 2. Barley, with clover; 3. Clover; 4. Wheat; 5. Green fodder, with manure; 6. Wheat; 7. Peas and beans; 8. Rye. In the low lands millet is much sown, and in the mountains flax. My own experience has given the following produce of various kinds of corn:—

	Greatest.	Mean.	Least.
Per acre Wheat	39 Bush.	24 B. sh.	14½ B. sh.
— Rye	36	21	10½
— Barley	45	26	16
— Oats	49	46	17½
— Potatoes	354	245	194

Distilleries and even breweries are commonly established on large farms in the country, and within a few years sugar manufactories, in which sugar is extracted from beet-root, have become frequent. 21 sugar manufactories are enumerated by Becker as existing, in 1836, in the various provinces.

It is not usual to let land on lease in these parts of the empire. The few cases in which this mode of tenure occurs must rather be considered as exceptions than as a rule, although it is the opinion of competent judges that the incomes of the large landholders would be increased by the introduction of the practice. In Poland villages are often let for short terms, that is, an estate with the resident labourers upon it, who are bound to labour so many days in the week in lieu of rent for their lands. "In the management of his holding the peasant enjoys the liberty of turning at pleasure vineyards into meadows, of tilling pasture fields, or of converting the tillage fields into pasture; only in the case of woods the landlord reserves a right of inspection, to prevent, and punish, their being dealt with contrary to contract. But the peasant cannot let his land, nor leave it uncultivated, nor sell it in parcels. From the peasants' holdings the lord usually derives 10. All that was stipulated on the original cession of the land, whether in the shape of a rent-charge in money or otherwise. 2dly, The *Landemium*, or fine, on transfer, whether by sale or inheritance (usually 5 per cent.). 3dly, The *Hobot*, or personal service, the maximum of which has been fixed by law. This consists generally in 3 days' work, with a wagon and horses, weekly, for the peasant's whole holding; the half holding gives 1½ days' work, and the quarter holding 2 or 3 days' hard labour, weekly; cottagers give from 10 to 13 days per annum. 4thly, The right of grazing on uncultivated fallows and stubbles; which however the peasant may exercise upon the land of his lord. 5dly, The great and small tithes, which are often ceded to the church, or have been otherwise transferred. Dominical property (allodial estates) pay, in general, no title. The peasant may cede or leave by will his holding to whichever of his sons he pleases; but it is then usually charged with a sum for each of his brothers and sisters. The custom prevails of leaving it to the eldest son; but it is often ceded during the father's life, who retains a certain quantum of the produce for his own use; this generally happens when the father wishes to free his son from liability to the conscription."

Manufactures, Trade, &c.—The subjoined table, which we take from Becker's *Handels-Lexicon*, gives the actual average produce of the mines between the empire during the five years from 1830 to 1834: it is taken from official sources, and is the latest statement of the kind that has been published. The cwt. is that of Vienna = 123·4 lbs. English:—

Table showing the average of Five Years actual Produce of the Austrian Mines between 1830 and 1834 inclusive.

Provinces.	Gold. In marks = ½ lb. Vienn. weight.	Silver. In marks = ½ lb. Vienn. weight.	Bar Iron.	Cast Iron.	Lead and Lead Ore.	Tin.	Copper.	Coals.

To those quantities must be added graphite, or black lead, 13,330 cwt.; alum, 26,531 cwt.; sulphur, 17,284 cwt.; vitriol, 41,000 cwt.; litharge, 21,155 cwt.; zinc, 468 cwt.; cobalt, 606 cwt.; calamine, 4,636 cwt. The production of quicksilver was as follows:—

Average produce of 5 years, from 1830 to 1834:—

	<i>Cwt.</i>
Illyria	3,230
Transylvania	30
	3,260

The amount of salt annually produced is not officially published, but the estimate of the *Nat. Encyclopedia* gives, for the produce of the salt pans of—

	<i>Cwt.</i>
Upper Austria	750,000
Illyria, boiled and rock salt	365,000
Tyrol	200,000
Illyrian coast, bay salt	400,000
Galicia, rock salt	900,000
Ditto, boiled	250,000
Hungary	900,000
Transylvania	1,000,000
Dalmatia	400,000

Some years back, the entire produce of the empire was estimated at 175,000 tons English, of rock; 107,000 tons of boiled; and 600,000 tons of bay salt. Of this quantity, a large portion is annually exported to Russia, Poland, and Turkey. With the exception of the article of salt, the amount produced by the mines is

exceedingly small in proportion to the capacities which almost each province possesses, and of the remarkable facility with which the ore is in all produced. A remarkable circumstance is, the indifferent quality of nearly all the metals produced in the mines worked by the agents of the government; a fact which is substantiated by the annual importation, to a great extent, of Russian copests by the wire-drawers, who are unable to use the produce of the Austrian mines for that purpose. It is a curious fact that although a Russian ukase exists, prohibiting the exportation of coin, yet the Russian mint has officially requested the Austrian wire-drawers to notify to them any deterioration that may occur in the quality of the coin thus exported! Surely the capital now so ill employed in keeping up forced manufactories, under the shelter of high import duties, and thus contributing to the taxation of the people, without enriching the coffers of the state, would be much better employed in ameliorating the system of mining, and in improving the means of transport within the country.—We refer to our articles on STYRIA, ILLYRIA, HUNGARY, and TRANSYLVANIA, for a description of the inexhaustible mining wealth of the Austrian empire.—Iron and native steel are especially found in such abundance in Styria and Illyria, that the ore is merely quarried from mountains several thousand feet in height, and which are solid blocks of carbonate of iron ore. Yet it is a fact, although almost incredible, that an advertisement of the New Polish Railroad Company, in the spring of 1838, in the *Vienna Gazette*, set forth that, "having proved by official statements, that a sufficient quantity of rails could not be furnished by the mines and foundries of the empire, they had received permission to import from foreign countries the required supply." The article of native steel is worthy of serious attention from every country in Europe; for though, owing to the bad state of the means of communication, English artificial steel be, at present, sold cheaper at Trieste, yet not only is the quality of the Styrian and Illyrian metal far superior, but it is found in such abundance, that it could supply a demand which would cause a serious fall in the price of artificial steel. The use of this metal for machinery must be very advantageous, and not less so for the chain cables of ships, which might be made much lighter; and perhaps ships of war and Indian men would then be able to take two such cables instead of one. The suspension bridge at Vienna, hanging from two main chains instead of four, is a practical illustration of what is here suggested. The prosperity of the provinces of Lombardy and Venice, where agriculture employs the main attention of the inhabitants, and whose cheese, raw and spun silk, choice fruits, rice, and macaroni, are exported, at a great profit, to all Europe, furnish another illustration of the natural direction which the trade of Austria would take. And yet how much might even be done, in those provinces, to improve the production of wine! The range of hills in Lower Austria, Styria, Italy, and Hungary, which, from their southern aspect, are suited to the cultivation of the vine, may be roughly estimated at more than 2,400 English miles in length; of this the largest portion falls to Hungary, with its dependent lands, Croatia, Slavonia, and the Military Frontier. What treasures does not Austria possess in this article alone, to say nothing of the immense increase in her produce of corn and cattle that must take place on the adoption of a liberal system of commerce? By abstracting capital from agriculture, the price of the necessaries of life is further so much advanced, that the very aim of manufacturing at home is defeated; as the statement of the Vienna market prices, which we give below, will prove. Truly, when an Englishman has surveyed the immense resources of the Austrian empire, he is tempted to imitate the exclamation made by his capricious countryman in ancient Rome, and to wonder "that a nation possessed of such riches, should envy us our cotton factories, and sugar plantations."

In the survey of the Austrian manufactures for 1834, given by Becker, we find—
Silk spinning mills and manufactories - - - 3,590
Woolen and cotton spinning and weaving establishments - - - 298
Flax and hemp spinning mills, linen, and calico factories - - - 869
Cloth factories - - - 165
Leather and leather wares - - - 889
Porcelain and earthenware - - - 163
Glass and plate glass - - - 210
Iron foundries, &c. - - - 700
Copper mills, &c. - - - 185
Steel mills and factories - - - 210
Roeofoil factories and distilleries of spirits and perfumes - - - 250
Chemical wares and dyeing stuff factories - - - 82
Beet-root sugar factories - - - 21

The total number of registered manufactories amounted, in that year, to 11,064; and were supposed to give

employment to 2,339,000 individuals; their produce being 1,425 millions of florins. Amongst the most remarkable, and those which are the most rapidly increasing, are the beet-root sugar factories; of which, according to a statement in Andre's *Commerciellen Neuigkeiten*, 25, besides 3 factories of molasses, were in operation in Bohemia alone, in the year 1835–1836; and 7 additional sugar factories, and 1 molasses factory, were expected to be at work in 1837. These 28 factories, according to the same authority, though able to make 30,000 cwt. of sugar, only produced 10,000 to 15,000 cwt., for want of a sufficient supply of beet-root. We have already remarked, that the greater number of these factories, together with the country breweries and distilleries, are carried on by the large landed proprietors. It is, however, singular that other branches of manufacture are likewise, to a great extent, carried on by the members of so proud an aristocracy; but who find themselves obliged by so doing to obviate the loss accruing from the system of restrictions on trade and manufacture, which is peculiarly discouraging to small beginners. Thus Count Bequigny has 5 glass-houses; Count Harrach, 1; Prince Schwartzemberg, 3; besides others belonging to Counts Deslours, Kinsky, &c. Among the earthenware manufacturers, we find the emperor; and Counts Wrbna and Falkenberg, Prince Colberg, Counts Salm and Egger, and many others, are large iron foundries; and Counts Wrbna and Prince Windshgritz manufacture tin plates. The list might be much extended: and it will be supposed that neither the public nor the noble tradesmen are so much benefited by this arrangement as they would be by a more natural one, which would make them, in their senatorial capacity, the protectors of tradesmen who should work cheaper.

The principal seats of the cotton and woollen manufactures are Bohemia, Moravia, Silesia, and Austria. Coarse cloths are everywhere manufactured; and large exports of cotton and woollen wares, especially of inferior shawls and red caps, are annually made to Turkey and the East. Linen is a great article of manufacture; spinning and weaving forming the principal employment of the peasantry during the winter, especially of the women, in the northern provinces. In Galicia, not only a portion of the rent, but, in many large establishments, a part of the wages of servants is paid in linen.

Notwithstanding all that has been done to facilitate the means of internal communication, large portions of the empire still find themselves isolated from the rest, to a degree highly injurious to internal traffic. Much has been achieved for Hungary by the introduction of steam boats on the Danube; and Galicia will be brought nearer to the capital by the railroad now constructing from Vienna to Bochnia. The subjoined statement of prices will, however, show the different value of marketable produce in the three grand divisions of the empire; and at the same time illustrate the advantages of employing capital to facilitate the transport of produce, in preference to the forced establishment of manufactories. The prices at Prague and at Graz are usually the same with those of Vienna.

Vienna	Sept.	23 9	17 41	15 04	11 94	1 13	2 4	
Posth	Aug. 30.	21 114	12 1	9 14	6 6			
Lemberg	Sept.	14 3	9 6	5 84	3 9			
Olmütz Cattle Market, Beef, 5s. 6d. per Stone. Sadagora Beef, 2s. 9d. per Stone.								

At the market of Olmütz, 90,007 oxen were sold in 1837, of which number 74,184 came from Galicia, including the importations from Bessarabia; 4,515 heu were driven by, to Vienna, without stopping. The dearest pair was sold for 200 florins (200.). In 1836, the dearest pair brought 220 fl.; in 1835, 240 fl. A fat ox weighs usually about 6 cwt., with the offal (verte). Prices taken from the market reports in the *Vienna Gazette*.

The number of cattle imported into the other provinces from Hungary, in 1837, was,—

Horned cattle	-	70,830
Sheep	-	93,450
Pigs	-	197,831

See HUNGARY.

It will be seen, on a comparison of the prices in this table, that the fluctuations of the respective markets are, as far as corn is concerned, nearly independent of each other. The high price of meat induces a considerable importation of cattle, which pay a duty of 4 fl. per head.

The price of manufacturing labour is, in the large towns, from 20 to 24 kr. per diem (8d. to 10d.) for men. A master mason, or carpenter, receives 2 fl. per diem, at Vienna, for job-work. Agricultural labour is much lower in price, and varies in the different provinces, to which we refer for details. Balbi has published a statement of the payments taken out since 1811, which shows,

From 1811 to 1820	= 92 patents were granted.
1821 to 1832	= 1,895 ditto.
1833 to 1837	= 825 ditto.

The last figure gives an average of 165 patents annually, during the last five years.

The following official statements, regarding the trade of the empire, are taken from *Becker's Handels-Lexicon*, and are the latest published:—

Salt		679,650		

The usual coins in circulation are the ducat of Holland = 4 fl. 30 kr.; the sovereign = 134 fl.; the florin of 20 = 1 fine mark, divided into 60 kr.; 12. sterling, at par = 9 fl. 31 kr. Bank notes, of 5 fl. and upwards, circulate, as well as the notes belonging to the depreciated currency, of which 5 fl. = 1 fl. in silver, and 1 fl. = 34 kr. This is denominated *Vicaria value*; the silver value is called that of the *Convention*. Pieces of 20 kr., silver, 3 of which form a florin, with smaller pieces of 10, 5, and 3 kr., form the silver coinage. The 20 kr. piece is termed, in Italy, lire Austraco. The lire di Milano was introduced by the French = 1 franc = 22.8 kr. The sualo = 2 fl. 20 kr., in silver.

The principal duties on importation fixed by the tariff (which the Milan treaty has not affected) are,

	Duty.	Value per Cent.
Cotton goods, of all kinds	36 kr.	per florin 60.
Wool, yarn	15	cwt.
Wool, thread	30	do.
Cast-iron wares	5 fl. 24 kr.	do.
Steel, in bars	6	do.
Iron plates	9	36 do.
Thin plates	15	36 do.
Glass	30	do.
Leather—Cow & ox skins	10 50	do.
Calves	25 50	do.
Kid, goat, deer, &c.	37 30	do.
Canaries, &c.	18	do.
Coarse linen, in small pack-	11	do.
ages of 10 lbs. & under	13 21	per cwt.
Liquors, rum, and brandy	1 15	do.
Mahogany in blocks	5 50	do.
Ditto sawed	15	do.
Groceries, not specified	43 30	do.
Brass, and brass wire	36	per lb. 60 per cent.
Ditto, wares	2 40	per cwt.
Paper	50 50	do.
Spun silk	63 19	do.
Ditto, dyed	152	do.
Sewing silk	10	per lb.
Silk wares	15	per cwt.
Tobacco	36	per lb. 60 per cent.
Cloth	60	per cwt.
Carrriage springs	21	do.
Sugar, refined	14	do.
Ditto, raw, for consumption	15	do.
Ditto, ditto, for refining	21	do.
Earthenware	7 30	do.
Pepper	21	do.
Coffee	15	do.
Indigo	15	do.
Colours, not named	15	do.

It will not excite surprise to find, that with these duties, which further impose the necessity of giving permits with many of the articles specified on their being transported from place to place, the regular importation is but trifling, while the quantity smuggled is said to be enormous. If we add the immense cost of covering a frontier of the extent of that of Austria with custom-house guards, the chances of bribery, &c., there is reason to believe that the gain of the state cannot be much in this department, whereas the loss to the country must be evident, the inhabitants being compelled to buy dear and inferior articles, without being able to export their produce on favourable terms.

How much the trade of the empire may be increased by a treaty of commerce with England, in which concessions are made on both sides, must be evident from our remarks on the extent and produce of the Austrian forests, on the corn that may be grown, and on the state of the wine and silk production. The town of Stry, near the Danube, in Galicia, is as near Carlsbad, in Croatia, as it is to Danzig; and from the plain which the Danube waters, the finest wheat is drawn, which supplies the Danzig market. How easy, therefore, would it not be for Austria to draw a large share of this carrying trade through its own territory instead of sending it to the Baltic and to do so nothing is to regulate but perseverance on the part of the government in the improvement of the means of communication, and some relaxation in the strict measures in force respecting Hungary. To this the whole of the produce of Moldavia, Wallachia, Servia, Bosnia, and Bulgaria, may be added; which, by the aid of towing steamers, might be brought up the Save to Sissek, and by the Kulpa to Carlsbad, within 70 miles of the Adriatic; so that, even as matters now stand, England, on an emergency, is in a great measure independent of Russia and the Baltic ports, as long as she is on friendly terms with Austria. On the other hand, by importing silk direct from the Mediterranean, England has it in her power to do without supplies from France; while Austria, as is evident from the list of exportations, could almost starve the Lyons market. It appears from these, that the importation of raw and spun silk into France averages 50,000,000 fr.; conse-

quently more than 1-3d of the exportation of manufactured silks, which averages 144 millions of fr. (Calculation of M. Arié Dufour, in Lyons.) Now the export of silk from the Milanese direct to France, in 1837, amounted to 1,227,000 *livres* Piccole, which may be estimated at 30,000,000 fr., or 4 3-8th parts of the whole exportation; and of the 1,383,000 *livres*, exported to Switzerland and Germany, no doubt a considerable portion found its way also into that country. The exports to England, in 1837, were

Raw silk	-	673,500 <i>livres</i> Piccole.
Spun	-	51,250 do.
Waste	-	681,800 do.
Strazze	-	211,100 do.

The nature and amount of the circulating medium in the empire may be approximately estimated from the following statements. The official publication of the Bank accounts showed that, on Dec. 31. 1837,

The advances on security amounted to	-	5,666,990 fl.
Ditto, on discounted bills	-	41,251,627
		<u>46,918,617 fl.</u>

Paper money still in circulation, part of the depreciated currency of 1811, 16,064,488 fl., or, in silver value, 6,027,795 fl. Further, if the sum stated in the view of the national debt to be due from government to the bank be correct, it amounts to 140 millions of florins; which would make it probable that little short of 200 millions of florins circulate in paper currency—about 20 millions of pounds sterling. M. Becker, in his latest work, upon the Austrian Mint, states the sums coined during the reign of the late Emperor Francis to have been,

Years.	Gold.	Silver.	Copper.
1792-1802	19,232,626	249,031,018	32,337,745
1803-1812	10,459,516	104,066,955	139,788,940
1813-1822	24,580,993	47,730,490	8,791,601
1823-1834	73,106,131	70,367,870	

The usual substitutes for money, such as bills of exchange, cheques, and drafts, are of remarkably limited extent; and Hungary may be said not to know what commercial credit is, owing to the small protection afforded to creditors by the existing laws. These, however, it is thought, will be ameliorated at the approaching meeting of the Diet; a circumstance which must tend to enhance the value of all kinds of property in that kingdom. On the other hand, arrangements, of which we are quite ignorant, render a smaller amount of circulating money sufficient—for instance, the payment of a great proportion of rents, in kind or in labour; some of the public contributions are also delivered in kind; and the public functionaries constantly receive a portion of their salaries in corn and fuel. We believe that, on one occasion, a sum due to Great Britain by Austria was paid in Dalmatian oak timber, to the mutual satisfaction of both parties.

Revenue, Taxes, &c.—The financial system of Austria is covered with a thick veil of secrecy. The total revenue is stated by Cronce (1826), with whom the *Nat. Encyclop.* (1836) agrees, at 150 millions of florins in silver. André (1823) estimated it at 116 millions. The estimate of the receipts of taxes, given by the last-named writer, is the only one which has been attempted. The direct taxes, in all provinces excepting Hungary, Transylvania, and Dalmatia (which have separate financial systems), consist, 1st, of the *land tax*, levied on the carefully estimated produce of the land, whose area has been ascertained by trigonometrical measurement. Cultivated land is divided into classes, according to its ascertained quality: but commons, sandpits, quarries, ponds, and marshes, are valued by investigation into their annual produce. The average rate of taxation, according to Krenner, is, for meadows, gardens, and fish-ponds, 17-55 per cent. (highest value of produce).—Commons and forest-land, 21-15 per cent. (least employment of labour and capital).—Vineyards, arable land, lakes, rivers, &c., 10-37 per cent. (greatest labour and capital), on the nett produce, valued according to the market-prices of the district. 2d. The *house tax* is levied on buildings in the capital and provincial chief towns, according to the rent of each. In Vienna, a special commission, and in the provinces the respective circles, controlled by commissaries, fixed originally the rate of taxation; but the principles laid down, and the rate thus fixed, have not been made public. Houses in smaller towns and in the country are classed under 12 divisions, which contribute from 20 kreutzers (3d.) to 30 fl. (3s.) each. There is, however, no proportion between the taxation of the houses in the large towns and those classed in the former paying nearly 30 per cent. of their rental under one denomination or other. 3d. Rents, tithes, and services due from tenants to landowners are rated at 12½ per cent. per annum. 4th. The *industry tax* on traders, manufacturers, and professions of all kinds, ascends, according to a scale, from 5 fl. annually; and the lowest class in Vienna, in which no capital is supposed to be employed (in the

provinces, 1d. 30 kr.), up to 1,500 florins (150l.) per annum as the maximum. 5th. The *class tax* is imposed on all clear revenues above 100 florins (100l.) per annum, with the exclusion of rents of houses, and the revenue derived from landed property farmed by the owner: certain investments in the funds are also exempted. The statements of individuals and corporations are controlled by the local authorities; and the trading and mercantile classes, although already taxed under the former head, are included in this contribution. The rate varies from 2½ per cent. for 100 fl. income, to 20 per cent. on a revenue of 150,000 fl. as the maximum. 6th. The *personal*, or poll-tax, is paid by all individuals on attaining their 15th year, with the exception of paupers receiving parish relief, and the military; labourers contributing 15 kr. to 30 kr., and the highest contribution being 1 fl. 30 kr. annually. Strangers pay this tax at much higher rates during the shortest residence in the Austrian states; and Jews are subject to peculiar and highly rated impositions. The legacy and stamp-duties are likewise productive sources of revenue. The estimate of the annual revenue arising from these taxes, as given by André, is,

Land, house, and rent taxes	-	50,000,000
Industry-tax	-	1,500,000
Income-tax	-	5,000,000
Poll-tax	-	2,800,000
Jews' taxes	-	3,000,000
The indirect taxes:—		
Customs	-	6,000,000
Salt monopoly	-	8,000,000
Tobacco ditto	-	2,500,000
Legacy duties	-	700,000
Stamps	-	3,650,000
Excise (levied on all articles of consumption, flour, meat, vegetables, groceries, beer, wine, &c.)		12,340,000
Other branches of revenue from several provinces:—		
Post-office	-	3,500,000
Mines	-	5,000,000
Donatus	-	6,000,000
		<u>110,590,000</u>

To these 1,000,000 is added for other taxes, not included above; which raises the *nett* revenue to 112 millions, or 11,200,000l. The cost of raising it is reckoned at 15 per cent., which raises the gross revenue to 130 millions. It must, however, be observed, that several of the above items are evidently stated too low, especially the industry, income, and poll taxes, and the cost of collection; so that, if we take into account the time that has elapsed since this calculation was made, and the great increase in the population and prosperity of the empire that has taken place in the 20 to 25 years that have elapsed since many of these estimates were made, the sum of 150 millions will not appear overrated. The greater share of these burdens fall upon the Bohemian, Gallician, German, Silesian, and the Italian provinces. Hungary only contributes a moderate sum voted by the Diet, and defrays the cost of a certain quota of troops. In Dalmatia, a tithe of the produce of the land is taken in lieu of taxes. The parochial and county rates have to be added to the above-named burdens in all provinces, and are defrayed by labour on the part of the lower classes, and by local imposts on the more wealthy. It is, consequently, impossible to state their value in money. The quartering of troops is also an important charge, especially in Gallicia, Hungary, and Italy, where the greater part of the large standing army has, of late years, been cantoned. The cavalry is mostly distributed through the villages of the different provinces, for the easier procuring of forage. The peasant receives 8 kr. per diem for house, fire, and diet, per man: the dung of the horse is the remuneration for stable-room. We subjoin the details of the taxes now paying by three different properties in Vienna and the neighbourhood, as illustrative of the amount and distribution of taxation in Austria:—

1. An estate in the circle " <i>Below the Forest</i> ," sold for 33,000 fl., c. m. (3,3000l.), in 1838.	Florins.
143½ joch (203 acres) sold for	- - - 15,140
Houses and offices	- - - 3,000
Tithes and various revenues from several small houses valued at 1,326 fl. per annum	- - - 15,000
Value of the estate	- (fl., c. m.) 33,140
Land-tax, house-tax, with supplementary contributions	- - - 159 49
Taxes on tithes, and other revenues	- - - 223 20
Annual taxes (exclusive of quartering of troops and parochial assessments)	- (fl., c. m.) 383 9

The owner is lord of the manor, and has the presentation to the living of the village and to its school.

2. A small country house and grounds $\frac{3}{4}$ miles from Vienna.

House and garden, estimated at	7,000	fl. kr.
Produce of garden, - - - - -	94	42 per annum.
The house pays in rent and service	11	15 annually.
		fl. kr.
Land-tax - - - - -	3	16
House-tax - - - - -	6	0
Parochial dues - - - - -	10	0
Taxes and parish rates - (fl., c. m.)	19	16

3. A brew house in a suburb of Vienna, with land in the immediate vicinity.

A brewery, valued (for house and premises, with the licence and good will) - - - - -	95,000	Flora.
140 joch (198 acres) land near the town, valued of 300 fl. per joch - - - - -	42,000	
	137,000	(fl., c. m.)

House and supplementary taxes - - - - -	462	43	fl. kr.
Tithes - - - - -	7	15	
School-money - - - - -	3	55	
Parish dues - - - - -	87	27	
Land-tax on 140 joch land - - - - -	181	49	
Watching ditto (country police) - - - - -	7	0	
	813	9	
Extra tax as landholder, not being a noble - - - - -	183	49	

Annual taxes - (fl., c. m.) 996 58

The brewer pays besides, as *industry tax*, with the additions (being rated in the 2d class) - - - - - 520 fl. per an.

The brewery produces in the season 60 emmer (23 barrels) per diem, the duty on which is paid in ready money, 103 fl. for 60 emmer, making the annual sum of - 25,000 florins.

The price of beer in Vienna (of the strength of porter) was, in Sept. 1836, when the price of barley averaged 12s. 3d. per quarter, 5 fl. per emmer, or 27s. 4d. per barrel of 76 gallons.

It will be necessary to observe, that the personal taxes to which the proprietors of the above-described houses and lands are liable, are not included in this statement. These are the *class* or income tax, and the *poll* or capitation tax. Neither is any allowance here made for the quartering of troops; which is not a small charge, even in those provinces where comparatively few regiments are stationed. In the city of Vienna itself no troops are quartered, the citizens having purchased their exemption by erecting a large barrack. Troops marching through are billeted on the houses of the suburbs, which are five times as extensive as the city itself.

The expenditure of the nation is never published, even if it be fully ascertained. The court, although splendid, is by no means extravagant in expense, and the family estates are considerable. The courts of justice might easily delay their expenses from the fees taken from suitors. The army and the administration of the interior are the great drains upon the treasury. In the latter department, the *Schematismus*, annually published, contains the names of upwards of 15,000 employes, whose functions embrace the direction and control of almost every action of the subject. The department of the public works is on a large scale; and its attention has of late years been specially directed to the establishment and conservation of the roads, canals, and means of communication in general, throughout the empire. The extensive mountain tracts, embracing the highest and most difficult mountain passes in Europe, have all been rendered accessible, at an immense expense of labour and money. The talent and perseverance displayed in this branch of administration have been rewarded by unusually splendid results. Among upwards of 60 mountain passes, varying from 5 to 70 miles in length, that over the Sielvis, between Tyrol and Lombardy, is the most elevated in Europe, as the road over it, considered as a work of art, exceeds every thing of the kind that has been as yet attempted. Similar undertakings, on a less vast scale, have been completed in the Carpathians, in Croatia, Dalmatia, and Inner Austria. The outlay required for the construction and annual repair of these extensive works (as the snow and winter torrents are continually damaging them) could only be met by a centralisation of the revenues of so large a state. Local taxation or extortion could not suffice in these cases; as the districts requiring the greatest expenditure are usually the poorest. Balbi has enumerated

the principal public works undertaken or assisted by the government in Lombardy and Venice, between 1814 and 1834. The sum expended on them amounts to 68 millions of lire, or about 2,500,000*l.*, in which, however, the cost of the roads is not included.

The *National Debt* may be calculated as follows, from the published statements of the Sinking Fund Commissioners, assuming the original sum given by André, and which has been adopted by Malchus, to be correct. This author estimates,

The old debt, in 1816, at - - - - -	630,000,000	fl.
Paid off or absorbed by the Sinking Fund down to 1837, - - - - -	270,000,000	360,000,000

New debt contracted from 1816 to 1834 - - - - -	416,554,840	
Redeemed, paid off, and drawn by lottery down to 1837 - - - - -	282,523,642	134,031,198

Liabilities of the nation in Oct. 1837, - fl. 494,031,198

Of this sum (about 50 millions of pounds sterling), the old debt bears interest in the depreciated paper currency; and the whole of that charge is redeemable by lottery; 5 millions of florins being annually drawn by lot, and either paid off or placed in silver value at the option of the holder. The new loans bear interest at 5, 4, and 3 per cent.; and three are lottery loans, which will expire in the years 1840, 1841, and 1850. Of the total given, above 50,000,000 fl. stands in the name of the Commissioners of the Sinking Fund; and into this fund the proceeds of the national domains, which are annually sold, are paid. The amount of the depreciated paper currency, still in circulation, must be added to the sum of the debt: in 1836, it was 16,000,000 (about 640,000*l.*). The sum in which the government is indebted to the bank for the portion of this currency, which that corporation redeemed by exchanging their notes for it, has not been officially published, but is stated by the writer of a letter on the bank affairs in the *Augsburg Gazette*, 27th March, 1838, to amount to 140,000,000 fl. in silver.

Laws, Civil and Criminal. — The present codes of civil and criminal law (*Bürgerliches Gesetzbuch*, *Gesetzbuch für Verbrecher*, &c.) were drawn up by a commission of lawyers at the command of the late Emperor Francis I., and published by his order after discussion in the council of state. They are much praised as a compilation of legal theories, but are open to the objections raised against all codes in practical respects; and in Austria the deficiency is not allowed to be remedied, as the decisions of the judges are not published, and each judgment passed under a paragraph of the codes is a fresh improvisation on the part of the judge. If it be by chance discovered that under the same circumstances a former judge or another court decided differently, the case is referred to the ministry of justice, which decides what the law is in that particular case, but its decision is not to be taken as a construction of the law for future cases. The judges are removable, and may be promoted at the pleasure of the crown; but, like all other employes, can only be dismissed with pensions, unless convicted of improper conduct by some court of justice. In all cases the trials take place in secret, and the proceedings are in writing; even the examination of witnesses is not public: the decision is according to the votes of the president and assessors of the court. Criminal trials are protracted to an enormous length; and accused persons, as in Germany, are often suffered to be in prison for years before their cases are brought on; when, if the trial be of a complicated nature, it may last from 3 to 4 years! The punishment of death can only be inflicted after confession. The lists of mortality furnish for the 11 provinces which they embrace, the following average of capital crimes and executions during the 5 years 1833—1837: —

Murdered, 429. Executed, 33.

Whence it would appear that a vast number of criminals must annually escape detection. A

statement, published by M. Koch, in the *Vienna Gazette*, gives the following details for Hungary:—

Year.	Criminals.			Summary Executions.
	Condemned.	Pardoned.	Executed.	
1832	74	65	9	10
1833	58	55	33	15
1834	77	65	12	16
1835	67	62	5	6
4 years.	276	247	59	45

The same writer states, that of 90 executions which took place in the other provinces of the empire between 1824 and 1828, 28 were summary executions without trial. This period, as well as the one regarding Hungary, does not embrace the years in which the cholera raged in the different provinces, during which period martial law was, to a great extent, established. The police board occupies, with respect to the tribunals of law, a similar position to that occupied by the emperor's cabinet in respect to the council of state. The preventive power entrusted to it being naturally one which no law either prescribes or controls, it is a formidable instrument. The political and local exercise of its authority is very strict in Austria, and includes not only the preservation of public order, but the permitting strangers to reside in any part of the empire,—the allowing subjects themselves to change their places of abode or to travel, passports being requisite even in the country itself, and frequently only procured after long delay and much trouble. The sanitary police is on an extensive scale, and is perhaps as well managed as it can be in so extensive an empire by a public board. The police of the provinces is entrusted in the large towns to a board whose officers are appointed by the crown, in small towns to the magistracy; in the country the captain of the circle unites these functions with his judicial and administrative powers.

Prisons, &c.—The Austrian prisons have attained a melancholy celebrity of late years. They are divided into three classes:—state prisons, for political offenders, the chief of which are the Spielberg at Brunn in Moravia, Kuffstein in Tyrol, Munkacs in Hungary, Lemberg, Milan, Venice, &c.; houses of correction (*Zucht-häuser*) in all the chief towns, in which criminals are kept to hard labour (those in irons are sent to the fortresses); and houses of detention, under the care of the police, in which persons who are arrested are kept before and during the judicial proceedings. A large prison, on an improved plan, has recently been erected in a healthy situation in Vienna; and it is usual to give every needy prisoner, on his discharge, a small sum of money, to keep him from the temptations of momentary indigence. In 1837, 234 individuals received this relief, the sum distributed amounting to 923 fl. In Prague the prison seems one of the best managed. At the close of 1837, the number of convicts is stated to have been 608 (446 males, 162 females); and the average proceeds of the labour of the prisoners, who follow their respective trades, was, for 6 years, 11,845 fl. (1,200*l.*) annually.

The Church, Clergy, &c.—The Austrian clergy are both numerous and powerful, although their wealth has been much diminished by the confiscations and secularisations of the Emperor Joseph II. They consist of 11 Roman Catholic archbishops, 1 Greek united abp., 1 Greek schismatic abp., 1 Arminian abp. The Roman church has further 59 bishops, with chapters and consistories, and 43 abbots of richly endowed

monasteries in Austria, Styria, Illyria, Bohemia, and Moravia. Hungary has 22 abbots with endowments, 124 titular abbots, 41 endowed and 29 titular prebendaries, and 3 college foundations. Transylvania has 3 titular abbots, and upwards of 150 monasteries and convents. In Galicia 70 monasteries are counted. The Greek United Church has 1 abp. and 1 bishop in Galicia, and 5 bishops in Hungary. The Arminian Catholic Church have an abp. at Lemberg. The Archbp. of Carlowitz is head of the Greek Church, with 10 bishops and 60 protopapas (deans). The Protestants, who, in the greater part of the empire, are only tolerated (not being allowed to build churches with steeples, to use bells, or keep parish registers independent of the Catholic parish clergy), are placed under 10 superintendents for the Lutherans, and 9 superintendents for Calvinists. In Hungary and Transylvania, the Protestants choose their superintendents, who are controlled by district inspectors. The greater part of the Magyar inhabitants of Hungary are Calvinists, and Protestants enjoy, in that kingdom and its dependent lands, equal rights with the Catholics. The Unitarians are tolerated, or rather recognised by law, in Transylvania; where they have a superintendent, and form 164 parishes. The Roman Catholic religion is the dominant one throughout the empire; and in case of dispute, the right to the tithes is assumed to be vested in the parish priest. The church is, however, far from being possessed of the tithes to a large extent; its wealth consists in endowments of land, or revenues charged upon estates; and its hierarchy may be considered as richer even than that of Great Britain. The richest see is the Primacy of Hungary; the Archbishopric of Olmütz being next in importance. On the suppression of the convents under Joseph II., a portion of the confiscated lands and revenues was appropriated to form a fund for improving the salaries of the parish clergy; the minimum of whose incomes has been fixed at 300 fl. for a parish priest, and 150 for a chaplain or curate. This fund is nominally under the control of the bishop, as far as concerns his diocese; yet estates belonging to it are constantly advertised for public sale. The united Greek and Armenian churches are assimilated to the Roman Catholic church, as far as their parishes extend. The schismatic Greeks possess a fund, vested in *bonum nationis*, in Hungary, which is managed by the Metropolitan and three assistants. The Protestant confessions have no endowed churches or parishes out of Hungary and Transylvania; the clergy elsewhere being chosen and supported by their flocks. The right of presentation to livings is vested, in general, in the landed proprietors and various corporations, as in England. The parishes in the gift of the crown, as heir to the right of the suppressed convents, are numerous. The emperor nominates all the bishops, with the exception of the Archbishop of Olmütz, and seeks the sanction of the pope through the medium of the imperial ambassador at Rome. The Hungarian bishops enter upon the exercise of their secular functions as magnates before the papal consent is received. All titular bishops, as well as all abbots and prelates in Hungary, are likewise nominated by the crown. The chapter of Olmütz enjoys the privilege granted by Wratislaw II. of Bohemia, in 1080, of choosing their archbishop from among their own members.

The Austrian church property throughout all the provinces, except Hungary and Transylvania, is very highly taxed; and the state inherits a moiety of the personal property of every Ca-

tholic clergyman; it being of course supposed that he has no direct natural heirs. But the line of policy respecting the church of Rome, of which the emperor Joseph laid the foundation, has not of late been adhered to; new religious orders having been suffered to establish themselves, and even the Jesuits have been permitted openly to settle in several provincial towns within these few years. According to the most recent census, the numbers attached to the different sects are as follow:—

Roman Catholics	-	-	26,990,000
Greeks	-	-	3,040,000
Protestants	-	-	2,850,000
Jews	-	-	480,000
Unitarians	-	-	80,000
Arminians	-	-	13,000
Mohammedans	-	-	500

These numbers are, however, for the present amount of the population, underrated; especially the estimate of the Protestants, for want of authenticated returns of the population of Hungary.*

Classes of Inhabitants, and State of the Provinces.—The three classes of *nobles, citizens, and peasants* are strictly defined in all the provinces. The nobility is both numerous and rich in Austria, where estates are generally entailed; and the higher charges of the court, the army, and the church, are reserved for this class. The members of the male sex of the various noble families throughout the empire, were estimated, in 1835, at 250,000. Of these, 163,000 belonged to Hungary, 24,900 to Galicia, and 2,260 to Bohemia. The latter country counted 14 princely families, 172 families of counts, 80 of barons, and 100 of knights. Their total incomes were estimated at 18,000,000 fl. (1,800,000 £).* The privilege of manorial rights can only be enjoyed by a noble in Austria. These include the right of presentation to livings and schools on his estates, and the right to hold courts of justice in the first instance. Other privileges are those of peculiar tribunals, before which only he can be cited; the freedom from the conscription; and the right of sitting in the provincial estates of each province in which he is qualified. These immunities are also enjoyed by the newly-created nobility, among whom not a few profess the Jewish religion; but the court draws a marked distinction between old families and those recently ennobled. As the patent is given without difficulty to all who are willing to purchase it, the price thus paid by citizens who wish to become landholders, may be looked on as a tax laid upon the transfer of estates. Persons not of noble birth, who do not purchase a patent of this kind, pay a portion of the taxes double. The peasant is personally free throughout the empire; and an appeal being allowed from the manorial court of his lord to the Circle court, his condition is daily improving, and his rights and property obtain more respect. Yet the circumstance that, in the greater part of the empire, the rent of his cottage and field are paid in manual labour (*Robot*), leaves him in a state of deplorable dependence; and in some provinces, the possession of this claim on the labour of the lower classes disinclines the higher orders from forwarding the mental and moral improvement of the peasants. On the introduction of the present system of direct taxation by the Empress Maria Theresa and her son Joseph II., an arbitrary regulation of the dues claimed by the landlords was effected, and the total amount which a landlord could demand, whether paid in money, service, or kind, was

ordained not to exceed 17 fl. 46 $\frac{1}{2}$ kr. for every 100 fl. which the land produced. This measure was indispensable to enable the peasants to meet the heavy taxes, which, as we have shown below, average 12 $\frac{1}{2}$ per cent. of the gross produce. At the same time, the peasant's *property* in the land he held, from whatever lord, was declared indisputable; and though the latter may seize upon his stock and moveables, he cannot eject for arrears of rent, unless the land be held on lease or tenure; which is by no means common in Austria.

A very great difference is found, as may be supposed, in the state of civilization of the different provinces. Among the higher classes, in the great capitals, this difference is of course nearly imperceptible; the universities and the better institutions for instruction being open to the inhabitants of all provinces, and being arranged throughout on a uniform plan. Another cause of this similarity in the larger towns is the great proportion of Germans found among the trading classes, even in the Slavonic and Magyar (Hungarian) districts, and who are everywhere distinguished in that class for intelligence, sobriety, and industry. The mass of the people may, perhaps, be said to be most advanced in the Italian provinces, where agriculture is carried to the highest perfection, and both skill and activity contribute to forward industrial operations. The next in rank, in point of intelligence, are unquestionably the inhabitants of the German provinces; then come the Bohemians, Silesians, and Moravians, who occupy almost exclusively the manufacturing provinces. The Illyrians may be looked on as not inferior to their Styrian neighbours; but a thin population and a rugged soil, together with the fact that their language is not a medium for the circulation of knowledge, keep the Slavonians in both provinces back, and they cannot be ranked higher than the Poles or Moravian inhabitants of Hungary. The rude and almost nomadic life led by a large portion of the Magyars of Hungary, will be noticed in treating of that country. It is partly ascribable to the nature of the soil they inhabit; and partly to the faulty laws which throw impediments in the way of their improvement. The Dalmatians stand on the lowest footing of civilization in Europe. The want of a central point of national interest to which the inhabitants of all the provinces might look, and which might direct the current of popular feeling in each to the common advantage of all, is strikingly felt; and each province having its own representation by estates, powerless as these bodies are (with the exception of the Hungarian Diet), and many having a different form of government from the others, every one is inclined to look upon itself as having separate interests from the rest. The effects of this system have of late years grown especially perceptible in the repeated applications made by the Bohemians, Poles, and Hungarians, to have their respective languages exclusively used in public business, and in the provincial schools.

As every province forms a separate land, each has its peculiar language or dialect, and its distinguishing customs and habits. Of the Slavonic languages, the Polish possesses the richest literature; but the Bohemian has of late years been highly cultivated, and forms the written language of the Moravians and Slovaks of the N. W. counties of Hungary. The dialect of Carniola has been methodized, and is grammatically taught as the written language of Illyria and Croatia. The ephemeral existence of

* The nobility of Hungary counted 4 families of princes, 81 of counts, 76 of barons, and 350 of knights.

the Illyrian kingdom established by Napoleon sufficed to call forth the powers of a lyric poet of considerable merit, named Vodnik, who wrote in this dialect. The Slavonian nations have all the distinguishing characteristics of ardent feelings and sanguinity of temperament, which makes them more easily elated and sooner depressed than their neighbours the Germans. They are fond of music; and every district has its national airs, which are often of great antiquity, and usually plaintive. Among the Slavonians, the Poles are distinguished by a martial disposition and love of show. The national costume is now only kept up amongst the peasantry, whose winter dresses especially are tasteful, and even elegant. In the other Slavonic nations of the empire, the love of ornament is less remarkable, the national spirit having sunk in the long lapse of time during which they have been dependent. No Slavonic dialect is used in the courts of justice or in public instruction in the higher schools of the empire. The German peasants wear the dress commonly met with all over Germany, with varieties in the colour and head gear, in nearly every village. The Austrian women wear caps or bonnets made of gold lace and decorated with spangles. In Tyrol the German costume is most picturesque. The German language is that used in transacting public business in the German and Slavonian provinces, and in the universities on the north side of the Alps. The extensive range and high excellence of the productions of the German authors in the fields of literature and science, render this language peculiarly adapted to be the medium for the diffusion of knowledge; and this circumstance lends a moral ascendancy to the Germans, whose numerical weight is not great in comparison with the other nations of the empire, which they will long continue to hold, if they do not lose sight of the foundations on which it is based.

The Magyars, or inhabitants of the Hungarian plains, of Tartar descent, are a high-spirited race, warmly attached to their national habits and rights. Their national costume is the most splendid in Europe, and every family wears its distinguishing colours. The rich *Dollmann* (Hussar jacket) and the tasteful *Attila* (a frock-coat, trimmed with fur) are only worn on state occasions by the nobles; but the tight pantaloons and short boot is the usual dress of the peasant, who also wears a blue jacket and a low broad-brimmed hat. Though fond of music the Hungarians are no musicians: the national dances are often highly pantomimic; and the Magyar, who is seldom seen to smile, expresses the excitement of his feelings, whether in joy or sorrow, in dancing. The Magyar and Latin languages are those used in the courts of justice and in the public offices. The dress of the Wallachian peasantry, on festive occasions, is highly ornamented and very becoming. The Italian costume is both rich and elegant; especially the head-dresses of the women, which are more tasteful than those worn on the north side of the Alps. In the conflict for superiority between the Germans and Italians, neither nation perhaps does sufficient justice to the good qualities of the other; but the northern Italian must be allowed the merit of displaying those of continence, sobriety, and industry, in a high degree, though he be less the slave of form than his German neighbour. The Italian language is used in the government offices, in the courts of justice, and in public instruction, in the Italian provinces.

The peasantry in every province have a re-

ligious turn, which they not only evince by a regular attendance at church, and following the frequent processions, but by assembling in great numbers at the stated periods for the annual pilgrimages, which are mostly made to the churches of the Virgin Mary. The chief of these places of resort, Maria Zell in Styria, is annually visited by more than 100,000 devotees. The next in importance is perhaps the shrine at Calvaria in Galicia, to which pilgrims annually flock from Bohemia, Silesia, Poland, and Hungary. The pilgrimages are however said to be, like the field "preachings," formerly held in Scotland, anything but conducive to morality. The Sunday evening is everywhere devoted to festive enjoyment, and indulgence in the wine-cup in such provinces as produce this beverage. Beer and whisky are the common drink of the northern provinces, the latter especially in Galicia and Hungary. Smoking is considered an indispensable luxury in all the provinces north of the Alps.

With respect to the comforts of life, the Hungarian, Italian, and German peasants are the most advantageously situated. The largest share of landed property falls to the Hungarian, and for the most part he receives the best remuneration. In Italy, where the peasant is hardly ever a landowner, unremitting industry, and a judicious division of labour, improve the condition of the mass of the people. Bohemia, Moravia, and Silesia rank on a level with the German provinces in the most improved districts. The Galician peasant is the lowest on the scale but one—the Dalmatian; the province of the latter forming a melancholy exception to the rapid improvement which the others are making.

Provision for the Poor.—A regular tax for the support of the poor is nowhere levied,—each parish is by law bound to support its own poor; but as the standard of pauperism is, in all cases, very low, the charge is nowhere burdensome. The large towns have poor-houses, supported partly by revenues from foundations, partly by voluntary contributions; and on extraordinary occasions, the emperor or the government supply a sum from the public revenues to meet their exigencies. The total sum expended in Vienna in 1837 by the public institutions of charity, (including the hospitals and asylums for the blind, deaf and dumb, and foundlings,) amounted to 1,352,124 fl., with which 62,133 individuals were relieved.—(See VIENNA.) We have likewise seen a list of the donations by the King of Hungary, the Empress, and the Archduchess Sophia, in the year 1834, which amounted to 21,530 fl. Savings' banks have been introduced into the different provinces with great success. At the close of 1835 the Vienna savings' bank held,

11,508,755 fl.	at 4 per cent.
1,999,564	at 2½ —
283,991	at 3 —
13,892,310 fl.,	

or about 1,400,000 l., standing in the names of 57,063 individuals. In 1836 the savings' bank at Prague held 5,200,460 fl. in the names of 17,704 individuals.

Among the institutions for ameliorating the state of the poor, the hospitals stand in the first rank. The exertions of the Emperor Joseph II., to improve the medical department of the army, had a very advantageous influence over the medical establishments throughout the empire. In the *Allgemeines Krankenhaus*, at

Vienna, one of the finest hospitals in Europe, 8,894 paupers were relieved, and supported, in the year 1837; and similar establishments are found in every provincial town of importance. The 29 hospitals of the "Brothers of Charity," throughout the various provinces, admitted (in the 6 years 1830-35) 111,086 patients; of whom, according to their own published reports, 101,669 were discharged cured, the deaths having only been in the proportion of 1 to 11½ patients. These hospitals are supported by voluntary contributions.

Literature and the Fine Arts.—Newspapers and periodical publications are published in German, Italian, Bohemian, Polish, and Hungarian. A periodical, in the Servian dialect, was attempted some time back in Croatia, but was suppressed by the police, and its types confiscated. In every provincial capital a semi-official newspaper appears, usually in German; but this is accompanied, in the greater part, by another in the language of the province. The following statement appeared some time back in the *Augsburg Gazette*, and was attributed to M. Balbi:—

Newsp. & Period.	
The Austrian, Bohemian and Illyrian provinces have	- 22
Milan	- 25
Lombardy	- 10
Venice	- 7
Verona	- 5
Galicia and Hungary	- 7
	<hr/> 76

The subjoined statement of the circulation of the Vienna periodicals and journals is from the *Nuremberg Correspondent*, but it seems very much underrated:—

Vienna Gazette	- 2,600
Austrian Observer	- 600
Eagle	- 270
Theatrical Gazette	- 1,300
Humorist	- 450
Vienna Fashionable Journal	- 600
Spectator	- 750

This extraordinary paucity of journals is accounted for by the fact that the Austrian government is as careless of praise, as it is intolerant of censure. But few foreign papers are admitted to general circulation; and those which are must offer no remarks upon the condition or policy of the empire. The severity of the censorship, which gives to underlings in office the control over the productions of men of genius, is calculated to degrade and stifle the intellectual energies of the country.

The fine arts are also in a languishing state, in part owing to the apathy which prevails both amongst the higher classes and the artists, neither of whom are excited by public praise or blame. The pictures in the splendid Imperial Gallery at Vienna are not open to be copied by artists; and every composition which is publicly exhibited is subjected, like the books, to the censorship,—a board which is unremitting in the enforcement of the political, moral, and religious restrictions which it prescribes to the flights of genius. A statement of Balbi, in the *Vienna Gazette*, shows the number of works annually exhibited at Milan to amount to about 600. In the exhibition of 1837, of 603 pieces exhibited at that capital, there were 14 statues and 41 busts of marble, 442 paintings of all kinds, the rest being drawings in water-colours and crayons, engravings on stone and copper, miniatures, and medallions. In Vienna there is an exhibition every third year, in which about the same number of works of art, but with a smaller proportion of

sculpture, are shown. Music is cultivated with more success, and enters largely into the education of all classes in Bohemia and in the German provinces. The Bohemians are particularly remarkable for their skill in instrumental music; and not only is it common to find eminent performers in small villages, but many of these excel on two or three different instruments.

Education.—We borrow the following statements on this important subject from Mr. Macgregor's valuable work, entitled *Austria and the Austrians*.—"The foundation of elementary instruction in Austria was first laid in the early part of last century; and, soon after, about one in twenty-five of the inhabitants were taught to read. Joseph II. directed his energies to the instruction of youth; but the clergy, high and low, opposed him, and after his death succeeded in establishing generally their own plan of educating children. The government has, however, taken special care that the priests should not have the control over public instruction, and the law of 1821, consequent to that of 1819, in Prussia, directs that no village in the hereditary dominions shall be without an elementary school—that no male shall enter the marriage state who is not able to read, write, and understand casting up accounts—that no master of any trade shall, without paying a heavy penalty, employ workmen who are not able to read and write—and that small books of moral tendency shall be published and distributed, at the lowest possible price, to all the emperor's subjects.

"The provisions of this law appear to me to have been very generally put in force; for I have nowhere in Austria met with any one under thirty years of age who was not able to read and write; and I have found cheap publications, chiefly religious and moral tracts, almanacks, very much like 'Poor Richard's,' containing, with tables of the month, moon's age, sun's rising and setting, the fasts, feasts, holydays, markets and fairs in the empire; and, opposite to the page of each month, appropriate advice relative to husbandry and rural economy, with moral sayings and suitable maxims.

"Besides these and several small elementary books and periodicals, the *Penny Magazine* is now very generally circulated in Austria. M. Fleischer, the intelligent and spirited bookseller of Leipzig, having managed to procure stereotypes of the wooden cuts of the London edition, republishes the work in German, and strikes off about 38,000 copies for Austria only. A *Heller* magazine, published also at Leipzig, is likewise very generally circulated. The spirit of elementary instruction, if not the most enlightened, inculcates, at every step, morality, the advantage and happiness of a virtuous life, the evils of vice, and the misery consequent on crime.

"I have found no difficulty in procuring statistical returns of the colleges and schools of the empire. From these it appears that, in the eight universities established in the archduchy of Austria, Bohemia, Galicia, Moravia, Tyrol, Styria, and the Italian provinces, viz. Vienna; Prague, in Bohemia; Lemberg, in Galicia; Olmutz, in Moravia; Inspruck, in the Tyrol; Grätz, in Styria; and Pavia and Padua, in the Italian states: there are 54 philosophical foundations, with 334 professors, and attended by 7,680 students; 55 theological (Catholic), 326 professors, 6,120 students; 16 medicine, 150 professors, 4,679 students; 1 (Vienna) veterinary, 6 professors, with assistants; and 8 jurisprudence, 57 professors, 3,228 pupils.

"Taking the population of the Austrian dominions, exclusive of Hungary and Transylvania, at 22,500,000, I find that there are 25,121 national elementary schools, divided into first and second classes of primary schools, with 10,280 ecclesiastical, and 22,082 lay teachers. In these schools 2,413,420 children are instructed in reading, writing, and accounts; that is, rather more than one in ten of the whole population. Besides these, there are numerous private schools and institutions. Cannabich gives, for 1835, the following statement:—'Exclusive of nine universities (including Pesth), there are 23 Catholic lyceums and academies; 1 Illyrian lyceum, 4 Lutheran lyceums and colleges, 7 reformed colleges, 1 Unitarian college, 20 Catholic theological, 1 Protestant theological, and 15 high philosophical foundations; 230 preparatory (*vorberertheuden*) gymnasia (of which 6 are high gymnasia in Hungary), besides special common schools (*volkschulen*) in the classes of primary, secondary, and practical schools: also burgher schools, and the military and forest institutes; blind and deaf and dumb institutes at Vienna, Prague, Linz, Waitzen, &c.; schools of hydrography and trades; the polytechnic institutes at Vienna and Prague; the medical and chirurgial academy at Vienna; to which has been added the optical museum of M. Reichenbach, 14 normal high schools, 57 special institutions for female education, and 4 communities of instruction; besides numerous scientific societies at Vienna, Pesth, Prague, Milan, &c.

"The inhabitants of Lombardo-Venetia and Lower Austria are the most generally educated. Among them, I think, one in eight must be receiving instruction.

"The universities of Vienna and Padua rank first among those of the empire. The salaries of the professors are, at the former, and I believe at all the universities, paid by government, and the professors are not allowed to take fees on their own account, nor to deliver lectures, except in their respective colleges. The theological, surgical, and veterinary courses are free to the students; but a fee is exacted for attending lectures on philosophy, medicine, and jurisprudence. These fees are appropriated towards the maintenance of indigent students. The whole course of lectures are read in the German language, excepting some deviations in respect to theology and physic." (Vol. ii. pp. 211—216.)

Education in Hungary is not in so flourishing a condition as in the German provinces of the monarchy; but even there it is in a much more advanced state than is generally supposed in this country. A statement, published in the *Vienna Gazette*, shows that, at an average of ten years, ending with 1834, 20,527 pupils have annually attended the universities and gymnasiums of that kingdom. The university of Pesth is by far the wealthiest institution of the kind in Europe. It has a host of professors; and is open to pupils of all religious persuasions. In 1835 it was attended by 1172 Catholics, 253 Protestants, 261 Jews, and 84 Greeks, in all 1770. Besides maintaining a great number of indigent scholars, and a preparatory ecclesiastical seminary, it aids or supports an arch-gymnasium of six classes, and about 3,600 district grammar and elementary schoolmasters.

The great defect of Austrian education does not consist in the want of elementary instruction, for that is very widely diffused, but in the jealousy entertained by the government of every

thing like freedom of inquiry or discussion as to matters connected with the principles of politics, public law, political economy, and even philosophy. These important branches are not taught, at least so as to be made available or useful, and are but little studied in Austria. The board of education (*Studienhofcommission*) has the appointment of all professors at universities and colleges, and of all teachers at schools; it likewise publishes the books used in instruction, and controls the minutest details relating to schools. It prescribes the course and distribution of the hours of study, from which not the slightest deviation is permitted; and the scholars of the few *private* schools are forced to attend the examinations of the *public* institutions, to ensure their being taught according to the prescribed system. The effects of this jealous plan of education on political and moral studies, are no less perceptible, and but little less injurious than those of the censorship already alluded to.

Army.—The army is raised in all the provinces, with the exception of Hungary and Transylvania, by conscription, from which, however, the families of the nobility and gentry (*Kleiner Adel*) are exempted. The whole country is divided into districts for each regiment, which are thus apportioned:—

	Infantry.	Rifles.	Cavalry.	Artillery.
Upper and Lower Austria, Tyrol, and Moravia	7	4	6	12
Holstein, Moravia, Silesia, Galicia, Illyria, Dalmatia, Croatia, and the Military Frontiers	26	6	18	
Lombardy and Venice	25	8	7	
The quota furnished by Hungary and Transylvania	14		12	
Total	78	12	43	5

At present the infantry consists of about 196,000 men, all regiments having two battalions of 1,200 men each, and 12 companies. A third battalion is provided for every regiment, but is only called out on emergencies; it is called the *Landwehr*, and this augmentation in time of war raises the number of the infantry to 651,000 men. The cavalry peace establishment is 45,000 men; that of the artillery 17,800; and of engineers, including garrison and frontier artillery corps, sappers and miners, and a battalion of pontoniers, and one of *tschaikistes* (in the gun-boats on the Danube and the Save), 13,000; making a grand total of 271,800 men. Since the accession of the present emperor, a number of improvements have been introduced into the military department. The short breeches and light gaiters of the infantry have disappeared, as well as the jack-boots which formerly encumbered the artillery, and have been replaced by trousers and shoes. The infantry are dressed in white coats, of coarse but comfortable cloth, with light blue trousers, the Hungarian regiments being distinguished by their national light pantaloons. The cavalry wear the national dresses peculiar to their several descriptions of arms. Hungary furnishes the hussars, and Galicia the lancer regiments; the Italian, Slavonic, and German cavalry regiments wear white uniforms with helmets. The men are usually taken from the provinces in which each regiment has its conscription depot; but the officers are mixed throughout the army, and their promotion is seldom confined to one regiment. The finest men of each infantry regiment are selected to

form the grenadier companies, usually in garrison at Vienna, Milan, Pesth, or Prague; these companies form a corps of 20 battalions, which (for their number) are perhaps the finest men in Europe. The troops are well clothed and fed; and though the annual drain of the strongest and healthiest of the population must be felt by the community at large, there is no reason for supposing that the conscription is regarded as a hardship by the poorer classes. In Hungary the case is different; the regiments of that country are raised by recruiting, and the men are usually seduced by the promise of being placed in the hussar regiments; but in general the Hungarian peasants are decidedly averse from the service, though they make excellent soldiers. It is permitted to those who can do so, to find a substitute; but the conscription too often includes persons of education who, being unable to purchase their exemption, are cut off from all hopes of advancement,—as no promotion, except in the artillery, is made from the ranks. The colonel-in-chief of each regiment names and promotes the officers up to the rank of captain. The field officers are nominated by the emperor, and usually advance according to seniority.

The word of command is given throughout the army in German; and it is probably to assist the memory of the numbers who do not understand its meaning, that the "Flügelmann" is still retained. Punishments are in general severe, and flogging is of almost daily repetition, especially in the Hungarian regiments. The term of service is, for the men raised by conscription, 14 years, but is expected shortly to be reduced to 10 years. At the expiration of this term, however, the men may re-enlist at their option. The service in the artillery is usually for life. Austria's contingent to the confederate German army is 94,822 men, forming the first, second, and third divisions. Exclusive of various foraging allowances, the army is supposed to cost annually about 45,000,000 fl., or 4,500,000*l*.

The fortification of the avenues by which the French armies in the last war penetrated to the capital has drawn much attention. Linz (*see* LINZ) has been rendered very strong, as the key to the valley of the Danube; and the passage from Italy through the Tyrol has been protected by the erection of a citadel and strong works at Brixen. The principal fortresses besides these in the Austrian empire, are, Mantua, Pizzighetone, Legnano, Fuentes, Malaghera, Asopo, and Palmanuova, in Italy; Zara, Ragusa, and Cattaro, in Dalmatia; Peterwardein, Broodt, Comorn, Buda, Leopoldstadt, Gütz, Szigeth, and Temeswar, in Hungary; Carlstadt, in Croatia; Essegge, in Slavonia; Alt Gradisca, in the Military Frontier of Croatia; Theresienstadt and Josephstadt, in Bohemia; and Olmutz, in Moravia. The whole of Galicia lies open towards Russia without a single fortress. Other fortresses of minor importance are scattered through the different provinces: besides the castles of Brunn, Kufstein, Milan, Trieste, Linz, Brixen, Buda, Munkacs, &c., Austria has likewise the right of garrisoning Commachio and Ferrara in the Papal States, and Piacenza in the grand duchy of Parma. Mayence, in the grand duchy of Darmstadt, is half garrisoned with Austrian and half with Prussian troops, as stipulated by the treaty of Vienna.

The Austrian navy is said to consist of 8 ships of the line laid up in ordinary at Venice, 8 frigates, 4 corvettes, 6 brigs, and 7 schooners or galliots, besides guardships and revenue cru-

sers: only the smaller vessels, however, are at sea. The flag is red with a white stripe. The marines consist of one battalion of infantry, a corps of marine artillery, and a corps of marine engineers. The arsenal is at Venice, where there is a marine college for cadets. The dockyard at Venice contains 32 covered stocks for building ships of the line, 54 for vessels of a smaller size, 4 large wet docks, 5 cannon foundries, with a covered rope-walk 910 ft. long, 70 ft. broad, and 32 ft. high. The uniform of the navy is dark blue with light blue facings and white breeches, that of the marines is light blue with red facings. Naval matters are directed by a branch of the War-office at Vienna.

Form of Government.—The empire of Austria being a collection of different states, with different rights and privileges, the form of government necessarily differs in each; but in none is the emperor either absolute or despotical. With the exception of Hungary, Transylvania, and the Tyrol, the powers of the states or provincial parliaments, that meet annually in each of the other provinces, are indeed very limited. They have no deliberative voice in legislative or financial matters. The amount of the taxes for the year, which vary according to the exigencies of the state, is communicated to them, and the distribution of the taxes amongst the contributors takes place under their inspection. They have likewise the permission of addressing humble petitions on the subject of grievances to the throne, of which they but rarely avail themselves. The estates of Lower Austria are invariably convoked at Vienna in September, which is one month previously to the assembling of the provincial estates, which meet in October.

The Hungarian Diet possesses very different privileges, and has been able to maintain them notwithstanding the vast influence of the crown. They have a full deliberative voice in legislation, and nothing can be decreed by the sovereign without their concurrence;—hence the country is not subject to the heavy taxation, nor legally to the police and censorship ordinances which prevail in other parts of the empire. Passports are not usual in the kingdom; and the Hungarians do not consider their liberty to travel in foreign countries as depending on the will of the sovereign. With these valuable privileges they have, however, preserved a number of faulty laws and cumbersome observances. But the exertions of the more enlightened members of both houses have of late years succeeded in obtaining considerable alterations in these, without sacrificing any of their rights; and the country is rapidly improving through their laudable efforts.

It is not, however, to be denied, that the freedom of Hungary has hitherto been merely the freedom of the nobles and clergy. The great bulk of the people have long been and still continue to be substantially in the state of *adscripti glebe*. Their condition has however been in some respects materially improved, and limits set to the lords' demands upon their services, through the interference of the government, and principally of Maria Theresa and Joseph II., in their behalf; but there can be no doubt that the power and privileges of the other classes, however advantageous in some respects, have hitherto been decidedly injurious to the peasantry, that is, to the bulk of the population. The fair presumption is, that but for these privileges the peasantry of Hungary would now have been as free, and

have enjoyed the same privileges as those of the German provinces of the empire.

In the provinces, the members of the provincial diets meet in one chamber, and are composed of prelates, nobles, knights, and burghers, the free peasants being only represented in Tyrol. In Hungary the prelates and magnates, with the *Obergespanne* (lord-lieutenants) of the counties, form the Chamber of Magnates (*Tabula excelsa Procerum*); the deputies of the cathedral chapters, of the counties, of the free royal towns, and of absent magnates, form the Chamber of the States (*Tabula inclutorum Statuum et Ordinum*). Transylvania has a separate Diet, but sends members to that of Hungary, as do also Croatia and Slavonia. In the Tyrol there is a Chamber of Peasants, and no new tax can be levied without the consent of the states.

Officers of Government and Administration. — The arrangement of the different branches of the administration in Austria attained its perfection under the late Emperor Francis I., and is admirably calculated to admit of the personal interference of the monarch in every department.

1. The ministry of state, which long consisted of three members, received a fourth in the person of a distinguished general, on the prospect of a disturbance of the peace of Europe after the French revolution of 1830. This board may be called the emperor's cabinet. The minister for foreign affairs, with the title of imperial chancellor, is its president, and is prime minister. 2. The council of state may be compared to a privy council, and is composed of three sections, embracing 7 departments; viz., justice, army, police, exchequer or crown-office, finances, board of health, and board of studies. A councillor is named for each department, and a referendary is attached to each in the person of a member of some one of the different administrative offices charged with the execution of the imperial decrees, that is, with the entire administration of the empire. The council of state exercises in a great measure the legislative functions; but the drawing up of laws is confided to a commission specially appointed for the purpose. As the legislative power in Hungary belongs to the Diet, two councillors manage the affairs of that country and of Transylvania, as far as they come under its cognizance. The 11 administrative offices embrace the functions of the different departments of the secretaries of state in England, together with those of courts of appeal and of the commander-in-chief. They consist of, 1. The united chancery for the German, Slavonic, and Italian provinces; 2. The Hungarian chancery; 3. The Transylvanian chancery; 4. The exchequer and finance board; 5. The mint; 6. The board of justice, or highest court of appeal for all provinces excepting Hungary and Transylvania; 7. The board of police and censorship; 8. The war-office, of which the navy board is a branch; 9. The book-keeper general's office, in which the accounts of every department, excepting those of the police and the ministry of foreign affairs, are inspected; 10. The board of education; 11. The legislative commission.

Under these different boards, which have all their seats at Vienna, the political, administrative, financial, military, police, clerical, and educational authorities of the provinces are placed, who communicate with the respective departments through the medium of the *Gubernium* of each province. Judicial appeals go direct from the provinces to the board of justice, with the

exception of Hungary and Transylvania, in the last of which the gubernium is the highest authority under the emperor. Under the gubernium are the captains of circles, and the magistracy of the towns; with this difference, that the former unite the functions of administration and police, whereas the police in towns is entrusted to a special board, independent of the magistracy. In Hungary the "*Statthaltere*," whose president is the palatine, is the chief administrative body, and, like the gubernium of Transylvania, communicates with the sovereign direct through the medium of a special chancery at Vienna. The *statthaltere* is composed of 22 councillors, two of whom are prelates, and has its seat at Ofen (Buda). Under this board the *Obergespann* (lord-lieutenant) of each county, who is named by the emperor (the charge is often hereditary), and the *Vicegespann*, his deputy, who is chosen by the nobles, with all authorities excepting the courts of justice, stand in a subordinate degree. Hungary has a peculiar court of appeal in the *Septemviral Tapel*. Public business in every department is carried on in writing. The personal influence of the emperor may be powerfully exerted even in the extensive and well-organized system of public offices here described. Though the councillors of state have each a peculiar department, they must not consider themselves as exclusively bound to it only. According to the will of the emperor, or of any of the ministers, the duty of investigating and reporting on any subject may be given to any member of the board, or, in case of need, a member of an inferior office may be charged with the temporary functions of councillor. Innumerable commissions of inquiry and control are annually appointed; and every check that can be devised is adopted in order to supply the place of the most effectual of all, the free expression of public opinion through the press. Appeals and representations to the emperor in person may be made by every individual, of whatever rank, upon the most trifling as well as the gravest subjects; and these appeals frequently occasion a revision of the decisions of the public boards either through another councillor or a special commission. The immense load of business which thus devolves upon the emperor, obliges him to keep a private cabinet, which communicates at pleasure with every office or functionary in the empire, and consequently may be said to represent the omnipresence of the sovereign. From a decree issued through this cabinet, there is no appeal; such decree (*Hand-billet*) supersedes all law.

As sovereign of many territories, which were formerly considered fiefs of the empire, the Emperor of Austria is a member of the Germanic Confederation, and his minister plenipotentiary is at present the president of its Diet at Frankfurt. The states which are included in the Confederation are the archduchy of Austria, the kingdom of Bohemia, with Moravia and Silesia, and the duchies of Oświęcim and Zator in Galicia, the county of Tyrol, and the duchies of Styria, Carinthia, Carniola, with the town and territory of Trieste. In the ordinary sittings of the Diet, Austria has one vote; in the plenary assemblies, 4 votes: the emperor's contingent to the confederate army is 94,822 men.

Temper and Spirit of the Government. — Dalpoggio says of the Austrian government, that "it has fundamental laws, usages, and precedents, from which it does not deviate. The right of private property is held sacred. The emperor

makes general laws for his subjects, but no special or exceptionable ones for particular persons or cases. There is equality before the law, and no odious privilege of caste is now admitted. There is no abusive influence of either aristocracy or clergy. The judiciary power is held independent, and not interfered with by rescripts from the sovereign. No special commissions are appointed to try particular cases; no arbitrary penalties are inflicted. All those who were condemned for political offences in 1820-21 were regularly tried; several were condemned to death, but not one was executed. The proceedings in the civil courts are neither dilatory nor expensive.* The conveyance of property has been rendered, by a wise system of registration, as easy and safe as any commercial transaction. With the exception of political cases, the penal code is very mild. The punishment of death is awarded in very few instances. Few countries in Europe enjoy so much material prosperity as the Austrian monarchy."

The accession of the reigning emperor to the throne has been marked by a tendency on the part of the Austrian cabinet to an enlightened course of domestic and foreign policy, the steady prosecution of which must prove of incalculable advantage for the empire and for Europe. The deceased Emperor Francis belonged to that school of policy in which the Richelieus and the Mazarins were masters, and which acknowledged no means of preserving unity, but the extermination of one of the jarring elements of discord. Under his reign the empire would probably have separated into several independent states, had not the violent but indispensable reforms, carried through with such energy by the Emperor Joseph, anticipated the necessity of the people's rising to effect them, and learning their own power. Thus, while the Emperor Francis attributed the submission he met with in the greater part of the provinces to the firmness with which he persevered in his repressive measures, it was really brought about by the temporary satisfaction inspired by what had been granted by his predecessor. Had the severity with which Galicia was treated between 1833 and 1836 been shown to that province at an earlier period, there can be no doubt but that the revolt of 1830 would have extended to Austrian Poland. What result the harsh treatment of the Italian provinces would have led to, has been adroitly veiled by the amnesty of 1834,—a measure of great importance for the future prosperity of Austria. The treaties of commerce, concluded at the same time with England and the Porte, are also measures of great interest to her well-being. Their importance lies in the avowed determination of the government to furnish Hungary with a débouché for her abundant produce, and consequently in the virtual abandonment of the jealous policy hitherto observed towards that province. The conciliatory effect of these measures will most likely occasion an increase of power to the Austrian government, which it is not improbable may, for the first time since the days of Charles V., give it a preponderating influence in the affairs of Europe. Their first effect will probably be a rise in the credit of the state, and of all kinds of property; and should they be followed up by an emancipation of the system of education from the restraints under which it languishes, and by some relaxation of the restrictions on the press, the inhabitants would be conciliated, their best

interests promoted, and the government rendered more secure.

Importance of Austria to Europe.—The central and western European states have from time immemorial felt the importance of having a powerful ally as a barrier towards Asia on the east. The might of these Moguls, who in the 13th century overwhelmed the rising Muscovite state, broke on the well-organized resistance opposed by the united power of the Bohemian king and the Margrave of Austria. At a later period, when the victorious Turks threatened to carry their arms into the heart of Christendom, it was Austria that bore the brunt of the fight, and gained time for the advance of Sobieski and his army. Under the present conjuncture of circumstances in Europe, the importance of Austria in a political, no less than in a commercial point of view, is evident; and as that importance depends altogether upon her power and the judicious development of her resources, the western states are deeply interested in her prosperity. From the nature of the various states united under the imperial sceptre, it is clear that Austria divides the rule over the Slavonic nations of Europe with Russia; it must consequently be for her interest to attach to her sway so numerous a portion of her subjects, who have a strong band of sympathy with a growing and very powerful rival. A mild government and a sincere attention to the material as well as moral condition of her subjects, will prove the best means of linking together provinces differing so much from each other, and each of which is too powerful to be long retained by any other than gentle means.

The conduct of the cabinet of Vienna justifies the expectation that its leading members are aware of the part which they are called upon to play, and of the true sources of their own influence and of that of the nation in European politics. If unity at home be promoted, and the material and moral condition of the people be improved, the power of Austria will be such that she need fear nothing even if she had to contend single-handed with Russia or France. The variety, however, of her population, and the different, or supposed different interests, of her various provinces, are sufficient guarantees to the rest of Europe that the power of Austria will not be abused. The pacific policy which her cabinet has generally observed is dictated by the peculiar composition of the state, and cannot safely be departed from. While Austria may thus be looked upon as a most useful ally by the other states of Europe, and as their grand bulwark against the power and ambition of Russia, her friendship will be courted in proportion to her increase of power. Her worst enemies are those, who, by fostering disunion at home, or keeping her people in ignorance of their true interests, weaken her influence, and prevent her from attaining a position to command the respect of her neighbours without exciting their apprehensions.

Rise and Increase of the Empire.—The House of Austria derives its origin and the foundations of its power from Rodolph, count of Hapsburg, in Switzerland. Rodolph, who was one of the ablest princes of his age, having extended his authority over the greater part of Switzerland, and distinguished himself by his ability and bravery, was raised in 1273 to the imperial throne. His elevation was owing principally to the wish of the electors to have an emperor of undoubted ability, capable of putting down the anarchy that had long prevailed in the

* But this is certainly not the case with criminal proceedings. See ante, p. 245.

greater part of the states included within the limits of the empire, and who, at the same time, was not powerful enough to occasion any fear of his subverting the privileges of the different states. The family of the ancient dukes of Austria, of the House of Bamberg, having become extinct a short while previously to the elevation of Rodolph, their states were taken possession of by Ottocar, king of Bohemia, whose ascendancy threatened the independence of the empire. But Rodolph, having secured the sanction of the diet, declared war against Ottocar, whose forces were totally defeated, and himself killed, in the decisive battle of Marchfeld, in 1278. This formidable competitor being removed, Rodolph had little difficulty in procuring from the diet the investiture of the duchy in favour of his eldest son, and it has ever since continued in the possession of his descendants, and formed one of the principal sources of their power.

Albert, the son of Rodolph, did not inherit the talents of his father. The Swiss revolted from his dominion in 1307, and after a lengthened contest achieved their independence. But notwithstanding this event, and the elevation of several princes of other families to the Imperial throne, the power of the House of Austria rapidly increased, and in no very long time its dominions embraced some of the largest and most important countries of Europe. It has been principally indebted for its extraordinary aggrandisement to fortunate alliances. The marriage, in 1477, of Maximilian, son of the emperor Frederick III., with the daughter and heiress of Charles the Bold, the last duke of Burgundy, brought to the House of Austria all the rich inheritance of the latter in the Low Countries, Franche Comté and Artois. Another marriage opened to the House of Austria the succession to the Spanish monarchy, including its vast possessions in Italy and the New World. And Ferdinand I., having married, in 1521, Anne, sister of Louis, king of Hungary and Bohemia, succeeded, on the death of the latter at the battle of Mohacz in 1526, to these states. There is, therefore, as much of truth as of point in the lines,

"Bella gerant alii, tu, felix Austria, nube,
Nam que Mars alii, dat tibi regia Venus."

Charles V., the most powerful monarch of the House of Austria, concluded, in 1521, a treaty with his brother Ferdinand, by which he assigned to him the hereditary possessions of the family in Germany. And there can be little doubt that this arrangement was for the advantage of both branches of the House — that of Austria, properly so called, and that of Spain.

The great power and ambition of the princes of the House of Austria, excited a well-founded alarm among the other European powers. For a lengthened period the whole politics of Europe, its alliances, and its wars, had little other object than the humbling of the power of Austria. This was the motive of the thirty-years' war, terminated by the treaty of Westphalia, in 1648, which secured the independence of the different states of the Germanic empire, and the free exercise of the Protestant religion.

For a lengthened period, the Turks held the greater portion of Hungary; but, in 1699, they were finally expelled from that kingdom; and the arms of Prince Eugene gave the Austrians an ascendancy over the Ottomans they have ever since preserved.

In 1740, the male line of the House of Hapsburg terminated by the death of the emperor Charles VI. But his daughter, Maria Theresa,

married to Francis of Lorraine, grand duke of Tuscany, succeeded to his dominions, and, eventually, to the imperial crown. Shortly after her accession, Frederick the Great, king of Prussia, seized upon the greater part of Silesia. The recovery of this province was the principal object of Austria and her allies in the seven years' war. But his Prussian majesty triumphed over all his enemies; and Silesia was finally ceded to Prussia, by the treaty of Hubertsburg, in 1763.

The reign of Joseph II., the son and successor of Maria Theresa, is important from the reforms he effected in most departments of the government, and the territories he added to the empire. It has been objected to the former that they were not introduced with sufficient caution, and that he would have accomplished more had he attempted less. No doubt, it must be admitted that he did not make sufficient allowance for the inveteracy of ancient prejudices, and that his innovations were frequently neither appreciated nor approved by those for whose benefit they were intended; but there can be no doubt as to the rectitude of his intentions, and, notwithstanding the obstacles he experienced, his reforms, and the change he introduced into the mode of government, have been productive of the greatest advantage. Under his reign, Galicia was acquired from Poland, and the Bukowine from Turkey.

It would be unnecessary, even if our limits admitted of it, to attempt any sketch of the fluctuations of Austrian power during the eventful period that has elapsed since the breaking out of the French revolution, in 1789. At certain stages of her great struggle with France, Austria seemed to be depressed almost to the rank of a second rate power. But the insatiable ambition of Napoleon having effected his downfall, Austria was left at the end of the contest as powerful as ever; the loss of the low countries being fully compensated by her acquisitions in Italy and elsewhere.

In 1801, Francis assumed the title of hereditary emperor of Austria; and on the 6th of August, 1806, he renounced the title of emperor of Germany. This latter event had been preceded by the formation of the confederation of the Rhine, and the entire dissolution of the old Germanic constitution. The present emperor, Ferdinand I., born 19th April, 1793, succeeded his father, Francis I., 2d March, 1835.

AUTUN, a city of France, dép. Saône et Loire, on the Arroux, 43 m. S. W. Dijon, lat. $46^{\circ} 56' 48''$ N., long. $4^{\circ} 18' 15''$ E. Pop. 9,000. It is picturesquely situated, partly on the declivity and partly on the top and at the bottom of a hill. It is neither handsomer nor regular; most part of its edifices are old, and have a mean appearance; but there are several among them well worth notice. It has two cathedrals situated on the summit of the hill; but neither has been completed. The spire of one of them, 325 feet in height, is remarkable for its elegance and the lightness of its construction. The church of St. Martin, built by Queen Brunehaut, and containing her tomb, furnishes specimens of different kinds of architecture. The *champ de Mars*, in the middle of the town, a spacious square elevated on a terrace, and planted with trees, affords an agreeable promenade. The square of the cathedral has a magnificent fountain. There are two bridges over the Arroux, one of which is said to be built on the foundations of a Roman bridge. Autun is the seat of a bishop, of tribunals of original jurisdiction, and of commerce; and has a college, a diocesan seminary, a cabinet of antiquities and natural history, a collection of pictures, two small libraries, a theatre, &c. It has also manufactures of cotton, velvet, of a sort of stuff described as *lapis de pu. d. dites marchaux*, fitted for coverlets, horse cloths, &c., with hosiery, tanneries, &c. There is a coal mine at the hamlet of Chambois within about a league of the town.

This is one of the most ancient cities of France. It was originally called *Bibracte*, and is described by Cæsar as by far the greatest and wealthiest town (*longe maximo as*

poposissimo) of the *Æduli*. (*De Bello Gall.* lib. i. § 23.) Having been made a Roman colony by Augustus, it took the name of *Augustodunum** from that emperor, and *dun*, a Celtic term for a hill. Subsequently it was called *Flavia Eboracum*. The Burgundians took it in 427; and it was afterwards sacked and burned by the Saracens, and latterly by the English, in 1379. It espoused the party of the League, and suffered much during the religious wars. It still possesses many fine remains of antiquity. Of these the most celebrated is the triumphal arch, called the gate of Arroux, of large dimensions, and which, though built without cement, is in exceeding fine preservation; a smaller triumphal arch; the ruins of an amphitheatre, of a Roman burying ground, of the temple of Janus, built by Drusus, and of a temple of Minerva, with many *bas reliefs*, medals, utensils, &c. The ancient city was much more considerable than the modern one. The walls may still be traced, and are so solidly built as to be almost like rock.

Tactius mentions (*Annal.* lib. iii. § 43.), that the noble youth of Gaul resorted for instruction to Augustodunum. Eumenius, the rhetorician, who was born here about the year 261, states in his oration *Pro Restituto Schola*, § 20, that representatives, or names, of the different countries of the then known world were defuncted on the porticoes or places where the youth met, setting forth their names, situations, the rise and course of their rivers, the outline of their coasts, &c.; and it is worthy of remark, that some portion of this ancient defunctio is said to have been recently discovered. (*Encyc. des Gens du Monde*, art. *Antiquités d'Aulun*.)

The Prince de Talleyrand, who afterwards played so many important parts in the political drama, was bishop of this town at the commencement of the revolution. The Abbé Roquette, whom Molière is said to have taken for a model, was also one of its bishops. This has given occasion for the following epigram:—

“Roquette dans son temps, Talleyrand dans le nôtre,
Furent les évêques d'Aulun;
Tartuffe est le portrait de l'un;
Ah! si Molière eût connu l'autre!”

(*Hugo, France Pittoresque*, art. *Saône et Loire*.)

AUXERRE (an. *Autisiodurum*), a town of France, cap. dep. Yonne, on the left bank of that river, 95 m. S. E. Paris, lat. 47° 47' 57" N., long. 3° 34' 21" E. Pop. 10,989. It is agreeably situated on a hill, and its environs are charming; but with the exception of the houses along the quay and the river's side, it is generally ill-built, with various crooked streets, and has a gloomy appearance. Principal public buildings, cathedral, one of the finest Gothic edifices in France; the church of St. Peter; the abbey of St. Germain; the bishop's palace; and the hotel of the prefect. A finely shaded promenade surrounds the town, and it is well supplied with water distributed from a public fountain. Auxerre was the seat of a bishopric which has been suppressed; it has tribunals of original jurisdiction and of commerce, a college (high school), a secondary ecclesiastical school, a model school, a society of agriculture, a botanical garden, a museum of antiquities, a public library with 24,000 vols. and 180 MSS., a handsome theatre, &c. It has manufactures of calicoes, woollen coverlets, hosiery and caps, hats, earthenware, violin strings, wine casks, &c. The wines produced in the environs are much esteemed, particularly those of *Myrme* and *Chamette*; and a considerable trade is carried on in them, and in casks, wood, staves, &c. The Yonne is navigable from a little above the town.

Auxerre is very ancient. It existed previously to the invasion of the Romans, by whom it was adorned with several monuments, of which remains have been found at different epochs. It was laid waste by the Huns, Saracens, and Normans, and at a later period by the English. In 1477 it submitted to Louis XI., and has ever since remained subject to the crown of France. (*Hugo, France Pittoresque*, art. *Yonne*.)

AUXI-LE-CHATEAU, a town of France, dép. Pas de Calais, cap. canton, on the Authie, 15 m. S. W. St. Pol. Pop. 2,646. Its environs are very marshy.

AUXONNE, a town of France, dép. Côte d'Or, cap. canton, on the left bank of the Saône, 18 m. E. S. E. Dijon. Pop. 5,150. It ranks in the 4th class of fortified towns, being defended by works constructed by Vauban. It is well built, and the ramparts serve as pleasant promenades. There is a fine bridge across the Saône, with a levy pierced by 23 arches to give a passage to the water in inundations. Auxonne is the seat of a tribunal of commerce; and has a college, a school of artillery, a small public library, &c. with manufactures of cloth, serges, and muslins, a brewery, a cannon foundry, &c.

AVA (*Ang-va*, a fish-pond, so called because one formerly stood there); the ancient and again the present cap. of the Birman empire, on the left bank of the Ir-

rawadi, 160 m. S. W. Bhamo, and above 300 m. N. Bangoon, lat. 21° 51' N., long. 95° 58' 10" E. Pop. under 30,000. (*Wilson*.) It consists of an outer and inner city, both fortified: the outer is 5½ m. in circuit, and is surrounded, except on the Irrawadi side, where there is scarcely any defence, by a brick wall 15 ft. high, and 10 ft. thick; outside of which, on the S., is a deep, rapid, and unfordable torrent, the *Myit-tha*; on the W. a jungle and swamp; and on the E. the *Myit-rge*, a rapid stream, 160 yards broad. The inner city is placed at the N. E. angle of the former, and is surrounded by a better wall, 1½ m. in circ., and has also some natural defences. The inner city is almost wholly occupied by the palace, council-chamber, arsenal, and the dwellings of a few of the principal courtiers. Ava contains many temples, in one of which is a sitting image of Gaudama, 24 ft. in height, said to consist of a single block of marble; in another all oaths of consequence are administered, the breach of which is considered a heinous crime. The houses are generally mere huts thatched with grass: the markets are furnished with British, as well as Chinese and Lao manufactures; but for trade, wealth, and prosperity, this capital is very far beneath Bangkok, the cap. of Siam. (*Crawford's Embassy to Ava*, &c., p. 313., &c.; *Wilson, Ducancants*, &c., Appendix, p. 46.)

AVALLON, (an. *Aballo*), a town of France, dép. Yonne, cap. arrond. on the Cousin, 25 m. S. S. E. Auxerre. Pop. 5,089. It is beautifully situated on a granite rock, and commands, especially from the promenade of the *Petit Coura*, a fine view of the rich and well-cultivated valley of the Cousin. It is a handsome town, with good houses, and broad and well-kept streets. The front of the parish church, the hospital, the theatre, and the concert hall, deserve notice. It has a court of original jurisdiction, a commercial tribunal, and a college; with fabrics of cloth, paper, mustard, &c. The casks and other articles of *tonnelerie*, are in high repute. The hills round the town produce excellent wine, of which it is the entrepôt; and it has also an extensive trade in corn, timber, staves, casks, &c.

Avallon is very old: it owes its foundation to a strong castle, every vestige of which has now disappeared, that once occupied the summit of the rock on which it is built. (*Hugo, France Pittoresque*, art. *Yonne*.)

AVEBURY, or **ABURY**, a parish and small village of England, co. Wilts, 5 m. W. Marlborough. Pop. 747. This parish contains the gigantic remains of what is usually considered to be a Celtic or druidical temple. This singular and stupendous ruin is situated in a flat tract of country, and consists of a large circular space of ground, having on the outside a bank or mound of earth, the inner slope of which measures about 80 feet in width; immediately within this bank is a broad and deep ditch; and along the inner edge of the latter stand the relics of a circle of vast upright stones, similar to those of Stonehenge, measuring from 15 to 17 feet in height, about 40 feet round, and estimated to weigh from 40 to 100 tons each. The diameter of this circle is about 1,400 feet; when complete it contained 100 stones, 40 of which were standing in 1722, when Dr. Stukeley examined it; but in 1812 only 16 stones were left, and the number has since been still further reduced. Within this outer circle, or great temple, as it is sometimes called, were two smaller temples, each formed of two concentric circles of stones, having one a single stone in the centre, and the other a group of three stones. Some of the stones in the two inner temples are of a prodigious size. They are all of a shagreened grit, and are of the same species as those that accompany the great chalk formation that here crosses the kingdom.

In connexion with the circular stones, or temples, already noticed, were two avenues each above 1 m. in length, formed by double rows of vast upright stones. One of these led in a S. E. direction to Overton, where, according to Stukeley, it terminated in a small elliptical temple of similar stones: the other, or W. avenue, terminated in a single stone. Stukeley supposes that the S. E. avenue had, when perfect, 200, and the W. 208 stones; but of the former, which had 72 stones standing in 1772, only 16 are now left, and of the latter only 2. The village of Avebury stands within the periphery of the great circle, or temple, and is in part built of the stones with which it and the minor circles were composed; these having been blasted and broken to pieces, to serve for this and similar purposes. It is much to be wished that efficient measures were taken to secure what still remains of this extraordinary monument; otherwise it is but too probable it will, at no very distant period, be entirely destroyed.

Immediately S. from the great circle or temple at Avebury, dist. ½ m., is the barrow, or artificial mound of earth, called Silbury-hill. This huge barrow covers, according to the measurement adopted by Sir R. C. Hoare, 5 acres and 30 perches of ground, being 2,027 feet in circumference at the base: its diameter at the top is 120 feet, the sloping height of its side 816 feet, and its

* The identity of *Bilrecks* and *Augustodunum* has been denied by Cellarius, the Abbé Longuet, and M. De Valois; but has been conclusively demonstrated by D'Anville, in his *Eclaircissement sur l'Antienne Gaulois*, p. 267-332.

perpendicular height 170 feet. It is impossible to say for what purpose this immense mass of earth was heaped together; but it seems not unreasonable to conclude that it may have been in some way connected with the stone circles at Avebury. (See *Dr. Stukeley's* volume on *Avebury*, published in 1743, and recently reprinted, *passim*; *Beauties of England and Wales*, art. *Wiltshire*, *Sir R. C. Hoare's Ancient Wiltshire*, &c.)

However desirable, it does not appear very probable that any satisfactory explanation will ever be given of the purposes for which the singular structures described above were erected. All traces of their origin seem to be buried in impenetrable obscurity. The favourite theory is, that the structure at Avebury, as well as that of Stonehenge, were druidical temples, where the druids, or priests of the ancient Britons, celebrated their sacred rites. But, notwithstanding the confidence with which this theory has been put forward, and the learning and ingenuity displayed in its support, it appears to be entirely destitute, not merely of proof, but even of any considerable degree of probability. Cæsar, Lucan, Tacitus, and Pliny, the principal authorities with respect to the druids, do not give the smallest countenance to the notion of their having constructed or made use of any such temples. Cæsar (See *Bello Gallico*, lib. vi. s. 13.) says that they retired at a certain period of the year *loci consecrati*; for which Grævius has proposed to read *lucus consecrati*; and this emendation is rendered probable by what is said by Lucan, Tacitus, and Pliny. The first says, in reference to the druids,

— "Memora alta remota
Incolitis lucus." Lib. i. line 453.

Tacitus (*Annal.* lib. xiv. s. 30.) tells us that the Romans, having taken Mona, or Anglesey, apparently the grand seat of the druids, cut down their groves sacred to savage superstitions—*crevisque luci, saxis superstitionibus sacri*. And Pliny (*Hist. Nat.* lib. xvi. s. 44.) states that the druids *hororum eligunt lucos, nec ulla sacra sine ca fronde conficiunt*. But no classic author makes the remotest allusion to the druids using such extraordinary temples as those previously described. Hence, if any dependence be placed on ancient authority, it would seem that the seats of druid superstition were in the recesses of the forest—in places as remote as possible from Stonehenge, or even Avebury.

AVEIRO, a sea-port town of Portugal, prov. Beira, 34 m. N. N.W. Coimbra, on the S. shore of the estuary of the Vouga, lat. 40° 38' 24" N., long. 40° 37' 54" W. Pop. 4,134. It is the seat of a bishopec and of a custom-house; and has a good deal of trade in salt, manufactured in the little islands in the bay; in sardines, of which there is an extensive fishery; and in wine, oranges, &c. It has a college, an hospital, a workhouse, and 7 convents. The oysters on the adjoining coast are reckoned the best in Portugal. The entrance to the mouth of the river is protected by two cone pyramids, each 70 feet high, which, when brought into a line, show the course over the bar. The latter has about 15 feet at high-water springs, and 9½ at low-water do.: at neaps the depths are respectively 12 and 7½ feet. It is necessary, however, to observe, that the bar being of shifting sand, is liable to perpetual changes, and that it should never be attempted without the aid of a pilot. (*Tafino, Spanish Pilot, Eng. trans.*, p. 97., &c.)

AVELGHEM, a town of Belgium, prov. W. Flanders, on the Schelde, 9 m. E. S. E. Courmay. Pop. 3,500.

AVELLA (an. *Abello*), a town of Naples prov. Terra di Lavoro, 5 m. N. E. Nola, in a charming situation, commanding a view of Naples. Pop. 5,000. It is celebrated by Virgil for its honey or its apples, it is not certain which:—

"Et quos maffere despectant inœmia Abellæ." *Æn.* vii. 740.

But some MSS. read *melifera*.

AVELLINO (an. *Abellinum*), a town of Naples, cap. prov. Principato Ultra, on the declivity of a hill, in a fertile valley near the Sabato, 29 m. E. Naples. Pop. 12,000. It is fortified, in the seat of a bishop, of the civil and commercial courts for the prov., and has a royal college. It has a cathedral, 3 parish churches, a square adorned with an obelisk, a public granary, &c.; with manufactures of coarse cloth, paper, macaroni, snuggles, whose superior excellence has long been admitted, and dyeing works. It is the entrepôt of the surrounding country, and has a pretty extensive trade. Chestnuts are gathered in large quantities in the environs, but hazel nuts are their most important product. The latter were greatly esteemed by the Romans, and were called by them *massæ Avellana*.

Avellino is said by Swinburne to be "a considerable city, extending a mile in length down the declivity of a hill, with ugly streets, but tolerable houses. The churches have nothing to recommend them, being crowded with monstrous ornaments in a barbarous style, which the

Neapolitans seem to have borrowed from the Spaniards. The cathedral is a poor building, in a wretched situation, with little to attract the eye except some uncouth Latin dialects, and shapeless Gothic sculpture. Their only edifice of note is a public granary, of the composite order, adorned with antique statues, and a very elegant bronze one of Charles II., king of Spain, while a boy. The town abounds with provisions of every sort, and each street is supplied with wholesome water." (*Swinburne's Two Sicilies*, vol. i. p. 111. 4to ed.) It has, however, been a good deal improved of late years; but the above is still a pretty fair representation of its general appearance.

AVENCHÉ (an. *Aventicum*), a town of Switzerland, in a portion of the canton de Vaud enclosed in that of Fribourg, 5 m. from Port Alban, on the lake Neuchâtel, and 1½ m. from the shore of Lake Morat. This town, now hardly worth notice, was formerly one of the most important in Switzerland. According to some authorities, it was built, and a Roman colony placed in it, by Vespasian; but others, with more probability, conjecture that it was only repaired and beautified by Vespasian, after being laid waste by Vitellius. The ancient walls enclose a space of more than 5 m. in circumference. It has some fine remains of antiquity, such as mosaic pavements, an amphitheatre, columns of white marble, an aqueduct, &c.; and its importance is known from several Roman mile-stones found in parts of the Pays de Vaud being all numbered from Aventicum. Though now at a considerable distance from the lake, it was during the period of its prosperity, by its margin, the iron rings to which the boats were fastened being still visible. (*Coeze's Switzerland*, let. 51.; *Malte-Brun*, art. *Switzerland*.)

AVENWELDE, a village of the Prussian states, prov. Westphalia, reg. Minden, about half-way between Bielefeld and Weidenbrück. Pop. 3,000.

AVERNO (LAKE OF), (an. *Æværus*), a famous lake in the Neapolitan states, about 10 m. W. Naples, near the sea. The lake occupies what there is good reason to think is the crater of an extinct volcano, and is everywhere surrounded by high hills, except where there is an outlet, by which it formerly communicated with the Lucrine lake. It is from 1½ to 1½ m. in circumference; the water clear, very deep, and well supplied with trench. During the early period of Roman history the hills round this lake were thickly covered with dense forests, which gave it a gloomy appearance, and by confining the mephitic vapours that rose from the volcanic soil, rendered the air extremely unhealthy. In consequence the place was early regarded with superstitious awe. The poets represented Averna as sacred to the infernal gods, and as being, in fact, the entrance by which Ulysses and Æneas descended to the lower regions!

— "fama est Acherontis ad undas
Pandore iter cæcis stagnante voragine fauces,
Læxat et horrendo apert telluris hiatus,
Incurvantur novæ perturbat lumen tenebre."
SIL. ITALICUS, xli.

It was said that no bird could fly over the lake without being destroyed by its poisonous exhalations, and hence its name *Æværus* (*Ægæus*, without birds). This is noticed by Virgil, in some well-known lines (*Æn.* vi. 237.).

But during the reign of Augustus, Agrippa dispelled the obscurity and sanctity that had so long encircled the Averna. He cut down its groves; and having joined it to the Lucrine bay, he brought ships into its solitude, and used it as a harbour in which to exercise galleys! The Lucrine lake, or rather bay, was almost entirely filled up by the subterraneous eruption of Monte Nuovo, in 1538. On one side the lake of Averna are the remains of a large octagon temple, probably appropriated to the worship of Hecate; and opposite: the temple, on the other side the lake, is the opening of the subterranean conduit usually called the grotto of the Sybil, but which was, in fact, a tunnel leading from the lake to the sea. The hills round the lake are now covered with gardens and vineyards, and retain none of that gloomy grandeur for which they were once so celebrated. They are still, however, at certain seasons unhealthy. (*Swinburne's Two Sicilies*, 4to ed. i. p. 35.; *Cramer's Ancient Italy*, ii. p. 160.)

AVERSA, a town of Naples, prov. Terra di Lavoro 9 m. N. Naples, and 11 m. E. from the Mediterranean. Pop. 15,000. It is situated in a beautiful plain covered with vines and orange trees; is well built and well laid out; is the seat of a bishopric, said to be the richest in the kingdom; of a royal governor, and of a tribunal. It has nine churches and some convents; but it is principally distinguished by its founding hospital and its large asylum. The former is said by Balbi, to be a nursery of artists and artisans for the entire kingdom. The latter is exceedingly well managed. The apartments are laid out and furnished so as to suit the state of the patients; and every method is resorted to, by amusement and exercise, to divert their attention. Those

that are furious are of course separated from the others, and subjected, if need be, to the strait-jacket. This establishment has served as a model to others, at Reggio, Modena, and Palermo. A sort of almond-cake, called *torrone*, made here, is in great demand at Naples. Aversa was built in 1030, by the Normans; but it was subsequently twice burnt down. Andrew, of Hungary, husband to Joan I. queen of Naples, was murdered here, in 1345.

AVESNES, a town of France, *dép.* du Nord, cap. arrond. and canton, on the greater Elpe, 104 m. S. Maubeuge. Pop. 3,030. It is a fortified place of the 4th class, its fortifications having been repaired by Vauban. It is the seat of a sub-prefect, and has a tribunal of original jurisdiction and of commerce, a commercial college, an hospital for old persons, and an agricultural society. It is ill built, and *triste*. The cathedral has a spire 300 feet in height, which has five chimies of bells. It has manufactures of coarse serge, woollen hosiery, carpentry work, with tanneries, breweries, soap-works, &c. Avesnes suffered severely from the explosion of a powder magazine, when besieged by the Prussians in 1815.

AVEYRON, a *dép.* of France, in the southern part of the kingdom, being separated from the Mediterranean by the Herault, between 43° 41' 30" and 44° 55' 25" N. lat., and 1° 50' 16" and 3° 36' E. long. Area, 887,473 hectares. Pop. 370,951. This is one of the most mountainous *dépts.* of France. With the exception of some volcanic plateaux detached from the Plomb de Cantal, and which advance as far as the Truyère, all the other mountains belong to the chain of the Cévennes, the summit ridge of which forms its S. frontier. The mean elevation of the soil is very considerable, Rhodex being 2,280 feet above the level of the sea. The mountains are intersected by ravines, and have many subterranean caves. The soil of the plateaux and elevated grounds is generally very inferior; but that of the valleys is very fertile, and produces all sorts of corn. Principal rivers, Lot, Aveyron, whence the *dép.* takes its name, and Tarn. Agriculture is in a very backward state, in consequence partly of the unfruitful nature of the soil, partly of the long continuance of frosts and the frequent occurrence of hail storms, but principally of the want of capital and poverty of the inhabitants. Field labour is mostly performed by oxen. Produce of corn sufficient for the consumption. Sheep numerous, and their wool, which is generally fine, estimated at 650,000 kilograms a year. A great number of cattle, horses, mules, and pigs are raised. In the district of Roquefort, where cheese is made from sheep's milk, and the district of Guyole, the dairy is an object of great attention. In some parts the farms are extensive, and the strict gradation is preserved among the labourers attached. The latter eat little butcher's meat, and their food is very indifferent. Some wine is made, but the quality is inferior. According to the official tables, the soil of the *dép.* is mostly distributed as follows:—Cultivable land 365,000, meadows 122,000, vineyards 34,000, forests 84,000, and heaths, rocks, wastes, &c. 209,000 hectares. The export of agricultural produce reaches at an average 6,000,000fr. a year; of which the cheese of Roquefort and Guyole make 1,100,000 fr., sheep 1,000,000 fr., and woollen stuffs, 400,000 fr. The coal and iron mines of the Aveyron are among the most important in France. The export of coal amounts to about 150,000 metrical quintals, and that of alum to about 200,000 kilograms. (*See* AUNIN, *Str.*) Iron-works have been established within these few years, and they are now prosecuted with great spirit and success, and furnish employment to some thousands of workpeople. A good deal of copper is also produced. Manufacturing industry has made very considerable progress. About 20,000 workpeople are supposed to be employed in the manufacture of coarse woollen stuffs, hosiery, &c. In the neighbourhood of St. Affrique about 700 hands are employed in the spinning and manufacture of cotton; and there are in the *dép.* about 800 employed in the tanning and dressing of leather and the glove trade. There are also factories of hats and paper, with dye-works, coopers' works, &c. Aveyron sends 5 members to the Chamber of Deputies. No. of electors, 1,450. Total public revenue in 1831, 5,821,817 fr. Principal towns, Rhodex, Milhau, St. Affrique, and Villefranche. The inhabitants are said to be much addicted to drinking and quarrelling; and as they all carry a knife, called a *coute-chadou*, their quarrels sometimes end fatally. The condition of the fair sex seems to be about as bad as possible. "La condition des femmes, dans une grande partie du département, et surtout parmi les habitants des campagnes, est pauvre et malheureuse; leurs parens les traitent souvent avec une sorte de barbarie, et les forcent dès le plus jeune âge à se consacrer sans mesure aux rudes travaux de la culture. Le hâle, la sueur, et la fatigue continuent altèrent leurs traits et leurs formes. Avant dix-huit ans des filles qui ailleurs auraient été gracieuses et jolies ont la peau tannée, les mains calleuses, et la taille voûtée. Le mariage, au lieu d'être pour elles une époque de bonheur et de la liberté, est souvent celle d'une servitude plus dure." (*Hugo, France Pittoresque, art. Aveyron; French Official Tables.*)

AVEZZANO, a town of Naples, prov. Abruzzo Ultra II., cap. district and canton, in a fine plain, within about a mile of the N.W. angle of the lake Tefino. Pop. 3,166. It is surrounded by walls, which, however, are in a ruinous condition. The houses are generally mean, but there are some good buildings, among which is a castle belonging to the Colonna family.

AVIGLIANA, a town of the Sardinian states, 15 m. W. Turin. Pop. 3,000. It is finely situated on a hill, has a castle, fabrics of coarse cloth and flatures of silk.

AVIGLIANA, a town of Naples, prov. Basilicata, cap. cant., 11 m. N.N.W. Potenza. Pop. 9,000. It is built on the declivity of a hill, a part of which being undermined in 1824, by continued rains, gave way, and destroyed a part of the town. It has a fine collegiate church, sundry convents, and a royal college. The surrounding country produces the finest oxen in the kingdom.

AVIGNON (an. *Avenio*), a city of France, cap. *dép.* Vaucluse, on the left bank of the Rhone, 63 m. N.N.W. Marseilles, lat. 43° 57' 8" N., long. 4° 48' 30" E. Pop. (ex. cant.) 27,733. It is the seat of an archbishopric, of a tribunal of original jurisdiction and of commerce, and has a royal college of the 2d class, a primary normal school, a theological seminary, a school of design, a public library containing 30,000 volumes and 500 MSS., a museum of pictures, a botanical garden, with societies of arts, agriculture, &c. Having been long the residence of the popes, Avignon was filled with churches, convents, and other religious houses, many of which have now fallen into decay. It is situated in a fine plain, and is surrounded by high walls, flanked by numerous towers; its promenades along the walls, and its quays along the river, are both said to be very fine. The city was formerly much more populous and thriving than at present, and half the space now included within the walls is occupied with gardens, &c. The streets are narrow and crooked; and the houses and buildings have generally a gloomy, melancholy appearance. Mr. Inglis says,—"I never saw any town that I should not prefer to Avignon as a residence; its filthiness is disgusting, absolutely inconceivable to be found in a civilized country. And it is the less excusable as the town is well supplied with water." (*Switzerland, &c.* p. 146.) Perhaps this may be rather overrated, but there can be no doubt that it is substantially true. The ancient palace, occupied by the popes, stands on the declivity of the rock called de Lions. It is a Gothic building, constructed at different periods, of vast extent, with high, thick walls, and now serves as a prison, military depot, and barracks. The cathedral church of Notre Dame de laus is very ancient, and contains the tombs of several distinguished persons. The church of the Cordeliers, of which only the spire now remains, contained the tomb of Laura, immortalized by Petrarch, and of the "brave Crillon," the friend of Henry IV., and one of the most chivalrous of French warriors. The Hôtel des Invalides, subsidiary to that of Paris, is an immense building, in which 1,000 old soldiers are accommodated. The Hôtel Dieu is also on a large scale. The theatre, a large handsome edifice, was erected in 1824. Avignon communicates with the opposite bank of the river by two bridges, one of wood and one of boats. Its manufactures are said to have improved of late years. They consist principally of silk stuffs and velvets. There are also some woollen and cotton fabrics, with a cannon foundry, a type foundry, dye-works, tanneries, &c. A good many works are printed in the town. Large quantities of madder are produced in the neighbouring country, and Avignon is the centre of the trade in that drug.

Avignon existed before the Roman invasion, and afterwards became a Roman colony. In 1305 Clement V. transferred thither the residence of the popes, who continued to reside here till 1377, when they returned to Rome; but two schismatical popes, or popes elected by the French cardinals, resided at Avignon till 1408. Clement VI. having acquired the property of the town and district, it continued to belong to the holy see; and though sometimes taken by the French, it was always restored, till 1791, when it was finally incorporated with France. (*Hugo, France Pittoresque, art. France.*)

AVIGNONET, a town of France, *dép.* Haute Garonne, near the canal of Languedoc, 10 m. N.W. Castelnaudary. Pop. 2,479. Here five inquisitors were put to death by the Albigensians in 1242. Raymond, Count of Toulouse, suspected of secretly instigating the crime, was condemned by Innocent III. to be stripped naked and whipped!

AVILA, a town of Spain, cap. prov. Avila, on the Adaja, 64 m. W.N.W. Madrid. Pop. 4,800. It is the seat of a bishopric, and has a university, 8 parish churches, and numerous convents and hospitals. Formerly it was richer and more flourishing than at present; still, however, it has manufactures of cloth, cotton, hats, &c.

AVILES, a sea-port town of Spain, Asturias, at the embouchure of the river of the same name, lat. 43° 36' N.,

* Balbi says about 6,000; but the above is the result of a census taken in 1831. Pop. of the canton 15,000. (*Del Re Descriptione della Due Sicilie*, li. p. 124.)

long. $60^{\circ} 44' E$. Pop. 6,000. It has some manufactures of coarse cloth, and prepares boilers and other utensils made of the copper obtained from the neighbouring mines. It has very little trade; the water in the port being so shallow that it is hardly accessible even to coasters.

AVIS, a town of the Tyrol, near the Adige, 13 m. S.S.W. Rovereto. Pop. 3,000. It has a castle, manufactures of silk and velvet, and a quarry of flints.

AVIZ, a town of Portugal, prov. Alentejo, 35 m. W.S.W. Portalegre. Pop. 3,330. It is the chief place of the knights of the order of the Avis, founded by Alphonso I. in 1146.

AVIZE, a town of France, dép. Marne, cap. canton, 6 m. S. E. Epervay. Pop. 1,660. Its territory is celebrated for its vineyards, which produce large quantities of *Champagne mousseux* of the second quality. It has an extensive trade in wine.

AVOLA, or **AULA**, a sea-port town of Sicily, prov. Syracuse, 12 m. S.W. Syracuse. Pop. 8,822. "This town is prettily and salubriously situated on a woody eminence, having a marshy village on the base, a tonara, and a battery for defence, and from several respectable edifices, tolerable streets, and a good market-place, has an air of cleanliness and regularity. Besides the profits of the tonara, this town has a considerable traffic in wine, corn, cheese, carubbas, almonds, oil, honey, and fruit, and some in sugar, made from the only cane plantation now left on the island. The adjacent country abounds profusely with game, and supplies pasturage to a great number of fine cattle, many of which are exported to Malta. S.S.E. of the village, on the beach, is the place where the nets for catching the tunnies are moored, and where they generally have a vessel at anchor with a hut built on hor as a beacon." (*Smyth's Sicily*, p. 170.)

AVOÏD (ST.), a town of France, dép. Moselle, cap. cant., on the Rossel, 18 m. W. Sarrebourg. Pop. 3,365.

AVON, the name of several rivers in England, of which the most important are:—

1. The *Upper Avon*, has its source at Avon-Well, near Naseby, in Northamptonshire, about 300 ft. above the level of the sea. It flows generally in a S.W. direction, but with a very winding course, passing successively the towns of Warwick, Stratford-on-Avon and Evesham, till it unites with the Severn at Tewkesbury. It has a large body of water; and is navigable by barges for about 40 m., or from the Severn to Stratford, where it is joined by the Stratford canal. Its entire course may be about 100 m.

2. The *Lower Avon*, has its sources contiguous to Malmesbury and Wootton-Basset, in Wiltshire, its two arms uniting near Great Somerford; it thence pursues a circular course, passing Chippenham, Bradford, Bath, and Bristol, falling into the Bristol Channel about 8 m. below Bristol. Owing to the great rise and fall of the tide, the largest class of merchantmen come up the river to Bristol. The Kennet and Avon canal, from Newbury to Bath, connects the Thames with the Avon, establishing a water communication across the kingdom.

3. The *Hampshire Avon*, rises near Devizes, on the N. side of Salisbury Plain. At Salisbury it is joined by the Willy and the Bourne; and is navigable from Trafalgar-house to where it falls into the English Channel at Christchurch.

There are some other rivers of this name in England, but none of them seem to be considerable enough to require any special notice. There are also three small rivers of this name in Scotland:—one an affluent of the Spey, one of the Clyde, and another having its embouchure in the Frith of Forth, near Borrowstoness.

AVRANCHES (an. *Augena*), a town of France, dép. Manche, cap. arrondissement, on a hill near the Seez, 32 m. S.S.W. St. Lo, and 3 m. from the sea, lat. $46^{\circ} 41' 23'' N$, long. $1^{\circ} 41' 32'' W$. Pop. 7,690. This is a very old town. Its cathedral, consecrated in 1121, was unroofed during the revolution, and is now in ruins. In it, in 1172, Henry II., king of England, did penance and received absolution for the murder of Beckett. (*Igntleton's Hist. Henry II.* v. p. 123.) Avranches has a tribunal of original jurisdiction, a college, a work-house, a theatre, and a public library, containing 10,000 volumes and 200 MSS., with manufactures of lace and blondes. Small vessels come up the river to the bridge opposite the town, but it has little trade.

AX, a town of France, dép. Ariège, cap. cant. on the river of that name, 20 m. S. E. Foix. Pop. 1,991. The situation of Ax is very picturesque and romantic. It derives its entire distinction from its numerous hot mineral springs, the heat of the water of some of which approaches nearly to the boiling point. Their reputation is daily increasing, and with it the size and importance of the town, the latter being entirely dependent on the resort to the wells.

AXEL, a fortified w. of the Netherlands, prov. Zealand, 21 m. W. N. W. Antwerp.

AXMINSTER, a town of England, co. Devon, hund. Axminster, on the Axe, 147 m. W. S. W. London, 26 m. E. Exeter. The parish contains 6,690 acres, and

2,719 inhab. of whom the town has about 1,700. It is irregularly built on the declivity of a small hill, has wide streets, and is clean and healthy. The church, a clumsy structure, is in part very ancient, and there is a free school where 14 children are educated gratis. The inhab. are principally engaged in the manufacture of carpets, in imitation of those of Persia and Turkey, which are but little if at all inferior to the genuine fabrics.

AXUM, an ancient and much decayed town of Abyssinia, prov. Tigré, near one of the sources of the Mareb (*Atakusippa*), 110 m. S.W. Arkesko, on the Red Sea; lat. $14^{\circ} 5' N$, long. $38^{\circ} 27' E$. Pop. 4,000? It is situated in a nook formed by two hills; and is said by Messrs. Combes and Tamliser, by whom it has been recently visited, to be the handsomest town of Tigré. The houses are of a cylindrical form, surmounted by a cone. In its centre is a Christian church, which seems to occupy the site of an ancient temple, described by Mr. Salt (*Valentin's Travels*, ill. 88.); but the travellers referred to above, say that Salt's statements with respect to it are much exaggerated. According to them it is inferior even to *paragvencis ornades*; so that in this instance Bruce, who is accused by Salt of having undervalued the church, would seem to be the preferable authority. (*Poyage en Abyssinie*, l. 267.) Axum, however, would not be worth notice in a work of this sort, were it not for its ancient fame, and its antiquities. That it is very ancient is abundantly certain; and its former greatness is evinced by the ruins which still remain. Of these the most conspicuous is an obelisk 60 ft. in height, (Salt says, in *Lord Valentin's Travels*, 80 ft.; but he afterwards rectified his mistake,) formed of a single block of granite, crowned with a *patera*, and beautifully sculptured, though not with hieroglyphics. There are said to have been formerly above 50 obelisks in the city; but, except the one now noticed, the others are all prostrate.

It is known that a Greek kingdom was founded in Ethiopia, of which Axum was the capital, and gave its name to the country, some time after the Christian era. The Greek writers of the later ages used, in fact, to call the Ethiopians Axumites; and the Periplus of the Erythraean Sea affords authentic evidence of the existence of the independent kingdom of Axum, towards the end of the second century. Some light is thrown on this intricate subject by the discovery, at Axum, of an upright slab or stone, bearing an inscription, copied and translated by Mr. Salt. This remarkable monument records the result of a successful attack made by Azizanas, king of the Axumites, on some barbarous tribes. And it so happens that Azizanas was king of Abyssinia during the reign of the emperor Constantius, who addressed a letter to him anno 330. This, therefore, may fairly be concluded as the date of the inscription in question; but there is no evidence to show the era of the foundation of the Axumite kingdom, or how long it existed after the above date.

Adulis, situated at the bottom of Annesley Bay, on the Red Sea, was anciently the port of Axum, and a great mart for the commodities of Ethiopia, Egypt, Arabia, &c. It was the port whence Ethiopian slaves were shipped for all parts of the world. (*Ancient Universal History*, xviii. 322. 8vo. &c.)

AY, or **AI**, a town of France, dép. Marne, cap. cant. on a hill near the Marne, 15 m. S. Rheims. Pop. 2,810. This town is famous for its incomparable wine, the best decidedly of the *vins mousseux* de Champagne. It is said by Julien to be *fin, spiritueux, pétillant, délicat, et pourvu d'un joli bouquet*. (*Topographie de l'ignobles*, p. 31.) Dr. Henderson says, that "it is unquestionably an exquisite liquor, being lighter and sweeter than the Sillery, and accompanied by a delicate flavour and aroma, somewhat analogous to that of the pine-apple." That which merely excites on the surface (the *no-mousseux*) is referred to the full-blown *ing (grand mousseux)* wine." (*History of Wines*, p. 154.)

AYAMONTE, a fortified town of Spain, prov. Seville, on the E. side of the embouchure of the Gaudiana, 25 m. W. Huelva, lat. $37^{\circ} 13' N$, long. $7^{\circ} 19' 15'' W$. Pop. 6,350. It stands on the declivity of a hill, and has two parish churches, a foundling hospital, an alms-house, and some convents. The inhabitants are principally engaged in fishing; but some ship-building is also carried on, and lace, soap, and earthenware are manufactured.

AYLESBURY, a borough, m. town, and par. of England, co. Buckingham, hund. Aylesbury, on an eminence in the celebrated vale of the same name, 38 m. N. W. London, 184 S. E. Buckingham. The borough includes an area of 3,200 acres, and a pop. of 5,021. It is irregularly built, has a modern market-house, constructed after the model of the temple of the eight winds at Athens, and a handsome county-hall, in which the Lent assizes for the county are held; the county jail is also in the town, and here, too, the members for the county are nominated, and the return declared. The church is a large ancient structure, with a tower visible many miles round. The charities of Aylesbury are numerous and valuable. Among others there is a free school, for the support of

which a considerable amount of property has been bequeathed, that furnishes education for about 130 boys; there are also a number of other charities, with almshouses, &c. Some lace is manufactured, and a number of the inhabitants of the town and its vicinity employ themselves in the breeding and fattening of ducks, of which large numbers are sent to the metropolis. Aylesbury has returned 2 m. to the H. of C. since 1654. Previously to 1804, the right of voting was in the inhabit. of the borough paying scot and lot; but in consequence of the flagrant corruption of the electors, the privilege of voting for the members for the borough was then extended to the freeholders of the hundred of Aylesbury. Parl. constituency in 1836-37, 1528. The vale of Aylesbury is one of the richest tracts in the empire. It is principally appropriated to the fattening of cattle and dairying.

AYLESFORD, a village and par. of England, co. Kent, late Aylesford; the village being on the right bank of the Medway, which intersects the par., m. 30. S. E. London. The par. contains 3,330 acres, and a pop. of 1301. The church, a handsome building, is situated on an eminence higher than the roofs of the houses in the village. There is here a bridge over the Medway, and an almshouse, endowed in 1605. Near the town was a Carmelite monastery, granted at the dissolution of the monasteries, by Henry VIII., to Sir Thomas Wyatt; from whom it has descended to the Pluch family, now earls of Aylesford, who have modernised the building, and made it a comfortable residence. But the most remarkable monument in the vicinity of Aylesford is *Kilnsey House*, about 1 m. N. E. from the village. It consists of 3 large upright stones, each about 8 feet in height, with another lying on the top, 11 feet in length by 8 in breadth, and 2 thick; and these are some similar stones in the vicinity. Antiquaries differ widely in opinion as to the object of this singular structure; but the more common opinion seems to be that it was intended as a monument to Catigern, a British chieft killed in a battle, circa A. D. 455, with the Saxons under Hengist and Horsa. (*Hasted's Kent*, 8vo. ed. vol. iv.; *Turner's Anglo-Saxons*, book iii. cap. 80.)

AYLE, a marit. co. of Scotland, on its W. coast, stretching for about 75 m. along the shores of the Irish Sea and the Frith of Clyde, having N. the co. of Renfrew, E. Lanark and Dumfriess, S. E. Kirkcubright, and S. Wigton. It contains 608,800 acres, of which nearly a half is supposed to be arable. It is popularly divided into the three district. of Carrick, Kyle, and Cunningham. The first, which comprises the county to the S. of the river Doon, is, for the most part, moorish, wild, and mountainous. Kyle, the middle district, lying between the Doon on the S. and the Irvine on the N., possesses a large extent of low, well-cultivated land along the shore; but the E. part is hilly and mountainous. Cunningham, though the smallest of the districts, is the most populous, best cultivated, and richest. Climate moist and mild. Agriculture, down to the close of the American war, was, speaking generally, execrable; but it has been prodigiously improved in the interval, and especially during the last ten or dozen years. The whole co. is now intersected with good roads, and is well fenced and subdivided. Draining, the most important of all improvements, has been prosecuted to a great extent; and the practice of *furrow draining* is carried on with extraordinary zeal and the most perfect success. Improved rotations have been every where introduced; and lands that formerly only produced poor crops of black oats now carry heavy crops of wheat and barley. The Ayrshire cow is particularly fitted for the dairy, which is extensively carried on, particularly in Cunningham, the original country of the Dunlop breed. Farm-houses and offices, formerly mean and wretched, now form the most part of extensive and commodious. Average rent of land in 1810, 10s. 13d. an acre. In proof of the wonderful improvement that has taken place, we may mention that the rental of one estate in the parish of Maybole amounted in 1785 to 364d. 11s., in 1819 to 2,157l., and has since rather increased. Coal is found in several parts, and is extensively wrought and exported. Iron is made at Muirkirk. The woollen manufacture is carried on extensively at Kilma-nock; and cotton mills have been erected at Catrine and other places. Principal towns, Kilma-nock, Ayr, Maybole, and Irvine. Ayr contains 46 parishes. It had, in 1831, 19,000 inhab. houses, 20,501 families, and 145,055 inhab., the pop. having increased from 84,306 in 1801. It sends 2 m. to the H. of C.; for the co., and the boroughs of Kilma-nock, Ayr, and Irvine are associated with others in the election of representatives. Co. constituency in 1837, 4,132. Valued rent, 191,665l. Scotch. Annual value of real property in 1815, 408,938l. (*New Statistical Account of Scotland*; *Robertson's Rural Recollections*, &c.)

AYRE, a sea-port, royal borough, and m. town of Scotland, cap. Ayrshire, on the S. side of the river Ayr, at its confluence with the sea, 75 m. S. W. Edinburgh, and 24 m. S. S. W. Glasgow. The pop. of the burgh and parish amounted, in 1831, to 7,606. But, though in a

different parish, the Newton and Wallace Town are substantially parts of Ayr, being separated from it only by the river, over whose arches are the bridges, celebrated by Burns; and these suburbs are, in fact, mostly included within the par. burgh, the pop. of which, in 1831, was 5,628. Ayr is finely situated on the margin of a broad, level plain; and has recently been very much improved and enlarged. The county buildings, containing a county hall, with apartments for the judiciary court, &c., and town's buildings, containing a news-room, and rooms for dinners, balls, assemblies, &c., are both on a large scale: to the latter is attached a fine spire, 226 feet in height. The Wallace Tower, erected a few years ago, on the site of an old building of the same name, is 116 feet high. A statue of Sir William Wallace, by Thoin, has been placed in a niche in its front; but the artist has not been so happy in this instance as in his statues of Tam O'Shanter and Souter Johnnie. There is an old and a new church, but neither is remarkable. The academy is a plain building, in a good situation; and no inconsiderable part of the late improvement of the town may be ascribed to the well-merited reputation of its teachers, which has attracted a great number of families. Ayr is a very ancient burgh, having been chartered in 1292; it is the seat of a synod and presbytery; of a judiciary and sheriff's court; has a good town's library, and a mechanic's institute; a theatre; several charitable institutions; two weekly newspapers; annual races, &c. With the exception of a large and flourishing carpet-manufactory, the manufactures carried on in the town are few and inconsiderable. From 50,000 to 60,000 tons of coal are annually exported. The port, at the mouth of the river, is formed by two piers, which project a considerable way into the sea; but it is labour under a deficiency of water, not having more than four feet water over the bar at ebb-tide, nor above 13 feet at high water springs; and is exposed to the W. gales, which throw in a very heavy sea. There belonged to the port, in 1837, 18 vessels of the burden of 2,459 tons. Ayr is joined with Campbellton, Inverness, Irvine, and Olan, in the return of a member to the H. of C. Parl. constituency in 1837-38, 452; municipal do., 215. Market-days, Tuesday and Friday. The cottages in which Robert Burns was born, with Alloway Kirk &c. are in the immediate vicinity of Ayr, on the road to Maybole. (*See Alloway Kirk*; *Boundary Reports*, art. Ayr; *New Statistical Account of Scotland*.)

AZANI a city of Phrygia, on the Edrenos (*Rhyn-dacus*), now wholly in ruins. The small modern village of Taudere-Ilsar, 22 m. W. by S. Kutachi, appears to have been entirely built from its remains. Little is said about this city in ancient authors; but its ruins, which have been recently described by Major Keppel, show that it had been a place of great wealth and magnificence. The principal remains are two bridges, connected by a superb quay, with a temple and a theatre, the latter being 232 ft. in diameter. Some of the columns of the temple are still standing; they are of the Ionic order; the shafts, formed of a single block of marble, being 28 ft. in length. And this is really only a fair specimen of the numberless remains of antiquity in a country once swarming with cities, and in the highest state of wealth and improvement; but now all depopulated, steeped in poverty, and a prey to every disorder that a barbarian government and a debasing superstition can inflict.

AZAY-LE-FRANÇOIS, a town of France, dép. Indre, 16 m. N. Le Blanc. Pop. 2,115. Azay is also the name for several small towns in other parts of France.

AZERBAIJAN (an *Asropatna*), a prov. in the N. W. of Persia, between 26° and 38° 40' N. lat., and 44° 20' and 49° E. long., having N. the Aras or Araxes, E. a part of the Russian territories and the Caspian, S. the Kizil-Oz, which separates it from the other Persian provs., and W. Turkish Armenia. It consists of a succession of high mountains, separated by extensive valleys and plains. Mount Sevelan, towards its E. frontier, the next highest mountain to Ararat in this part of Asia, rises to between 12,000 and 13,000 feet above the level of the sea.* The Sahand Mountains, in the centre of the prov., attain to the height of 9,000 feet. The Talish Mountains run from N. to S. parallel to, and at no great distance from the coast of the great salt lake of Urmiah (see ARMENIA and URMIAH) is one of the distinguishing features of the prov. It has numerous rivers, of which the Araxes, Kizil-Ozcin, and Igutaty, are the chief. The summers are hot; but the winters, owing to the height of the country, and the number of high mountains covered with snow for the greater part of the year, are severe and long-continued. In the valleys and plains the land is very fertile, and yields abundant crops.

* The story of the frozen prophet on Mount Sevelan, alluded to by Mr. Morier in his second journey, has been satisfactorily cleared up by a party of English gentlemen, who ascended the mountain in 1827. They found on its summit a tomb, with a skeleton, partly imbedded in the ice, and in pretty good preservation. (*Journal of Geog. Society*, vol. p. 24.)

Mr. Kinneir says, "Azerbaijan is reckoned among the most productive provs. of Persia, and the villages have a more pleasing appearance than even those of Irak. They are, for the most part, embosomed in orchards and gardens, which yield delicious fruits of almost every description; and were it not for the tyranny of their rulers, no people could anywhere enjoy to a greater degree the comforts of life. Provisions are cheap and abundant, and wine is also made in considerable quantities; but the bulk of the people are too poor to avail themselves of these blessings; and, in the hope of bettering their condition, contemplate with pleasure the approach of the Russians." (*Memoir*, p. 149.) The principal towns are Tabreez, Ardebil, and Urmiah.

AZINGHUR, an inland town of Hindostan, presid. Bengal, prov. Allahabad, cap. distr.; 40 m. N. E. Benares; in 24° 6' N. lat., 83° 10' E. long. Cotton stuffs used to be largely manufactured here and in the vicinity. It was ceded by the Nabob of Oude in 1801.

AZMERIGUNGE, an inland town of India beyond the Brahmaputra, pres. and prov. Bengal, distr. Sylhet; 55 m. N. E. Dacca; lat. 24° 33' N., long. 91° 5' E. It is a place of considerable inland traffic, and has an establishment for building native boats.

AZOFF (SEA OF), the *Palus Mæotis* of the ancients, an inland sea in the S. E. quarter of Europe. It communicates by the narrow Strait of Yenicalé (an. *Bosphorus Cimmerius*) with the Black Sea, and is everywhere else surrounded by Russian territories. Its name is derived from the town of Azoff (See next article), near its N. E. extremity. It is of a very irregular shape; its greatest length, from the long, narrow sand-bank facing the E. coast of the Crimea, to the mouths of the Don, being about 212 m.; and its greatest breadth about 110 m. From the Strait of Yenicalé to Taganrog is about 160 m. It is generally shallow, and encumbered with sand-banks, having, where deepest, not more than 7 fathoms water, and in some places much less. Along its western shore it is marshy; and its N. E. division, that extensive arm (Geomæotis) the Gulph of the Don, is so very shallow that it cannot be navigated, even where deepest, by vessels drawing more than 10 or 12 feet water. During the prevalence of easterly winds, the waters at Taganrog, and other places in the gulph, recede sometimes to a considerable distance from the shore, rushing back with great violence when the wind changes to an opposite direction. Inasmuch, however, as its bottom consists mostly of mud, vessels take the ground without being injured; and it is in consequence, less dangerous than might have been supposed. Owing to the vast quantity of fresh water brought down by the Don and other rivers, its waters are little more than brackish; and at times are potable more than 20 m. below Taganrog. It teems with fish; and the fisheries are important and valuable. It is partially or wholly covered with ice from November until February, or even March. The commerce of this sea principally centres at Taganrog, which see. (*Furley's Sailing Directions for the Black Sea*, &c., p. 212; *Hagmeister on the Commerce of the Black Sea*, p. 31, &c. Eng. Trans.)

AZOFF, a town and fortress of European Russia, on an eminence on the left bank of one of the arms of the Don, near the N. E. extremity of the above sea. This town was founded at a very early period, by Carian colonists engaged in the trade of the Euxine; and was called by them *Tanaïs*, from the river (Don, then *Tanaïs*), of which it was the port. In the middle ages it was called *Tana*. It came into the possession of the Venetians after the taking of Constantinople by the Latins; and was held by them till 1410, when it was sacked, and its Christian inhabitants put to the sword, by the Tartars. The latter gave it the name of Azoff, which it still retains. Formerly it had an extensive trade, being the emporium of all the vast countries traversed by the Don. But owing to the gradual accumulation of sand in that channel of the river on which it is built, and the consequent difficulty of reaching it by any but the smallest class of vessels, its trade has been entirely transferred to Taganrog; its fortifications have also fallen into decay; and it now consists only of a cluster of miserable cabins, inhabited by little more than 1,300 individuals. (*Formaleoni, Histoire des Colonies dans la Mer Noire*, i. cap. 7, and ii. cap. 22; *Marin Störin del Commercio del Vencianini*, iv. 129., &c.)

AZORES (THE), or **WESTERN ISLANDS**, an archipelago in the Atlantic Ocean, belonging to Portugal, from which it is about 800 m. distant, occupying a line of about 100 leagues from E. S. E. to W. N. W., between 36° 30' and 39° 44' N. lat., and 31° 7' and 29° 10' W. long. It is divided into three subordinate groups. The 1st, lying at the W. N. W. extremity of the archipelago, includes Flores and Corvo; the 2d, or central, Fayal, Pico, St. George, Graciosa and Terceira; and the 3d at the E. S. E. extremity, St. Michael's, the largest of the whole, and St. Mary's. The name (*Ilhas dos Açores*) is said to be derived from the vast number

of hawks (*falco mitens*), called by the natives *açor*, by which they were frequented at the epoch of their discovery. These islands seem to be of comparatively recent volcanic formation. Their general aspect is picturesque and bold. For the most part they present an irregular succession of isolated, conical, or acuminate hills, with table lands rising from 2,000 to 5,000 feet in height; the former separated by valleys, the latter stratified and intersected by tremendous ravines and deep chasms, formed by the action of rain on the soft volcanic remains composing the mountains; the whole are almost invariably bounded by magnificent mural precipices, rising abruptly from the sea, and frequently rendered inaccessible by soft crumbling lava, and masses of loose tuff, of which they are formed. The peak of Pico, about 7,000 feet in height, is the highest elevation in the Azores. When seen from a distance it appears like an isolated cone in the middle of the ocean. This archipelago is subject to the most tremendous convulsions, towns and villages being sometimes swallowed up, while, at other times, rocks and islands have been forced up from below the waves. The last of these phenomena occurred in 1811, when an island was thrown up that has since disappeared. The soil is extremely fertile, and industry and intelligence are alone wanting to make it in the highest degree productive. The climate, though unsettled and humid, is, on the whole, excellent. The average annual range of the thermometer is from 60° to 75°. Rains are frequent, and often so violent as to effect considerable changes in the appearance of the country; but scarce a day passes in which the sun does not, at some period, shine forth. The decidedly fine days may be estimated at about 200, and the wet days at about 60. Sudden gusts and gales of wind are frequent; and this, combined with the fact that they have not to boast of a single good harbour, make the islands be shunned by the navigator. They produce luxuriant crops of all sorts of grain and pulse, wine, the finest oranges and lemons, bananas, sugar-cane, coffee, tobacco, the valuable lichen *rocceila*, and, with a little care, most vegetable products may be brought to the utmost perfection. Asses and bullocks are the usual beasts of burden. Horses are scarce and bad; sheep and goats numerous; and pigs and dogs swarm to an excess. Owing however to the idleness, occasioned in part by the productiveness of the soil and mildness of the climate, but in a far greater degree by the ignorance of the people, and the influence of vicious laws and regulations, industry is all but unknown. The islands are generally divided into large estates, held under strict entail; and the system under which they are leased out to the actual cultivator is as bad as possible. The latter, being exposed to every sort of exaction and tyranny, never thinks of attempting any improvement. Hence the practice of agriculture is but little, and the science not at all understood. The rude system of their forefathers is continued without change or modification of any kind; and their implements are little superior to those of the American Indians. And yet, despite this want of industry, such is the extraordinary fertility of the soil, that, though in great part waste and uncultivated, it not only furnishes sufficient supplies of corn and other things for the native population, but also a considerable surplus for exportation. A good deal of coarse linen is manufactured, part of which is exported.

The principal exports are, in ordinary years, to England, about 130,000 boxes of oranges, 2,000 pipes of wine and brandy, and some *rocceila*; for which she sends in exchange woollen and cotton stuffs, hard-ware, wearing apparel, &c. To Brazil the exports are about 5,000 pipes of wine, 12,000 yards of coarse linen, and sugar of all sorts; for which she sends back rum, coffee, sugar, &c. To Hamburg and the N. of Europe are exported 14,000 boxes of oranges and lemons, and 6,000 pipes of wine and brandy, the returns being made in pitch, iron, glass, and cordage. To the United States are sent 4,000 pipes of wine, 200 of brandy, and 12,000 boxes of oranges and lemons, the returns being fish, staves, timber, tar, oil, &c. To Portugal are sent large quantities of grain and pulse, salt pork and beef, coarse linen and cheese; for which she returns salt, lime, tea, with muskets, crucibles, indulgences, dispensations, and relics; the last five articles being publicly sold in the shops at very high prices! (*Boyd*, p. 38.)

The population of the archipelago was found by a recent census to amount to about 260,000, not a sixth part of what it might be, were the islands moderately well cultivated. They are divided into three departments, and are governed by a governor-general and two lieutenant-governors. The seat of government is at Angra in Terceira, but Ponta Delgada, in St. Michael, is the principal town. The revenue amount, in all, to about 525,000 crowns a year, and the expenditure to nearly 200,000, leaving a balance of about 320,000 crowns to be remitted to Portugal. (*Boyd*, p. 80.) The men are well proportioned, strong, and well made; and the women fairer than those of Portugal. All classes are grossly

ignorant; and are, consequently, in the last degree superstitious and bigoted. The lower orders are temperate, and all ranks are passionately fond of music. The dress of the common people is rude, and they are intolerably filthy and dirty in their persons. The higher classes are pompous, overbearing, and in the most abject state of moral debasement. The ladies possess few acquirements, have no conversation, and lead a life of excessive indolence. The low state of intelligence and morals is principally ascribable to the ignorance and vices of the clergy, most of whom are disgracefully immoral and corrupt. Previously to 1832, there were numerous monasteries and convents, said to have been openly devoted to the practice of all sorts of debauchery. Luckily, however, these dens of profligacy were suppressed at the last-mentioned epoch; and it is to be hoped that this wise measure may be followed up by others of a similar character; and that such alterations may be made in the government and laws, as may develop the dormant energies and industry of the inhabitants.

The history of the Azores is obscure. They were unknown to the ancients; but the Arabian geographers of the middle ages seem to have had some knowledge of them, though it was not till towards the middle of the 15th century that a Flemish merchant, who had sailed from Lisbon, was driven by stress of weather on their coast. The court of Portugal, being informed of the circumstance, sent the navigator Cabral to prosecute the discovery, who fell in with St. Mary's, in 1432. In 1457 they were all discovered. At this epoch they were entirely uninhabited and covered with forest and underwood. (*Diet. Géographique*, art. *Açores*; *Boid's Description of the Azores* passim.)

AZPYTIA, a town of Spain, prov. Guipuscon, 15 m. S.W. San Sebastian. Pop. 4,800. It is surrounded by walls, and has some iron foundries. There are jasper quarries in its vicinity.

AZREK (BAHR-ËL), or the BLUE RIVER. See NILE.

B.

BAL-REC, or BALBEC (the *Heliopolis* of the Greeks), anciently a large and splendid city; lat. 34° 1' N., long. 36° 11' E.; 40 m. N.W. Damascus, 41 m. S.E. Tripoli, 58 m. N.E. Sidon, and 130 W. by S. Palmyra. It is situated in fertile well-watered valley, the Cœle-Syria (hollow Syria) of the ancients, and the Batena of the moderns, between the ridges of Libanus and Anti-Libanus, at the foot of the lower ranges of the latter.

Baal-Bec has been declining for a lengthened period; but, of late years, its decay has been peculiarly rapid. In 1758 the pop. amounted to 5,000, in 1785 it had diminished to 1,200, in 1818 it did not exceed 500, and in 1835 it barely amounted to 300. In 1810 it had a serai (the residence of the emir), two handsome mosques, and one good bath; in 1816 one mosque had vanished, the other was in ruins; and in 1835 there remained no trace of either, or of the serai. The remains of ancient architectural grandeur are, however, more extensive in Baal-Bec than in any other city of Syria, Palmyra excepted; and Burckhardt regards them as superior in execution even to those of the latter. Finely grouped together, on the W. side of the town, are three temples, the largest occupying a circuit of more than half a mile, and originally consisting of a portico, hexagonal court, and a quadrangle, besides the peristyles of the temple itself. Of this last, six gigantic and highly polished pillars, 71 ft. 6 in. in height, and 23 ft. in circumference, with their cornice and entablature, remain to attest the stupendous magnitude and beauty of the structure of which they made a part. The two courts were encompassed by chambers, open towards the front, supposed by Wood to have been either the dwellings of the priests, or public schools; and the peristyle was surrounded, towards the W. by an esplanade 294 ft. in width, and terminated by a sloping wall 32 ft. high. In this wall are three enormous stones, of which two are 60 and the other 63 ft. in length, their common breadth and thickness being 12 ft. These gigantic masses are more than 20 ft. from the ground; and the course immediately below them consists of blocks, less enormous, certainly, but varying from 36 to 37 ft. in length, with a breadth of 12 and a thickness of 9 ft. The remainder of this cyclopean wall is formed of very large stones, but there are none so vast as the above. Immediately to the S. of the great temple is a smaller, but more perfect edifice, of which the peristyle, walls, and 20 columns remain. The door-way leading into the body of this temple is 25 ft. high by 20 ft. 10 in. broad, surmounted by a superb basso-relievo, representing an eagle

hovering, as it were, over the whorlpper when about to render homage to the presiding deity. Both ruins are among the finest specimens of the Corinthian order. Walls, ceilings, capitals, entablatures, every spot where the chisel could be introduced, is covered with the most exquisitely finished carving and sculpture. Mr. Elliott says that no description can do justice to the taste and beauty of the workmanship of these structures, "nor can any rule of antiquity that I have seen or read of be placed in competition with them" (ii. 273.) Solidity, too, has been most successfully combined with, and not sacrificed to, ornament. Though little cement has been used, the joints are so admirably formed that a penknife cannot be introduced into them. The more ponderous masonry has preserved its position by the mere force of gravity; the parts of the pillars are connected by iron cramps. When perfect, the great temple, with its four stories, exhibited 130 pillars; the lesser, 60; and, according to Wood and Dawkins, the dimensions of each were as follow:—

GREAT TEMPLE.

	Length.	Width.		Length.	Width.
	Feet.	Feet.		Feet.	Feet.
Steps - -	60	158	Peristyle - -	- -	- -
Portico - -	48	261	Esplanade - -	- -	294
Hesag. Court	190	266			
Quadrangle -	410	420	Height of Temple from ground to pediment, 120.		

SMALLER TEMPLE.

Length.	Width.	Height.
225 ft.	118 ft.	102 ft.

The smaller temple is without columns.

A barbarous Saracenic wall is built across these ruins on the E.; 300 or 400 ft. from which is the third temple, a beautiful circular building, surrounded by Corinthian pillars; its extreme external diameter being 63 ft., and its interior 32 ft.; most probably it had been surmounted by a cupola. It is considered as a *chef-d'œuvre* of art; but unfortunately it is in a very dilapidated and tottering state. Like the larger temple, it is built of compact limestone, with but little, if any, cement. In the S.W. corner of the town, on the highest spot of ground within the walls, is a solitary Doric column (Pococke says Tuscan), 60 ft. high, including capital and pedestal. On the top is a basin 3 ft. deep, from which a hole, cut through the capital, communicates with a curved channel 9 in. wide and 6 deep, cut in the S. side of the shaft, from top to bottom. From this it has been inferred that the pillar was connected with the water-works of the city; some suppose it to have been a clepsydra or water-dial. The walls of the city, 3 or 4 m. in circuit, exhibit a strange mixture of materials; the breaches made by time or war, in the older erections, having been repaired at different times from the ruins of the ancient temples and other buildings. In one place may be seen a large altar-piece reversed; in others, stones inscribed with Greek or Roman characters; but all in confusion, and many turned upside down. The gates are of the Saracenic period. Without the walls, 5 or 6 m. W. is a remarkable isolated Corinthian column, between 50 and 60 ft. high, with a square compartment on its N. side, as for an inscription, but no letters remain. N.E. of the town is a subterranean aqueduct, 16 ft. below the surface, with several curious chambers cut in the surrounding rock. The whole neighbourhood looks like an immense stone quarry; and on the S.E., at 50 or 60 paces from the walls, among other stones of immense size, is one worked on three sides, larger than any used in the wall of the great temple. It is 70 ft. in length, with a breadth and thickness of 14 ft. Greek, Roman, and Saracenic ruins cover the country for 3 or 4 leagues round, all evidently connected with the former greatness and prosperity of this city.

No ancient author refers to the buildings at Baal-Bec. I John of Antioch, a Christian writer of the 7th century, ascribes, in an incidental manner, the erection of a temple (perhaps the great one) to Antoninus Pius; and this is the only account, with any pretensions to authority, of the origin of these extraordinary remains. But Baal-Bec was a flourishing city ages before the Christian era, and the probability seems to be, that the Baal-At, built by Solomon, in Lebanon (2 Chron. vi. 6.), was identical with Baal-Bec. This is, indeed, the received opinion of all classes in Syria; and though the remains of Corinthian architecture cannot be referred to a remoter period than that of the Roman emperors, the cyclopean wall is evidently of a far more ancient date, and answers to the description of the "House of the Forest of Lebanon," built for the daughter of Pharaoh. (1 Kings, vii. 10.) Dr. Richardson has shown that the cutting of the stones is of Jewish workmanship. (*Travels*, ii. 310, and 504.)

That the Syrian deity BAAL (literally *Lord*) was a personification of the sun, as the vivifying principle of nature, is evident from Herodian (v. 5.), the various pas-

* Authorities differ considerably as to the situation of Baal-Bec. Pococke's map (*Travels*, 1745) makes the lat. 34° 9' N., long. 36° 36' E.; Rennell (*Comp. Geog.* l. 74) reduces them to 34° 1' 30" N., 36° 11' E. In Robinson's map (*Travels*, 1827) the lat. is 33° 58' 30" N., long. 36° 9' E.

sages of Scripture from Judges to Jeremiah, and, indeed, from the united testimony of antiquity. (*Calmet, Dictionnaire de la Bible*, art. BAAL.) Bec, or more properly BERT, is a dwelling. Baal-Bec signifies, therefore, the house or city of the sun, and this designation the town retained, in the Greek form, *Heliopolis*, which is merely a translation of its Syrian name. It may be concluded that Ben-hadad subdued this city, with the adjacent country (2 Chron. xvi. 4.); and that, on the overthrow of the Syrian kingdom of Damascus, it passed beneath the sway of the Assyrians (2 Kings, xvi. 9.); but the silence of all the most ancient authors, respecting so populous and wealthy a city is as profound as it is remarkable.

It, of course, shared the fate of the rest of Syria, passing, successively, into the hands of the Persians, Greeks, and Romans. It was the station of a garrison in the time of Augustus; but, while under the Romans, seems to have been famed, rather for its wealth and splendour, than for its military importance. It made, however, a brave resistance to the Arab arms A.D. 635, and was at length surrendered upon a capitulation, the terms of which sufficiently attest its great resources: 2,000 oz. of gold, 4,000 do. of silver, 2,000 silken vests, and 1,000 swords, besides those of the garrison, being the price demanded and paid to preserve it from plunder. In 748 it was sacked and dismantled in the wars of the Ommyyad and Abbasside caliphs, and from this blow it never revived. During the crusades it submitted, alternately, to whichever party happened, for the time, to be the stronger. In 1400 it was plundered by the Tartars under Tamerlane or Timur Bec, since which period it has been of no importance except to the antiquary and historian. In 1759 it was shaken by an earthquake; and, judging from its decline during the last century, the day is not far distant when, like many other eastern cities, it will cease entirely to be inhabited.

Though nothing certain be known of the history of Baal-Bec, it is sufficiently obvious that its opulence and grandeur must have been mainly owing, partly to its situation in a fertile and well-watered country, but more to its being a commercial *entre-pôt*. Any one who takes up a map of Syria will see, at a glance, that its position is one of the best that could have been selected for an intermediate station between Palmyra and the cities and ports along the Phœnician coast. Commodities passing from Palmyra to Tripoli, Berytus (Hyrunt), Sidon, and Tyre, and conversely, would be most conveniently and expeditiously carried by way of Baal-Bec. No doubt, therefore, it was mainly indebted for that wealth, of which its ruins, like those of its great rival Palmyra, attest the magnitude, to the trade of which it was long a principal centre. And the desolation in which these two splendid cities are now involved is at least owing as much to the changes that have taken place in the channels of commerce, as to the barbarism and ignorance of their modern masters. (*Mauscler*, li. 181.—*Pococke*, ii. 106.—113.; *Wood and Dawkins's Ruins of Balbec, passim*; *Folsey*, li. 195, 208.; *Burckhardt's Travels*, 10. 17.; *Richardson's Travels*, li. 502.—510.; *Robinson*, li. 53.—106.; *Addison*, li. 49.—73.; *Elliott*, li. 274.)

BAAR, a town of Switzerland, cant. Zug, 2 m. N. Zug. Pop. 2,200. It is situated in a fertile plain, has a fine town-house, built in 1674, and a paper manufactory.

BAARLE, a town of the Netherlands, prov. Brabant, 12 m. S. E. Breda. Pop. 1,600. It gave its name to Barleius, the celebrated litterateur and Latin poet.

BABA (an. *Lectum*), a cape and sea-port town of Asiatic Turkey, Anatolia, 22 m. S. from the most southerly point of Tenedos, lat. 39° 30' S., long. 26° 5' E. Near the cape is the town, small and ill-built, with about 4,000 inhabitants. It was formerly famous for a manufacture of knives and sword blades; but, though not entirely abandoned, this manufacture has greatly fallen off. The port is practicable only for small vessels. Large quantities of valonia are produced in the neighbouring country. The trees, with the fields on which they grow, belong to a multitude of individuals; one man being the proprietor of 3 trees, another of 10, and so on. The right to export the valonia is a privilege annually conferred by a firman; a less or greater sum being paid to the *seraskier* by whom it is obtained. (*Voyage du Duc de Raguse*, li. p. 146.)

BABA-DAGLI, a town of Turkey in Europe, prov. Silistria, near the N.W. angle of Lake Rassen, which communicates with the Black Sea, 21 m. S. Danube. Pop. 10,000. It is well fortified; streets paved, but dirty; has 5 mosques, 2 public baths, and a college. The ground on which it stands is marshy; and the only water fit for drinking is conveyed to it a distance of about 3 m. by an aqueduct. It carries on a considerable trade by means of the port of Kara Kerman, one of the outlets of Lake Rassen on the Black Sea.

Baba-Dagh was built by the Turkish sultan Bajazet. It is a place of considerable importance in the wars between Russia and Turkey, and has sometimes been the winter quarters of the grand vizier. (*Diction. Géographique.*)

BAB-EL-MANDEB (STRAITS OF), the strait

uniting the Indian Ocean with the Arabic Gulph or Red Sea. The distance across, from a projecting cape on the Arabic shore to the opposite coast of Arabia, is about 20 m.; but in the intermediate space, though much nearer Asia than Africa, is the small island of Perim, and some other still smaller islands. Perim is in lat. 12° 35' 30" N., long. 43° 28' E. The channel between Perim and the Arabic coast, though narrower than the other, and the current more rapid, is the most frequented by Arabic vessels, probably because, being only from 7 to 14 fathoms deep, it allows of their casting anchor, which, owing to its great depth, is impracticable in the greater or western channel.

Bab-el-Mandeb means literally the gate of tears; a designation it may have derived either from the dangers incident to its navigation, or from those incident to the navigation of the seas on either side.

BABYLON (*Βαβυλων*) or BABEL (*בבל*), a city of Asia, cap. Chaldaea, and of the Assyrian empire, being probably the largest city of antiquity, and certainly one of the most famous. Nothing remains of the ancient buildings but immense and shapeless masses of ruins; their sites being partly occupied by the modern and meanly built town of Hillah, the cap. of a district, and the residence of a bey appointed by the pacha of Bagdad. This town lies on the W. bank of the Euphrates, and occupies nearly the centre of the S. part of the old enclosures; lat. 32° 28' 31" N., long. 44° 9' 43" E. Pop. 6,000 or 7,000, Arabs and Jews. It is surrounded by mud walls and a deep ditch, and has four gates.* It has a rude citadel, the only public building within the walls, except a single mosque, and 6 or 7 oratories. It may be gathered from the statement, by Rich (*Mém.* 11.), of the sources whence the public revenue is derived, that some manufactures of silk exist, and that there are also dyeing houses, tanneries, and lime kilns; but the mass of the inhabitants are evidently agriculturists (*fellahs*). The Euphrates, at Hillah, in its medium state, is 450 ft. wide, 7½ ft. deep, and its mean velocity is about 2½ m. an hour. The whole surrounding country is intersected with canals. The undoubted antiquity of many of these works is not a little surprising, considering the nature of the soil, which is wholly alluvial, and so soft that the turning the course of the river by Cyrus (*Herod. Chio.* 191.; *Xen. Cyrop.* vii. 5.), does not appear to Rich an exploit of any great difficulty. (*Mém.* 17.) The Euphrates annually overflows its banks, inundating the country for many miles round, and even rendering the district between the Euphrates and Tigris navigable in many places for flat-bottomed boats. This annual flood fills the canals, and facilitates agriculture in a surprising degree. The air is salubrious, and the soil extremely fertile, producing dates, rice, and grain of every kind, in astonishing profusion; but, in consequence of the illegal and irregular exactions of the pachas, and the insecurity to which all kinds of property is exposed, the inhabitants exert no sort of industry; the numerous canals are left dry and neglected, except when filled spontaneously by the river; and the small quantity of land that is cultivated is not half tilled. (*Niebuhr, Voy. en Ar.* ii. 234.—237.; *Rauwolf's Travels*, p. 174, &c.; *Rennell's Geog. Her.* i. 459, &c.; *Rich's Mém. on Ru. Bab.* pp. 1—17.; *Mignan's Trav. in Chaldaea*, pp. 114.—122.)

Such is the present state of a city, once the greatest, most magnificent, and powerful, in the world; "the glory of kingdoms, the beauty of the Chaldee's excellency." (Isa. viii. 20.) We need say little of the identity of the site occupied by the ancient and modern towns; this has been completely established by Major Rennell. It is

* When Mr. Rich was here, 1811, the pacha of Bagdad had ordered a new wall, of Babylonian bricks, to be constructed (*Mém.* 1.); but this appears not to have been done as late as 1837. (See *Mignan's Travels*, p. 121.)

sufficient to observe, that the traditions preserved by eastern writers; the universal belief of the present inhabitants; the descriptions of the ancient historians, and, above all, the discoveries by modern travellers of stupendous ruins answering to those descriptions, — leave no room or ground for any reasonable doubt upon the subject. (*Rennell*, i. 459—511.) The magnitude assigned by ancient writers to this celebrated city is so immense as to stagger belief. It was a perfect square, and, according to Herodotus, 480 stadia in cir. (*Clio*, § 178.) Strabo (p. 738.) gives the circ. at 385 stadia; Diodorus Siculus at 360, on the credit of Ctesias; but at 365, on that of Clitarchus, who was on the spot with Alexander (ii. 1.). Quintus Curtius gives it at 368 stadia (v. 1.), and Pliny (vi. 26.) at 60 Roman m. The inextricable obscurity in which the itinerary stadium of the Greeks is involved (see *Rennell*, i. 17—44.) renders it exceedingly uncertain whether these differences are to be regarded as real, or as arising from the adoption of different standards. Assuming, however, that the same stadium is meant in each case, taking it at its least possible value, 491 ft.; and taking also the measure of Diodorus, the least of the whole, the area of ancient Babylon, within the walls, will be found to be upwards of 72 sq. m., or nearly 3½ times that of London with all its suburbs. If, at the same value of the stadium, the measure of Herodotus, or that of Pliny (which agrees with it*), be taken, the area will amount to more than 124½ sq. m., or 6 times that of London; and, finally, if the common stadium of Herodotus, 600 Grecian or 604½ English ft. (*Euterpæ*, § 149.), be adopted, as well as his measurement, the area will swell to 188½ sq. m., or 9 times that of London.

Various attempts have been made, by comparing its area with the area and population of modern cities, to estimate the population of Babylon. But, on the lowest calculation, it would be found, supposing it to have borne any considerable resemblance to a European city, to have had a population of the enormous magnitude of 5,000,000, or about treble that of London, — a supposition to which all but insuperable obstacles are opposed. For, notwithstanding the amazing fertility of the surrounding country; the fewer wants of its inhabitants compared with those of northern latitudes; and the facilities afforded by the numerous canals which intersected the adjoining provinces, and by the Euphrates and Tigris, to the importation of bulky and distant products; still there were circumstances connected with its situation and government sufficient to countervail these advantages, and to render it all but impossible that so vast a population could be supported within its walls. If any one take up a map of Asiatic Turkey, he will instantly perceive that the extent of country round Babylon available for agricultural purposes must have been quite inadequate to supply the necessary demands of the supposed population. The Babylonian plain, fertile as it is, is soon lost in the interminable deserts of Sinjar and Arabia: the marshes and lakes of Lower Mesopotamia and Chaldea make a large deduction even from its fertility; while, as if wholly to neutralise the natural advantages of the city, the Babylonian monarchs threw a variety of obstacles in the way of commercial enterprise. (*Her. Clio*, 185.) But we need not pursue this discussion, the fact being universally admitted that Babylon possessed but few points of resemblance to a modern European town. The build-

ings and population bore no proportion to its extent, and, in the words of Rich, "it would convey the idea rather of an enclosed district than that of a regular city." (P. 43.) Pasture and arable land was contained within the walls, sufficient, says Q. Curtius (v. 1.), to supply the wants of all the inhabitants. This, no doubt, is a gross exaggeration; but if, as must have been the case, a large portion consisted of productive ground, its produce might have added considerably to the provisions it was possible to place in store. Xenophon affirms, that when the city was taken by Cyrus, it was stored for 20 years, — *πλὴν ἡ ἕκαστον ἱστῶ*, (*Cyrop.* vii. 5.); and though this may reasonably be considered as much beyond the mark, yet, at a subsequent period, it actually did sustain a siege by Darius Hystaspes of 1 year and 7 months, and was then, as in the former case, subdued, not by famine but by surprise. (*Herod. Thalia*, 152.) That only a small part of its immense area was occupied by buildings is therefore evident. How much is another question, and one that it is impossible to decide. Perhaps, on the whole, we may estimate the population of Babylon at from 1,000,000 to 1,200,000. This supposition derives support from the fact that Seleucia, with a pop. of 600,000, is stated to have been about half the size of Babylon in the days of her greatest glory. (*Strabo*, xvi. 739.; *Pliny*, vi. 26.)

But though a population at all commensurate to the magnitude of the city, calculated on a scale of European density, be thus improbable, it does not by any means follow, seeing the way in which the area was partially filled up, that the magnitude itself is to be discredited. The authority on which we must mainly rely is undoubtedly that of Herodotus. Not only is he the earliest profane writer upon this subject; but he alone, of all the ancient historians, had the advantage of having visited Babylon in person, and while it was still in a state of tolerable preservation. His account of this interesting city has been, with trivial exceptions, amply corroborated by the testimony of all succeeding writers, as well as by the investigations of modern travellers; and though it would be unfair to test his statements by the severe standards applied to topographical descriptions of the present day, — where critical accuracy in such inquiries is rigidly demanded, — it is clear that his general veracity is unimpeachable, while the circumstance of his having been an eyewitness of what he describes, heightens our belief in the details he has exhibited.

It is rather remarkable that Herodotus says nothing of the foundation of the city or its founder, merely remarking, that after the destruction of Nineveh, it became the seat of the Assyrian empire. (*Clio*, 179.) But even in his time it was of considerable antiquity, and biblical critics have unanimously referred its origin to the presumptuous attempt of the early post-diluvians to "build them a city, and a tower whose top may reach to heaven." (*Gen.* xi. 4.) Josephus (*I. Antiq.* iv. 3.) expressly says that Nimrod, the grandson of Ham, was the originator of this attempt; and to this day the inhabitants of these parts are as fond of attributing every great work to this "mighty hunter before the Lord," as those of Egypt are of referring similar works to Pharaoh. (*Rich*, 41.) Asshur, the founder of Nineveh, (*Gen.* x. 11.; *Diod. Sic.* ii. 1.) having subdued the Babylonian with other surrounding powers, laid the foundations of the Assyrian empire. A domestic tragedy, resembling in many points that of David and

* The Roman mile was 8 Roman stadia. (*Rennell*, i. 18.)

Bathsheba, having made him the husband of Semiramis, the strong mind and many accomplishments of his wife, induced him, on his death, to leave her regent for his son, though it would appear that she governed in her own name, till her death (*Diod. Sic.* ii. 20.); and to her was owing most of the grandeur of Babylon.

According to Herodotus, the city was built on both sides the Euphrates, the connection between its two divisions being kept up by means of a bridge formed of wooden planks laid on stone piers. The streets are described as having been parallel, and the houses from 3 to 4 stories in height. The city was surrounded by a deep and broad ditch, and by a wall of extraordinary dimensions, flanked with towers, and pierced by 100 gates of brass. The wall was built of bricks, formed from the earth taken out of the ditch, and cemented by a composition formed of heated bitumen and reeds; the former being brought from Is (Hit), on the Euphrates, about 128 m. above Babylon. The temple of Jupiter Belus (most probably the Tower of Babel) occupied a central position in one of the divisions of the city. Herodotus describes it as a square tower of the depth and height of one stadium, upon which, as a foundation, 7 other towers rose in regular succession, the last tower having a large chapel, a magnificent couch, and a table of solid gold. The building was ascended from without by means of a winding-stair. The space in which it was built was enclosed within walls, 8 stadia in circumference, and consequently occupying above 33 acres. The gates to the temple, which were of brass, and of enormous magnitude, were seen by Herodotus. In the other division of the city stood the royal palace, which seems to have been a sort of internal fortification, and was, no doubt, of vast dimensions. (*Clio*, 181.)

It is exceedingly difficult, or rather, perhaps, impossible, owing to their extremely dilapidated state, to say to which of the ancient buildings the existing ruins are to be ascribed. The principal of these are the Kasr, or palace; the Mujellibe, or the overturned; and the Birs Nemroud, or tower of Nimrod. These are all of great magnitude, and are at very considerable distances from each other. The most considerable, the Birs Nemroud, is a mound of an oblong figure, 762 yards in circumference. On its W. side it rises to an elevation of 198 ft., and on its summit is a solid pile of brick, 37 ft. high. It consists entirely of brick-work, and Niebuhr, Rich, and Mignan, agree in supposing it to be the remnant of the sacred edifice, and identical with the Tower of Babel. (*Niebuhr*, ii. 236.; *Rich*, 38. 49. 54. &c., *2d Mem. pass.*; *Mignan*, 202.)

The particulars given above of the ancient state of this famous city are all derived from Herodotus, by whom, as already stated, it was visited after its conquest by Cyrus, and before it had sustained any material injury. But if credit be given to later and less trustworthy authorities, Babylon had to boast of still more extraordinary monuments than any previously mentioned. Among these may be specified a tunnel under the Euphrates; subterranean banqueting rooms of brass; and the famous hanging gardens, containing near 4 acres of land, elevated 300 ft. above the level of the city, and bearing timber trees that would have done no discredit to the Median forests. (*Diod. Sic.* ii. 7. 9. 10.; *Strabo*, xvi. 738.; *Curt.* v. 1.)

We confess, however, that we are extremely sceptical as to the existence of any one of these structures. How can it be supposed that so careful and curious an observer as Herodotus,

who saw, and has minutely described, the city, should not have made the faintest allusion to such extraordinary structures, had they really existed. The tunnel under the Euphrates was an object more worthy of notice, and more likely to attract attention, than the bridge, and yet while Herodotus describes the latter, he says not a word about the former! And to say nothing of the extreme improbability that any such stupendous structures as those of the hanging gardens should have been erected by a people apparently ignorant of the arch, it is not conceivable, had they been constructed, that Herodotus should have omitted to mention them. His silence seems to show clearly that the statements as to these extraordinary fabrics are really as fabulous as they appear to be incredible. Diodorus Siculus and Curtius are writers of little authority, and have, on all occasions, evinced the greatest readiness to give credit to and repeat the most absurd and unfounded statements; and in this instance Strabo seems to have shown quite as little of sound criticism or discernment.

The great works of Babylon were all constructed of brick, except the bridge, the stones for which must have been brought from a distance, since none could be found in the alluvial soil of the country. The bricks are of two kinds, sun-dried, and kiln-dried: they are much larger than the bricks now in use, and generally marked with figures or letters. Straw or reeds are mixed with the courses, and bitumen, procured from Is or Hit, is the usual cement, though mortar and slime are also frequently used. Such is the extent of these vast ruins, that nearly all the cities in their neighbourhood are built from the materials found there, and the storehouse seems to be regarded as one which is inexhaustible.

From the death of Semiramis, Babylon continued a kind of second capital to Assyria, till the revolt of Arbaces and Beleses against Sardanapalus, 30 generations later. It was subsequently sometimes the capital of the whole country, and sometimes that of the separate kingdom of Babylonia; but always advancing in grandeur and prosperity till the days of Nebuchadnezzar, under whom it may be considered as having reached its zenith. (*Joseph. Antig.* x. xi. 1.) In the midst of its glory, however, the voice of the Jewish prophet was raised against it. The Median conquest is threatened full 120 years before its occurrence; and "this glory of kingdoms" is doomed to the fate of Sodom and Gomorrah; to be swept with the besom of destruction; to become a possession for the bitter and pools of water; a lair for the wild beasts of the desert, doleful creatures, owls, and satyrs (*Isa.* xiii. xiv. *et pass.*); predictions, the accomplishment of which has been as literal as complete. In the reign of Labynetus, or Belshazzar, son of Nebuchadnezzar* and Nitocris, Cyrus, the "anointed of the Lord" (*Isa.* xlv. 1.), led his army against the city. Trusting to their fortifications, the Babylonians derided his attempt; but cutting a canal, he diverted the course of the Euphrates, leaving its channel through the town sufficiently dry for the passage of his army. The same thing had been done on a former occasion, by Nitocris, to build the bridge; but in this instance an additional work seems to have been performed, in the erection of locks or dams, to preserve the river in its natural course till the very moment of attack, and thus prevent suspicion of his design; for had the Babylonians

* Nebuchadnezzar is called also Labynetus by Herodotus. (*Clio*, 74.)

been aware of it, says Herodotus, they might easily have enclosed the Persians, as in a trap, and effected their total destruction. Taking advantage, however, of a night of revelry, Cyrus drew off the waters, entered the town by surprise, and captured it almost without resistance. (*Xen. Cyr. vii. 5; Herod. Clio, 191.; Dan. v.*) The sacred historian gives a vivid account of the manner in which the last Babylonian king spent the night before his death, and of the awful warning which preceded his overthrow. Babylon remained subject to the Persian monarchs till the reign of Darius Hystaspes, when it revolted, but was again subdued by stratagem. Darius took away the gates, and otherwise injured the city, so that its declension may be fairly dated from his time. Xerxes is said to have defaced the temple of Belus on his return from Greece; but such were the resources and conveniences of the city, that it remained the winter residence of the Persian monarchs for several generations. It made no resistance to Alexander, who intended making it the capital of his gigantic empire. He contemplated, also, the restoration of the temple; but having employed 10,000 men for two months, in removing the rubbish, the work was stopped by his death. Seleucus Nicator, who, after that event, became monarch of Babylonia, founded the city of Seleucia, on the banks of the Tigris, and made it his capital. From this time, the decline of Babylon was as rapid as well could be; but the mighty city which required ages to rear, required also ages in which to perish. It was still important, though in ruins, at the commencement of the Christian era. (*Herodotus, Thalia, 159.; Strabo, xvi. 738.; Arrian, xvi.; Pliny, vi. 26.*) Its subsequent history is unknown. It is said to have been turned into a hunting-park by the Parthian kings, who overthrew the Seleucidian dynasty; and it is probable that the materials of its vast buildings served to construct the newer cities in its neighbourhood. It had shrunk to a mere name in the early days of Arab greatness (*Ebn Haukel, 70.*); and in the 495th Hegira, A.D. 1101, was founded the present town of Ilillah. (*Abul Feda Irak, art. Babel.*) The rest of this once famous district is now, and has been for ages, a desolate void; its buildings masses of shapeless ruins, channelled by the weather, and literally the desolation which the prophet predicted:—"And Babylon shall become heaps, a dwelling place for dragons, an astonishment, a hissing, without an inhabitant." (*Jer. li. 37.; Rich*, passim; Mignan, 118-236.; Hende, 92-105.; Kinneer, 268-282.*)

BACCARAT, a town of France, dép. Meurthe, cap. cant., on the Meurthe, 16 m. S.E. Lunerville. Pop. 3,067. This town is remarkable for its being the seat of the principal manufacture of flint glass, or crystal, in France. It was established so far back as 1764; but it did not attain to any very considerable eminence till after the peace of 1815, when a manufacture carried on at Vonche in Belgium was transferred thither. The workmen and their families, to the number of 600, are lodged in the establishment; but the women employed in polishing the crystal live at Bon-l'Étape, 2 leagues distant. The value of the raw material employed in the manufacture is estimated at 400,000 fr. a year, and the salary of the workmen at 450,000 fr. The annual product in rough or uncut crystal is estimated at 1,400,000 or 1,500,000 fr. Exclusive of the work-people already referred to, about 350 are employed in subsidiary departments, in preparing milium or red lead, extracting potash, preparing tools, &c. The machinery employed in the manufacture is all driven by water. (*Hugo, France Pittoresque, li. p. 248.*)

* The references to Rich's *First Memoir* are to the edition of 1815, except when otherwise expressed; those to Rennell's *Topography* are made to "Babylon and Persopolis," published in 1839. Some interesting corroborative matter will be found in Sir R. K. Porter's *Travels in Georgia and Persia*, ii. p. 390-397; and Buckingham's *Travels in Asipria*, 358-475.

BACHARACH, a decayed town of the Prussian States, prov. Rhine, at the foot of a steep mountain, on the left bank of the Rhine, 28 m. S.S.W. Coblenz. It is surrounded by old walls, strengthened by 11 towers. Bacharach is a translation or corruption of *Bachet ara*, or altar of Bacchus, the name given to a rock in the river, usually covered with water, but appearing in very dry seasons, or in those most favourable to the growth of the vine. Hence the Romans are said to have sacrificed on the rock to Bacchus; and its appearance is still hailed as an omen of an excellent vintage. The town is mean and dirty, and the inhab. very poor.

"In fact," says Mr. Barrow, "the principal part of the food of the people, through the whole of the long ravine from Boppard to Bacharach, and as far as Bingen, must be brought to them from a distance, as, from the scarcity of land, wine and fruit are the only articles capable of being cultivated; and how the land which we here see can possibly pay the labour of cultivation is quite a mystery. There is scarcely a patch of half an acre in any one continued space; mostly not half a rood. Every little sheltered spot, however small, that possesses the least soil—every little crevice between the naked rocks—is choked up with vines; in many places the vine is planted in a basket, with adventitious soil, and sunk in the rocky fragments by the side of the hill. The care and the labour bestowed, though not tollsome, is constant; and the distance is frequently several miles which the poor cultivator has to go from his habitation to his vineyard; we should rather say *Acra*, for they appear to be chiefly women, who bear but little resemblance to those fair and sylph-like damsels with which painters are in the habit of peopling their vineyards, when assembled to gather the purple grape. A jacket and petticoat, a dirty handkerchief tied round the head, the legs and feet naked, the features dark, dull, and unmeaning, furnish the true picture of a female labourer of a Rhenish vineyard; and this was so generally the prevailing feature of the picture, in all places where the chief produce was wine, that we may almost with certainty come to the conclusion, that the culture of the vine is an indication of the poverty of those who perform the manual labour, however profitable it may be to the large proprietor."

BACKEITUNGGE, a distr. of Hindostan, prov. Bengal, div. Dacca, including part of the Sunderbunds, and the mouths of both the Ganges and Brahmaputra; having N. Dacca Jelapore distr., E. Tipperah and the Bay of Bengal, S.W. Jessore; area 2,780 sq. m.; pop. (1822) 686,640; land revenue (1829-30) 78,180*l*. It is mostly covered with jungle, abounding with alligators and the largest class of tigers; but in parts it is very fertile in rice, &c. It has been noted for the frequency of crime, especially of river piracy or dacoity, the country presenting great facilities for the shelter of the culprits. It is subject to inundations that are occasionally very destructive. (*Hamilton's Hindostan, Rep. and Append. New-nur, and Map.*)

BACKNANG, a town of Württemberg, circ. Necker, 16 m. N.E. Stuttgart, in a valley on the Murr. Pop. 3,400. It has fabrics of cloth, and tanneries, and a considerable trade in horses.

BACQUERILLE, a town of France, dép. Seine Inférieure, cap. cant., 11 m. S. by W. Dieppe. Pop. 2,810.

BACS, a town of Hungary, cap. co. of the same name, on the marsh of Mestonga, 32 m. W. N.W. Peterwardein. Pop. 2,770. It was formerly much more considerable than at present, and has still some fortifications. It is the seat of the chapter of the Greek bishop of Bacs, who resides at Neusatz; and has a considerable transit trade.

BADAJOZ (an. *Pa Augustu*), a city of Spain, cap. Extremadura, near the frontier of Portugal, in an extensive plain in the angle between, and at the point of confluence of, the small river Ilivillas with the Guadiana; 198 m. S.W. Madrid, 135 m. E. Lisbon; lat. 38° 52' N., long. 6° 11' W. Pop. 12,084. The castle, situated on a rock overhanging the confluence of the two rivers, commands them and the town, which is further defended by various very strong fortifications. The Guadiana is here considerably a good bridge of 28 arches, erected in 1596, and protected by a strong *riede du pont*. Streets narrow and crooked, but they are well paved and clean, and the houses good. It has 5 gates, and a fine promenade along the river. There is a deficiency of springs, and the supply of water is derived from reservoirs, cisterns, &c. It is the seat of a bishopric, and the residence of the captain-general of the prov. The cathedral has some good paintings, especially those by Morales, a native of the place; and there are several convents and hospitals. It has manufactories of soap and coarse cloth, with tanneries and dye-works, and is the seat of a pretty active trade (mostly contraband) with Portugal.

Badajoz is very ancient, having been a considerable place under the Romans. It has always been regarded as a military post of the greatest importance. During the late war with France, it was taken by the French under Marshal Soult on the 10th of Jan., 1811; the garrison, amounting

to 15,000 men, becoming prisoners of war. In the course of the same year it was twice unsuccessfully besieged by the Anglo-Portuguese army. In the following year the siege was undertaken by the army under the Duke of Wellington; and, after some of the outworks had been carried, it was taken by storm after a desperate resistance, on the 6th of April. On this occasion the allied army lost about 5,000 men, killed and wounded. The glory of this brilliant achievement was unhappily tarnished by the excesses committed by the victorious soldiery, despite every effort to prevent them, on the defenceless inhabitants of the town. (*Milano; Napier, lii. 433.*)

BADALONA, a town of Spain, Catalonia, within a short distance of the sea, with a castle; 6 m. N.E. Barcelona. Pop. 4,375. The climate is excellent; and the environs are fertile and beautiful.

BADAUMY, a strong hill fortress of Hindostan, prov. Belgaon, presid. Bomhey, 55 m. N.E. Darwar; lat. 18° 55' N., long. 75° 49' E. Pop. about 2,500. It consists of fortified hills, with a walled town at the bottom, containing an inner fort. It has always been reckoned one of the strongest hill-fortresses in India, and successfully resisted a whole Maharatta army. It was taken by storm in 1818, by a division of the army under Sir T. Munro. A remarkable chaotic distribution of rocks prevails throughout the country around Badaumy.

BADEN (THE GRAND DUCHY OF), in Germany, is bounded on the S. by the Lake of Constance, with its two arms, the lakes *Überlinger* and *Zell*, as far as Stein, between which town and Eggen, however, the territories of the Swiss cantons, Schaffhausen and Zurich, intervene three times between the Rhine and the frontier of Baden. On the W. the Rhine forms the boundary towards Switzerland, France, and Rhenish Bavaria, with the exception of a part of the territory of Basel, which lies upon the right bank of the river. Towards the N. the territory of the grand duchy of Hesse and the kingdom of Bavaria, and towards the E. the kingdom of Württemberg and principally of Hohenzollern-Sigmaringen form its limits. It lies between lat. 47° 32' and 49° 14' N. The surface is exceedingly varied, the length of the grand duchy being about 180 m. from N. to S.; its breadth, in Lower Rhine circle, from the Rhine to the Bavarian frontier, being about 60 m.; in the Middle Rhine circle, from the Rhine to the frontier of Württemberg, about 20 m.; and in the Lake circle, from the same river to the Württemberg frontier, extending to nearly 115 m.; thus forming a long irregular figure, very narrow in the centre, but stretching out to some breadth at the N. and S. ends. The eastern half of this tract of country is entirely occupied by a mountainous tract, extending from S. to N. under the denominations of the Black Forest, Odenwald, &c.; while the western half, extending from the fall of these mountains to the Rhine, is partly an undulating, but along the banks of that river, mostly a level country.

Mountains.—The Black Forest stretches from the banks of the Rhine, where that river forms the Swiss boundary, in a northern direction through the grand duchy as far as the Neckar, and towards the E. far into the kingdom of Württemberg, falling gradually in the latter direction with prolonged ridges, but suddenly and steeply towards the valley of the Rhine. Its main stock is composed of gneiss and granite, which form, as in the Vosges, dome-like masses, with steep sides, rising in the Feldberg, 4,650 ft. in the Belchen, 4,397 ft. (this name is analogous to the Balluns of the Vosges), and in the Herzogen Horn to 4,300 ft., above the level of the sea. On the granite red sandstone is superimposed, and forms extensive plateaux, capable of cultivation to a great height; so that not only extensive forests cover these mountains, but pastures, and even small villages, are found in them at an elevation of 3,500 and 4,000 feet. Deep valleys, with picturesque precipitous sides, intersect the sandstone layer, and pour rapid streams for the most part navigable for rafts, into the Valley of the Rhine. In some hills, as the Kneibitz, for instance, the sandstone appears to form compact isolated masses. 2. The bed of the Neckar, which divides the Black Forest (Schwarzwald) range from the Odenwald, is also of sandstone, which alternates in the northern parts of the grand duchy with blue limestone and marl. The principal mass of the Odenwald is likewise, according to Keferstein (from whose work we take these details), composed of sandstone, little interrupted by the rise of the granite. The highest summit, the Katzenbüchel, 2,180 ft., lies in Baden; but the greater part of the chain belongs to the grand duchy of Hesse. Like the Black Forest, these heights fall steeply towards the Rhine, and along the foot of the range the *Bergstrasse*, from Heidelberg to Frankfurt, a road celebrated for picturesque mountain scenery, uniting with the rich luxuriance of vegetation of the valley, has been carried. 3. The Kaiserstuhl, in the circle of the Upper Rhine, is formed of a clump of heights of volcanic origin, separated from the Black Forest by the Dreissam and the Elz. On the rock, called

BADEN (GRAND DUCHY) OF.

the Toddenkopf (death's head), a tradition tells us that Rodolph of Hapsburg held a court of justice, whence the name of Kaiserstuhl (emperor's chair) is derived. The highest point is 1,768 Paris feet in elevation. 4. A range of steep hills, stretching from the Rhine near Schaffhausen, along the W. and N. shores of the Lake of Constance, is named the Randen. The dominant formation of these hills is limestone; the highest point is 2,527 ft. in height. They run into the Black Forest on the W. and N., and on the N.E. into the hilly district of Nellenburg and Hegan. The last named elevations are composed of Jura limestone, in which the basalt and other isolated volcanic rocks of Hohendwyl, Hohenstoffeln, Hohenhöwen, &c., occur. 5. Finally, the Heiligenberg, a rough and sterile tract, rises N.E. of the Lake of Constance, and slopes down towards its banks; on its summit, 2,200 ft. high, Prince Fürstenberg has a raveling seat, from which there is a fine view of the lake and the Swiss mountains.

Rivers.—The principal river of the grand duchy is the Rhine, which receives all its streams except the Danube. After losing itself in the Lake of Constance, at a distance of 100 miles from its source, it re-appears as a rapid stream near Stein, where its breadth is 250 ft., and works its way through limestone rocks to Schaffhausen, a little below which place it falls over a precipice from 50 to 60 ft. in height. Near Laufenburg the bed narrows to a width of only 50 feet, forming a rapid scarcely inferior in grandeur of effect to the celebrated fall at Schaffhausen. At Rheinfelden the rocky ravines in its bed form a violent eddy, and all these obstacles preclude the possibility of rendering the stream navigable above Basel, from which city onward it takes a northerly and tranquil course. Its breadth at Basel is 750 ft.; but its depth is by no means proportionate to this extent of surface, the stream being in many spots no more than 3 ft. deep, while its greatest average depth between Basel and Strasburg, does not exceed 10 to 12 ft. At Mannheim the bed of the river is 1,000 ft. in breadth; but its average depth between Strasburg and Mayence varies between 5 ft. and 24 ft. The fall of the Rhine between Stein and Basel is stated by Lennetich to be 703 Paris ft., and between Basel and Mannheim 494 ft. The navigation on the Rhine is the most important of all the inland water carriage of Germany. Between Basel and Strasburg boats of 25 to 30 tons are used, and between the latter city and Mainz barges of 120 tons burden. Steam-boats now go up to Basel, notwithstanding the islands and banks formed by the shifting of the river's bed, and the uncertainty of its depth, which varies after every flood. The Rhine is traversed by two bridges of boats at Kehl and at Mannheim, besides several flying bridges.

The greater number of the streams falling into the Rhine on its right bank descend from the Black Forest with so rapid a fall that but few of them are navigable even for forest rafts. The most considerable are the Wiebach, which, during part of its course forms the frontier of the canton of Schaffhausen; the Wiesen, which falls into the Rhine below Basel, the Elz, the Kunzig, which joins the Rhine near Kehl, and the Murg. The two last named streams, on which the greatest quantity of timber and firewood is floated down, have a fall of nearly 3,000 ft., in a course not exceeding 60 English miles. The largest accession which the Rhine receives during its course through the grand duchy is the Neckar, which has its source in Württemberg in the Black Forest, and after traversing that kingdom, enters Baden at Heimsheim. It is navigable for boats from Cannstadt near Stuttgart, below which place it is joined by the Rems, the Kocher, and the Jax on its right, and the Enz on its left bank; it falls into the Rhine near Mannheim.

2. The Main is the frontier towards Bavaria but for a short distance, and receives the Tauber at Wertheim. Its depth is not great, but is regular; and its gentle fall, which is assisted by the numerous windings of its bed, renders its current well adapted to navigation.

3. The Danube, whose sources are in the grand duchy, leaves the territory before it assumes any greater importance than that of a mountain stream. Its most westerly source is that of the Breg, between the Ilossuk and Briglein, in the Black Forest, a few miles N.W. Furtwangen. It is joined a little above Donau-essingen by the Brizach, and into their united streams, which from that point bear the name of Danube, the waters fall, which, issuing from the springs in the Castle-yard of this town, claim the honour of being the original sources of the great river. After traversing a small district of Württemberg, the Danube once more enters the territory of Baden, and finally leaves it at Guttenstein on the frontiers of Sigmaringen.

The natural facilities for internal navigation in the grand duchy bend for the most part towards the W. and N., and merge into one grand channel, the Rhine. With the exception of some cuts to regulate the course of this river between Kehl and Mannheim, the execution of

which is regulated by a treaty with Bavaria, according to which those on the left bank are managed by Baden, and those on the right bank by the Bavarians, no navigable canals exist in the grand duchy.

The Lake of Constance is an important feature in the natural facilities for water communication. Part of its northern bank, from Immenstadt to Mersburg, together with the whole shore of its northern branch, the *Weberingen See*, and the north shore of the *Zeller See*, with the city of Constance on its southern shore, belong to Baden. A considerable trade with Switzerland is carried on across it, and the introduction of steam-boats, which keep up a daily communication between Constance, Lindau, and Hohrathach, in Switzerland, has made it a convenient passage for travellers. The whole lake with its branches, contains, according to Hennrich, an area of 94 German square miles, and its deepest part, between Constance and Lindau, is 854 Paris ft. Its level above the sea is 1,255 ft., but at the period of the melting of the snow its waters rise as much as 10 ft. A sudden swell, which takes place at other times, and which is termed the *Kuhla*, is not easily accounted for. The lake is not unfrequently frozen over in winter, and in 1830 horsemen and carriages passed over it. The Ilmen See, near Pfaffenwies, in the Lake circle, and the Mühl See, are rather fish-ponds than lakes; and the various meads in the Black Forest, which are found at considerable elevations, the largest of which are the Feldsee at 3,401 ft., the Tittelsee 2,538 ft., the Mummelsee 3,130 ft., the Nonnemattweiher 2,845 ft., and the Eichner See 1,494 Paris ft. above the sea, are neither interesting for their extent, nor for picturesque scenery. The last-mentioned lake dries up occasionally, so that corn is sown in its bed; and in the Nonnematt a floating island of turf rises and falls with the water which supports it.

Climatic.—Berghaus gives the following details concerning the climate of the Valley of the Rhine, in the grand duchy, one of the warmest in Germany.

Town.	Lat. N.	Elevation in feet.	Mean temperature of the year.	Winter.	Spring.	Summer.	Autumn.
Freiburg	48-01	1,652	49.7	51R	+0.41R	+9.9R	+18.4R
Sirachburg	48-55	1,450	9.4	1.4	9.9	17.8	9.8
Carlsruhe	49-01	380	10.2	1.5	10.4	18.3	9.8
Mannheim	49-30	258	10.3	1.5	10.4	19.5	9.7
Mean	48.75	500	10.0	1.2	10.1	18.5	9.9

For the mountain districts the same author gives the following mean temperatures:—

The Black Forest.—

Between the sources of the Enz and the Murg	6° 30' R.
Doitto ditto Murg and the Dreissach	5 30
Doitto ditto Dreissach and the Kinzig	5
Doitto ditto Danube & the Lake of Constance	9

The mean temperature for the whole grand duchy is estimated at 8° 30' R., being 30° warmer than the climate of the plateau of Bavaria, S. of the Danube, but 1° colder than the mean temperature of Hanover, although that kingdom lies 4° lat. further to the N.

Observations, as to the fall of rain, give a mean at Freiburg of 28 in. per annum. In Carlsruhe the mean variations of the weather are, 23 clear, 86 sunshine, 161 mist, 42 partial cloudy, 54 cloudy days in the year. Rain falls 146, snow 26, and fogs occur on 12 days. The mean direction of the winds is, in Carlsruhe S. 88° W. or nearly W., in Mannheim N. 65° W. Thunderstorms in Carlsruhe occur on 26, at Mannheim on 21 days in the year.

Productions.—Before the accession of the grand duchy to the Germanic Customs' League, the attention of the inhabitants of the valleys of the Rhine and Neckar was almost exclusively devoted to agriculture, for which the soil and climate of those districts is admirably adapted. Corn is grown with great success; the average return given for the whole state by Berghaus, being, for barley 8 to 9 fold, wheat 9 fold, maize 340 to 380 fold, potatoes 28 to 30 fold. The slopes of the hills are every where covered with vineyards, in which excellent wine is grown, although only the N. shore of the Lake of Constance and part of the vale of the Rhine have a S. declivity; and here the vicinity of the Alps, the Jura, and the Black Forest, diminish the warmth. Between the vines, the walnut, chestnut, peach, apricot, plum, and cherry trees produce abundantly the choicest fruit; and the valleys above mentioned resemble one beautiful garden. Tobacco, hemp, of a very fine description, and flax, are extensively cultivated; and the forests send annually a large quantity of excellent fir and oak timber down the Rhine. Mining is also carried on with partial success. Silver is found at St. Anton, in the valley of the Kinzig; copper at Kork and Neustadt; iron is produced at Kanderst, near Waldshut, near Hansen, and in other parts of the Black Forest;

manganese is dug near Villingen; salt in two chief beds at Rappensau in the circle of Lower Rhine, and at Durrheim, in the Lake circle. Coals in the neighbourhood of Offenburg; besides alum, vitriol, and sulphur, form the principal mineral productions. Upwards of 60 mineral springs are counted in the grand duchy. The thermal springs of Baden are those which are the best known and the most used for medicinal purposes.

The grand duchy is divided into four circles, and contained, according to the census of 1834, 241,820 families, or 1,231,319 inhabitants.* Berghaus estimates the population in the year 1838 at 1,263,100.

	Area in Ger. sq. m.	Population in 1838.	Per sq. m.	Chief Towns.	Population.
Lake Circle	61.5	184,500	3,000	Constance	6,230
Upper Rhine Circle	71.25	338,100	4,700	Freiburg	12,800
Middle Rhine Circle	77.75	421,000	5,400	Rastatt	5,650
Lower Rhine Circle	64.5	319,500	4,950	Mannheim	20,500
Totals	275.0	1,263,100	4,584	Carlsruhe	20,500

The movement of the Population in the year 1833-34 was as follows:—

	Births.			Marriages.	Deaths.	An. increase from 1833 to 1834.
	Legit.	Illegit.	Total.			
Lake Circle	5,720	1,216	6,936	1,289	6,512	1,544
Upper Rhine	8,821	2,192	11,013	2,382	8,771	6,915
Middle Rhine	15,017	2,430	17,447	3,449	15,888	7,122
Lower Rhine	10,907	1,722	12,629	2,751	10,914	7,461
Totals	40,465	7,560	48,025	9,871	41,985	23,422

Thus the proportion to 1,000 inhabitants is, of births 38, of deaths 34, of marriages 8; and the illegitimate births are to the legitimate as 1 to 5.4. The annual increase in the 22 years from 1811 to 1833 averages only 10,600, and for the years 1831, 1832, and 1833, was only 2,538.

The proportion of male to female births was, in the year 1834, as 1.06 to 1; of births of legitimate children to marriages as 4.1 to 1. Hennrich, in his detailed statistical description of Baden, gives the following tables, showing the religious distinctions of the inhabitants in 1833.

	Catholics.	Protestants.	Menonites.	Jews.
Lake Circle	165,909	6,189	105	1,966
Upper Rhine	229,669	89,983	159	5,174
Middle Rhine	252,545	146,356	308	5,817
Lower Rhine	162,407	155,002	817	9,166
Totals	810,530	377,530	1,419	19,423

Occupations of the People.—*Agriculture.*—The cultivated land is divided, according to Berghaus, as follows:—

Arab. Land.	Cul. Meadows in Acres.	Commons, &c. part cult.	Forests.	Vineyards.
1,212,901	360,791	501,825	1,155,300	60,561

The produce is stated to amount to—

Total Produce of Corn. Quarters.	Potatoes. Quarters.	Wine. In Gals.	Hemp. Quintals.	Tobacco. Quintals.	Hops. Quintals.
1,728,965	620,000	15,459,255	48,000	90,000	10,000

Of the Cerealia, wheat is grown, but in a small proportion, not exceeding 1.30th of the whole. Spelt is the grain of which bread is principally made. Maize is extensively cultivated, but chiefly as green food for cattle, being sown thick, and allowed to run up to a great height. Artificial grasses and turnips are in universal use in the vale of the Rhine, in which agriculture, on the whole, is carried on upon the best scale, and far exceeding the cultivation of any other part of Germany. The meadows are irrigated in the Italian style, which the numerous mountain rills assist, while the corn-fields are interspersed with countless fruit-trees, and even the beds are surrounded with plants of hemp, sown singly, which attain a remarkable height and thickness. The best descriptions of wine are those of the Ortenau and of the valleys of the Main and Neckar. The *Klingenberger* and *Wertheimer* growths are those most admired. The produce of timber and firewood is estimated at 978,000 cubic fathoms, of which a large portion is sent down the Rhine to the ship-builders of Holland, and is known by the name of *Holländerholz*. Masts of 160 feet in length, and oaks of the choicest growth, are yearly felled in great numbers for exportation to the mouth of the Rhine.

The number of head of cattle in the grand duchy is stated to be, 73,183 horses; 480,404 horned cattle; 188,706 sheep; 22,275 goats; 302,800 pigs.

Of the sheep 16,866 are designated as Spanish merino.

* Viz., 600,334 males, and 631,085 females.

noes, and 110,067 as improved breeds. The number of beehives is stated at 14,030. An agricultural association at Karlsruhe has branches in several other towns, and prizes are annually distributed to encourage improvements.

Mining and Manufactures.—Gold-washing was formerly a principal object of industry along the Rhine, from Basel to Mannheim; it is now confined to the district between Philippsburg and Wittenweiler. The mines of Teufelsgrund yielded in 1835-6, 7944 mks. of silver. In the year 1836-7 the same mine produced 1,032 mks. of silver. The mines of St. Anthony in the valley of the Kinzig produced, under the management of the same company to which those of Teufelsgrund belong, in 1836-7, 429 mks. of silver, and 900 cwt. of cobalt ore. The salt springs are the next most productive mineral branches, the two principal ones yielding 300,000 cwt. annually. Since the accession of Baden to the Prussian Customs' League the number of factories has very much increased. In 1829 the grand duchy numbered 161 fabrics, with 2,756 workmen, and a capital registered for taxation of 1,777,055 fls. At the end of 1837 the number of fabrics was 294, with 9,281 workmen, and a capital of 2,488,352 fls. The additional manufacturing undertakings are cotton spinning and weaving establishments, riband, and beet-root sugar fabrics, of which last description 8 have been opened within a few years. From the following survey of the employments of the people given by M. Hennitch, it will be evident that this increased activity, although it may have received a peculiar direction by means of the protecting duties, which amount almost to prohibitions of some articles of colonial produce, was yet, in most respects, the natural result of the peculiar circumstances under which the population have been placed. The forest and mountain tracts, which occupy half the country, scarcely supply food for their scanty inhabitants, whose manufactures of cloaks, wooden toys, straw hats, lace, and embroidery, have been sent, from a long date, into all parts of Europe. Croone states the number of wooden clocks annually exported to amount to 187,000, besides musical snuff-boxes, barrel-organs, and other articles for which the forests furnish the materials.

According to Hennitch, the number of families registered for taxation as manufacturers and tradesmen amounted in 1829 to 95,624.

12,037	families with capital between 400 and 1,000 fl.
4,216	do. do. above 1,500 fl.
70,139	do. without capital.
9,232	do. exempt, as being taxed in another manner, or as paupers.
95,624	families of capitalists, &c.
33,269	do. workmen and labourers.

The trading classes were further divided as follows:—

87,131	families; tradesmen; capital 10,680,500 fl.
161	do. manufacturers; do. 1,777,075 fl.
8,332	do. dealers do. 9,759,300 fl.

95,624 families.

The number of agricultural families at the same period is stated to be 101,792.

The density of the population in the different parts of the grand duchy is shown by the following table:—

Choro.	Level and Lowlands.			Hilly Districts.			Mountainous.		
	Eng. sq. miles.	Population.	Pop. in a sq. m.	Eng. sq. miles.	Population.	Pop. in a sq. m.	Eng. sq. miles.	Population.	Pop. in a sq. m.
Lake	63	10,000	156	406	105,000	259	467	60,000	128
Up. Rhine	169	90,000	529	393	110,000	279	176	130,000	739
Mid. Rhine	382	140,000	471	445	110,000	247	806	122,000	151
Lo. Rhine	297	130,000	438	721	185,000	258	329	36,000	89
	911	410,000	450	2354	450,000	204	2589	345,000	132

Thus the lowlands of this state rank amongst the most populous districts of Europe, and the transition to manufacturing employments is in every respect a natural one.

Moral Condition of the People.—The restraints upon the obtaining a settlement in a distant parish, which in all German states depends upon the possession of a livelihood rather than of the power to gain it, with the impediments thrown in the way of marriage, tend, it is said, to weaken the stimulus to exertion, and to promote immorality. These must be regarded as the true causes why the lower classes in this state do not stand upon an equal footing with their Swiss neighbours, notwithstanding the freedom of the political institutions and the high rank which the upper classes of the grand duchy assume amongst the enlightened nations of Europe. The constitution of Baden

is the one which allows the most political influence to the representatives of the nation of all the German governments, and the law establishing the liberty of the press has only been suspended by the decrees of the Frankfurt diet of the year 1832.

The legislative functions are exercised in Baden by the sovereign and two chambers. In the upper chamber, besides the members of the royal family, the heads of mediatised princely houses, the bishop of Freiburg as head of the Catholic church, and the chief of the Lutheran consistory, the representatives of the universities of Heidelberg and Freiburg, 8 representatives of the lesser nobility, and 8 members named at pleasure by the grand duke,—the heads of families possessing entailed estates of the value of 300,000 florins (capital) may claim the hereditary peerage.

The second chamber consists of 22 deputies of towns, and 41 deputies from as many districts of the country. The members of the upper chamber must have completed their 25th, those of the lower chamber their 30th year. The latter must prove the possession of an income of 1,500 fl. per an. without any limitation as to the source whence it is derived: they are chosen for 8 years. The chambers meet every second year, and their sittings are public. The parliamentary history of Baden since 1830, when the legislative bodies commenced their career of activity, is that of the present improved and flourishing state of the institutions and finances of the grand duchy. In the session of 1831 the budget was fully controlled for the first time, and the responsibility of the minister established. The annually increasing revenue has occasioned some alleviation of the public burdens, and in 1836, when a reduction of taxes was made, the benefit was allowed to accrue principally to the poorer classes, although the principle of equal taxation of all classes is that upon which the financial system is founded.

Financial System.—The direct taxes are levied as follows:—The *land tax* upon the estimated value of all lands, calculated according to sales of landed property in each district at two periods; viz., between the years 1780-90 and 1800-9, half the average price of the district in the one period being added to half the price in the second, and all lands being classed, according to their quality, in several classes. The *rent and revenue tax* is levied upon all dues payable by landholders to their lords, whether as rent or service dues. The capital taxed is calculated at 25 years' purchase for tithes, and 18 years' purchase for other dues; and the cost of collection is deducted. The house tax is rated according to a scale of the value of each tenement, between the years 1800 and 1809. The registered amount of the value of all these descriptions of property, in the estimate for the budget of 1837 and 1838, was 601,530,080 fl., (50,120,000 v.); and the tax levied was 19 kreutzers on 100 florins, or 8 per cent. on a revenue of 4 per cent. from the capital. The *industry tax* is levied in a particular manner. The personal labour of every tradesman and manufacturer is estimated by a capital sum, varying according to the description of employment. All trades are embraced in 10 classes, and the capital so found is increased by a proportional additional sum for every apprentice or labourer employed. The capital sum registered for this tax in 1837 amounted to 100,864,925 fl., (8,408,000 v.), and the rate was 23 kr. per 100 florins, or nearly 3.5ths per cent. Another series of 18 classes embraces the capital employed in tools, stock in trade, &c. The personal industry tax is the one which was modified in 1836, when 300 florins were struck off from the registered capital of each individual; by means of which a large proportion of the poor were relieved from this burden. All persons in the service of the state pay a tax upon the salaries they receive, according to a scale of 9 classes. In the first, the income being below 1,000 florins, is rated at 1½ per cent; but in the last class, which includes the apapages of the members of the royal family, and revenues exceeding 80,000 fl. per ann. (6,000 v.), it amounts to 13½ per cent.

Of the indirect taxes the most important are the excise on beer, wine, and spirits; the slaughtering tax, the stamp duty, and the salt monopoly. The last-named branch of service supplies the inhabitants at 5 fl. 50 kr. per cwt. (10x.), while the price at which the salines furnish salt for exportation is 3 fl. 30 kr., or 6x. The estimate of the budget for 1837 to 1838 was 13,026,559 fl. a year, of which the direct taxes yielded 2,651,168 fl., the excise 1,495,993 fl., the share received from the Prussian Customs' League 1,495,993.

The military force of the grand duchy amounts nominally to 10,000 men, which form part of the 2d division of the 8th corps of the confederate army. The troops are raised by annual conscription; but after the exercising months are over, the greater part are disbanded, and the whole department is managed with the strictest economy. The cost, including pensions, does not exceed 1,500,000 florins annually. In the session of 1838 the second chamber passed a motion for reducing the number of the cavalry.

BADEN (GRAND DUCHY OF).

In the department of justice, the fees taken from suitors and the fines more than cover the annual expenses. The number of trials in the four principal courts of Mannheim, Freiburg, Rastadt, and Mursburg were—

Civil Bankruptcies.		Criminal.		Appeals.	
In 1832	2,011	741	1,680 acqu., 612 acqu., 1,038 con.	248	
1833	2,994	—	1,629 do. 673 do. 956 do.	305	

The sentences were as follows:—

	1832.	1833.
Imprisonment with hard labour	229	206
Hard labour in irons	104	129
Solitary confinement	1	3
Fines, &c.	692	611
Death	12	7
Executed	1	6

The police reports for 1832 give the number of arrests and informations laid at 23,269; but of these 3,377 were for irregularity of passports, and 1,024 for neglect of the regulations concerning travellers, with 5,348 cases of an equally light description. The prisons contained, in 1832, 866 prisoners, of whom 469 were men, and 117 women. An association was formed in 1831 to improve them. The highest judicial tribunal is the Supreme Royal Court at Mannheim, which is the final court of appeal. Under this stand the four courts in the respective chief towns of the circles. In civil cases the trials are public, and the pleadings oral, as in France and England; but the greater part of the criminal proceedings are carried on with closed doors, although the form of pleading and the examination of witnesses is the same. This deviation from the principle of publicity was demanded by the Frankfort diet.

The institutions for education are numerous and good. They consist of—

	No. of schools.	Teachers.	Scholars.
Elementary schools	1,886	2,501	185,400
Middle class schools	21	111	1,821
Politechnic schools	1	30	500
Universities	2	—	1,026

The university of Heidelberg is one of the oldest established in Germany; it was founded in 1386; that of Freiburg in 1451. The faculty of divinity in the former is Lutheran, in the latter Catholic. The school attendance is obligatory on every individual, and the attendance at the Sunday schools continues for two years after dismissal from the elementary school. Every parish has its proportional number of schools. For the formation of schoolmasters two normal schools are founded; for Protestants at Karlsruhe, for Catholics at Ettlingen.

Religion.—Although the reigning family in Baden professes the Protestant religion, yet more than half the inhabitants are, as we have stated, Catholics. According to a treaty entered into with the pope, the bishopric of Constance was suppressed, and by the bull of 11th April, 1834, the bishop of Freiburg was nominated as metropolitan of six German states, viz. Baden, Wirtemberg, the grand duchy, and the electorates of Hesse, Nassau, and Frankfurt. The sovereign confirms the prelates who are chosen by the pope, and the revenues allotted to the church are to be secured on landed property. All bulls, and other religious proclamations, must be sanctioned by the government, and receive its *placet*, previous to publication. The Protestant church is managed by a consistorial court, whose chief has equal rank with the bishop of Freiburg. Its members assemble in a convocation to regulate clerical affairs, the last sitting of which was held in 1834. The foundations of the different religious orders for religious and charitable purposes are stated by Hoinitsch as follows:—

	No. of Foundations.	Annual Revenue.
Catholic { Religious	1,721	996,525 fl.
Protestant { Secular	613	430,713
Jewish	603	674,616
	—	14,900

In addition to these rich donations all classes of civil and religious functionaries have subscription funds for providing for orphans and widows; and savings' banks are general, to encourage providence amongst the lower classes. Beyond these institutions no formal provision is made for the poor, whose moderate habits keep them from being burdensome. In the larger towns, as Mannheim, for instance, subsidiary relief is generally given in the shape of food, clothing, or fuel, from voluntary subscriptions raised by the inhabitants. The regulations are very strict as regards settlement in the communes, and permission to marry; and the number of tradesmen is every where limited by the magistracy, who also control the price of provisions. The weights and measures used in the grand duchy are—the florin or gulden at par 12 fl. = 1 l.; 1 fl. = 60 kreutzers; the foot = $\frac{2}{3}$ Engl. ft.; the morgen = $\frac{389}{100}$ acres; the maap = $\frac{189}{100}$ mp. gallons; the prund = $\frac{1}{10}$ lbs. avoirdupois.

BADEN.

299

The reigning family descends from Berthold, Landgrave of Zähringen, one of the most powerful and meritorious families of the 11th century, whose son acquired the district of Baden. Margrave Augustus George united all the possessions of the two houses of Baden and Durlach, and received, by the treaties at Lunenburg and Presburg, as additions, the bishopric of Constance; the Austrian Breisgau; part of the palatinate of the bishoprics of Spire, Strasbourg, and Basel; the county of Hauenstein; the Ortenau; the island of Meau in the lake of Constance; seven free imperial cities; a part of the estates of the Teutonic order, and nine abbies; together with the sovereignty over seven mediatised nobles of the empire, with a territory of 67 sq. Germ. miles, and 222,000 inhabitants. The reigning Grand Duke Leopold succeeded his half brother, 30th March, 1830, and is married to his cousin Sophia, the daughter of the abdicated King Gustavus IV. of Sweden.

BADEN, a town and celebrated bathing-place of Lower Austria, on the E. bank of an affluent of the Danube, at the entrance of a fine valley 13 m. S. S. W. Vienna. Resident pop., with the neighbouring townships of Guttenbrunn and Welkersdorf, about 4,000; but increased during the summer months by 3,000 visitors, amongst whom are usually the emperor and other members of the imperial family. The presence of mineral springs here was known to the ancients, by whom they were called *Aqua Coite*, from the neighbouring mountains; and in 1769, when the modern baths were constructed, the ruins of a Roman vapour-bath and other buildings were discovered. There are at present 13 baths, each capable of at once accommodating from 50 to 100 persons; for here, it is to be observed, both sexes bathe *en masse*! All parties are attired in loose flowing robes, and promenade in the baths, arm in arm, as if at a *soirée*; and as much interest is used with the master of the ceremonies to obtain the honour of being *parboiled* with high-born exclusives, as to obtain an invitation to the most *recherché* assemblies. (*Spencer's Germany and the Germans*, li. 194.)

The waters, according to the analysis of Volta, contain sulphate and muriate of soda, sulphate and carbonate of lime and magnesia, sulphate of alumina, and considerable quantities of carbonic and hydrosulphuric acid gases: their temperature varies from 88° to 98° Fah. Next to the baths, the most remarkable buildings are, St. Stephen's Church, the palace of the Archduke Anthony, the town-house, theatre, *chiosk*, &c. There are many well-built private houses; several hospitals and other charitable institutions; and a handsome park and public promenade: the neighbourhood abounds with natural beauties, and contains various ancient remains (*Natural Encyclopedia*, pp. 155–163.)

BADEN, a town of the g. d. Baden, famous for its hot baths, usually called Baden Baden, to distinguish it from the watering-place of the same name near Vienna, romantically situated in the Middle Rhine Circle, 24 m. S. S. W. Karlsruhe. Resident pop. 4,700. It was formerly the constant residence of the margraves of Baden, and the grand duke still usually passes the summer in the villa here. The mineral springs were known and appreciated by the Romans, who planted a colony in it, and gave it the name of *Civitas Aurelia Aquensis*. The springs, 13 in number, burst out of the rocks at the foot of the castle terrace. The temperature is not affected by the seasons: the hottest are 84° Reaumur, the coldest 37°. A handsome building, in form of a temple, is erected over the *Ursprung*, as the principal spring is called. Dr. Granville, speaking of this spring, says—“The water is perfectly clear, has a faint animal smell, a taste somewhat salish, and when drunk as it issues from the spring, approaches to that of weak broth.” According to a recent analysis, its specific gravity is 1.030. A pint of the water, containing 7.392 grains, contains 23.8 solid matter, the principal ingredient of which is culinary or common salt (16 grs.); the next in importance are the sulphate, muriate and carbonate of lime (6 grs.); the remainder consists of a small portion of magnesia and of traces of iron with about half a cubic inch of carbonic-acid gas in addition. There is here no public building appropriated exclusively to the purpose of bathing. The water is conveyed by pipes to the different hotels, in which there are numerous baths, some of these being very luxuriously fitted up. Mr. Murray says that this is the most beautifully situated of the German baths, even surpassing, in this respect, the Nassau Brunnens. The surrounding country, without the sublimity and grandeur of Switzerland, is distinguished by a pleasing and romantic wildness, and is, as it were, a prelude to the Alps. July and August are the season when the baths are most frequented; but visitors come and go from May to October. In 1833 they were visited by 13,900 individuals. English visitors have of late years been very numerous; and, but for the prevalence of fogs in winter, it is a desirable residence. A number of handsome buildings, among which, besides the temple over the *Ursprung*, the *Conversationshaus*, with its plantations, is conspicuous. The dungeons under the *New Schloss*,

or palace, are supposed to have been the seat and prisons of some secret and dreadful tribunal; but nothing certain is known of their history.

BADEN, a town of Switzerland, cant. Argau, on the left bank of the Limmat, 14½ m. N.E. Aarau. Pop. 1,800. It is surrounded by walls; is the seat of a tribunal of original jurisdiction; has a good town-house, a handsome Catholic church, 2 convents, an hospital, and a house of correction. The river is crossed by a wooden bridge. Baden is celebrated for its hot baths, known to the Romans by the name of *Therma Helvetica*: they are at a short distance from the town, on both sides the river: the water in the hottest baths has a temperature of 37° Reaumur: they are much frequented by the inhabitants of Basil, Zurich, &c. The environs are very beautiful; and a number of fine cottages for the use of strangers are scattered over the neighbouring heights. The deputies of the Swiss cantons have often held their diets at Baden. The treaty between Franco and the Empire in 1714 was signed here.

BADIA, a town of Austrian Italy, prov. Polesina, on the Adige, 16 m. W. by N. Rovigo. Pop. 3,500. It has a fine bridge over the Adige, and two convents for monks; with a manufacture of earthenware, and some trade in corn, silk, firewood, flax, &c.

BADOLATO, a town of Naples, prov. Calabria Ultra, 24 m. S. Catanzaro, situated on a hill near the sea. Pop. 3,000.

BADONVILLER, a town of France, dep. Meurthe, on the Blette, 20 m. E.S.E. Lunerville. Pop. 2,212. It has a manufactory of awls, which produces about 1,000,000 a year, with fabrics of cotton and earthenware.

BAEÇA, a town of Spain, prov. Jaen, 20 m. N.E. Jaen. Pop. 10,400. It is situated on a hill, in a fertile and extensive plain; has good streets and squares, one of the latter being adorned with a superb fountain. Among the principal public buildings are the Gothic cathedral, the colleges of the Jesuits and of the oratory, the chapel of the ancient university, and the prison. It has a collegiate church, several parish churches, and convents for both sexes, three hospitals, an economical society, and some tanneries. Baeça is supposed to occupy the site of the ancient *Baetia*; and it was the residence of several Moorish kings, having been wrested from the latter in 1228. At this epoch its population is said to have amounted to 150,000; but this is probably an exaggeration. The bishopric, of which it was once the seat, was transferred to Jaen in 1248; and its university has also been suppressed. (*Milana*.)

BAENA, a town of Spain, prov. Cordova, 23 m. S.E. Cordova, on the Marbella. Pop. (town and district) 13,460. It has four parish churches and five convents. There are, in its environs, very productive salt-mines.

BAFFA (an. *Paphos*), a sea-port town on the S.W. coast of the island of Cyprus, lat. 34° 47' 20" N., long. 32° 20' 20" E. This inconsiderable town, not containing more than 1,000 inhab., occupies the site of the famous Paphos of antiquity, which, after being destroyed several times, was rebuilt by Augustus, and was thence called *Augusta*. During the occupation of Cyprus by the Venetians, Baffa was a city of considerable wealth and importance. It is now nearly deserted, and is filled with the ruins of churches and palaces that are every where crumbling to the ground. The bay is large; but the port, commanded by a castle on the beach, is shallow and unsafe. Caves, or rather dwelling-places, have been cut in several of the rocks in the neighbourhood, some of which are inhabited. The country round Baffa is fruitful, and produces considerable supplies of corn, cotton, and silk.

Old Paphos is supposed to have stood about 6 m. S.E. of Paphos or Baffa, at a little distance from the sea. It was the favourite residence of Venus, *Dina potius Cyprî*, the place where the sea-born goddess first took up her abode, and was famous from a very remote epoch for its temples appropriated to her worship, and for the rites and processions performed by her votaries. Hence the epithets Paphian and Cyprian applied to Venus:—

"O Venus, regina Gaidi Paphique,
Sperno dilectum Cyprum."

It is worthy of remark that, according to Tacitus, the goddess was not represented at Paphos under the human figure, but under that of a cone. (*Hist.* lib. 2. §. 3.) There were also temples and altars where sacrifices were offered to the goddess in New Paphos. The office of high priest of the Paphian Venus was both lucrative and honourable. In the proof of this it may be mentioned, that when Cato was sent to Cyprus, he represented to Ptolemy that if he submitted without fighting he should not want either for money or honours, for the Roman people would make him grand priest of the Paphian Venus. (*Larcher, Mémoire sur Venus*, p. 42.)

BAFFIN'S or BYLOT'S BAY, a large inland sea, between Greenland and the N.E. coast of America, between 68° and 74° N. lat., and 52° and 80° W. long. It extends, from S.E. to N.W., about 980 m.; its width

varying from 350 to something less than 100 m. at its N. end. Its surface may therefore be estimated at about 255,000 sq. m., an area exceeding by more than a half that of the Baltic. In fact, however, it is much larger even than this; its natural boundaries being evidently Cape Farewell, the S. point of Greenland, and Cape Chudleigh, on the coast of Labrador, both nearly on the 60th parallel, and respectively in 45° and 65° W. long. Taking these for its dimensions, its surface will amount to 456,000 sq. m.; but it is usual to take for its limits those first assigned, the additional S. part being denominated Davis's Strait. (*Arrowsmith's Atlas*, pl. 41.; *Baffin's Voy.*; *Purchas's Pilgrimage*, ill. 844—848.; *Ross's First Voy.* 84—161.; *Parry's First Voy.* 6—28.)

Modern discovery has shown that the N.E. and N. coasts of America, as far as 120° W., are broken into innumerable islands, and that Baffin's Bay is connected with other great internal gulphs; such as that of Boothia (*Ross's Second Voy.* 93—116.), and the larger basin of Lindson's Bay (*Parry's Second Voy.* 267—247.), and also with the Polar Sea. (*Parry's First Voy.* 29—52.) The term *Mediterranean* cannot be therefore properly applied to this great expanse of water, since, large as it is, it is only one among a number of enormous gulphs in the singularly tortuous channel connecting the N. Atlantic and the Arctic oceans.

The water of this bay attains a great depth, the maximum being 1,050 fathoms, and this was found at a great distance from the land in lat. 72° 29' N., long. 74° 73' W. The bottom must, however, be extremely mountainous, since 15 m. farther N. it was reached in 120 fathoms. The bottom in both cases was mud; and though, from the greater depth, of course, neither insect nor organic matter was procured, yet a small star-fish was found sticking to the line below the point marking 800 fathoms, an extraordinary depth for life in this lat., if the creature were brought up from the point indicated. (*Ross's First Voy.* 191, 192.) In different parts, Parry found no bottom in 250 fath. and 310 fath., while in others his lead reached the ground in 200 fath., 125 fath., and 120 fath. He also, in a high lat. (74½°), found the depth to be 1,050 fath., but he imagined that 100 or 200 fath. should be allowed on this for drift and swell. (*First Voy.* 7, 8, 23, 30.) The temperature of the water is, in summer, from 2° to 3° lower than that of the air in the shade; and this temperature decreases with the depth. It would seem, however, that the bottom mud is pretty uniformly at 29° or 29½°. (*Parry's First Voy.* 27.; *Ross's First Voy.* Appen. 133.) The mouth of this bay or sea being towards the S.E., that is, towards the approach of the tidal wave; tides are, of course, experienced in its waters, but they do not appear to rise to any great height, especially towards the N. 8½ ft. or 8 ft. seems about the average. (*Ross's First Voy.* 41. et pass.; *Parry's First Voy.* 27. et pass.) The melting of the vast masses of snow and ice produces very sensible differences in the appearance and composition of these waters: under such influence, they become turbid and of a dirty brown colour; their gravity diminishing, at the same time very materially, so that the observed extremes in July, 1819, were 1.0261 and 1.0183. (*Parry's First Voy.* 7, 28.) Strong currents, setting towards the S., are experienced in Davis's Straits; and it was this fact which led to the belief that Baffin's Bay was not bounded by land upon the N. as marked by its intelligent discoverer; but would yield a direct passage, in the summer, to the Arctic Sea (*Ross's Official Instr.*, *First Voy.* 3.); but these currents were found not only to diminish in intensity with increase of lat., but even to run N. in the upper part of the bay (*Parry's First Voy.* 31.), while the continuity of land round the bay-head was fully demonstrated by Ross, who, in 1814, followed very nearly the identical track which Baffin had sailed over 200 years before. (*First Voy.* 153. et pass.) Baffin's Bay is full of indentations upon both its coasts, but only one continuous channel has been discovered; and this is the *Sir J. Lancaster's Sound* of Baffin, to the continuation of which, to the Polar Sea, Parry gave the name of Barrow's Strait. (*First Voy.* 52.) It runs W. from lat. 74° 30' 3" N., long. 78° 1' W. It is now in the highest degree improbable that any other outlet should exist from this bay in any direction. There are but few islands in these waters. Disco, on the E. coast, in lat. 70° N., long. 58° W. (mean), is a Danish whaling station; and Hare or Waygat Isle, a little N. of the former, has acquired some celebrity as the place where one of the most modern experiments was made to determine the elasticity of the earth. The acceleration of the pendulum between London and this place was 53° 23' 36" vibrations in a mean solar day, showing a diminution of gravity from pole-to-equator, equal to .0055139, and a compression of the polar axis equal to 3½". (*Parry's First Voy.* Appen. 166.) The land in the neighbourhood is mountainous, and in the last degree barren; wood is totally absent, and the few plants that are found are of the low-growing, hardy kind, fitted to endure the intense cold of these regions. (*Ross's First Voy.* Appen. 141—144.; *Parry's First Voy.*, pass.) The com-

position of the rocks is very various, but with an immense preponderance of old formations (granite and gneiss); limestone is found, but not abundantly; and a trap appears to form a very characteristic feature of these shores. Basalt occurs; and rock of every kind is brought down on the floating ice. (*McCulloch's Paper; Ross's First Voy., Appen. 69-82; Parry's First Voy. 26, et pass.*) The birds and animals are those of the Arctic regions generally (*Edwards's Paper; Ross's First Voy. 41-64.*); and in the water, the whale and seal are particularly numerous. Parry, by showing the possibility of crossing through the ice, which always occupies the centre of the bay, performed an important service to the whalers, whose fisheries had before been confined to the coast of Greenland, where the whales are fewer in number and inferior in quality to those met with on the American shore. (*First Voy. 18-23, 29.*)

The discovery of a N.W. passage to India has been a favourite project for more than three centuries. In this attempt, Sebastian Cabot led the way in 1497, when he approached this sea as nearly as the 58th parallel of lat. He was followed by Martin Frobisher, who, between 1576 and 1578, made three voyages for the same purpose, entered between the shores of Greenland and America, and gave his name to the strait between Resolution and Camberland islands. John Davis, between 1585 and 1587, made three voyages, and proceeded as high as 68° N. lat.; his name is very properly preserved in that portion of the sea which he traversed; but the term strait (D.V.I.S. STRAIT) is not very appropriately applied to it, the narrowest part of the sea being 160 m. across. Lastly, in 1616, Robert Bylot, or Bilect, commanded an expedition, fitted out by private adventurers, for similar discoveries. Baffin was pilot of this ship; and the result was the exploration of the bay to its very head, and the ascertaining of all its points, sounds, and bearings, with a precision that has not been improved, except in the correction of some errors of longitude. Bylot and Baffin not having been followed by other navigators for more than 200 years, suspicions began to be entertained as to the authenticity of their statements; and Baffin's Bay (N. of 68°), is not actually struck out of the charts, was laid down in the greater number as doubtful. There never, however, was any probable ground for this discredit; and late discoveries have shown how unjust it was, and have placed the names of Baffin and Bylot in the first class of enterprising and trustworthy navigators. (*Hakluyt's Collect. Voy. iii. 6-9, 29-96, 98-119; Purchas's Pilgrims, iii. 831-848, &c.; Ross and Parry, passim.*)

BAFRA, a town of Asiatic Turkey, pacha. Sivas, on the right bank of the Kizil Ernak, 13 m. above where it falls into the Black Sea; lat. 41° 32' 52" N., long. 36° 11' 45" E. Pop. 2,000. It has a fine bridge, and two mosques. The environs are fruitful of rice and flax, and its bazars are said to be well supplied.

BAGDAD, an important prov. or pachalik of Turkey in Asia, of a triangular form, stretching N. W. from the bottom of the Persian Gulf, in about 30° to 38° N. lat., and lying between the 40th and 48th degree of E. long., having W. and S. the Euphrates and the Arabian desert; E. Kurdistan, mount Zagros, and the Persian prov. of Azerbijan; N. W. the pachalik of Diarbekr; and N., Armenia and the territories of the Kurdish chief of Julamerik. This immense tract extends over an area of above 100,000 sq. m., and comprises the whole of the ancient *Babylonia* and *Chaldea*, and the greater part of *Assyria Proper* and *Susiana*. Except where it is bounded on the W. by the Euphrates, the prov. is traversed in its whole extent by this great river and its rival the Tigris, and by the greater and lesser Zab, the Diala, and other affluents of the latter. It is naturally divided into three portions; viz. 1st the country between the Arabian desert and the Euphrates; 2d, that between the latter and the Tigris, the *Mesopotamia* of the ancients; and, 3d, the country to the E. of the Tigris. That portion of Mesopotamia S. of the city of Bagdad is now called *Irak-Arabi*, and that to the N. of Bagdad *Al-Azzerah*, or the island. The soil and appearance differ widely in different parts. At present its most fertile portion is that situated between mount Zagros and the Tigris, N. to Mosul. The tract lying between the two great rivers, one of the richest, best-cultivated, and most populous regions of the ancient world is now, in most parts, an absolute desert, through the misgovernment to which it has been subjected. "The mighty cities of Nineveh, Babylon, Seleucia, and Ctesiphon have crumbled into dust: the humble tent of the Arab now occupies the spot formerly adorned with the palaces of kings; and his flocks procure but a scanty pittance of food, amidst the fallen fragments of ancient magnificence. The banks of the Euphrates and Tigris, once so prolific, are, for the most part, covered with impenetrable brushwood; and the interior of the prov. which was traversed and fertilised by innumerable canals, is destitute of either inhabitants or vegetation." (*Kinncir's Persian Emp., p. 237.*) The country W. of the Euphrates is but of limited extent, and at a short distance from the river becomes an arid waste. The

climate in the S. parts in June, July, and August, is exceedingly hot during the day; but the nights are always cool, and fires are absolutely necessary in winter. The prevailing wind is from the N. W. The *Simsom* (see ARABIA) is more common at Bagdad than in other parts of the prov.; but, in general, it is fatal only to strangers, the Arabs being, in most instances, aware of its approach. It would be easy, were the government not proverbial for imbecility and ignorance, to restore some portion of the ancient prosperity of Mesopotamia. Few countries are blest with a finer soil, or are capable of being cultivated with less labour. The Euphrates and Tigris, which are seldom more than 30 m. apart, approach in the latitude of Bagdad to within 25 m. of each other, and afford an inexhaustible supply of the finest water. They rise twice a year (see EUPHRATES), and as the water is then nearly on a level with the surface of the plain, the irrigation, so indispensable to countries like this, is effected with the utmost facility. But the insecurity of property renders these advantages of no avail. Under the stupid despotism of the Turks, the cultivators, liable at all times to have their fields laid waste and their habitations pillaged by the myrmidons of those in power, avoid, as much as possible, all sorts of labour. Here, as in all similarly situated countries, the natives restrict their tillage to the immediate vicinity of towns and villages; and it is only in rare instances, and under peculiar circumstances, that cultivation is prosecuted on a larger scale, any thing like adequate vigour. The products of this naturally fertile region are alike various and valuable. Excellent crops are raised of wheat, barley, rice, maize, and other grains: tobacco, hemp and flax, cotton, &c., are cultivated; dates are an object of much attention, are reckoned of a peculiarly good quality, and are almost as much prized here as in Arabia. The mountains in the E. and N. parts of the prov. are covered with vast forests, consisting principally of oaks, which furnish the best gall nuts brought from the E. The horses of this prov. have been long renowned. They are small, being seldom more than 14 hands high, docile, never known to be vicious, and capable of undergoing a vast deal of fatigue. The camel, however, is at once the most common and most useful of the domesticated animals. Mules and asses are both met with in considerable numbers; buffaloes are kept for the sake of their milk, and oxen for agricultural purposes. Among wild animals are lions, panthers, hyenas, jackals, wolves, and wild boars. All sorts of poultry are bred except the turkey: ostriches are found in the deserts, and black partridges are common on the banks of rivers. There are no means by which to form any accurate estimate of the pop. of this pachalik; but it probably exceeds 1,300,000—a number hardly, perhaps, equal to the pop. of either Nineveh or Babylon. The pop. consists of Turks, Arabs, Kurds, Turkmans, Armenians, &c. The prov. is only partially subject to the Porte. The chiefs or sheiks of the Arabs and Kurds, who are masters of the whole country beyond the precincts of the towns, are frequently at open war with each other. They are bound to furnish the pacha with a certain number of troops and a certain amount of tribute; but these contingents are always very irregularly paid; and, in many instances, the chiefs acknowledge only a nominal dependence on the Porte. Were this country subject to a vigorous and moderately intelligent government, it would soon become one of the most flourishing in the world. But no improvement need be looked for so long as it continues subject to its present rulers. (*Kinncir's Persian Empire, pp. 236-312.*)

BAGHDAD, a famous city of Asiatic Turkey, long the cap. of the Caliphate, and now of the above prov., on the Tigris, about 156 m. in a direct line from the junction of the latter with the Euphrates. Lat. 33° 19' 40" N., long. 44° 24' 45" E. Pop. variously estimated, but may probably amount to about 70,000, principally Arabs and Turks. It stands on both banks of the river, which is here about 620 feet across, but the larger portion is to the E. side; the communication between its two divisions is maintained by means of a bridge of boats. It is of an oblong shape, is surrounded by a high wall of brick and mud, about 5 m. in circ., flanked at regular distances with towers, some of which, of an immense size, were built by the earlier caliphs. There are 6 gates, 3 on each side the river. The castle at the N. corner of the city commands the passage of the Tigris, but is a place of no strength. The town is mainly built; streets so narrow that where two horsemen meet they can hardly pass each other. The bazars, though extensive and well supplied, are far from handsome. Few of the ancient buildings remain; but these few are far superior in elegance and solidity to the more modern structures. Of the former, the most worthy of notice are the gate of the Tallasman; a lofty minaret built in 785; the tomb of Zobaida, the most beloved of the wives of Haroun-al-Raschid. The famous *Madrassa Mostanseri*, or college founded in 1233 by the caliph Mostanser, and long the best attended and most celebrated

seminary in the E., still exists; but *quantum mutatus*! It is converted into a khán or caravanera, and its old kitchen into the custom-house! (*Niebuhr*.) Nothing remains of the far-famed palace of the caliphs; *etiam ruina perire*; and the spot where it stood is not even ascertained. The only handsome modern edifice is the tomb and sanctuary of a famous Soudi doctor, the patron saint of the town, who flourished anno Hegira 860.

Bagdad was recently a place of great trade, and the resort of merchants from almost every quarter of the E. It supplied Asia Minor, Syria, and part of Europe with Indian commodities, which were imported at Basora, brought in boats up the Tigris, and then transported by caravans to Teocat, Constantinople, Aleppo, Damascus, and the W. parts of Persia. The chief imports from India are gold brocade, cloths, sugar, pepper, tin, sandalwood, iron, china-ware, spices, cutlery, arms, and broad cloth; in return for which they send bullion, copper, gall-nuts, tamarisk, leather, and otto of roses. From Aleppo are imported European silk stuffs, broad cloth, steel, cochineal, gold thread, and several other European articles, brought in Greek vessels to Scanderoon. The imports from Persia are shawls, carpets, silk, cotton, white cloth, leather, and saffron; and those from Constantinople are bullion, furs, gold and silver thread, jewels, brocade, velvets, and otto of roses. The principal manufacture is that of red and yellow leather, which is much esteemed; but silk and cotton stuffs are also produced. Of late years, however, the trade of the city has a good deal declined, in consequence principally of the inability of the government to repress the attacks and exactions of the Arabs.

The climate, notwithstanding its great heat, is admitted to be very healthy; but the natives are, without exception, the ugliest people in the Turkish empire, and are universally subject to a cutaneous disorder similar to that which prevails in Aleppo (which see). In this city, though the former cap. of the scientific world, reading and writing are rare accomplishments; and when Niebuhr was here, there was not a dealer in books in the town, nor any means of procuring a single volume!

Bagdad was founded by Al Mansour, second caliph of the Abbasides, A. D. 763, and is said to have been principally formed out of the ruins of the ancient city of Ctesiphon. It was greatly enlarged and adorned by the grandson of its founder, the famous Haroun-al-Raschid. It continued to flourish, and to be the principal seat of learning and the arts, till 1250, when it was taken and sacked by Huloak, grandson of Gengis Khan. It has since undergone various changes, and has successively fallen into the hands of the Persians and Turks. The latter, however, have held it since 1638, when it surrendered, on capitulation, after a brave resistance. The terms of the capitulation were, that the lives and property of the inhabitants should be saved; but the bloodthirsty conqueror, Amurath IV., regardless of this convention, barbarously massacred a large proportion of the inhabitants. It was inefficiently besieged by Nadir Shah. (*Kiaucir's Persia*, pp. 246-252; *Niebuhr, Voyage en Arabie*, ii. pp. 239-267.)

BAGNA-CAVALLO, a town of the Papal States, leg. Ferrara, on the Sino, 12 m. W. Ravenna. Pop. 10,000. It has establishments for the spinning of silk; and large quantities of hemp are cultivated in its environs, which are also productive of corn, &c.

BAGNA LOUKA, or **BANGALUKA**, a town of European Turkey, in Bosnia, on the Verbas, cap. anjak. 30 m. S. Gradiska; lat. 44° 58' N., long. 17° 3' E. Pop. 7,000. It stands in a fertile valley, is defended by a castle, and was for some time the cap. of a pachalik. It has numerous mosques, two public baths, a powder manufactory, which furnishes the best in the country, and various bazars. The inhabitants are partly Turks and partly Greeks and Jews. (*Diction Géograph.*)

BAGNARA, a town and castle of the Papal States, leg. Ravenna, on the Sarnero, 7 m. N.N.W. Faenza. Pop. 2,000.

BAGNARA, a sea-port town of Naples, prov. Calabria Ultra, cant. Scylla, 16 m. N.E. Reggio. Pop. 5,000. It has a considerable trade in excellent muscat wine, produced in the vicinity, and in wood and tar. Bagnara suffered severely from an earthquake in 1783. It is supposed by some geographers to be the Portus Orestis of the ancients.

BAGNAREA, a town of the Papal States, leg. Viterbo, 16 m. N. Viterbo. Pop. 3,500. It is situated on a hill, and is the seat of a bishopric.

BAGNÈRES-DE-LUCHON, a town of France, dép. Haute Garonne, 24 m. S.S.W. St. Gaudens. Pop. 2,385. It is situated in the beautiful valley of the Luchon, at the foot of the Pyrénées, within about 5 m. of the Spanish frontier. It is celebrated for its mineral waters, which, as well as those of Bagnères-en-Bigorre, were known to the Romans. The town is said to be "*triste et caduë*;" but it is improving and improving, and now possesses almost all the establishments peculiar to a well-frequented watering place. The Hôtel des Thermes

is the principal edifice. In winter the climate is very severe, and the town is deserted not merely by visitors, but even by a portion of its inhabitants. There are 9 mineral springs, all of which issue from a rock at the foot of the adjacent mountains; their temperature varies from 28° to 59° of Reaumur; they have a fetid smell, and are said to be very efficacious in a variety of complaints. More invalids resort to Bagnères-de-Luchon than to either Bagnères-en-Bigorre or Bourges. The season lasts from May till October, and upwards of 1,500 strangers may be accommodated. The avenues of trees leading to the baths are as fine as can be imagined. In the neighbourhood of the town, among the Pyrénées, is the wild solitary lake of Seulegro. (*Hugo, France Pittoresque*, art. *Haute Garonne*; *Ingli's Switzerland*, p. 290.)

BAGNÈRES-EN-BIGORRE, a town of France, d.p. Hautes Pyrénées, cap. arrond. on the left bank of the Adour, in a delightful situation at the entrance to the valley of Campan, and the foot of a finely wooded hill, 13 m. S.S.E. Tarbes. Pop. 8,168. Bagnères is the Bath or Cheltenham of France, and is indebted for its celebrity and importance to its hot mineral springs, which were known and resorted to by the Romans. The waters have no peculiar taste, but are aperient and tonic. During spring and autumn the town is crowded with invalids and pleasure-hunters from moon cities of Europe, and by many foreigners, partly early Russians and English. As many as 8,000 strangers have been assembled here at the same time; uniting, as has been stated, "*ce qui fait le charme, l'honneur de la société, mais aussi ce qui en fait l'opprobre*." The town has not been built on any regular plan, but has increased according to the influx of company. In consequence, though it has some good streets, with very excellent houses, and good inns and hotels, it has not a single good square, nor any public building worth notice except the New Bath Hotel, in the Greek style, and of bluish marble. Streets well paved, clean, and well watered. The promenade, called *Costans*, in the centre of the town, is ornamented with a fountain; there are several delightful drives and promenades in the vicinity; and it also affords the finest excursions for the botanist, mineralogist, and the lovers of the picturesque and the sublime. There are 14 or 20 baths: "Each is under the direction of a medical inspector, who must be consulted before any one is permitted to employ the waters. He is paid by government, and, therefore, the consultation costs nothing; and the expense of the bath is not more than a franc." (*Ingli's Switzerland*, &c. p. 264.) The principal bath, or that called *du Salut*, is situated in a ravine about ½ league from the town. Bagnères has a court of original jurisdiction, a college, an hospital, with a theatre, a concert-hall, and numerous places of entertainment. It has also fabrics of banios (a kind of woollen stuff), linen, étamines, crape, and paper. On the road to Tarbes is a monument in black and white marble in honour of Count Segur. (*Hugo, France Pittoresque*, art. *Hautes Pyrénées*.) According to Mr. Ingli, Bagnères is not a very cheap place. "At the public establishments one chamber costs 5 fr.; breakfast of tea or coffee, 2 fr.; dinner, 4 fr. To those who live in private lodgings market prices are also high. Butchers' meat is seldom below 8d. per lb.; a fowl costs 1s. 3d.; milk and butter are both dear; and although *vin ordinaire* may be had at 4d. per bottle, tolerable wine costs at least double that sum." (p. 265.)

BAGNOLES, a village of France, dép. Orne, in a solitary valley, 10 m. E. by S. Domfront. This village, celebrated for its mineral springs, was built in the 17th century, the springs having been discovered in the preceding century. During the last twenty years it has been embellished with some new and elegant buildings, and in its environs are extensive plantations that afford fine promenades. In 1822 an establishment for the use of the military was founded here, capable of accommodating about 200 invalids. The temperature of the water is about 26° centigrade. This is the only mineral spring in the département of Normandy. (*Hugo, art. Orne*.)

BAGNOLI, a town of Naples, prov. Sanp'io, 9 m. S.W. Trivento, on the declivity of a hill. Pop. 3,000. It has five churches, an abbey, and an hospital.

BAGNOLO, a town of Austrian Italy, 8 m. S. Brescia, on the high road from Brescia to Cremona. Pop. 2,600.

BAGNOLO, a town of Naples, prov. Principato Ultra, on the declivity of Monte Calvello, 9 m. S.W. St. Angelo de Lombardi. Pop. 5,000. It has a fine collegiate church, and several convents.

BAGNOLS, a town of France, dép. Gard, cap. cant., near the Cèze, on a rock 25 m. N.N.E. Nîmes. Pop. 4,847. It is generally ill-built, but has a good square, adorned with a public fountain. It has a college, an hospital, with filatures of silk, dye-works, hat-makers, tanners, &c.

BAGOLINO, a town of Austrian Italy, prov. Briscia, on the Caffaro, 24 m. N.N.E. Brescia. Pop. 3,000. It has several forges for the manufacture of iron and steel.

BAGULCOT, a subdiv. of the distr. Darwar, Hin-

dostan, prov. Bejapoor, presid. Bombay, including the pergunnahs Bagulcot and Badaumy: shape irregular; length 54 m.; breadth 44 m.: area about 1,230 sq. m. Pop. about 100,000. It is bounded N. E. by the Krishna river, but is badly watered, as well from the want of running streams and large wells, as the general deficiency of rain, which in some years does not exceed 26 inches, a quantity surpassed in one month of the S. W. monsoon near the coast. Garden culture is consequently very limited, and most of the villages are on the banks of the larger rivers. In 1820 these pergunnahs contained 319 inhab. townships, including the towns of Bagulcot, Badaumy, Keroor, Seroor, and Perwate. Under the Marathas, who obtained them in 1755, they were the theatre of violence and rapine; but after their transfer to the British gov. in 1818, a rapid and complete change took place, and they soon became singularly noted for the absence of crime. (*Hamilton*, i. p. 101.)

BAGULCOT, a town of Hindostan, cap. of the above district, and of a pergunnah. Pop. in 1820, 7,500. It is the residence of the principal merchants and bankers. BAGUR, an inh. division of Hindostan, anciently described as a separate, though minor prov., but more recently attached to the prov. Malwa and Gujrat, between which it lies, in about 24° N. lat., and 74° E. long. It consists of a hilly country, the several ranges of which run N. and S., decreasing in height from Malwa to Gujrat, and mostly covered with thick low jungle forests of teak, black-wood, &c. It is indifferently watered, and the climate for a considerable part of the year is reckoned unhealthy. From the first cause the ground is comparatively unproductive; the digging of wells, &c., is also attended with great labour and expense, but reservoirs are sometimes constructed by throwing an embankment across the stream of a narrow valley. The pop. consists chiefly of Bheels and Meenas, under various petty chiefs: many vestiges of antiquity lie scattered over its surface; but at present this div. contains no inhabited places of any importance, except the towns of Doongurpoos, Bauswarra, and Sangwara. (*Hamilton's E. I. Gaz.* 102.)

BAHAMAS (THE) consist of several hundred islands, of various magnitudes, extending in a S.E. and N.W. direction, between Hayti and Florida, nearly 600 m. from Turk's Island, in 21° 23', to the Mantanilla Reef, in 27° 50' N. lat., and from 71° 5' to 79° 5' W. long. They are mostly of coral-lime formation, low, flat, and but scantily covered with soil, and the greater number of them uninhabited. They belong to Great Britain. St. Salvador, one of these islands, was the first land discovered by Columbus, on the 12th of Oct. 1492. Like the neighbouring islands, it was densely peopled by Indians, who were harmless and inoffensive. The most important of the group, however, from its harbours and its position with respect to the Florida Channel as New Providence, and as this is the residence of the governor, the seat of the legislature, and the headquarters of the troops, and as it differs from the other islands in no essential degree, we shall confine ourselves to an outline of its geographical features and general appearance, deeming it unnecessary to dwell upon any of the others. It lies in lat. 25° 29' N., and in long. 76° 34' W., and extends about 21 m. from E. to W., and 7 m. from N. to S. It is nearly covered with large trees and brush-wood, and much intersected with marshes and lagoons. A range of slightly elevated hills runs along a part of the island at a very short distance from the sea; and upon the face of this ridge stands Nassau, the capital, and the seat of government. Another range of hills runs parallel to the former, at the distance of about 24 m.; the whole of the intervening space forms an extensive marsh. The total number of sq. m. in the Bahamas, including all the islands from Key-Island to Key-Island, and Anguilla, is, according to Porter's Tables, 5,424. The pop., in 1832, was 4,674 whites, 4,069 coloured and free blacks, and 9,765 slaves. In 1837 the total pop. was 19,943. The inhab. are divided into the two classes of residents and wreckers. The latter are mostly employed in rescuing vessels, with their crews and cargoes, shipwrecks being very frequent in these intricate, shallow, and dangerous seas. They sail in small flat-bottomed boats, admirably fitted for the water they navigate. They are excellent sailors; are familiar with all the keys, shoals, and breakers; and encounter danger with alacrity and courage. Their great places of rendezvous are the Florida Gulph, the Hole in the Wall, and the Hog-sties. Their vessels are very numerous. They are licensed by the governor, and receive a salvage on all property rescued from the waves. The climate varies very considerably, both in temperature and salubrity, according to the geographical position and local peculiarities of the islands. At New Providence the weather, during the cold season, which extends from Nov. to May, is extremely pleasant; the thermometer in the shade being generally from 60° to 70°, the mid-day heat tempered by a constant breeze; and the evenings cool and agreeable. From May to Nov. the heat increases or decreases, as the sun advances or retires from the tropic of Cancer, and during this period

the range of the thermometer is from 75° to 85°, seldom rising above 90°. The increase of temperature is generally accompanied by southerly winds or calms, which are described as being very oppressive. A considerable quantity of rain falls during the year, but we possess no exact measurement of it. The spring rains commence about May, and continue for a few weeks; those of autumn commence in Sept., and generally terminate in Nov. or Dec. During the autumnal months fogs are very frequent in the mornings and evenings; but from Dec. to May the weather is generally fine, clear, and dry. It is impossible to ascertain the exact amount of acres cultivated, as, owing to the rocky nature of the islands, spots are generally selected to plant in, without any attention to the regularity observed in more favoured soils; but the number of persons set down in the official tables as employed in agriculture are 3,590. The chief articles of produce are, Indian and Guinea corn, potatoes, yams, beans, peas, pine-apples, cotton, ochres, casada, pumpkins, arrow-root, onions (of which a great quantity are raised), oranges, limes, and lemons. There may be about 12,000 acres of pasture, which give support to 1,490 horses, 2,765 horned stock, 7,890 sheep and goats, and 3,350 swine. A great quantity of dye and other woods is exported; but the principal export is salt, of which no less than 442,031 bushels, valued at 16,391*l.*, were exported in 1834. The gross amount of exports in 1834 was 32,802*l.*; of imports, 142,021*l.*; the principal of which were slops, flour, corn-meal, and oats, cotton wool, cotton manufactures, dyo-woods (for exportation), linen manufactures, wood and lumber, woollen manufactures, and hardware. The number of tons of shipping employed inwards was 34,150 in 1834, and the number of men 2,251. Outwards there were 31,607, in which were 2,090 men. The number of vessels built in 1834 were 17; in all, 716 tons burden. The total number of the militia is 367. At the several schools, chiefly supported by the colonial government, except others by the home government, and another by the associates of the late Dr. Bray, there are 1,117 pupils, and the Wesleyans instruct about 630 more of all colours and sexes. The government consists of a governor, a council of 12, and a house of assembly of 30 members. The courts of law are, the Supreme Court, which holds its sessions in terms of 3 weeks, with the powers of the common law at Westminster, and its practice modelled on that of the King's Bench. The revenue of these islands for 1837 was 23,165*l.*, and the expenditure 27,153*l.* The historical sketch of the Bahamas will not detain us long. New Providence was settled in 1629 by the English, who kept possession of it till 1641, when they were expelled by the Spaniards, who murdered the governor, and committed many acts of barbarous cruelty. It was recolonized in 1666 by the English a second time; but they were again expelled by the French and Spaniards in 1703, and from that period it became a rendezvous for pirates, till formally ceded to the English in 1783, in whose possession, with the other islands, it has since remained. The proportion of the 20,000,000*l.* of compensation granted by Britain awarded to the inhabitants, was 124,340*l.* 7*s.* 8*d.*, while the relative value of the slaves was 290,573*l.* 15*s.* 3*d.*

The principal islands forming the Bahama group are, New Providence and Keys; Andross Island, Green and Grassy Keys, Grand Bahama, and the Berry Islands; Great and Little Abaco and Keys, Harbour Island, Eleuthera, Royal Island and Keys; St. Salvador and Little Island; Watling's Island and Rum Key; Great and Little Exuma and Keys; Ragged Island and Keys; Long Island; Crooked Island, Fortune Island, and Acklin's Island; Great and Little Henegua, Mayaguana, French and Atwood's Keys; the Calicos Turk's Island, Key-Island, and Anguilla.

BAHAR, or BAHAR, an inh. prov. of Hindostan, presid. Bengal, one of the largest and most important under the British dominion. It lies chiefly between 22° and 27° N. lat., and 83° and 87° E. long.; having N. Nepal; W. Oude, Allahabad, and part of Gundwana; S. the latter prov.; and E. Bengal: area about 63,744 sq. m. Pop. (1828) 8,117,700.

The Ganges runs a course of 200 m. through this prov. W. to E., dividing it into two nearly equal parts. The other chief rivers are the Sone, Gunduck, Dumdodah, Caramnassa, and Dewah, all tributaries of the former: there are numberless smaller streams, and the prov. generally is well watered, especially its N. portion; in the S. irrigation is artificially effected by means of wells, dams, trenches, &c. It may be described under three divisions; one an uninterrupted flat extending for 70 m. N. of the Ganges, to the forests of Nepal and Morung; a second, or central div., extending 60 m. S. from the Ganges, consisting only in part of plains, but yielding nearly 2-3ds of the whole annual produce of opium; and a third and more elevated region, S. of the latter, with an area of 18,000 sq. m., less fertile than the others, but said to contain diamond mines, and thence called Nagpore. Climate temperate, but in the hot seasons parching wind from the W. often prevail during the day. Frosts are

rare, but during the cold seasons the thermometer often ranges from 35° to 70° (Fahr.) in the course of the day, among the hills; and in this district the winds are very bracing to European constitutions. No diseases are peculiar to the prov., but bronchocela is very prevalent on the N. side of the Ganges. Soil fertile, and productive of the drier grains: it also produces large quantities of nitre, with sulphate and muriate of soda, especially N. of the Ganges, where nitre is a gov. monopoly. Agriculture, commerce, and manufactures, have always been in a comparatively flourishing state in this prov.; partly from its central position, easy internal communications, and being a thoroughfare for the trade of Bengal with the upper provinces; and partly from its fruitfulness and natural fitness for tillage. Here, however, as well as in Bengal, only about 1-3d part is supposed to be under cultivation, (*Hamilton's E. I. Gaz.* i. 177.) Opium, a staple commodity of the prov., is perhaps the best in India. It is a gov. monopoly. Bahar and Benares being the only provs. within the Bengal presid. where it is allowed to be cultivated: in 1825-27, the produce of Bahar was 9,981 factory mauts, of the value of £387,372 sterling; and it has since increased. (*Rep. Res. sec. iii. p. 701.*)

Indigo is very extensively grown in Tirhoot, where much forest land, and land formerly used for grain, has been appropriated to its culture, and where the produce is also manufactured upon a large scale. The planters and cultivators are now on good terms with each other; and since it was agreed that only one planter should settle in a village, quarrels among the latter have also ceased. The people in the indigo districts are said to be in a much better condition than elsewhere. Sugar cane, betel, tobacco, and grain of all kinds, are cultivated largely, and there is a good stock of cattle. Most part of the lands in Bahar are held in small lots by cultivators or *ryots*, who pay a land tax of half the produce: the permanent settlement has been by no means so widely established as in Bengal; jaghires are there rare, but frequent here; while, on the other hand, there are in Bahar but three large zemindaries, viz. those of Shahabad, Tirhoot, and Tickary. This arises from the circumstance that the zemindars of Bahar were always inferior in power and influence to those of Bengal, and their zemindaries much smaller; so that they were sooner and more easily identified with the body of cultivators.

The chief manufactures are, cotton cloths for exportation, essences, and saltpetre, the manufacture of which scarcely passes the E. limits of the prov. Bahar is divided into 8 districts or collectorates, viz. Bahar, Bhaugulpore, Bhurrunpore, Ramgar, Shahabad, Sarun, Tirhoot, and Patna, and yielded (1830) an annual revenue of 7,167,171 rup., or 716,747l. sterl.: the revenue has varied but little since 1813. The chief city is Patna. The natives have a finer physical appearance, but are inferior to their Bengal neighbours in cleanliness and domestic economy. In the S. parts agriculture is wholly carried on by slaves; and many of these consist of individuals who, by a practice peculiar to this prov., mortgage their labour until able to redeem a debt; a large part of the pop. are Mohammedans. This prov. anciently is supposed to have formed two independent sovereignties—that of Mithila in the N., and Magadha in the S.; and distinct languages still continue to be spoken in them. It was acquired from Cossim Ali by the British in 1763, since which it has enjoyed perfect tranquillity. The city of Gaya was the birthplace of Buddha, but no Buddhists now remain in Bahar. (*See Hamilton's E. I. Gaz.* i. 102—106; *Fleming, W. M. Esq., Letter in Dec. Report, pp. 282—288.*)

BAHAR (DISTR. OF ZILLAH OF), occupies the central portion of the above prov.; being bounded N. by the Ganges; E. by the distr. of Bhaugulpore; S. by those of Bhaugulpore and Ramgar; and W. by Shahabad: extreme length, E. to W., 120 m.; breadth, 80 m.; area, 5,235 sq. m. Pop. in 1811, 2,755,000, of whom 725,000 were Mohammedans. Surface generally level, especially in the N., where the banks of the Ganges are highly cultivated; there are, however, many scattered hills, and three principal ranges, in the heart of the distr., of primitive formation, containing granite, gneiss, mica, quartz, jasper, hornstone, silica, &c.; but, except toward the S. boundary, none of them probably exceed 700 ft. in height. Next to the Ganges, the chief river is the Son, its channel being sometimes nearly as large as that of the former; its E. banks are all cultivated (tamaris and blown up from its bed in the dry season; there are no lakes, and few marshes in this distr., although in the wet season much of the country is under water. There are many hot springs in various spots; bituminous and other volcanic substances have been also met with, and in one place an extinct crater is distinctly visible. About 490 sq. m. are covered with woods and thickets, including the bamboo, palm, mango, fig, apple, pomelo-granate, &c., which are all cultivated (tamaris and syclypus bushes in large quantity); the *strychnos*, *ner sennia*, *cashu*, nut, and the *saltia*, believed by Mr. Colebrook to be the tree yielding gum olibanum. The chief

wild animals are a large and formidable black bear, the spotted tiger, ichneumon; a few monkeys, squirrels, foxes, and dogs; many birds of prey; porpoises, and a profusion of fish, are found in the Ganges, as well as alligators; but there are no wild elephants, rhinoceroses, or buffaloes; few tigers, and neither parrots, &c., nor singing birds. The lands near the river yield two crops in the year, but this is not the case with more than 1-4th part of the arable land in the interior. Rice is by far the most important article of culture, but the ears only are reaped; the straw being abandoned to the cattle, or left uncut, till wanted for thatch. Wheat is next in importance; and with it, or with pulse, barley is often sown; maize is almost wholly confined to the banks of the Ganges. Cruciform plants, linseed, and sesamum, are cultivated for their oil; ginger, coriander, capsicum, the potato and other succulent vegetables, are likewise grown; cotton on 24,000 begas, the sugar-cane on 20,000 b., indigo by itself on 1,500 b., and tobacco on 480 b.; betel only on 265 b., but the poppy is very extensively planted, though generally in conjunction with some other produce. The plough and the cattle are both well reared, though the latter are somewhat better than those more to the E.; the grain is trodden out by cattle, and kept by the more opulent proprietors in hovels of mud and thatch. The *ashraf*, or higher ranks, pay no rent for land occupied by their houses, and no landlord may refuse to grant them land for building; but Europeans, not being dignified with the title of *ashraf*, find much difficulty in obtaining it. Few of the cultivators are rich. A large portion of the land, perhaps about a half, is exempted from the land tax; and yet it is affirmed, and we believe truly, that the taxed portions are the best cultivated and most productive. Some of the rent-free estates are still large, but, owing to the rules of inheritance, they are rapidly subdividing; and many of the zemindars are reduced to the condition of peasants, or are but little above beggary. Many occupiers are in the habit of receiving advances from their landlords, to enable them to carry on their business; while others borrow money for the same purpose, at 2 per cent. per mo. interest; and, ruinous as such payment may appear, the latter are universally observed to be in the end the best off. The cultivators are not subject to the illegal exactions that press on the tenantry in Bengal, and are in consequence attached to their landlords, and ready to promote their interests. The total land revenue in 1830 amounted to 167,370l. sterl. Bahar distr. is divided into 12 pergunnahs; it contains a number of considerable towns, one of which, Gaya, the birth-place of Buddha, is celebrated as a place of pilgrimage, and some years since was annually visited by nearly 30,000 devotees: there are a great many small towns, of from 100 to 500 houses. Cotton stuffs, blankets, and carpets, are manufactured; with paper, soap, leather, bricks, &c.; and there are extensive nitre factories and sugar refineries.

Tradesmen have very little capital; general dealers seldom more than 25 rupees, and many of the small in grain no more than 400 rupees. The people are of a warlike disposition, passionate, and jealous; the habits of the women proportionally strict. The great subdivision of property has banished every thing like opulence; and marriages and funerals, by the expenses they cause, often bring families to poverty. The houses are neither so well built nor so clean as those met with in Bengal. Drinking to excess, betel chewing, and smoking, are not, however, pursued so far. Among other customs of this distr., girls are never married till puberty: the feet of dying persons are not put into the Ganges; but the parents and children, not of the vulgar, but of "men of rank and learning," are turned out of doors when they are about to die, exposed to all the inclemency of the weather. This odious custom, which would disgrace a nation of savages, has been in numerous cases perpetrated to the most infamous purposes. (*See Hamilton's E. I. Gaz.* i. 106—111; *Martin's Hist. Topog. Antiq. of India*, i. 1—389.)

BAHAR (Bahar, a monastery of Buddhists), a town in the above prov. and distr., in lat. 25° 13' N., long. 85° 35' E.; 35 m. S.E. Patna. It is a large straggling place, containing about 5,000 houses, and probably, therefore, about 30,000 inhab. It has few or no good streets; most of its public buildings are in a state of decay; and it has a ruinous appearance. It is supposed to have been at some remote age the cap. of the prov. The plain on which it stands is well watered, fertile, and well cultivated.

BAHAWULPOOR or DAODPOOTRA, a territ. of Hindostan, formerly belonging to Caubul, but now tributary to the maharajah of the Punjab, between lat. 29° and 36° N., and long. 70° and 74° E.; length N.E. to S.W. 380 m.; greatest breadth 120 m.; having N. the Punjab, E. the Bleasner territ. (Talpoootana), S. and S.W. Jaysulmire and Sind. Its N.W. boundary is for the most part formed by the Sutlej, but for a certain distance opposite the cap. it includes both banks of that

river, as well as those of the Chinnauf. The banks of the rivers are mostly fertile; but the rest of the country towards the E. is a more desert. For 4 or 5 m. on either side the Sutledge, the soil is formed by the slime deposited by that river, and is annually watered by its inundations; some portions of it are highly cultivated; others are covered with a soft turf, and the rest with jungle and coppice of low tamarisk trees, abounding with wild hogs, wild geese, game, &c., but having interspersed many small hamlets. The inhabs. are chiefly Juts and Beloochees, Mohammedans, who came thither from the district of Shikarpore, where they were settled early in the reign of Aurungzebe. They are a fair and handsome race, and apparently in a better condition than some of their neighbours. Lieut. Conolly says, "As soon as we had crossed the frontier (from Shikarpore) into Bahawal Khan's territory, we were struck with the improved appearance of the land; the ground was cleared, and cultivated with the better sorts of grain; the people, also, seemed more orderly and respectable." The principal towns are Bahawalpoor, Ahmedpoor (the residence of the chief), Julalpoor, Seedpoor, and Ooch. Durawul, an ancient fort in the desert, is the only place of strength in the country. The public revenue is about 10 lacs rupees a year. The khan maintains an army of about 2,000 regular troops; but in time of war he can raise more than 20,000 men. The government is despotic; but the late khan, who died three years ago, ruled mildly and paternally, and was much beloved by his subjects. This territory was taken from the Moguls by the Persians, and, after the death of Nadir Shah, belonged to Caubul, to which kingdom it was tributary as long as the monarchy lasted. The three last rulers have been nearly independent; but the political power of the country has been broken by the sikhs, and the rajah of the Punjab only spares it on condition of pecuniary payments. It is at present governed by a son of the late Bahawal Khan. (*Elphinstone's Caubul; Burnes's Trav.; Hamilton's E. I. Gazetteer.*)

BAHAWULPOOR, the ancient cap. of the above territory, near the S. bank of the Sutledge, 320 m. W.S.W. Delhi, lat. 29° 21' N., long. 72° 10' E.; at the point of junction of the road leading from Bombay and Calcutta to Caubul. It is about 4 m. in circ., but includes gardens and mango groves. It is surrounded with a thin wall of mud, the houses being of unburnt bricks, with mud terraces. The inhabs. consist chiefly of Hindoos, mostly occupied in the manufacture of the silken girdles and fine turbans for which Bahawalpoor is celebrated. The Hindoo traders are distinguished by their enterprise; they deal extensively in European goods, which they receive by way of Bikaner, and carry these and the productions of India to Balkh and Bokhara, and sometimes to Astrakhan. The Sutledge is navigable, but not used in the transport of merchandise. Notwithstanding the manufactures and trade of Bahawalpoor, Lieut. Conolly says that it shows symptoms of general decay. (*See Elphinstone's Caubul; Conolly's Journey*, li. 243.)

BAHIA, a marit. prov. of Brazil, on the E. coast, extending from about 9° to 35° S. lat. It comprises, as at present divided, nearly all the territory included formerly under the ancient captaincy of the same name, together with a portion of that of Ilheos. It derives its name from *Bahia de Todos os Santos*, and is bounded N. by the provinces of Sergipe and Pernambuco (from the latter of which it is divided by the Rio San Francisco); on the S. by Porto Seguro, and Minas Geraes; on the W. by Pernambuco, though still separated by the Rio San Francisco, and on the E. by the ocean. Its length is estimated at about 480 m., and its breadth at from 150 to 200. The estimates of its area vary from 54,000 to 97,000 sq. m. The latter, we are inclined to think, is nearest the mark. The accounts of the pop. are also very various: perhaps it may amount to about 700,000. It is subdivided into 3 comarcas, viz., Bahia, Jacobina, and Ilheos.

The province of Bahia is traversed from S.W. to N.E. by the Serra Cincoza, Ghiboya, and Itabayana. The Serra de Montequiva forms the chief ridge in the interior. Bays and inlets abound along the coast, among which the most celebrated is All Saints Bay. Numerous rivers traverse the province, and the Rio San Francisco, one of the largest of the Brazilian rivers, flows along its N.W. frontier.

The cultivation of tobacco is peculiar to the province, and its produce is highly sought after, not only for the market of Portugal, but also for Spain and the whole of Barbary. The soil is admirably adapted to the cultivation of the sugar-cane; and the sugar of Bahia bears a high character for its excellent quality, which is sufficiently proved by the fact that Bahia alone exports more sugar than the whole of the rest of Brazil. (*Mallet-Brun*, vi. 562.)

The growth of cotton exhibits an annual increase, and Bahia is already become a formidable rival to Pernambuco. The other productions are, rice, of a superior quality; coffee, much excelled however by that

of Rio de Janeiro; and Brazil-wood, equal to that of Pernambuco.

The province of Bahia was one of the first peopled by Europeans, and it is also one of those from which they have most effectually removed all traces of the original inhabitants.

BAHIA, or SAN SALVADOR, the cap. of the above prov., immediately within Cape St. Antonio, which forms the right or E. side of the noble bay of All Saints (*Bahia de Todos os Santos*), whence the prov. and the city derive their names; lat. (of lighthouse on Cape St. Antonio) 13° 0' 30" S., long. 35° 30' W. It was founded about 1549, by Thomas de Souza, first captain-general of Brazil, and was, until 1763, the capital of the colony. Since that period Rio has been acknowledged as the capital, and it also has been the residence of the count since its emigration to Brazil. But, though now inferior to its rival in population and commercial importance, Bahia is one of the largest and most important cities of S. America. The estimates of the population vary from 120,000 to 160,000, of which a third are supposed to be whites, a third mulattoes, and a third blacks. It is built partly along the ridge, and partly on the declivity, of a very high and steep hill fronting the entrance of the bay. It consists of an upper and a lower town, the former including the suburbs of Bom Fim and Victoria. The upper town stands on the ridge between the sea and a lake on the N., and contains several fine streets, in which reside the principal inhabitants of the city. The lower town is extremely dirty, and although the streets are very narrow, it is no uncommon thing to see them occupied by artillery, with their tools and benches.

The city is defended by Fort do Mar, and some other fortifications, but none of them are of any very great strength. The local revenue is derived from direct taxes on land and provisions, excise upon exports and imports, and harbour-dues. Land is subject to a tax of one tenth of its produce, and, since the revolution, church lands have also been rendered subject to the same impost, and the clergy are paid by the government. The taxes on provisions, which include beef, fish, flour, vegetables, &c. &c., are annually farmed out in separate parishes. As respects the number and beauty of its public buildings, Bahia ranks first among the cities of Brazil. In the upper town, amongst the chief may be enumerated the cathedral (formerly the church of the Jesuits), dedicated to San Salvador, built of European marble, and considered the handsomest ecclesiastical building in Brazil. The interior is very richly decorated, and over the high altar are two portraits, one of Ignatius Loyola and San Francisco Xavier, probably the only remarkable objects of art which any of the public buildings of Bahia have to offer. (*Dennis Brazil*, p. 234.) The other public buildings are, the ancient college of the Jesuits, now converted into a military hospital and medical school; the palaces of the archbishop and the governor; the town-hall (caxa de camara); the tribunal of appeal (caxa de relacao); the theatre, built upon a rock; several hospitals (part of the funds for sustaining them are derived from lotteries); a casa do misericordia, a bank, &c. &c.

Bahia contains a great number of religious houses, all of them situated in the upper town, but they offer nothing worthy of observation. It also contains between 30 and 40 churches, scattered through the upper and lower towns. The clergy are very numerous, in consequence of its being the residence of the archbishop, who has the control of the ecclesiastical affairs of the empire.

In the lower town the exchange, a massive building of modern date, is worthy of remark. It is built in a peculiar style, in which it has been attempted to imitate the Grecian. The principal street is the Praya, in which is situated the church of the Conceicao (conception), remarkable on account of the stones with which it is built having been prepared and ~~assembled~~ in Europe, and brought thence in two trunks, so that on their arrival they had merely to be arranged in the order previously allotted to them. (*Dennis Brazil*, p. 234.) The houses are chiefly constructed of stone, and, contrary to the usual mode in S. America, many consist of three, four, and even five stories. In the upper town are many handsome houses, constructed with balconies and blinds, instead of windows.

The city of San Salvador is almost destitute of institutions devoted to intellectual improvement. Amongst the seminaries of education is one which furnishes a large number of ecclesiastics. There is a public library, with from 60,000 to 70,000 volumes, among which are a few ancient Portuguese works, and some MSS. The greater portion of the good works are in French.

The vehicles generally used in Bahia are called *cadeiras*, and are a kind of palanquin supported by negroes who make a practice of dusting the corners of the streets, to be hired for that purpose.

The harbour of Bahia is one of the very best that is any where to be met with. It may be entered either by

day or by night, and at any time of the tide. The largest ships anchor close to, and immediately abreast of, the town, in from 6 to 7 fathoms. N. and N.W. of the town the bay expands into a noble basin, studded with islands, and affording safe anchorage for innumerable ships. The trade of Bahia is very extensive. The exports consist principally of sugar, cotton, and coffee; the average export of sugar, since 1830, being about 50,000 chests (13 cwt. each), 40,000 bales of cotton (each 174 lbs.), and from 4,000 to 5,000 tons coffee; with tobacco, hides and horns, rice, dye and fancy woads; nuts, bullion, &c.

Of the imports into Bahia, slaves, notwithstanding the nominal suppression of the trade, continue to be the most important article. It is, indeed, impossible to get any accurate accounts of the numbers imported; but those brought to the city and the other ports of the bay are believed not to fall short of from 12,000 to 15,000 a year! Next to slaves, the most important articles of import are cotton manufactures, woollen and linen stuffs, fish, flour, earthenware, wine, copper, iron, &c. The total value of the articles imported into Bahia in 1835, exclusive of slaves, has been estimated at 1,412,521*l.*; of which Great Britain furnished no less than 942,986*l.*; viz. cotton goods, 573,057*l.*; woollens, 64,740*l.*; linens, 57,457*l.*; earthenware, 15,912*l.*, &c. The value of the imports from Portugal during the same year was 104,854*l.*; from France, 156,733*l.*; from Hamburg, 105,473*l.*, &c. (*Board of Trade Tables*, v. 489.)

The country round nearly the whole Bay of Bahia, to the extent of from 12 to 20 m. inland, is known by the name of the Reconcavo, and is the most fertile and productive in the comarca. Its soil, called by the inhabitants *massapé*, is black and its fertility is proverbial. In this district is situated the town of Cachoelra or Caxoeira, which ranks next Bahia, as regards extent, population, and importance. It occupies an extensive trade with the interior of the province, and has a population of about 16,000 inhabitants. The district called the Reconcavo comprises several flourishing villages and country towns, which owe their prosperity to the abundance of their agricultural productions. Among these Tapajipe, or Nossa Senhora de Penha, may be distinguished on account of its containing the country residence of the archbishop of the prov. It contains also a dock-yard, whence many well-built and substantial vessels are constantly launched.

The island of Itaparica, situated in the Bay of Bahia, is the largest with which it is studded. It is about 14 m. in length and 6 in its greatest width. Fruit-trees are very extensively cultivated throughout the island. The industry consists chiefly of whale-fishing, the distillation of rum, and some rope-making. Several towns in the Reconcavo equip vessels for prosecuting the whale-fishery in the bay, which forms a branch of industry on this line of coast.

In the comarca of Ilheos the chief town is San Jorge dos Ilheos, which was formerly flourishing and comparatively opulent and extensive, but has now the appearance of being deserted. It was frequently subject to the ravages of the tribe known under the name of the Gherins.

The expulsion of the Jesuits gave the finishing blow to its importance, and the college in which they dwelt (built 1728) is now falling to ruins.

Camamu is worthy of notice on account of the magnificent bay upon which it is built. Next to San Salvador it is the most important port in the prov. of Bahia.

The comarca of Jacobina comprises the W. portion of the prov. of Bahia. Nearly all the cattle consumed at Bahia are pastured in this district. The chief city is Jacobina.

BAHLINGEN, a town of Wirtemberg, circ. Black Forest, on the Fyach, 14 m. N.E. Rottweil. Pop. 3,000. It has fabrics of cloth and woollen stuffs, tanners, and numerous breweries and distilleries. There are mineral springs in the vicinity.

BAHREIN, or **AVAL ISLANDS**, a group consisting of one large, and several smaller islands, in the Persian Gulph, subject to the imam of Muscat, in a bay near the Arabian shore, between lat. 26° 45' and 26° 16' N., and long. 50° 18' and 50° 20' W. The largest island (Bahrein) is about 25 m. in length, N. to S., by 6 or 7 m. wide, and 80 or 90 m. in circuit; a hilly tract occupies its centre; 4-5ths of its surface are waste, but the remainder is well watered, partially cultivated, and thickly inhabited. The pop. of the whole group of islands is, perhaps, 60,000, and composed of several different tribes. The native Bahreins number about 40,000 or 50,000; they are a mixed breed between the Persians and Arabs, but possessing more of the indolence and cunning of the former than of the bold frankness of the latter. They are chiefly cultivators, merchants, and fishermen; and for the most part Mohammedans, of the sect of Omar; the rest of the inhabitants are mostly Arabs. The pearl fishery, for which these islands are chiefly noted, employs, during the season, 30,000 men; and yields pearls of the value of from 300,000*l.* to 350,000*l.* yearly. Most of the fishery boats belong to merchants possessing con-

siderable capital, but the largest proprietor in them is the sheik himself, who has upwards of 2,000 boats, each manned, during the season, with 8 or 10 men: he imposes also a small tax on every other boat. The fishing season is from the beginning of June till October. The diving is conducted pretty much in the same manner as in Ceylon (*see Ceylon*); but the divers attach their oyster-net to their waists, and are in the habit of always stuffing their ears and nose with horn or other substances: they can remain under water nearly two minutes at a time. They are often in the most abject circumstances, and generally in debt to the merchants, who obtain the pearls at their own price. Bahrein has a considerable traffic, and might be rendered valuable under a good government, and made the centre of all the commerce on this part of the Arabian coast. Although the only cultivation consists of date plantations, and a few wheat, barley, and clover fields, at least a part of the soil is very rich; and by irrigation much of the rest is capable of being greatly improved. Pomegranates, mulberries, figs, melons, &c. are produced; and cattle, poultry, and plenty of vegetables obtained from the neighbouring coast. Numerous small villages and towns are scattered over the cultivated parts of the island; and at the N. portion there are two towns, Manama and Ruffar. Manama is the residence of the principal merchants, and contains a fort originally built by the Portuguese; the remains of several fine reservoirs and aqueducts, constructed by the same people, exist on this island. At the N. end are two harbours; that to the N.W. having a depth of four to seven fathoms water near the shore. The principal exports are pearls to India, Persia, Arabia, and Bussorah; dry dates, tortoise-shell, canvass, sharks' fins, &c. to India; and dates, canvass, mats, and coloured cloths to the other countries. The chief imports are, rice from Bengal and Mangalore; sugar, pepper, blue and white cloths, planks, iron and other metal, cinnamon, camphor, drugs, indigo, &c. from India; coffee, dry fruits, grain, &c. from Bussorah, Persia, and Muscat. There are 20 merchant-vessels, of 140 to 350 tons, belonging to Bahrein, chiefly employed in the India trade. The islands of Maharag, Arad, and Tamahoy, lie N.E. Bahrein, and contain 7,500 inhabitants. Maharag is the residence of the sheik, and has a town with a pop. of 6,000. The sheik of Bahrein keeps up 5 armed vessels; but in time of war, can fit out 15 or 20. One of his ships is of 400 tons burden, and mounts 22 guns. He also maintains a body of troops, consisting of five hundred men; but the best defence of Bahrein is in the multitude of reefs surrounding it; and 800 determined men might oppose the landing of as many thousands. The sheik's authority extends over a few places on the Arabian coast. These islands were known to the ancients by the name of Tylos, and are mentioned by Arrian. The Portuguese established a settlement here soon after Ormuz had been taken by Albuquerque; but they were expelled by the Persians subsequently to the fall of Ormuz. For a long period the Persians and the Alassar sheiks contested the possession of Bahrein; but since 1790 it has been wholly separated from the Persian dominions. (*MSS. belonging to the Royal Geogr. Soc.*; *M'Culloch's Dict. of Commerce*.)

BAIÆ, a famous marine watering-place of ancient Italy, the Brighton of the Roman world, on the W. shore of the Bay of Naples, 8 m. S.W. of that city, and 24 m. N. Cape Misenum. Baiæ was indebted for its rise and celebrity to a variety of circumstances—to the softness and serenity of its climate, the beauty of its situation,—

Nilius in orbe sinus Baiis prænotat ænalem,—

the abundance of its hot springs, which gave to the Romans, who were passionately fond of the bath, the opportunity of indulging in that luxury in every form that was most acceptable, &c. It seems to have come into fashion previously to, or about, the era of Lucullus, who had a splendid villa, either in the town or its immediate neighbourhood, as had also Cæsar, Pompey, and Augustus; and it continued to increase in popularity, and to be a favourite resort of the emperors and of the affluent voluptuaries of Rome till the irruption of the barbarians under Theodoric the Goth. The town was built originally on the narrow slip of ground between the hills and the sea; but as this space was but of very limited dimensions, after Baiæ became a fashionable resort, the foundations of its streets and palaces were projected into the bay itself! This is alluded to by Horace:—

*Marique Baiis obstruuntur uragus
Subnocturne litore,
Færum locupletis continente ripæ.*

II. OD. 18.

No sooner, however, had opulence withdrawn her powerful hand, than the sea gradually reassumed its old domain; moles and buttresses were torn asunder, washed away, or tumbled headlong into the deep, where, several feet below the surface, pavements of streets, foundations of houses, and masses of walls, may still be descried. Earthquakes and other convulsions of nature have also

largely contributed to the destruction of Baie, of which only a small portion of the ruins now remain. (*Switzerland's Two Sicilies*, li. 29.; *Cramer's Ancient Italy*, li. 187.)

BAIBOUT, a town of Asiatic Turkey, pach. Erzeroum, on the Tchorkohl, 62 m. W. by N. Erzeroum. Pop. 3,000. ? It is a straggling ill-built town, supposed to occupy the site of the ancient *Varutha*, with a castle which has some marks of antiquity. Instead of walls and bastions, it is defended by portable towers made of logs of wood. They are market-proofs of a triangular shape, and have raised turrets at each angle. If required in any distant part of the country, as not unfrequently happens, they may be taken to pieces, or, if the roads permit, transported on wheels! The accumulation of snow in winter is here so great as to cut off all communication between Baibout and the circumjacent villages for four months in the year. Cow dung baked in the sun, and collected during the summer months, is the only fuel the poor can afford to purchase. The natives in this part of Armenia are described as a stout, stout, and active race of men; remarkably dark in their complexions, brave and hardy, passionately fond of hunting the stag, with which their mountains abound, and invariably civil. (*Kinncir's Asia Minor*, &c. p. 353.)

BAIKAL (LAKE OF), sometimes called the *Svintore More*, or Holy Sea, in Siberia, in the gov. of Irkutsk, between 51° and 56° N. lat., and 103° and 110° E. long. Its greatest length, in a N.N.E. and S.S.W. direction, is nearly 400 m.; but where greatest, its breadth does not exceed 60 m., and is in most parts much less. It is of very unequal depth, sand-banks and shallows occurring alongside of all but unfathomable abysses. It is situated in a mountainous country, and receives several considerable rivers, while its surplus water is entirely carried off by the Angara, a large and rapid river, an affluent of the Jenissei. The fisheries of this lake are very valuable. Great numbers of seals, of a silvery colour, are captured; the skins of which are sold to the Chinese. Sturgeon, to the extent of about 1,000 poods a year; salmon, &c. are also taken, but the grand object of the fishery is the *omul*, a sort of herring (*Salmu autumnalis*, vel *migratorius*), taken in vast numbers (about 100,000 poods a year) in Aug. and Sep., when it ascends the rivers. The most singular fish belonging to the Baikal is the *golomyinka* (*Callogymnus Baicalensis*), from 4 to 6 inches in length, so very fat that it melts before the fire like butter. The latter is never taken alive; but is cast dead upon the shore, sometimes in immense quantities, after storms. It yields an oil, sold to great advantage to the Chinese. The surface of the lake is frozen over from Nov. to the end of April or the beginning of May. (*Klaproth, Mémoires Relatifs à l'Asie*, lii. 89—108.; *Storch, Tableau de la Russie*, li. 142.)

BAILLEUL, a town of France, dép. du Nord, cap. cant., on a hill near the Meterbeque, 16 m. W. N. W. Lille, within a short distance of the Belgian frontier. Pop. 9,911. It is open, and is generally well built; it has various fabrics of cloth, cotton and lace, paper and hats, with a large distillery, oil-mills, tanneries, potteries, &c. A species of cheese ditto *de Bailleul*, made in the environs, is highly esteemed. Bailleul is the name of several small towns in various parts of France, but all too inconsiderable to deserve notice in this place.

BAIN, a town of France, dép. Ille et Vilaine, cap. cant., 18 m. S. Rennes. Pop. 3,515. It has manufactures of serges and woollen stuffs.

BAIS, a town of France, dép. and arrond. Mayenne, cap. cant. Pop. 2,443. This also is the name of a town of about the same size, in the dép. Ille et Vilaine, arrond. Vitré.

BAJA, a town of Hungary, co. Bacs, near the Danube, 29 m. N. by W. Zombor, lat. 46° 10' 26" N., long. 38° 55' 17" E. Pop. 12,000. It is the seat of the courts of justice for the co., has a Catholic and a Greek church, a synagogue, and a Catholic gymnasium. It contains the castle of Prince Graskacovich.

BAKEWELL, a town of England, co. Derby, hund. High Peak, par. Bakewell, 22 m. N.N.W. Derby. Pop. (1821) 1,782; (1831) 1,898. Area of township, 3,380 acres. The town is beautifully situated on the W. bank of the Wye, 2 m. above its confluence with the Derwent. The church, a spacious Gothic structure, on an eminence, contains many fine monuments. The Independents and Wesleyans have each a chapel. There is a free-school, founded in 1695, with a small endowment, and an almshouse for six old men. Over a chalybeate spring (which had a high reputation in the Saxon times), modern baths have, within a recent period, been formed; these are constantly supplied with fresh water, which, on its influx, emits considerable quantities of carbonic acid gas: its temp. is 60° Fahr. There is a news-room, museum, &c., connected with the establishment. Near the entrance to the town, from Ashford, is a cotton manufactory, built by Sir Richard Arkwright: it employs about 300 hands. Many of the other inhabitants are employed in the lead mines and marble quarries

of the neighbourhood. The weekly market is held on Friday, but there is little business of any kind transacted. There are annual fairs held, Easter Monday, Whit Monday, Aug. 29th, Monday after Oct. 10th, and Thursday after Nov. 11th. The petty sessions for the hundred are held in the town. It is the chief polling town for the N. division of the county. The living is a vicarage, in the patronage of the dean and chapter of Litchfield. The poor-rates levied in the township in 1836 amounted to 1,654 4s.

Three miles N. E. of the town is Chatsworth, the splendid seat of the Duke of Devonshire, on a gentle rise near the base of a finely wooded hill: the Derwent, spanned by a handsome stone bridge, flows past its principal front. The mansion forms a square of 190 ft., enclosing a spacious court, with a fountain in the centre; it has a flat roof surrounded by balustrades, and is decorated with Ionic columns. At the principal entrance, a grand flight of steps lead to a terrace extending the length of the building. The water-works (with the exception of those of Versailles) are considered the finest in Europe. The present edifice stands on the site of the mansion built by Sir William Cavendish in the 16th century, in which Mary, Queen of Scots, was imprisoned 13 years. It was completed in 1706, but a wing, and other additions have been made to it by the present duke, and many improvements are still in progress. Altogether, it is one of the noblest residences in the kingdom, and contains a very large collection of pictures, statues, and articles of *serius*. Haddon Hall, the property of the Duke of Rutland, the most perfect of the ancient baronial mansions remaining in the kingdom, is about 2 m. S. of the town, on an eminence overlooking the fine vale of Haddon. It was built at different periods; the most ancient part in Edw. III.'s reign; another, in that of Hen. VI.; and the most modern, in the reign of Eliz.; at which period it came into the possession of the Manners family.

The present name of the town is a contraction of its old Saxon name, derived from the chalybeate spring. The castle stood on a knoll, on the E. bank of the Wye. The parish in which this township is situated is the largest in the co., its area being 45,020 acres; and it includes, besides the towns of Bakewell and Buxton, 8 chapelrys, 10 townships, and 4 hamlets. The entire population in 1831 was 9,503. (*Lysen's Mag. Brit.; Glanville's Hist. of Derbyshire*.)

BAKUCHISHERAI (palace of the gardens), a town of Russia in Europe, in the Crimea, of which, while under the Tartars, it was the capital and the residence of the khan, 7 m. S.W. Simpheropol. Pop. 9,500. "This," says Dr. Clarke, "is one of the most remarkable towns in Europe; first, in the novelty of its manners and customs; these are strictly oriental, and betray nothing of a European character; secondly, in the site of the town itself, occupying the craggy sides of a prodigious natural fosse, between two high mountains, somewhat like the appearance exhibited by Matlock in Derbyshire. The view breaks all at once upon the traveller, exhibiting a variety of objects in a most irregular and scattered manner; while bubbling fountains, running waters, gardens, terraces, hanging vineyards, and groves of the black poplar, seem to soften the horror of rocks and precipices, and even to make them appear inviting." (vol. ii. p. 170., 8vo. ed.) But, notwithstanding this profusion of fountains and water, Bakuchisera is not distinguished by its cleanliness; on the contrary, its streets are narrow, winding, and filthy. It suffered a good deal after its first occupation by the Russians, but latterly it has improved: it is entirely occupied by Tartars. The ancient palace of the khans has been repaired, and is preserved in all its former magnificence. (*Schnitzler, La Russie*, &c., p. 734.; *Lysen's Travels*, i. p. 261.)

BAKU, or **BADKU**, a sea-port town of the Russian dominions, prov. Daghestan, on the S. shore of the peninsula of Absheron, on the W. coast of the Caspian Sea, of which it is one of the best and most frequented ports; lat. 40° 22' N., long. 51° 10' E. Pop. 5,000. ? It is defended by a double wall and deep ditch, constructed in the reign of Peter the Great. It has some mosques and caravanseras, but is mainly built: the houses, which are flat roofed, are covered with a coating of naphtha. Its excellent harbour, and its central and advanced position, give it great advantages as a trading station. The value of the imports, consisting principally of raw silk and cotton goods from Persia, amounted, in 1831, to 1,702,460 roubles. The exports consist principally of naphtha, saffron, &c.

The peninsula of Absheron is famous for its naphtha springs and mud volcanoes, and before the Mohammedan conquest was a favourite resort of the Ghebers, or fire-worshippers. "The quantity of naphtha procured in the plain to the S.E. of the city is enormous. It is drawn from some wells, some of which have been found to yield from 1,600 to 1,800 lbs. a day. These wells are, in a certain sense, inexhaustible; for they are no sooner emptied

than they again begin to fill, the naphtha continuing to increase till it has attained to its former level. It is used by the natives as a substitute for lamp oil, and, when ignited, emits a clear light, with much smoke, and a disagreeable smell. E. of the naphtha springs the attention is arrested by the Atash-Kudda, or fire-temple of the Ghebers; a remarkable spot, something less than a mile in circ., from the centre of which a bluish flame is seen to arise. Here some small houses have been erected; and the inhabitants, in order to smother the flame, have covered the space enclosed by the walls with a thick loam of earth. When the fire is, therefore, required for any culinary purpose, an incision is made in the floor, and on a light being produced, the flame immediately arises, and when necessary is again suppressed by closing the aperture! With the fire a sulphureous gas also arises; and a strong current of inflammable air, with which leathern bottles are frequently filled, invariably continues after the flame has been extinguished. The whole country, indeed, around Baku has, at times, the appearance of being enveloped in flames. It often seems as if the fire rolled down from the mountains in large masses, with incredible velocity; and during the clear moonshine nights of November and December, a bright blue light is observed, at times, to cover the whole western range. This fire does not consume; and if a person finds himself in the middle of it, he is not sensible of any warmth." *Kinnir's Persia*, p. 359.) The mud volcanoes, in the vicinity of the town, often throw up vast quantities of mud. Baku was acquired by the Russians from the Persians, in 1811, and along with Astrakhan carries on the whole trade of the Caspian. (See CASPIAN SEA.)

BAKU, or BAKOWA, a town of Moldavia, on the Bistritz, near its confluence with the Sereth, lat. $46^{\circ} 30'$ N., long. $26^{\circ} 47'$ E. It is a poor, miserable, filthy place, but has a considerable trade in cattle, corn, salt, and wood. It occupies the site of a city which was once the residence of a Catholic bishop; the ruins of the cathedral still exist.

BALA, a township, market, and assize town of N. Wales, co. Merioneth, hund. Penlyn, 37 m. N.W. by N. Shrewsbury, at the W. end of the largest of the Welsh lakes, in a wild and mountainous district. Pop. of par., 2,359; of town, about 1,200. The town, which consists of one wide street, with a smaller one branching from it, has a neat and respectable appearance. It has a chapel of ease, and 2 other chapels belonging to Independents and Calvinistic Methodists; an endowed grammar-school, founded in 1712, where 30 boys are clothed and educated each for 4 years; a book society, established in 1828; and a town-hall, to which one of the co. bridewells is attached. The market is held on Saturdays, and is well attended. There are 5 fairs, chiefly for the sale of live stock, on the Saturday before Shrove-tide, May 14th, July 10th (a large lamb fair), Oct. 24th, and Nov. 8th. Bala appears to have been anciently incorporated, but at present is merely a nominal borough in the jurisdiction of the co. magistrates. The spring assizes, the summer and winter quarter sessions for the co., are held here, and a co. court for debts under 40s. every other month; all the courts being alternately held here and at Dolgelly. The town and neighbourhood have been famous from a remote period for the manufacture of knitted stockings and gloves, esteemed for their strength and softness of texture; but this has of late years declined considerably. At present (1838) about 40,000 dozen stockings and socks, and 5,000 pairs of gloves, are annually made. At the S.E. end of the town is a large artificial mound, supposed to be of Roman construction, from the summit of which is a magnificent view, having the lofty Arrans on one side, and Cader Idris on the other. The lake Bala, Tegid, or Pimblemer, is about 4 m. in length by 1½ in width; it abounds with pike, perch, trout, and still more with the white-scaled gwyniad. The whole is the property of Sir W. W. Wynn, who has a fishing-seat on it. The Dee rises in Arran Penlyn, a mountain at the head of the lake, and emerges from it near Bala, where it is spanned by a bridge, near which, on the E. bank, a castle was erected in 1302, of which some traces are yet visible. A branch of the Roman Walling St. passed through or very near the present town, and at the head of the lake are the remains of a Roman station. The artificial mound above mentioned was occupied by the Welsh as one of a chain of forts across this part of the principality, to prevent the incursions of the English lords marchers; at a subsequent period the place was a dependency of Harlech Castle. Bala is a favourite resort of sportsmen during the grouse season.

BALAGINA, a town of European Russia, gov. Nijni Novgorod, on the Volga. Pop. 3,000.

BALAGANSKOT, a town of Asiatic Russia, gov. Irkoutsk, 90 m. N. W. Irkoutsk, on the Angara.

BALAGUER (an. *Bergusia*), a town of Spain, Catalonia, on the Segre, 14 m. N. E. Lerida. Pop. 4,000. It is situated at the foot of a steep mountain in a fertile plain, and is defended by a castle.

BALAGHAUT CEDED DISTRICTS, an incl. prov.

of S. Hindostan, presid. Madras, between $13^{\circ} 15'$ and $16^{\circ} 20'$ N. lat., and $75^{\circ} 40'$ and $75^{\circ} 30'$ E. long.; consisting of part of the region called Balaghat, or above the Ghauts (which extends from the Krishna to the S. of Mysore, and formed the anc. Hindoo emp. of Karnata), having N. Kurnool, and the territories of the Nizam: E. Guntoor, Nellore, and Arcot; S. Mysore; and W. Dharwar: length about 200 m., breadth various, area 25,456 sq. m. Pop. (1835-37) 2,176,003. It is almost equally divided between the collectorates of Bellary and Cuddapah. It consists mostly of elevated table-lands stretching out into extensive plains; but large tracts are rugged, and there is a great deficiency of wood. There are no large rivers: the Toombuddra forms part of its N. boundary, and fills some watercourses about Bijanagar, the anc. Hindoo capital; but elsewhere irrigation is scarce, and drought frequently prevails. The soil is in most parts either black or red mould: the former is most common in the W. districts, where it forms an extensive plain: it is deep, without vegetable remains; and when cleared, broken up, and properly cultivated, is found to be exceedingly fertile, and is afterwards very easily cultivated. But this bringing in of the black soil is a very expensive process; and, in consequence, though the red soil be less fertile, yet, as it is more easily brought into a productive state, the poorer classes are generally settled upon it. Drill husbandry is universal. Rain is uncertain; and if it fall in June, the whole crop is in danger of being lost. The dry cultivation is almost universal; the wet not being supposed to exceed 7 per cent. of the whole. Plantations of indigo, beet, sugar cane, red pepper, tobacco, &c., are pretty extensively scattered over the country. In 1807 garden produce paid about 68 per cent. of the ground rent. The temperature is much cooler than in the surrounding and less elevated districts. Manufactures inconsiderable.

The land has always been regarded as belonging to government, and the metayer system was prevalent under both the native and Muhammadan dynasties. Between the conquest of the Latwals and the reign of Aurnungebe, the class of *polygars*, who were originally either mere collectors of the revenue or heads of villages, having greatly increased in numbers and influence, withheld the revenues, set up for petty chiefs, and having established a kind of feudal system, desolated the country by their mutual wars, and reduced it to a state of anarchy and of the utmost misery. When it came into the possession of the British in 1800, its inhab. generally were the worst in our dominions: "they were seldom even fixed as tenants, but migrated from farm to farm, and from village to village, where they clubbed together to carry on their cultivation." The judicious administration of Sir T. (then Col.) Munro, who was appointed principal collector, not only averted a famine, in consequence of drought, in 1803, but in seven years raised the revenue, without burdening the cultivators, from 1 million to 1½ million pagodas. In 1836-37 the land revenue amounted to 4,083,377 rup., the total revenue for the same year being 5,362,378 rup. or 536,237½. The average total revenue paid by each inhab. of Bellary is 2 rup., 8 an. 8 pie.; and that paid by each inhab. of Cuddapah 2 rup. The village settlement is predominant in this prov., especially in Cuddapah. The inhab. are more laborious, hardy, and manly, and their food, dress, and weapons, ruder than those of the people below the Ghauts; they were never thoroughly subdued by the Mohammedans, who settled in this prov. at a comparatively late period, and do not now exceed 1-15th part of the pop. Balaghat formed part of the last Hindoo empire of Bijanagar; after the fall of the Delhi dynasty, it became separated into several indep. states, was conquered by Hyder before 1780; and after 1792 belonged to the Nizam, by whom, in 1800, it was ceded to the British. (*Hamilton's E. I. Gazetteer*, l. pp. 113-118.; *Madras Almanac* for 1838.)

BALAKLAVA, a small sea-port town of European Russia, at the S.W. extremity of the Crimea; lat. $44^{\circ} 25'$ N., long. $33^{\circ} 34'$ E. It has a small but excellent harbour, land-locked, and with water sufficient to float the largest ships. It has no trade, and is resorted to only by coasters.

BALAMBANGAN, an isl. of the E. Archip., 4th division, lying off the N. extremity of Bornoe; lat. $7^{\circ} 15'$ N., long. $117^{\circ} 5'$ E.; 15 m. long and 3 broad, but uninhabited. It has a rich soil, and two harbours abounding in fish. A settlement, formed in 1774, by the E. I. Company, was soon after destroyed by the Sooloes, and a subsequent settlement planted in 1808 was afterwards abandoned.

BALASORE (*Valaswara*), a sea-port town of Hindostan, presid. Bengal, prov. Orissa, distr. Cuttack, of which it is the chief port; lat. $21^{\circ} 32'$ N., long. $86^{\circ} 56'$ E.; 125 m. S.W. Calcutta. Pop. (1822) 10,000. It is a large straggling place, on the S. bank of the Boori-Balang, and much fallen off. Formerly it was a flourishing town, with Portuguese, Dutch, and English factories. It has dry docks, but is at present frequented only by Maldiv vessels, salt boats, and other small craft: its exports are

BALATON.

chiefly rice to Calcutta in winter. (*Hamilton's E. I. Gaz.* i. 120.)

BALATON (LAKE OF), in Hungary. See PLATTEN—SKK.

BALBRIGGAN, a magt. town of Ireland, co. Dublin, prov. Leinster, near the mouth of the small river Delyan, forming the co. boundary to the N. 17 m. N. by E. of Dublin. It was the scene of a sanguinary battle in 1329 between the first Earl of Louth and some of the English settlers, who disputed his claim to the palatine dignity of the county, but were defeated. William III. encamped here on his march to Dublin, after the battle of the Boyne. It has been much improved by the exertions of the proprietor, who has succeeded in making it both a respectable manufacturing and commercial mart, and a desirable watering-place. It is well built, and baths of every description have been constructed. It is a chapelry formed from Balrothery parish. The chapel, built in 1816, at an expense of upwards of 3,000*l.*, was accidentally burnt down in 1835, and has not yet been rebuilt. There is also here a Rom. Cath. chapel, and a place of worship for Methodists. There is a dispensary, and petty sessions are held every alternate Tuesday. The town is the head quarters of the co. constabulary, and near it is a martello tower, with a coast-guard station. There are two cotton mills here, one only of which is (1838) in action, giving work to 90 persons, of whom 84 are females. The yarn is wrought into cloth chiefly in the town, where there are 250 looms thus employed; besides which, in the village of Garrinstown 150 looms, are worked for the Balbriggan manufacturers. The finished article is chiefly sold in Dublin and Glasgow. The embroidering of muslin is carried on here and in the neighbourhood so as to give employment to upwards of 1,000 females, at the permanent average wages of 2*s.* a week throughout the year: this department is carried on through Belfast and Glasgow agencies, the cloth being embroidered by the workers in their own dwellings, and is bleached in Belfast. Hosiery is also manufactured here, and sold in Dublin. There are 36 farms, which employ 50 persons. The corn trade is extensive. Four flour mills supply flour, meal, and bran to all the neighbouring places, and to Drogheda. The public markets are held on Mondays, in a market-house erected in 1811. The fairs are on the 29th April and 29th Sept.

The exports and imports of the port for 1835, including the coasting trade, were as follow:—

Exports.			Imports.		
	Tons.	Value.		Tons.	Value.
Corn, Meal, & Flour	645	5,418	Cloth, &c.	11,373	8,054
			Wool	30	300
			Potatoes	1,108	2,710
			Salt	551	368
Total	645	5,418	Total	11,962	11,322

The post-office revenue for 1830 was 327*l.*, and for 1836, 403*l.* A *caravan*, a mail-car, and two other cars, conveying, at an average, 30 passengers each trip, ply between Dublin and Balbriggan every day. The fishery, particularly for herrings, used to be carried on extensively in Balbriggan, but has declined considerably since 1830, when the bounties which had been granted by the Board of Irish Fisheries were withdrawn. The number of fishing vessels, and men, in 1830 and 1836, are said to have been—

1830.			1836.		
	No.	Tonnage.		No.	Tonnage.
Decked Vessels	85	3,773		10	387
Half-decked ditto	1	6			70
Open Sail Boats	1	5			
Row Boats	59	351			
Total	149	5,135		10	387

Supposing these returns to be correct, they afford no grounds for impeaching the policy of withdrawing the bounties. On the contrary, they strongly evince its wisdom; as they show that, while it existed, vessels had been fitted out as much in the view of catching the bounty as of catching herrings.

The harbour, which is naturally small and much exposed, was considerably improved by a pier built about 1765. The quay, which is now 600 feet long, with a lighthouse at the extremity, is frequently filled with craft. At the pier head there is 14 ft. water at high spring-tides, but the harbour dries at low water. (*Priv. Information.*)

BALCARIC ISLANDS. See MAJORCA, MINORCA, &c. **BALFRON**, a village of Scotland, in the W. part of Stirlingshire, in the parish of the same name, 19 m. N. Glasgow, and 19 m. W. Stirling. Pop. of par. 2,057. The village is neat and well built. The inhab. are principally

BALKH.

279

employed as weavers for the Glasgow manufacturers, and in the Ballindalloch cotton mills in immediate vicinity. The latter employ a great number of hands.

BALFROOSH, a town of Persia, prov. Masunderau, on the Baxloo, about 12 m. from the S. shore of the Caspian Sea, lat. 36° 37' N., long. 59° 42' E. This is a large flourishing city. There are, however, no accurate details with respect to its population; but that was estimated by Mr. Fraser at 200,000, though we should be disposed to think that this was rather beyond the mark. It is situated in a low, swampy, but rich country; and stands literally in the middle of a forest, it being surrounded and interspersed with fine trees. It has an extensive trade, to be accounted for principally by the comparative immunity it has enjoyed from oppressive imposts, as the roads leading to it are bad, and its port, 12 m. off, little better than an open roadstead. It is, or at least was, when visited by Mr. Fraser, entirely peopled by merchants, mechanics, and their dependents, and learned men; and was prosperous and happy, far beyond any other place he had seen in Persia. Streets broad and straight, but unpaved; houses mostly constructed of bricks, in good repair, and roofed with tiles. It has no public buildings of any consequence; the only places of any interest being the bazars, which extend for a full mile in length, and consist of substantially built ranges of shops covered from the sun and weather by a roof of wood and tiles, kept in excellent repair. There are about 10 principal caravansaras, several of which are attached to the bazars, and are parcelled out into chambers for the merchants and warehouses for their goods. All the bazars and caravansaras are well filled with various commodities, and present a scene of bustle and business, yet of regularity, very uncommon in this country, and, therefore, the more gratifying. There are between 20 and 30 medrasses or colleges, Balfroosh being nearly as much celebrated for the number and eminence of its moolahs, or learned men, as for its commerce. The river is crossed by a bridge of 9 arches. (*Fraser's Travels along the Caspian Sea*, &c., pp. 82—99.)

BALI, BALLY, or LITTLE JAVA, an isl. of the E. Archipelago, W. or 1st division, between 8° 6' and 8° 56' S. lat., and 114° 40' and 115° 42' E. long.; 70 m. long by 35 m. average breadth. Pop. estimated in 1815 at 800,000. Coast rugged and without harbour; surface rising gradually to the centre, where a chain of mountains stretches W. and E. across the isl., terminating in the peak of Ball, which is volcanic; geology the same in other respects as that of Java. The land is productive where well watered, as around the coasts, by numerous streams, and elsewhere by artificial means: irrigation is so necessary, that the sovereigns of Bali impose a tax not on the land but on the water by which it is fertilized. In the lower tracts rice is much cultivated, maize and sweet potatoes in the upper lands; in addition to these articles, the Balies, though mostly Hindoos, eat poultry, hogs' flesh, and even beef, without scruple, excepting the sacerdotal class. The chief exports are rice, coarse cloths, cotton yarn, hides, salted eggs, birds' nests, oil, d'ginged (dried flesh), gambier (catechu), &c.: the imports, opium, betel, gold, silver, and ivory. The natives being superior to the Malays and Javanese in size, strength, and intelligence, are preferred by the Chinese as slaves. Bali was divided, in 1815, into eight independent states, governed by despotic chiefs: the village system prevails here as in Java. There are but few Buddhists or Mohammedans; but Hindooism prevails in Bali only, of all the isl. of this archipelago. The mass of the people, however, worship the elements, and the tutelary gods of rivers, forests, mountains, &c. There are no religious mendicants, but suttees and immolations are conducted on a much more aggravated scale than in India. The Sanscrit tongue may be distinctly traced in the language of Bali. (*Hamilton's E. I. Gazetteer*, i. 120—132; *Crawford's Hist. of the Indian Archipelago*, ii. 236—259, &c.)

BALIZÉ. See HONDURAS.

BALKH, or BULKH (an. *Bactra*), a prov. of Central Asia, now subordinate to the khanat of Bokhara, chiefly between lat. 35° and 37° N., and long. 63° and 65° E.; having N. the Oxus; E. Bukhara; S. the Hindukush, and Paropamisian mts., and W. the desert; length, E. to W., about 250 m.; breadth 100 to 120 m.; area 30,000 sq. m. Pop. about 1,000,000. (*Elphinstone*, ii. 195.) The S. part is full of stony hills, but has many good and well-watered valleys, the E. is mountainous, and more valuable than the W., which, as well as the N., is sandy and barren. It formerly comprised several districts, which now belong to separate governments, as Khovakoom, Koondoor, and others to the K. Its capital, and the territory subordinate to it, were, since the fall of the Duorance monarchy in Caubul, to which state it formerly belonged, been taken possession of by the khan of Bokhara. (*Elphinstone's Caubul*; *Burnes's Trav. into Bokhara*.)

BALKH (the *Zoraspas* and *Bactra* of the Greeks), a decayed city of Central Asia; cap. prov. belonging to the

kanat of Bokhara, but gov. by its own chief, who receives the whole of its revenues : on the right bank of the Adirash or Balkh riv., in a plain 6 m. N.W., a range of the Paropamisian mountains, 18 m. S. the Oxus, and 250 S. E. Bokhara : lat. 36° 48' N., long. 67° 18' E. Pop., in 1835, under 2,000. (*Burnes*.) The ruins of Balkh occupy a circuit of 30 m. : they consist chiefly of fallen mosques and decayed tombs, none of an age prior to that of Mohammed. The city, like Babylon, has become to the surrounding country an all but luxuriant mine of bricks. There are many inequalities on the surface of the plain, probably proceeding from buried ruins, and clumps of trees in many directions. Balkh seems to have inclosed many extensive gardens, but these are now neglected and overgrown with weeds. The aqueducts, of which there are said to be 16, are dried up or choked, and overflow after rains, leaving standing pools, which make the place very unhealthy, though Balkh be not naturally in a marshy position, but on a gentle slope toward the Oxus, about 1,500 feet above the level of the sea. A mud wall, of late construction, surrounds a portion of the present town, excluding the ruins on every side for about 3 m. The town contains 3 large colleges, but empty and decaying ; and at its N. side is the citadel, a solid building, but not strong as a fort ; it contains a stone of white marble, pointed out as the throne of " Cyrus ! " The country round is flat, fertile, and well cultivated, said to contain 360 villages, and is watered by 18 canals, drawn from a celebrated reservoir in the Paropamisian mts. Its wheat and peaches are remarkably fine. Balkh is said to have been built by Kymoor, the founder of the Persian monarchy, and is called by the natives *Omm-el-Baldan*, " mother of cities." After its conquest by Alexander the Great, it flourished as the capital of a Grecian kingdom. In the 3d century of the Christian era, Artaxerxes held an assembly at Balkh for the recognition of his authority. The Magi were expelled by the Caliphs : Jenghiz, Timour, Aurungzebe, Nadir shah, and the Afghans, successively possessed it : within the last 12 years it has belonged, with its territory, to the khan of Bokhara (*Burnes's Travels*, ii. 204, 207.)

BALKHAN. See TURKEY.

BALLENSTEDT, a town of the duchy of Anhalt-Hernburg, on the Getol, 15 m. S.E. Halberstadt. Pop. 2,600. It is situated at the foot of a hill, and is ill-built. In its environs is a castle, the residence of the duke, which commands a fine view, and has fine gardens. It has fabrics of linen, dyeworks, and an hospital.

BALLINA, an inland town of Ireland, co. Mayo, prov. Connaught, on the Moy, 126 m. W.N.W. Dublin. Its former name was Belleek, " the ford of flags." The pop., including that of Ardarae, a village on the Sligo side of the Moy, connected with it by a bridge of 16 arches, and which may be regarded as a suburb of Ballina, was, in 1821, 6,243, and in 1831, 7,992 : the numbers in both parts of the town not being specified in the census of 1834, but included generally in those of the parish in which they are situate, no satisfactory statement can be made of the proportions of the several religious denominations, but the Roman Catholics appear to outnumber the episcopal Protestants in the ratio of 16 to 1, and the number of Presbyterians is quite insignificant. The town, which occupies a pleasing and healthy position, contains several good streets and houses. The parish church is a plain building ; the Rom. Cath. chapel, which is considered as the cathedral of the Rom. Cath. bishop of Killala, is a large and very ornamental edifice : there are also places of worship for Baptists and Methodists. The town contains 8 public schools, in which, and in several private seminaries, about 800 children receive instruction. Here also is a dispensary. A new bridge below the town is now being erected, and arrangements are being made for widening the old bridge, which is inconveniently narrow. Races are held in May, on a fine course in the neighbourhood. General sessions of the peace are held in July, and petty sessions every Tuesday in the court-house, a neat modern building. Here is a station of the constabulary, and a barrack. The market, for which commodious shambles are erected, is held on Mondays, fairs on 18th May and 18th August. There are 2 ale and porter breweries, and 3 large flour mills : 8,369 bushels of malt paid duty in 1836. A tobacco and snuff manufactory has been carried on since 1801, and coarse linen is woven, but not to any extent. Within the last four years the provision trade has been introduced, and is now very flourishing ; large quantities of pork and bacon being cured, chiefly for the London market. In the neighbourhood is a very productive salmon fishery, rented at 1,500*l.* per annum ; the fish is packed in ice, and exported to London. Eels are also taken in large quantities from September to the beginning of November ; the fry is sold at 2*d.* per quart. A branch of the Provincial Bank was opened here in 1828, of the Agricultural in 1835, and of the National in 1837. The post-office revenue increased from 643*l.* in 1830, to 1,212*l.* in 1836. The communication with the interior is kept up by the mail road between Castlebar and Sligo, which passes through the town ; a new line is also opened from Swinford and Fossford to

Killala. Three mail-cars, conveying at an average 7 passengers each trip, ply daily between the town and Crosmolina, Killala and Swinford.

The following is a general Estimate of the Inland Traffic in Merchandise and Produce of every kind.

Carried into the Town.		Carried from the Town	
	Tons.		Tons.
For exportation -	6,000	Proportion of imports	500
Agricultural produce		Surplus produce of	
used as food -	4,500	breweries, &c.	1,400
Ditto in breweries		Coal, manure, &c.	1,200
and distilleries -	200		
Ditto shop goods and		Total	2,100
exciseable articles -	600	Add -	39,500
Stone, lime, turf -	26,000*		
Total -	39,300	Total to and from	41,400

The Moy is navigable for vessels drawing 11 feet of water for 5 m. from the sea, but the further passage is checked by a bar 1½ m. below the town. A ship canal was commenced a few years ago, to obviate this defect, and to admit vessels of large draught to discharge at the town quay, but the works have been discontinued. The principal exports and imports for 1836 were as follows :

Imports.		Exports.	
	Tons. Value.		Tons. Value.
Corn and Meal	8,840	Coal, &c.	600
Provisions -	453	Iron	350
Kelp -	40	Herrings -	160
		Sugar -	35
		Herrings -	283
		Spirits -	19
		Cottons -	13
		Woolens -	16
			2,000

The total value of these imports and exports, including several minor articles, amounted to 70,568*l.* and 13,532*l.* respectively. The entrances and clearances for the years 1835-36 were, in tons —

Ships Entered.				Ships Cleared.			
Cargoes.	Hallast.	Total.		Cargoes.	Hallast.	Total.	
1335	4,571	5,124	7,725	7,298	484	5,712	
1836	5,009	5,127	5,736	5,506	381	5,777	

On the whole, the general aspect of the town, combined with its present improved state in manufactures, trade, and commerce, afford indications of rapidly increasing prosperity. The working classes are generally in a state of comfort : fuel is cheap and abundant. (*Private Inform.*)

BALLINASLOE, an inh. town of Ireland, co. Galway and Roscommon, prov. Connaught, on the Suck, 78 m. W. by S. Dublin. It owes its origin to a castle (now fitted up as a private residence) on the Roscommon side of the river, long considered as one of the strongest forts in the prov. The battle of Aughrim, in 1691, in which the army of William III., under Ginkell, afterwards earl of Athlone, completely defeated that of James II., under St. Ruth, who was killed in the action, was fought in its neighbourhood. Pop. in 1821, 1,811 ; in 1831, 4,615. The proportion of episcopal Protestants to Rom. Cath. is about 1 to 5. The two portions into which the town is divided by the river are connected by a line of road, consisting of a causeway and two bridges between the banks, and an island that intercepts its course, having together 16 arches : the whole line is about 500 yards in length. The private buildings have increased rapidly both in number and respectability, nearly a half having been erected within the last 12 years. The parish church is a plain building, with an octagonal spire springing from scrolls, that give it a very singular appearance ; the Rom. Cath. chapel is also a neat unornamented structure. The Methodists have two places of worship. About 700 children of both sexes are instructed in the public and private schools. The district lunatic asylum for the province stands on the Roscommon side of the river. It is built in the form of a cross, with accommodations for 214 patients, and is surrounded by an enclosed area of garden and sowing ground of 14 acres. The total expense of the land and buildings was upwards of 27,000*l.* Some statements relative to it, in the return for 1837, call for immediate attention. From them it appears that 16 additional cells then building are defective, from want of ventilation, are exposed to the weather, and have no means of being properly heated ; that 4 new rooms, built for incurable patients, are dark, and some feet below the ground level ; that there is no sufficient fall for the sewers, and that 4 acres of the garden ground are too wet for cultivation ! A very objectionable practice of admitting patients who pay for their accommodation is also noticed. A dispensary is maintained in the town. An agricultural society meets here in October, and a horticultural in March. The town is the head-quarters for the Galway constabulary, and there is a small barrack for infantry. Petty sessions are held on Wednesdays

* The turf alone is estimated at 21,500 tons.

BALLINROBE.

and Saturdays in the court-house, and there is a small bridewell, so defective in its interior arrangements, that the male and female convicts are confined in the same sleeping room. There are 4 flour and meal mills, 3 tan yards, 2 breweries, a pork and bacon stove, and manufactories of coaches and hats; 5,894 bushels of malt paid duty in 1836. The post-office revenue increased from 601*l.*, in 1830, to 980*l.*, in 1836. Branches of the bank of Ireland, and of the agricultural and national banks, were opened here in the same year. The market is held on Saturdays, in the market-house; there is a large supply of grain, the trade in which, and in other departments, has been materially increased, by a branch of the Grand Canal from the Shannon having been lately carried hither, a distance of 15 m. The principal fair, not only of the district but of Ireland, for the sale of sheep and black cattle, is held in October, and is numerously attended by buyers and visitors from all parts of the U. Kingdom. It continues from the 5th to the 9th of the month. A field in Lord Clancarty's demesne, of Garbally Park, is opened the day before the fair for the show of sheep, and large enclosed spaces are prepared for the sale of both kinds of stock. We subjoin an account of the numbers exposed for sale and purchased every 10th year since regular returns have been made.

Year.	Sheep.			Horned Cattle.		
	Sold.	Unsold.	Total.	Sold.	Unsold.	Total.
1790	59,231	2,700	61,931	7,782	850	8,632
1800	67,007	3,379	70,386	5,275	9,774	7,749
1810	69,481	2,590	71,071	5,351	4,348	9,699
1820	59,943	20,853	80,796	4,014	4,001	8,505
1830	66,874	14,611	81,485	5,894	1,563	7,457
1837	63,129	6,177	69,306	7,735	1,402	9,137

In 1828 the number brought to sale was greater than in any other year between 1790 and 1837: viz. 97,384 sheep, 11,513 horned cattle. The decline in the numbers from 1829 to the present period is principally caused by the establishment of sheep and cattle fairs of a similar kind in other places. Wool was formerly sold in this fair in large quantities, but the trade is now generally managed by factors in the great staple towns; there is, however, a wool fair for 4 days on the 6th of July, in which large purchases are made, and fairs of an inferior description for live stock are held on 7th May and 4th July. The town is a great thoroughfare, a main division of the roads leading into Galway and Mayo branching off from it. The conveyances for passengers are numerous; a mail coach and a stage coach from Dublin to Galway passes through it, another mail coach plies between it and Westport; a stage coach plies to Dublin, another to Tuam, and cars daily to Athlone, Roscrea, Galway, and T. am, conveying an average of 55 passengers each trip. Passengers are also conveyed by the Grand Canal from Dublin, by boats fitted up for their accommodation. The town is extremely well kept; much attention is paid to external cleanliness; the lower classes are generally employed and comfortable; and the constantly increasing influx of visitors every year, whether for business or pleasure, seems to have acted upon those interested in its welfare as a powerful stimulus for its further improvement.

BALLINROBE, an Inl. town of Ireland, co. Mayo, prov. Connaught, in the Robe, 25 m. N.N.W. Galway. Pop. in 1821, 2,191; in 1831, 2,575: that of the entire parish in 1834 was 9,635, of whom 372 were of the Estab. Church, and 9,263 Rom. Cath. The town consists of a main street and two branches of well-built houses. Near it is a turlough or winter lake, called Lough Shy, which, though flooded to a considerable extent in winter, dries in the summer months, and affords pasturage for sheep. Lough Mask, into which the Robe discharges itself, lies about 3 m. W. of the town. The par. church is a small building; the Rom. Cath. chapel is spacious; the Baptists have a place of worship. Two schools, supported by subscriptions, and 7 private schools, afford instruction to about 600 children. A dispensary is maintained here. Barracks of considerable dimensions, both for cavalry and infantry, are now unoccupied. There is a flour-mill, a malt-kiln, in which 2,231 bush. of malt paid duty in 1836, a brewery, and a tan-yard. A brisk trade in corn and potatoes is carried on, for which a Monday market is held. Fairs are held on Whit-Tuesday and 5th Dec. General sessions of the peace take place in June and December, and petty sessions are held on Mondays in the court-house, which is also used as a market-house. The bridewell contains sufficient accommodation for the prisoners confined temporarily in it. The post-office revenue in 1830 was 247*l.*, and in 1836, 348*l.* A daily car, conveying 3 passengers each trip, plies to Tuam. Though the town does not lie on any of the great lines of internal communication, it is in a state of progressive improvement, attributable chiefly to the increased attention to agriculture in the district, and the general spirit of improvement.

BALLYMENA.

281

BALLON, a town of France, dep. Sarthe, cap. cant., on the Orne, 14 m. N.N.E. Le Mans. Pop. 2,322. It has manufactures of coarse linens and etamines.

BALLYCASTLE, a marit. town of Ireland, N. coast co. Antrim, prov. Ulster, on a bay to which it gives name, 42 m. N. by W. Belfast. It originated in a castle built here by the Earl of Antrim in the early part of the reign of James I., but was not remarkable as a town until about 1770, when large parl. grants were voted to aid the working of the collieries in its neighbourhood. Pop. in 1821, 1,436; in 1831, 1,683; that of the parish of Ramoon, in which it is situated, was, in 1834, 4,977; of whom 1,718 were of the estab. church, 1,549 Prot. diss., and 1,710 Rom. Cath. It lies in a beautiful valley in the inner extremity of the bay, and consists of two detached portions, the upper and lower towns, connected by an avenue bordered by forest trees. The houses are mostly respectable, all slated and kept with much neatness. The church is a handsome building; the Rom. Cath. chapel is small; the Presbyterians and Methodists have each a place of worship. Twenty almshouses, provided for workmen reduced or disabled in the collieries, or their widows, are now tenanted by deserving paupers. A manor court is held monthly by the seneschal, for the recovery of debts under 20*l.*; courts baron are held in April and October, and petty sessions on alternate Tuesdays. For these purposes there is a convenient court-house. Ballycastle was formerly a place of considerable business, having in it a brewery, glass-house, and salt-works, all of which have declined since the stoppage of the mines; and it is now little more than a fishing village and a summer watering-place. The collieries, from which it derived its temporary prosperity, lie on each side the promontory of Fair Head; and the discovery of old workings and rude implements, in a part of the previously unexplored, shows that they had been opened at a very remote period. The seam of coal, which shows itself in the face of the cliff at a considerable height above the sea, forms, in one part, a single bed 4½ feet thick; at another, it appears in six strata from 1 to 2½ feet each, four of which are of flaming, and the two others of bituminous or blind coal. The workings, after having been carried on for a number of years to a considerable extent, have been relinquished, partly on account of the difficulty of penetrating to the dip of the old excavations, and partly from the want of a safe harbour for shipping. The only existing manufacture is that of linen, carried on in the houses of a few cottiers. The fishery of salmon, taken from February to September, appears, from the official return of 1836, to employ 9 boats and 27 men. The markets are held on Tuesdays, that of the first Tuesday in every month being so numerously attended as to resemble a fair. The regular fairs are held on Easter Tuesday, the last Tuesdays in May, July, and Aug., and on 25th Oct. and 22d Nov. Large numbers of a very small breed of horses, called Raghey ponies, are brought for sale from the island of Rathlin or Raghey. This island, which lies about 5 m. off the main land, is remarkable both for the singularity of its geological formation, and for having afforded shelter to Robert Bruce when forced to fly from Scotland. The post-office revenue declined from 325*l.*, in 1830, to 267*l.* in 1836. The town is on the extreme N. point of the line of road leading round the coast of Antrim from Belfast to Coleraine, and out of the direction of any great channel of trade. The only public conveyances for passengers, who are chiefly visitors to the Giant's Causeway in the vicinity, are two carriages to Coleraine, which ply once a week, each conveying a total average of 12 passengers each trip; and mail cars to Dervock and Cushendall, both which carry an average of six passengers daily. The harbour, which was originally capable of admitting vessels of large draught, was unsafe from the heavy sea thrown in from the ocean by the northerly gales; but, after upwards of 150,000*l.* of the public money had been expended in attempting to remedy this defect by the erection of a pier, the harbour was filled up with sand, and the pier having been neglected, has gone to ruin. In consequence of this and of the stoppage of the collieries, the trade of the place is almost extinguished.

BALLYMENA, an Inl. town of Ireland, co. Antrim, 23 m. N.N.W. Belfast, on the Braid, an affluent of the Maine, which flows into Lough Neagh. The town was taken by assault by the insurgents in 1798, after a sharp engagement, but was immediately after evacuated. Pop. in 1821, 2,470; in 1831, 4,063: that of the parish in which it is situated amounted in 1834, to 8,005, of whom 912 were of the Establishment, 8,709 Prot. Diss., and 1,384 R. Cath. The town stands in the midst of an extensive plain of uninviting appearance, though pretty well cultivated, and interspersed with low hills, marsh, and bog. The river is crossed by a large stone bridge; many of the houses are antique, with gabled fronts, but those of modern erection are generally of respectable appearance. The ecclesiastical buildings consist of the par. church, a R. Cath. chapel, two places of worship for Presbyterians, one for Seceders and one for Methodists. The

diocesan school of Connor was removed here from Carrickfergus in 1829, and large schools for boys and girls are maintained on an endowment by John Guy. Courts leet and baron are held annually; a manor court monthly, for the recovery of small debts; the general sessions in January and June, alternately with Ballymoney; and petty sessions on alternate Tuesdays; there is a well-arranged bridewell, and a police constabulary station. The town owes its prosperity chiefly to the linen trade: the brown linen sales average 70,000*l.* annually, and upwards of 14,000 pieces are bleached yearly in 14 bleaching-grounds in the neighbourhood. There is a mill for spinning linen yarn. A distillery in the town paid, in 1836, duty on 41,778 gal. spirits; and in the same year 3,393 bush. malt paid duty in the town. The market for linens is held on Saturdays; there are also two other markets in the week for grain and provisions, principally pork, large quantities of which are sent to Belfast. The market-house is a well built edifice in the middle of the town. The fairs are held on the 26th July and 21st Oct. The post-office revenue in 1830 was 737*l.*; in 1836, 937*l.* A branch of the Provincial Bank was opened here in 1833; of the Belfast and Northern banks, in 1834; and of the Agricultural Bank, in 1837. The town lies on the mail-coach road from Belfast to Londonderry, and maintains a coach, a *caravan*, and a car, to ply to Ballymoney, each six times a week, carrying an aggregate average of 16 passengers each trip. The general appearance of the place, both as to its external aspect, and that of its population in dress and manners, is the same as what is to be seen in most other towns in the N. part of Ireland under similar circumstances.

BALLYMONEY, an Inl. town of Ireland, co. Antrim, prov. Ulster, on a small branch of the Lower Bann, 8 m. S. E. Coleraine. Pop., in 1821, 1,949; 1831, 2,222. That of the parish was, in 1834, 12,003, of which number 1,019 were of the Establishment; 9,498 Prot. diss.; and 1,495 Rom. Cath. It is irregularly built on an eminence, about 3 m. E. of the Bann. Its places of worship are, the par. church, a Rom. Cath. chapel, and houses for Presbyterians, Remonstrants, Seceders, and Covenanters. A school, on the foundation of Erasmus Smith, is established, and several others on private endowments, in which, including private seminaries, about 700 children are instructed. There is a dispensary, and a mendicancy association. A steep chase in December for a gold cup has been substituted for races, which had been a favourite sport. A manor court is held on the first Friday of every month; general sessions of the peace in January and June, alternately with Ballymena; and petty sessions on alternate Tuesdays. The court-house is in the centre of the town, and there is a well-arranged bridewell: a chief constabulary station is fixed here. The trade is principally in fine linens, a species of which, called Coleraines, is in great demand: there are two markets for coals in the town. An extensive trade is also carried on in grain, butter, and provisions. In 1836 duty was paid on 109,792 gall. spirits, and 12,992 bush. malt: there is also a tallow manufactory, a brewery, and a tannery; a large mill for spinning flax, and a flour-mill. The regular market-days are Thursdays; fairs are held on 6th May, 10th July, and 10th Oct. The post-office revenue for 1830 was 365*l.*; for 1836, 519*l.* A branch of the Belfast Bank was opened in 1834, and of the Ulster Bank in 1836. The town lies on the mail-coach road from Belfast to Londonderry; a coach and two cars ply each six times a week between it and Ballymena, conveying an aggregate average of 18 passengers each trip.

BALLYSHANNON, a marit. town of Ireland, co. Donegal, prov. Ulster, on the Erne, where it discharges itself into Ballyshannon Bay, 10 m. N.W. Dublin. It consists of three very steep and irregular streets on one side of the river, and a poor suburb, called the Purl, on the other: the communication between them is by a bridge of 14 arches. The parish church stands on the summit of the hill on which the town is built: there are 2 Rom. Cath. chapels, 2 places of worship for Methodists, and 1 for Presbyterians. An artillery barrack adjoins the place, and it is a chief constabulary station. The bor. was incorporated by James I., in 1613, and returned 2 mem. to the Irish H. of C. till the Union, when it was disfranchised. A manor court for pleas to the amount of 2*l.* is held every three weeks, petty sessions once a fortnight. The court sits in an upper apartment of the market-house, which is also used as an assembly-room. In the immediate vicinity of the town is a magnificent cascade formed by the Erne, here 150 yards broad, throwing its waters over a ridge of rock 16 ft. high, with a noise audible for several miles. Salmon and eels are caught in great numbers; the former chiefly for the British markets: the annual produce is upwards of 50 tons. There are no manufactures of any consequence, and the trade is confined chiefly to retail dealings, owing to the badness of the harbour, which, notwithstanding the most spirited exertions of the chief proprietor, is still impracticable for vessels of any draught. There is a distillery, which in 1836 paid duty for

BAL TIC SEA.

114,631 gallons of spirits; also a brewery: 8,234 bushels of malt paid duty the same year. The post-office revenue in 1833 was 579*l.*; in 1836, 859*l.* A branch of the Provincial Bank was opened in 1835. Markets are held on Tuesdays and Saturdays; fairs on 18th of Sept., and on the 2d of every other month. A mail-coach, conveying an average of 3 passengers each trip, plies between Enniskillen and this town every day in the week; and a car to Silgo carries an average of 3 passengers each trip on every day but Sunday. The land traffic of goods carried to and from the port is estimated for the year 1836 by the railroad commissioners as follows:—

Carried into the Town.		Carried from the Town.	
	Tons.		Tons.
For exportation -	1,800	Proportion of Imports -	500
Agricultural produce for food -	2,850	Distilleries, &c. -	800
For distilleries -	1,100	Coal, manure, &c. -	760
Exciseable and shop articles -	300	Total -	3,060
Stone and lime, &c. -	2,850	Carried into the town -	17,400
Turf -	8,500	Grand Total -	19,460
Total -	17,400		

The exports are, oats, 1,794 tons, value 11,130*l.* Imports, coal, &c., 1,225 tons; stone and slate, 310 tons; corn and flour, 354 tons; sugar, 24 tons; with other minor articles of the total value of 9,524*l.*

The fishery is carried on from the town and the neighbouring village of Buncrana, in not more than 2 open sail boats, and 6 row boats, which employ but 46 hands.

Natural impediments connected with its locality have prevented this town, otherwise advantageously placed near the mouth of a large river, opening after a course of a few miles into Lough Erne, which washes the shores of a great tract of country, from rising rapidly in the scale of improvement.

BALTA, a town of European Russia, gov. Podolia, on the Kadyva, 160 m. S. E. Kamencz. Pop. 1,600. Its suburb, on the S. side of the river, now in the gov. of Kherson, was formerly in Turkey, while the bulk of the town, or the portion on the N. side of the river, was in Poland. The latter is comparatively well built, and industrious.

BALTIC SEA, an internal or mediterranean sea, in the N.W. part of Europe, surrounded and very nearly enclosed by Sweden, Finland, Russia, Prussia, Germany, and Denmark. It is usually understood to commence S. of the Danish islands (Funen, Zealand, and Laland), and, thus limited, it is unquestionably the most nearly isolated of any similar body of water in the world. But N. of these islands the Kattegat and the Skager Rack can be regarded only as parts of the Baltic, which may therefore be described as commencing at the Narve of Norway, in long. 7° E., and extending to St. Petersburg on the Gulf of Finland, in long. 30° 24' 45" E. Its extreme points in lat. are Wismar, in Mecklenburg, 53° 50' N., and Tornea, on the Gulf of Bothnia, 69° 51' N. These points mark also its greatest length, which is consequently about 840 m.; its width varies from 75 to 150 m., and its area is estimated at 155,000 sq. m. without including the Kattegat and Skager Rack, for which an addition of 19,000 or 19,400 sq. m. may be made. (*Catruu, Tableau de la Mer Baltique*, l. 2-37.; *Thomson's Travels in Sweden*, 384.)

The direction in which the Baltic penetrates the land is extremely tortuous. The Skager Rack, the first great gulph of the North Sea, runs N.E. between the shores of Jutland and Norway, for rather more than 150 m., to the W. coast of Sweden; and the Kattegat, from the Skaw (the N.E. point of Jutland), has a direction almost due S. between Jutland and Sweden for about 120 m. The average width of these gulphs is nearly equal (120 m.); but the former is much the most uniform, the latter being narrowest at its N. end, between the Skaw and Gotenburgh, and widening considerably towards the S. From Laholm Bay to the opposite Danish coast is full 100 m. The 2 belts and the sound are the 3 straits which connect the Kattegat with the Baltic, properly so called; and their direction is the same as that of the gulph in which they terminate, namely S. This sea has been so long known to Europeans, that its peculiar entrance has ceased to excite attention; yet there is not one, perhaps, where navigation is so intricate. The direct distance between the Kattegat and the open sea of the Baltic, is less than 110 m.; that between the shores of Jutland and Sweden is no where more than 130 m.; and in this space, which would not be accounted large, even were it clear, are crowded between 60 and 70 islands, with shoals and sand banks innumerable. Two of these islands, Funen and Zealand, may be called large, and some of the others, as Alten, Langeland, Laland, Falster, and Moen, of respectable size, their situation in a close sea being considered. It is the two large islands which, with the Danish and Swedish coasts, form the 3 straits; the smaller isles and

sand banks serving to break up their channels, which would otherwise be sufficiently direct, into many small and variable currents. The Little Belt (the strait between Jutland and Funen) is, at its N. end, less than $\frac{1}{2}$ m. in width. It expands, however, immediately, and between Arrosund and Assens is $\frac{1}{2}$ m. broad. Still further S. the continent recedes into a great bay; and this island becoming broken up into several smaller islets, the greatest width of the Little Belt is, perhaps, not less than $\frac{1}{2}$ m. Its most S. channel contracts again to about $\frac{1}{2}$ m. between the islands of Alten and Årø. The Great Belt (between Funen and Zealand) is more uniform in its width, which averages about $\frac{1}{2}$ m. Towards the S., however, this strait also stretches out W. into a large bay, formed by the islands of Zealand and Laland, and at its S. termination it is divided into 2 channels by the island of Langeland, of which the widest or most E., between Langeland and Laland, is about $\frac{1}{2}$ m. across, the other not more than $\frac{1}{4}$ m. The Sound, at its entrance between Elsinore in Zealand, and Helsingburg on the coast of Sweden, is about $\frac{1}{2}$ m. wide; but it spreads into a succession of bays upon the Swedish shore, and towards its S. end, into one of considerable size (Kilde Bay) on that of Zealand. It is here about $\frac{1}{2}$ m. across, but the return of the land contracts its final outlet to about half that amount. (*Catcau*, i. 2-6; *Thomson*, 385; *Curr.*, *Northern Summer*, 27, 30, 102, &c.)

The direction of the sea from these straits is first E. to Memel (about 300 m.), and then N. as far as the lat. of Stockholm, $59^{\circ} 21'$, a distance of 250 m. It is to these portions that the term *Baltic Sea*, in its limited sense, is restricted, for at this point it separates into 2 great gulphs; of which one, the Gulph of Finland, runs nearly due E. between the Russian territories of Finland and Revel; the other, the Gulph of Bothnia, a little E. of N., between Finland and Sweden. The Gulph of Finland is 200 m. in length, with a mean breadth of 60 or 70 m.; that of Bothnia is about 400 m. long, and 120 m. in average width, but at its narrowest part, the Quarken, opposite Umea, it does not much exceed 40 m. The Gulph of Riga, or Livonia, S. of that of Finland, is also an important inlet, stretching into the countries from which it is named, about 80 m. from E. to W., and about 50 m. from N. to S. (*Catcau*, i. 27-114; *Thomson*, 326.) Beyond the Danish islands the Baltic is a tolerably clear sea, except on the coasts, where alluvial islands are continually forming. In the main stream the only interruptions to the continuity of water are found in Rugen (which is, however, close to the Pomeranian shore); Bornholm, between the coasts of Prussia and Sweden, but much nearer the latter than the former; Oeland, on the S.E. of Sweden; Gotland, N.E. of Oeland; Oesel, Dago, and several smaller islands between the Gulphs of Riga and Finland; and the Åland archipelago at the mouth of the Gulph of Bothnia. Opposite to these last the S.W. coast of Finland is crowded with an innumerable quantity of islets, which seem as though the main shore were advancing by rapid strides to join the larger islands of Åland, as a stage in its progress towards a junction with the opposite Swedish shore. (*See* ÅLAND, BORNHOLM, GOTLAND, &c.)

The Baltic is not, like other close seas, the Mediterranean, Red Sea, &c. shut in by rocks and high mountains. On the N.W. and N., indeed, the mountains of Sweden and Norway form a sufficiently definite boundary; but, towards the E., S.E., S., and even S.W., its borders stretch away in plains occupying much more than half Europe. On the S. the nearest high lands are the Hartz, the Bohemian mountains, and the Karpasians; S.W. lie the flat lands of Jutland, Holstein, and Holland; S.E. the plain is unbroken to the shores of the Black Sea and Caspian; and E. there are no hills except the insignificant elevations of Valdaï, between the Baltic and the Ural mountains. The basin of this sea is, therefore, by no means well defined, except towards the N. and N.W. In every other direction it has to be determined by the direction of the running water only, and that on land so level that the basin of the Baltic is constantly combining with those of other seas; with that of the White Sea, for instance, through the lat. of Russian Lapland; with that of the Caspian, by the close approach of many of the affluents of the Volga to Lakes Onega and Ladoga; and with that of the Black Sea, among the innumerable streams of Lithuania and Poland. It is, therefore, impossible to calculate accurately the amount of land constituting this basin, but it is of very considerable extent, its extreme points being in lat. 49° and 69° N. in long. 7° 40' E. (*Arrhenius's Atlas*; *Von Buch's Travels*, 337; *Catcau*, i. 44, &c.) With the exception, perhaps, of some portions of America, there is no part of the world more abundantly watered than this district: upwards of 240 rivers find their way to the Baltic; the lakes in its neighbourhood are all but innumerable, and altogether this sea drains more than a fifth part of the whole surface of Europe. The rivers which flow from the S. and S.E. run the longest courses, varying from 330 to 750 m. (*See* ODER, VISTULA, NIEMEN, DWINA, &c.)

Some of those from the E. appear at first to be much shorter, as the Neva, which from Lake Ladoga does not exceed 45 m.; but as this Lake is connected with that of Onega by the Sviz, and as Onega receives the Volga, a stream rising close to the 40th meridian, the whole of this water course is not less than 400 m. in length. The other Finnish rivers are not long; but W. of the Gulph of Bothnia, the rivers of Sweden vary from 300 to 400 miles. The most peculiar part of the basin is the N. corner, where, though the nearest mountains are those of the Hartz, the basin itself does not exceed 20 or 25 m. in width. The Elbe, which runs within 60 m. of the Baltic, and the Eyder, which rises close to its shores, fall into the North Sea, and their affluents belong of course to that system; but such is the flatness of the country in this part of Germany, that the different waters are constantly uniting, and a canal of less than 3 m. has served to connect the Baltic with the Elbe by joining the rivers Trave and Stricknitz, below Lubek. A similar junction has been effected between the Baltic and the Eyder, a little to the N. of Keil. (*Catcau*, i. 86, ii. 1-81; *De Luc, Géol. Trav.*, 136, 192, 274, &c.)

The Baltic is extremely shallow, being not more in its W. parts, between Keil and Copenhagen, than 16 fathoms deep, and most commonly not more than 8 or 10 (*Von Buch*, 10.); but farther E. it deepens considerably, and midway between Memel and Oeland it is from 60 to 100 fathoms. This is, however, its greatest depth, for the Gulph of Finland suddenly shallows from 50 or 60 fathoms to 16 fath., 4 fath., and, in the Bay of Cronstadt, to even less than this. The average depth of the Gulph of Bothnia is not greater than that of the rest of the sea, but it is less encumbered with sand banks, and its harbours are more convenient: none of those S. and E. of the Gulph of Finland have more than 20 ft. water, and but few have as much as 16. (*Catcau*, i. 39-114.)

The Baltic, being a close sea, with its entrance from the approach of the tidal wave, is, of course, not subject to the phenomena of tides. These, so very powerful in the German Ocean, are found to decrease sensibly in the Skager Rack and Kattegat, to be barely perceptible in the entrances of the straits, and entirely to vanish S. of the Danish Islands. (*Catcau*, i. 115-118.) But though tides be wanting, a variation in height equal, frequently, to $\frac{1}{2}$ ft. * (Swedish) is observed, at irregular intervals, in the waters of this sea. This phenomenon occurs at all seasons, but chiefly in the autumn or winter, or at the time of heavy rains, or when the atmosphere is charged with clouds, though unattended by falling weather. The water maintains its height frequently for several days, sometimes even for weeks, produces considerable agitation in the gulphs and straits, and, except in winter, when its power is restrained by the accumulated snow and ice, inundates the low wastes to a considerable extent. Prevalent winds, flooding rains, melting snows and many other causes, have been assigned for this very remarkable phenomenon, which continued, however, to occur under circumstances totally incompatible with any one of these; but in 1804 Schulten, a Swedish physician, after collecting all the observations that had been made, found that the greatest height of the water corresponded to the greatest depression of the barometrical column and conversely. The extreme variation of the latter amounts in N. Europe to $\frac{1}{2}$ ins., equivalent to nearly $\frac{1}{4}$ ins. of water; and combining this with the fact that the movement of the water always preceded, by a little, that of the mercury, he concluded that the former was owing to the unequal pressure of the atmosphere upon different parts of the surface; the extreme height sometimes attained being dependent upon local and accidental circumstances. It need scarcely be remarked that the almost total absence of oceanic action in this sea leaves the cause, thus assigned, to operate with full power; and if Schulten's hypothesis be confirmed, of which there is now but little doubt, it will, in all probability, serve to explain similar phenomena, observed in other close waters; as the Caspian, Lake Balkal, and the Lake of Geneva, to the similar variations in which Saussure has assigned a cause analogous to that offered by Schulten in the case of the Baltic. (*Mem. Acad. Stock.*, 1804; *Saussure's Voyage dans les Alpes*, i. 15.)

The currents of such a sea as the Baltic must depend, in a great degree, upon its rivers; and as these exist in the greatest number towards the N. and E. parts, the general direction of the water is from N.N.E. to S.E.W., as far, at least, as the latitude of Königsberg. The impulse from the S. here given by the great rivers of Prussia aids the resistance of the land to turn the current W., towards the Danish islands, among which it of course becomes broken into many parts, all combining at last in a general N. direction through the Kattegat, and thence S.W. through the Skager Rack into the N. Sea. The currents of the Baltic are, therefore, outwards; and when a W. wind forces the water of the ocean into its gulphs, these currents, always intricate, become ex-

* The Swedish foot is 14-60 inches, English.

tremely complicated, and even dangerous. (*Catteau*, i. 125-132.) This general direction of the water, together with the number of rivers which flow into the Baltic, account for the very slight degree of saltness which it is found to possess. It is well known that the Ocean yields in solution salt, muriate of magnesia, sulphate of lime, and sulphate of soda, to the amount of about 1-37th of its own weight; but at Copenhagen, Von Buch found this proportion reduced to considerably less than 1-100th; and Thomson, at Tuusberg, S. of Stockholm, found it less than 1-210ths—a quantity so slight as scarcely to affect the palate; and it is said that farther to the N. and E. the sailors commonly use the water of the Baltic for their food. The following is the relative gravity of the waters of the Ocean and of the Baltic, under various circumstances: for, it is to be observed, that the latter becomes much saltier under a W. wind, when the water of the ocean is forced into it, and that this effect is perceptible for a considerable distance:—

Open sea at Heligoland	sp. gr.	Baltic at the Scaw Sound	sp. gr.
Firth of Forth	1.0231	1.0047	1.0203
	1.0250	Tuusberg	1.0247

In a N.W. wind the gravity at Copenhagen rose to 1.0180; and near Stockholm the following changes were observed, under the various circumstances:—

Wind E.	sp. gr.	Storm at W.	sp. gr.
Wind W.	1.0067	Wind N.W.	1.0058

Lastly, the quantity of salt procured from 1,000 grains of water, from the following places, was as under:—

Firth of Forth	grs.	Sound	grs.
Scaw	36.6	Tuusberg	7.4
	32.0		

When it is considered that all these experiments were made S. of the lat. of Stockholm (59° 21'), and that an immense number of rivers flow into the Gulph of Bothnia, it seems reasonable to conclude that the N. part of that Gulph should be still less salt, if, indeed, it be not free from any saline mixture whatever. (*Von Buch*, 10; *Thomson*, 386-390.) The experiments of Von Buch and Thomson, conducted independently, and with every possible care, must be received as satisfactory; but it is, perhaps, necessary to observe that Catteau gives the amount of salt held in solution by the Baltic, generally at 1-30th to 1-40th of the water. (i. 142.) It is not, however, possible to reconcile this statement with others by the same author: such as, that in many bays the water is used for cooking; that in *summer* the Gulph of Bothnia yields only 1 ton of salt from 300 tons of water, and that the specific gravity varies between 1.0126, 1.0047, 1.0041, and 1.0039. (i. 144.) Neither is this quantity of salt consistent with the following table of the relative amount in 3 lbs. (German) of water taken from the N. Sea and Baltic; which is given by Catteau, on the authority of Halem and Vogel (i. 143.):—

	N. Sea.	Baltic.
Muriate of Soda	52.8	46.5
Magnesia	19.4	111
Sulphate of Lime	25	12
Soda	1-3d	1
Residuum	1	1
Total	746 1-3d	338

The German pound is a variable weight, but it is no where lighter than the English, and in most places on the Baltic it is from 400 to 500 gr. heavier; taking, however, the English pound of 7,000 grains, the above results give less than 1-54th, and not 1-40th, for the 1-30th as the proportion of salt to the water of the Baltic. The proportion for the N. Sea is about 1-28th, differing very little from that assigned above.

This freshness of the water combines with its shallowness and confined situation to render it peculiarly liable to congelation; in fact, it is every year encumbered with ice, and its straits are usually impassable from December to April. Severe frosts made the sea passable in its wildest parts, between Prussia and Denmark, in 1833, 1839, 1423, and 1429. The climate, like that of all Europe, and more especially of Germany, has become more mild under the effects of better drainage and cultivation; but, even within recent times, Charles XII. marched across the Sound and the two belts to the attack of Denmark, and so late as 1809 a Russian army crossed the Gulph of Bothnia on the ice. (*Catteau*, i. 146-154; *Thomson*, 120, 138.) The temperature in the neighbourhood of this sea does not appear to diminish with increase of lat. so much as might be expected: at Tornø, nearly 68° N., Von Buch affirms that the season does not differ from that of N. Germany by more than a month; and that the polar winter does not set in till the end of November.

The productions, animal and vegetable, of the surrounding countries are somewhat modified by the pre-

sence of this considerable body of internal water. (*See SWEDEN, DENMARK, PRUSSIA, FINLAND, &c.*) The sea itself is extremely rich in fish of many varieties; the taking of which forms an important branch of industry in all the neighbouring countries. The larger amphibia—mosses, lamantins, &c., are absent; but seals are very plentiful, not only in the sea, but in the neighbouring Lakes of Ladoga, Onega, &c.: they do not form a part of human food, as in other less fertile countries of the North, but are chased with great avidity for their oil and skins. Whales are stated to be sometimes of enormous dimensions, but are very rarely found: one was seen in the Gulph of Bothnia, in July, 1811; but this, like every other appearance of the animal, was regarded by the inhabitants as an evil omen. Of other and smaller cetacea, the marsouin (*Delphinus Phocaena* of Linnaeus) is common enough in the Baltic. (*Catteau*, i. 190-251.)

The Baltic is decreasing. Of this there can be now little reasonable doubt, the nature of the surrounding countries and recent observations being taken into consideration. The innumerable lakes that lie between it and the White Sea are nothing but the last remains of a once continuous sea; which may be considered as proved by the appearance of similar animals in these waters, though now fresh, and the broad bands of tertiary strata which extends throughout the whole space. (*Lyell*, *Prin. Geol.*, i. 209.) On the S., even within the period of modern history, great changes have taken place. Lubeck, which when first built was undoubtedly a sea-port, is now 12 m. from the shore, and incessant pains are requisite to preserve its communication with it by the channel of the Trave. The numerous lakes of N. Germany, like those of Finland, are but the last remnants of the sea, which once and lately lay upon the soil, as is, incontestably proved by the continual choking up of some, and the constant detaching of others from the main body of water by the deposits brought down by the rivers. The Haffs of Prussia are now quite detached; the Isle of Rugen is all but joined to the German Continent; while its former division into several separate islands is attested by the different names bestowed upon its different parts, of which *Rugen Antick*, in the language of the country, means Rugen Proper. Similar instances might be accumulated all along this coast, all parts of which are full of evidences of the same gradual and rapid changes. (*De Luc*, 200, 236, 243, 247, 276, *et pass.*;) and were other proof wanting, it would be found in the extensive mosses abounding in marine plants, which constitute so great a part of N. Germany. (*Von Buch*, 2; *De Luc*, 192, *et pass.*) In the N., on the Gulph of Bothnia, the same decrease is going on with equal, if not greater, rapidity (*Von Buch*, 386.); and though it is certain that the surface of the sea cannot sink, this the laws of equilibrium would prevent; yet, from every observation, it is no less evident that its bed is filling up, and that the surrounding land is slowly (perhaps not very slowly) rising. Olaf Dalin, a Swedish mathematician of the last century, calculated the change at 1 inch per annum; and judging by the very evident alterations in many parts, this is not probably too high, though the hypothesis was held in scorn when first broached. (*Algarotti's Letters*, 86.) As the same operation may be traced on the shores of the Caspian and Black Seas (*See CASPIAN and BLACK SEA*), there can be little doubt but that these are the last drainings of the European plain towards the S.E., as the Baltic is towards the N.W., or that these waters were once in connection; the very trifling elevation between their basins serving to determine the direction of the rivers, and the consequent deposit of new land. (*See Lyell's Geol. Map of Europe*, i. 209.) One of the most peculiar appearances on the shores of the Baltic consists of the immense number of granite blocks, boulders, as they are called, with which the alluvial soil is every where covered: after all that has been said upon this subject, the appearance of these anomalous masses continues a mystery. The opinion of De Luc, that they were forced by explosion through the superstrata, is perhaps the least objectionable; at all events, it is less violent than the supposition, that they were floated from a distance upon water or ice. (*Geol. Trav.*, 99-76; *et pass.*)

The ancients were but very slightly acquainted with the Baltic: it is mentioned by them under the title of *Sinus Codanus* (Gulph of the Gothic Dane), and was the theatre of those marvels, which, in ancient geography, always mark imperfect knowledge. Its shores gave forth, however, the warriors who overthrew the Roman empire, and laid the foundations of modern European society. In modern times its straits are more crowded with ships of all nations than those of any other inland sea; and the toll charged by Denmark, on all vessels passing the Sound, is a considerable source of revenue. Large quantities of amber are collected on its shores, especially those of Prussia, and the Isle of Rugen. (*Catteau*, i. 189-251.) The origin of the name Baltic has divided etymologists. Some derive it from the Danish *Belt* (a girdle), and others from the word *Balta*, which, in the Lithuanian tongue, signifies White. The

great quantity of snow which annually falls in its neighbourhood, renders this last derivation far from probable, though the former be evidently not less applicable; at all events, the name has existed from very early times, though at present the general designation, used by the inhabitants of its shores, is *Oost-see* (Eastern Sea), as serving to distinguish it from the Atlantic, or *Western Ocean*.

BALTIMORE, a marit. city of N. America, the third in point of size and importance in the United States, and the principal city, though not the cap. of the State of Maryland, on the N. side of Patuxent Bay, 14 m. above its entrance into the Chesapeake, 37 m. N.E. Washington, and 1.0 m. S. W. Philadelphia; lat. $39^{\circ}17'N.$, long. $76^{\circ}36'W.$ Pop., in 1800, 23,971; in 1820, 62,738; and in 1830, 80,625. It is pleasantly situated, on slightly undulating ground, and is built round a basin or inner harbour, which affords a spacious, secure, and commodious harbour for vessels of 200 tons, quite close up to the town. The principal part of the city is divided from the portions called Old Town, and Fell's Point, by a small river called Jones's Falls, over which are erected three handsome stone bridges and four wooden ones; in the outer harbour, near Fell's Point, vessels of 500 or 600 tons lie in perfect safety. The entrance to the harbour is narrow, and effectually commanded and defended by Fort M'Henry. The city is regularly laid out, and well built; streets generally spacious and well paved, and houses neat and commodious. The principal public buildings are the exchange, court-house, college, and university halls; two hospitals, a penitentiary, gaol, circus, two theatres, 6 market-houses, and 45 places of worship. The exchange is a large and handsome edifice, 366 ft. by 140; the Roman Catholic cathedral is perhaps the finest church in the country, and contains some good paintings: the Unitarian church, St. Paul's church, the court-house, Union Bank, and several other of the public buildings, are both spacious and elegant. St. Mary's College is a Catholic institution, and has a library containing 10,000 vols. The medical college, now the university, received that title with a new charter in 1812; the city contains besides, a museum, and a gallery of paintings. The houses are mostly of brick; the principal street, about 1 m. long and 80 ft. wide, runs parallel to the water. On an elevation, above the compact part of the city, is the Washington monument, a Doric column of white marble, 140 ft. in height, and 20 ft. in diameter, standing upon a base 60 ft. square, and 23 ft. high; containing a circular stair-case, by which visitors ascend to the summit, on which a colossal statue of Washington is placed. It is by far the most splendid structure of its kind in the Union. The Battle monument, an elegant marble obelisk, 35 ft. high, is erected to the memory of those who fell in the defence of the city and Fort M'Henry, in 1814, and is inscribed with their names. The city is supplied with excellent water from four public fountains, which are also ornamental structures. Baltimore is admirably situated for commerce, and is a place of considerable wealth and trade; it engrosses most of the trade of Maryland, together with half that of Pennsylvania, and part of that of W. Virginia and the western states. Its inland communication has been and is being much extended and facilitated by the construction of canals, and of the Baltimore and Ohio Railway, now (1839) in progress. Tonnage belonging to the port, in 1837, 67,107. It is one of the greatest flour and tobacco markets in the world; the annual inspections* of flour amount to from 350,000 to 600,000 barrels; those of tobacco were, in 1838, 28,026 hhd. The other exports are chiefly hemp, flax, flax-seed, Indian corn, and other agricultural products, timber, iron, &c.: the imports are cottons, woollens, sugar, coffee, tea, wine, brandy, silk goods, spices, rum, &c. Total value of the imports into Maryland in 1837, 7,857,033 doll.; exports, 3,789,917 doll.; but that was a year in which, owing to previous over-trading, the commerce of the Union was very much reduced. There are in the vicinity numerous cotton manufactories, and flour and other mills in operation. A part of the city is low, and was formerly accounted unhealthy; but this has been obviated by the filling up of the marshy grounds, &c.: to the N. and E. the land rises to a considerable elevation, and affords a beautiful prospect of the city and surrounding country. The citizens of Baltimore are distinguished as well for bold and persevering enterprise, as for hospitality and agreeable manners. Baltimore has had a remarkably rapid growth. It was first laid out as a town in 1729; in 1769 it contained only about 50 houses: it was first erected into a city in 1797. A formidable but unsuccessful attack was made on it in 1814, by a British force under Gen. Ross. (*Encycl. Americana*, i. 537; *American Official Accounts and Almanacs*.)

BALTIMORE, a marit. town of Ireland, co. Cork, prov. Munster, on a bay of the same name, near Cape

* Flour is one among numerous other articles not allowed to be exported from the Union till they be inspected and their quality determined by public officers appointed for that purpose.

Clear Island; 46 m. W. S. W. Cork. Pop., in 1831, only 460. In appearance and accommodation it is merely a village, and claims rank as a town only from having been incorporated, and being a port. The houses are built round the remains of the old castle, and have latterly been increasing in number and respectability. The church is a new and elegant building on an elevated site: there is an endowed school-house for both sexes, and a dispensary. Baltimore was incorporated by James I., in 1613, and sent 2 mem. to the Irish H. of C. till the Union, when it ceased to be represented, and its other privileges fell into disuse. The jurisdiction of the port extends from Mill Cove to Galley Head, including the creeks of Berehaven, Bantry, Ross, Glendore, and Castle Townshend, in the last named of which (ten miles distant) the custom-house and principal fiscal establishment is held. The customs' duties were, in 1834—1836, respectively 1,041l., 2,151l., 1,408l.; the increase in the second of these years was occasioned by the import of timber for the Allihies copper-mine near Castletown, and for which the greater part of the duty was returned. The exports during the same year from Baltimore, with Castle Townshend, Glendore, and Ross, were, corn, &c., 5,681 tons; potatoes, 8,55 tons; copper ore, 85 tons; swine, 107 head; estimated value, 37,144l. The imports, in tons, coals, &c., 607; iron, 113; sugar, 55; salt, 114; herrings, 66; with some minor articles: total estimated value, 17,767l.

The fisheries, for the protection of which a small pier and quay were erected in 1833, are carried on to some extent. The following is a statement of the number of boats and men employed, as given by the commissioners of fisheries for 1830, and by the coast guard officers for 1836:—

	1830.			1836.		
	Vessels.	Tonnage.	Men.	Vessels.	Tonnage.	Men.
Decked -	4	107	25	2	45	14
Half Decked -	27	445	143	20	800	120
Open Boats -	84	-	70	70	-	110
Row Boats -	336	-	1,973	-	-	350
Total -	417	552	2,267	112	945	584

The post-office revenue is included in that of Skibbereen, at which town the conveyance S. by public vehicles ceases.

BALTINGLASS, a par. and town of Ireland, co. Wicklow. The town is situated on the S. side of the Slaney, 34 m. S. W. Dublin. Pop. of par., in 1831, 4,110; of town, 670. The latter is remarkable only from a parliament having been once held in it, and from its having formerly returned 2 mem. to the Irish H. of C.

BAMBARRA, a considerable country of interior Africa, the precise position of which is far from being accurately ascertained. On Rennell's map to Park's first expedition, its lat. is given from 12° to $15^{\circ}22'N.$; its long. from 15° E. to $20^{\circ}20'W.$ The map to the last journal of Park makes the lat. extend from $10^{\circ}15'$ to $16^{\circ}20'N.$ the long. from $10^{\circ}35'$ E. to $40^{\circ}52'W.$ (See also, *Advertiser*, Park's 3d Journal.) And, lastly, Caillie appears to place it between 9° and $14^{\circ}N.$ lat., and between 40° and $90^{\circ}20'W.$ long. (*Travels*, 2d Map, i. 364, et seq.) A mean among these different statements will give about 400 m. for its greatest length, from N. W. to S. E., and about 300 m. for its greatest breadth, in the direction of the meridian. Upon Park's map, the area is about 95,000 sq. m. but of course little reliance can be placed upon the accuracy of these results. The names of the surrounding countries are known with more certainty; they are, on the E., Gotta, Baedoo, and Maniana; on the S., the Mandingo country, and district of Kongt; on the W., Kaarta; and on the N. and N.E., Beeroo and the tributary kingdom of Masina. (*Park*, pp. 92, 140, 216, &c., and *Map*.) Bambarra is, for the most part, a plain country, with a general inclination to the N. and E. The W. portion is, however, mountainous, or rather hilly, and forms the E. termination of the high lands of Kaarta, Manding, &c. These mountains are of granite and other old formations, but of no great height; and the soil, both on their sides and on the plains, though in the immediate neighbourhood of the Sahara, is generally good. The Niger, Joliba or Quorra, has its rise about 180 m. S. W. from the frontiers of Bambarra, and flows through the whole length of that country from S. W. to N. E. It is an important stream at this early part of its course, but by no means so gigantic as it afterwards becomes. At Sego, the Bambarra capital, it is about the size of the Thames at Westminster. (*Park*, p. 194.) There is no other river of importance in the country, but the smaller

† This term, though the generic appellation for a mountain in the Mandingo language (*Caillie*, i. 366.), appears unquestionably to be the proper name of a kingdom also (*Park*, p. 340); and not improbably the high range in 9° or $10^{\circ}N.$ may be called Kong, Tan Moutraire, by way of eminence.

water-courses are innumerable; they all overflow during the rainy season, which lasts full 6 months, so that the moisture is fully sufficient to render the land in a very high degree productive. The climate is one of intense heat, especially in the N., where the land borders upon the desert; but, upon the whole, the temperature is more endurable in Bambarra than in some of the neighbouring countries; and in the S. parts it is cold enough in the rainy season to render it desirable. (*Caillie*, i. 327.) The rainy season extends from June to November, and is ushered in by violent tornadoes. Its termination is usually marked by the dry N.E. wind called Harmattan (*see ASHANTEE*), which is here, however, not cold, as on the coast of Guinea, and so far from being dreaded, is accounted salubrious, particularly to Europeans, from the rapidity with which it absorbs the superabundant moisture of the air.

The mountains are said to be rich in gold, but less so than in Jallonkoo and other countries further W. They also produce iron, and there can be little doubt but that a well-directed industry would turn their mineral treasures to account. Vegetation is varied and abundant; of trees there are the immense baobab, the bombax (silk cotton), oil palms, dates, tamarind, and a great variety of forest trees. The earth produces, with little labour, yams, cassava, maize, small millet, fulgine, rice, &c., many of which yield two crops a year; and the loka (*Phamulus lotus* of Linnaeus) is an important article of food. The tropical fruits, so common in Guinea, are, however, very scarce here; Paik (p. 260), did not meet with the pineapple, orange, or banana, except near the mouth of the Gambia; and though Caillie (i. 181.) mentions them, their locality is fixed by him also near the coast, and consequently at a considerable distance from Bambarra. It does not appear that the sugar-cane, coffee, or cocoa-tree are met with; but to compensate for this, corn, rice, &c. are so plentiful, that, in the language of the natives, "hunger is never known." This must, however, be received with limitation, since war and neglect of cultivation have sometimes produced destructive famines. The most remarkable production of this country is the shea, or butter-tree, a plant about the size and appearance of the American oak, the oleaginous fruit of which answers every purpose of butter made from cow's milk, combined with the inestimable advantage, in such a climate, of preserving its firmness and sweetness for the whole year without salt. This last is an article peculiarly deficient in Bambarra and the neighbouring countries; so much so as to be a valuable article of foreign commerce, and bought at a high rate with the corn and gold dust of the district. Tobacco is cultivated in many parts with great success. The animals, except monkeys, which are strangers, are the same as those of tropical Africa, generally; lions, tigers, wolves, panthers, elephants, camels, giraffes, antelopes, &c. Cattle are not abundant, and in some few places unknown (*Caillie*, i. 325.); neither do sheep or hogs appear to be plentiful; but goats and dogs are very numerous. There are birds of many species, and a great variety of reptiles, among which are crocodiles, in the river, but these do not appear to be particularly dangerous; the hosts of powerful and venomous insects are regarded with a much greater degree of apprehension.

The natives of Bambarra are a part of the great Mandingo family, which extends from the W. coast to the river Niger (*see MANDINGO*). They speak the same language, though with a peculiar dialect; and their habits, appearance, and general attainments, are the same. The towns and villages are very populous, some of them containing as many as 30,000 inhabitants; but, on the other hand, the open country is utterly deserted; for which, two reasons may be assigned; viz. the constant danger from wild beasts, and the constant war between the different states and princes. From Park's account of the pop. of Sego, Sansanding, Wapala, and other towns, combined with the number of such towns which appear on his map, it may perhaps be inferred, that Bambarra contains altogether between 2,000,000 and 3,000,000, of whom 3-4ths at least are slaves. In customs they do not materially differ from other negroes; they are tolerable agriculturists, turn in gold and iron, and tan, dress, and manufacture leather. These are the only arts which are held in esteem, as distinct callings; and by spinning, weaving, and dyeing, are very diligently performed by the women, and the Bambarra cloth, though coarse, is soft and durable, and generally of a rich, lasting, blue colour.—A pretty extensive trade, at least for a barbarous people, is carried on with the Moors of the desert, the more remote kingdoms of Timbuctoo and Houssa, the territory of Kong, and even with Ashantee and Senegambia. Their exports are iron, cloth, sometimes grain, ivory, and, above all, slaves; their imports consist of salt, with a few Manchester goods, some hardware, and arms. In skill, refinement, and cleanliness they are far below the negroes of the Gold Coast, but in moral feeling they appear to be above them: their slaves, who are of two kinds, native born, and foreigners, either purchased, or captured in

war, are usually treated with kindness; the disgusting cruelties which mark the festivals of the Guinea Negroes (*see ASHANTEE*) are unknown among them; and they are said to be anxious (especially the women) to assist, to the utmost of their power, the sick and unfortunate: the worst trait in their character is their propensity to theft. The government is rather oligarchical than monarchical; the king is nominally the head of the state, but he appears to have little more power than to recommend certain lines of conduct to the *dooties* (governors) of towns, which recommendation is not always attended to.—The Moors of N. Africa long since introduced Mohammedanism among the tribes S. of the desert: the great majority of these retain, however, their old faith, which, in Bambarra, seems to extend no farther than a general acknowledgement of a supreme being and a future state, with a periodical assembling for worship, only at the time of the full moon. The only religious buildings are the mosques, the ministers of which are also schoolmasters; for instruction, to some small extent, is given to the young Negroes, but it is in Arabic, or, perhaps, in some cases, in the native language, written in the Arabic character; there being no Negro tongue which possesses an alphabet. The Moslem Bambarrans are called Bushrunn, the Pagans, Kaitirs or Infidels.—Polygamy is common with both sects, and among their marriage laws is one which is rather peculiar: a woman may refuse to become a wife, but should she, after that, contract marriage with another, the first suitor has the power of seizing her as a slave. The domestic relations are, however, generally maintained with great kindness, and the affection of children to their mothers is touching and peculiar.—The food is usually vegetable; the amusements, music, dancing, and singing; and the effect of simple diet, and cheerful, or rather thoughtless, disposition, is evinced by the fact, that though the climate breeds fevers, fluxes, yaws, elephantiasis, leprosy, and gonorrhea, the Bambarrans, as a people, must be described as healthy, though they do not usually attain to any very great age. (*Park's Travels*, pp. 168—328; *Caillie*, i. 321—475.)

BAMBERG, a town of Bavaria, circ. Upper Mayne, on a piece of uneven ground on the banks of the Regnitz, about 3 m. above its confluence with the Mayne, 33 in. N. Nuremberg, lat. 49° 53' N., long. 10° 59' E. Pop. 21,000. The Regnitz divides it into 3 parts, the communication between them being maintained by two bridges. It is well built, paved, and lighted, and is partially surrounded by ramparts and fosses. Among the public buildings is the cathedral, a noble structure in the Byzantine style, founded in 1004, and finished, after being partially burnt down, in 1110. It contains tombs of its founder, the emperor Henry II., and of his spouse, the empress Cunigunda, with that of Pope Clement II., &c. St. Martin's church, erected by the Jesuits, is a fine building. The church and old convent of St. Michael occupy a height adjoining that on which the cathedral stands. The convent has been converted into a poor-house. There is also a *schloss*, or palace, formerly the residence of the bishops, or princes of Bamberg, a plain building of considerable extent, with a gallery of bad pictures; a town-house, theatre, &c. Bamberg is the residence of an archbishop, a court of appeal for the circle, &c.; and has numerous literary and charitable institutions. At the head of the former may be placed the lyceum and gymnasium, that have replaced the old university, suppressed in 1585, and which furnish a very complete course of instruction for between 700 and 800 pupils; it has also a seminary for the instruction of schoolmasters, a school for mechanics, a museum of natural history, a royal library with nearly 60,000 volumes, and numerous literary societies, and private collections of books and pictures. The infirmary has surgical, anatomical, and other medical schools attached to it, and a botanical garden. Large quantities of beer, in much repute in the surrounding country, are produced here; and there are also manufactures of gloves, jewellery, wax, tobacco, porcelain, &c. A great deal of lignite is raised in the environs; and its preparation forms a considerable branch of business. Garden seeds are also largely produced. It has two annual fairs, and is the centre of a considerable commerce.

Bamberg was formerly the capital of an independent bishopric, acquired in 1801, and assigned in 1803, to Bavaria. (*Murray's Hand-book for S. Germany*; *Reichard, Guide des Voyageurs*; *Penny Cyclopædia*, &c.)

BAMBOROUGH, a small town of England, on the coast of Northumberland, nearly opposite to the Fern Islands, and 17 m. S.E. Berwick-on-Tweed. Though once considerable, it is now so small as to have only about 490 inhabitants, and would be unworthy notice were it not for its old castle. The latter, which is very extensive, and in good preservation, is built on a basaltic rock, 150 ft. above the level of the sea, from which it is a most conspicuous object. The castle and some other property, having been purchased by Lord Crewe, bishop of Durham, he bequeathed it, in 1720, for charitable purposes. In pur-

sance of the benevolent intentions of the founder, the castle has been partially renovated and repaired. Watch is constantly kept, and signals made from the tower in hazy weather, to warn ships of their approach to this dangerous coast; a life-boat is also kept in readiness, and the most efficient measures adopted, not merely for the prevention of shipwreck, but for the relief of those who have undergone that misfortune. A school on the Madras system is established in the castle, in which there are also a library and a dispensary. The income of the Famborough Castle estates amounted, in 1830, to 8,126*l*. (*Penny Cyclopædia*, &c.)

BAMBOUK, a country in the interior of W. Africa, in about from 124° to 141° N. lat., and from 102° to 124° W. long. In form it is nearly a parallelogram, 140 m. in length, and 100 m. in width, and containing apparently about 14,000 sq. m. in area; but, as the travellers in the country had frequently no better means of determining positions than by estimating distances, and marking courses, the accuracy of these observations cannot be much relied on. The surrounding countries are, Kajaŋga, or Galam, and Kaason on the N.W. and N.; Brooko and Fooladoo on the E.; Woroda on the S.; and Dentilla and Bondou on the W. (*Voyage au pays de Bambouk*, (no name), Paris, 1789, p. 1.; *Labat, Nouvelle Relation de l'Afrique Occid.*, iv. 1.; *Golberry, Voy. en Afrique*, i. 380.; *Park, 1st Journ.*, p. 62.—*2d Journ.*, p. 51.; *Houghton, Afric. Assoc.*, cap. xiii. 9, &c.)

Bambouk is a mountain country, most probably a table-land, near the centre of the Senegal system, with a general inclination towards the N. and N.W. In some places it is very rugged, though the peaks do not appear anywhere to attain a great elevation: the highest are not more than 600 ft., and those in the S. rarely exceed 300 ft. above the general level of the land, which, however, must still be considerably higher than the sea. Glens and valleys of the most romantic kind are scattered among these mountains, and they are skirted by plains of some considerable extent. (*Park, 2d Voy.*, p. 60. 65. &c.; *Golberry*, i. 412. &c.) Water is very abundant, the Senegal forming the N.E. boundary, and two large affluents of that river, the Fa-lame and the Bar-fing, constituting the W. and E. frontiers of the country. Park considers the latter to be the main stream of the Senegal (*1st Journ.*, p. 336.) and it is certainly much larger than the branch which meets it at the N.E. corner of Bambouk, though the direction of the latter be the same as the after course of the river. Besides these, there are a great abundance of rivulets, more especially towards the W.; and there is one other stream, the Saouŋ Coler, or Golden River, which is of considerable size. It rises near the capital, and, after traversing the whole country with a N.W. course, is received into the Fa-lame. (*Labat*, iv. 20. &c.; *Golberry*, i. 381. 412. &c.)

The climate is extremely hot, and Golberry remarks (i. 412.), that the heat of the interior, which is screened from every wind except that of the desert, is quite insupportable. Towards the S. however, cool days are experienced, and the grass is fresh and verdant throughout the year. The rainy season commences about July or August, and lasts four months: during this period the low country is flooded, the whole rendered frightfully unhealthy for Europeans, and probably not very salubrious to the natives, since their labours seem to be confined to the eight dry months. (*Voy. au pays Bambouk*, p. 37. &c.; *Labat*, iv. 4. &c.; *Golberry*, i. 411.; *Park, 2d Journ.*, p. 52. &c.) But the effect of the heat, combined with this abundant moisture, is to render Bambouk one of the most prolific countries in the world. The few sterile spots are on the summits of the highest mountains, where, denuded of soil, the bare granite refuses, of course, to nourish vegetable life, but in all other situations the vegetation is rich and varied, almost beyond example. Among trees, there are the majestic baobab, the baumé, the calabash, tamarind, every species of palm, and a great variety of acacias. The vine grows wild and in great luxuriance, but its fruit, like that of all the other trees, is extremely acid, though eaten with great avidity by the natives. As in other countries N. of the Kong mountains (see BAMBARRA), the rich fruits of Guinea are absent; but the earth produces in great abundance, and almost without culture, maize, two sorts of millet, melon, water melons, and nearly every species of leguminous plants. The low lands also, subject to inundation, are covered with rice of an extremely fine kind, and which grows to the height of eight ft. The Guinea grass is abundant, which, with a great variety of other rich pasture, serves to feed innumerable herds of cattle. (*Golberry*, i. 404—411.; *Voy. au pays Bambouk*, p. 31—45.) This extreme fertility is strangely contrasted with the account given by the Abbé Raynal (*E. and W. Ind.*, iii. 134.) on the authority of a namesake traveller, that the soil was an irredeemable desert, producing nothing but metals, and wholly unfit for the residence of man! The traveller

* It is supposed, at least, that Golberry means the banyan by the tree which he calls *Dentimier*. (i. 405.)

referred to was probably Compagnon, who, according to the author of *Voy. au pays Bambouk*, was never in the country, but had published *les impostures les plus absurdes et les plus punissables*, by confounding soils, people, governments, and manners, the most opposed to each other. (pp. 3. 6.)

The animals of Bambouk are those of tropical Africa generally, and all in great abundance. The number of cattle has already been alluded to; the other domestic animals are horses, sheep, goats, and camels. The lion is not found upon the mountains, but is very numerous in the plains, where also wander immense herds of elephants. The rivers teem with life, and, among other inhabitants, are infested with very powerful crocodiles. Birds of all kinds are numerous, and insects as prolific as in other equinoctial regions; bees, in particular, are so plentiful, that the manufacture of mead is, next to mining and dairy work, the most common occupation of the people. This fact alone is a sufficient proof that Bambouk must abound in trees and plants of the richest kind. (*Golberry*, pp. 405. 408.; *Labat*, iv. pp. 92—99.; *Houghton's Afr. Assoc.* xiii. pp. 10. 14.)

But that which has rendered Bambouk a subject of interest for many generations, is its reputed riches in gold and other metals. From the first settlement of Europeans on the coast of Senegambia, now five centuries ago, they heard of an interior country, the centre of all the auriferous mountains in that part of Africa; and, unlike most tales of wonder, the facts seem to have verified all that was related. So abundant indeed is the ore, and so numerous are the mines, that curiosity, even when prompted by interest, seems to have palled, and become insufficient to induce a traveller to delay his journey for the purpose of inspecting a greater number. (*David's Journ.* in *Golberry*, i. p. 475.) There are four principal mining, or rather gold-producing districts; but the whole soil abounds with gold, which can be collected with very little labour, and hardly any skill. It lies so near the surface, that merely scraping up and washing the earth serves, in many cases, to separate the metal in a pure state; and the more elaborate attempts at artificial operation consist in sinking a few pits, and breaking up the ore, which usually puts from its matrix in such a state that washing only is necessary to render it fit for the market. It need scarcely be remarked, that in such a country the rivers literally run over golden sands; and should skilled labour be ever brought to bear upon the land, there can be little doubt but that its treasures are inexhaustible. At present, however, the art of mining, properly so called, is quite unknown to the natives. Besides gold, extensive veins of iron exist in Bambouk; and it is extremely probable that most of the other metals would be found if sought for. (*Golberry*, i. p. 434—440.; *Voy. au pays Bam.* p. 21—36.; *Labat*, iv. p. 54—58.; *Park's 2d Journ.* p. 55—59.)

The population of Bambouk is dense. The people form a part of the great Maudingo family, from which they do not differ in any respect with regard to appearance, religion, or general manners. (See MANDINGO.) The government, though under a king as head, appears to be oligarchical; the farmers, or chiefs, exercising almost unlimited authority, each in his own district, but acknowledging a general dependence (perhaps little more) upon the sovereign.

The Bamboukians are inferior in activity and industry to the other Mandingoes, and they have also corrupted their language by a large mixture of Jaloof, Foulah, and Moorish terms. Their arts are extremely few, but their wants still fewer; for though they manufacture nothing but some rude tools and ornaments, their only imports seem to be cotton cloth, ornaments for their women, and such of which necessary article, Bambouk, like so many other African countries, is totally destitute. For these they freely give their gold in exchange, and the commerce is one of great profit to their Arab neighbours. (*Golberry*, i. pp. 381. 383—418.; *Voy. au pays Bam.* pp. 45—48.; *Labat*, iv. pp. 2—9. &c.)

Buried in the interior of a burning continent, and surrounded by mountains of difficult passage, Bambouk remained long totally unknown to the rest of the world. It is indeed not a little surprising, that a conqueror of the country by a European power should have remained unheard of, till communicated by the Negroes themselves 300 years afterwards. In the 15th century the Portuguese made themselves masters of the country, and retained it for some considerable time. The natives affirm that they acted very tyrannically, but that becoming reduced in numbers by the unhealthy nature of the climate and their own debaucheries, the remnant were set upon and destroyed in a single day! This story is confirmed, not only from the fact of many ruinous forts and houses of Portuguese construction still existing, but from the knowledge which the Bamboukians have that such a people as the Portuguese live at a great distance; from the deep-settled hate with which they regard their name; from the terror which they feel lest their former conquerors should return to take vengeance on them;

and from the large mixture of Portuguese words in their language. The expulsion of the Marabouts or Mohammedan priests from their country is another singular event in Bambook history. (*Golberry*, i. pp. 419—424; *Pov. au pays Bam.* p. 7. *cf. seq.*; *Houghton*, *cf. Assoc. xiii.* p. 11, &c.)

With the exception of the Portuguese, who have left no records of their observations, the first European who reached Bambook was an English officer, named Gasche, who, ascending the Gambia, contrived to reach the Bamboonk capital in 1690. His stay was short, and his observations merely general and incidental. Compagnon's reported visit was in 1716. Soon after this, M. Brûé, a director of the French African Company, formed the project of subduing Bambook, and securing its mines of gold.

To obtain the necessary information as to the practicability of his project, he attempted to enter the country from Kajaaga, on the N.; but it does not appear that he made any great progress in the interior. His impression, however, was, that with a force of 1,200 men his plan could be carried into execution, and the mines secured to European industry. It is indeed more than probable that a less force might succeed in effecting a first conquest; but the fate of the Portuguese, and the extreme unhealthiness of the climate, make it also certain that their possession could be retained only by a frightful sacrifice of life, and the most unremitting watchfulness. Between 1730 and 1744 much was done to effect a better knowledge of this country by Messrs. Levens, David, Pilay, and Legrand; the two first governors, the others employees of the French African Company at Senegal: *Golberry* speaks, also, in high terms of an English journal published in 1782; but this work cannot now be found. *Mungo Park*, in his first journey outward, reached the W. and N. frontiers of Bambook (Boudou and Kajaaga); and on his return, as also in his unfortunate second journey, he traversed a considerable part of its S. division: but the traveller from, whom the most perfect information might have been obtained was Major Houghton, who not only traversed the interior of the country, but resided in it a considerable time, under terms of the closest friendship with the king. The small remnants of his papers are unquestionably the most valuable documents which exist respecting it.

Such, then, are the scanty sources whence our knowledge of this region is derived; a region the mineral wealth of which is probably not exceeded by that of any other in the world: but which, owing to its climate, will most probably continue in irreclaimable barbarism.

BAMPOORA, an inh. town of Hindostan, prov. Malwah, on the Rewa river, 1,244 ft. above the level of the sea; lat. $24^{\circ}31'N.$, long. $75^{\circ}50'E.$ In 1820, it contained 4,000 houses: it possesses an unfinished fort, with well-built walls, inclosing a palace, also unfinished, but containing a white marble statue of *Jeswant Row Holcar*, by whose order the building was constructed. The town and its territory formerly belonged to *Holcar's* dominions.

BAMPTON *with Weald*, a parish and town of England, co. Oxford, hund. Bampton, 64 m. W.N.W. London. Area, 8,750 acres. Pop. of par., in 1821, 2,304; 1831, 2,514; of which the town has about 1,600. The latter is built in a level tract of country near the Isle. Its church is an ancient and very fine structure; the living annexed to which is apportioned amongst three vicars. There is an endowed free school, founded in 1635, and a national school for 170 children. The chief trade of the town is feltmongering, which was once considerable, but of late years has greatly declined; its ancient market has also fallen into disuse, but an annual horse fair is still held, Aug. 26. *Philips*, author of the *Splendid Shilling*, &c., was a native of Bampton.

BAMPTON, a town and par. of England, co. Devon, hund. of same name, on the confines of Somersetshire, Area, 8,130 acres; of which the par., in 1831, 1,961. The town is situated on the small river *Bathern*, an affluent of the *Eke*, 17 m. W. Taunton. It is built in a straggling manner; and was formerly of more importance than at present, having sent mems. to the H. of C. It has a weekly market on Saturday, and fairs for cattle and sheep, which are well attended, on Whit-Tuesday and the last Thursday of October.

BAN or **BANOVICS**, a town of Hungary, 16 m. S.E. *Trenczen*, on a hill near an affluent of the *Nentra*, lat. $48^{\circ}48'28''N.$, long. $162^{\circ}5'55''E.$ Pop. 2,300. It has a considerable trade in cattle, wood, and iron.

BANAGHER, an inh. town of Ireland, King's co., prov. Leinster, on the *Shannon*, 68 m. W.S.W. *Dublin*. The river is here crossed by a bridge of 19 arches, 400 ft. long, and 15 wide, guarded by batteries on each side, this being considered a military pass of some importance. Pop. in 1821, 2,813; in 1831, 2,611; that of the parish of *Reynagh*, in which it is situated, was, in 1834, 4,793, of whom 316 were of the estab. church, and 4,377 Rom. Cath. The tower stands on the side of a hill overlooking the *Shannon*, and consists of one long street

of well-built houses. The church and Rom. Cath. chapel are modern. Near the town is a school of royal foundation, endowed with 370 acres of land: in the town is a national school and a dispensary. An infirmary stands near the bridge, and the constabulary has a station here.

The bor. was incorporated by *Charles I.* in 1628, and sent 2 mem. to the Irish H. of C. till the Union, when it was disfranchised. A court of petty sessions is held on alternate Mondays. It has a distillery, brewery, and some tan-yards. It is well situated, having a great command of inland navigation. Markets, well supplied with corn, are held on Fridays, and fairs on May 1., Sept. 15, which continue for four days; 28th Oct., and 8th Nov. That of Sept. is for live stock, in which it ranks next to *Ballinasloe*. The post-office revenue in 1830 was 292*l.*, and in 1836, 306*l.*

BANALUFAR, a town of Spain, Majorca, 10 m. N.W. *Palma*. Pop. 5,000. It is situated on a mountain cultivated with the greatest care; the ground being supported on terraces, and planted with vines, olives, &c. There is in its environs a quarry of stained marble.

BANBRIDGE, an inh. town of Ireland, co. Down, par. *Ulton*, on the *Bann*, and 8 m. S. *Castell.* Pop. in 1821, 1,715; in 1831, 2,469; that of the par. of *Seapark* rich, in which it is situated, was, in 1824, 7,748; of whom 1,427 were of the estab. church; 4,867 Prot. diss.; and 1,424 Rom. Cath. It is built on the summit and sides of a hill of some height, and so steep as materially to impede the progress of heavy-loaded carriages. To remedy this inconvenience, the centre of the road was lately cut down for a length of 200 yds. to the depth of 15 ft. in the middle part of the section, so as to form a carriage-way nearly level, while the great breadth of the street still admitted carriages-way on each side on the original level, a communication being maintained between the houses on the opposite sides of the streets by a bridge or viaduct across the centre of the cut. This is a neat thriving town. A handsome church has lately been erected, partly by voluntary subscription; there are also places of worship for Presbyterians, Remonstrants, and two for Methodists; a public school, and a dispensary. Petty sessions are held every fortnight, and a party of the constabulary is stationed here. This town and neighbourhood is one of the principal seats of the linen manufacture.

The great command of water in the vicinity adapts it peculiarly for bleaching, and there are large manufactories of union cloth and thread, and chemical works for the use of the bleachers. The markets are held on Mondays, in a spacious new building; there is also a separate market place for meal and grain, and a brown linen hall. Fairs are held on the first Monday in every month, and on 12 Jan., first Sat. in March, 9 June, 26 Aug., and 16 Nov.; the last is a great horse-fair. Branches of the Provincial and Ulster banks were opened here in 1833 and 1836. The post office revenue increased from 526*l.* in 1830, to 897*l.* in 1836. The trade of the town is promoted by its vicinity to the canal between *Newry* and *Lough Neagh*, which passes at about 3 m. distance. It lies in the line of the mail-coach road from *Dublin* to *Belfast*, and coaches and cars ply several times every week between it and *Belfast*, *Lurgan*, *Newry*, and *Rathfriland*, conveying at an average 35 passengers every trip. Its manufactures have increased with a rapidity seldom experienced. The external appearance of the place, and the habits and manners of its inhab., correspond with this progress. The wealthier classes live in respectable independence; and squalid poverty is not perceptible even among the lowest. The highly cultivated state of the surrounding country, and the calm beauties of its scenery, tend much to heighten the pleasing impressions excited by the contemplation of such a picture of prosperous industry.

BANBURY, a bor., par., and town of England, co. Oxford, hund. Banbury, 64 m. N.W. *London*. Pop., 1821, 5,247; 1831, 5,906; houses at the latter date, 1,212. The town is situated in a fertile vale, on the banks of the *Cherwell*; it is remarkably clean and well built; and is paved and lighted by gas. The church, a spacious structure, was built in 1790. The Friends, Independents, Presbyterians, and Wesleyans, have chapels. There is a blue-coat school, founded in 1705, and endowed with 80*l.* a year; which was incorporated with a national school in 1817. A free grammar-school, once in high repute, has been given up for many years. There are almshouses, in which 12 poor women reside, and receive a charity called *Widows' Groats*. The market is held on Thursday; the annual fairs on Jan. 22, March 5, April 9, May 28, June 18, July 9, August 13, September 10, October 5 and 30, and December 17. The principal manufactures of the town were horse-girths and plush, both of which have declined. The place, however, is in a flourishing state, from its numerous fairs and large weekly markets, all very well attended, and causing an extensive retail trade. The *Oxford* and *Birmingham* Canal passes close to the town, and gives it also a considerable carrying trade. Many

improvements in the sewerage, footpaths, &c., have been effected within a recent period. Cheese of a superior quality is made in the neighbourhood; and the town has long been noted for a sort of cake that bears its name.

Subsequent to the Municipal Reform Act the limits of the borough have been extended, for the purposes of local government, so as to include the whole town of Banbury, and the suburbs of Neithrop, Calthorpe, and Waterloo, which are continuations of it; the former at the N.W. end; the latter on the opposite bank of the river, which flows N. and S., along the E. side of the town, with the canal running nearly parallel to it. It was originally incorporated under a charter in 1st of Mary, granted expressly for the whole parish; but the borough came subsequently to be restricted to a part only of the town. Another charter was obtained in 6th James I.; and a third in 4th Geo. I., which was the governing charter: under it, the corporation consisted of a mayor, 12 aldermen, 6 capital burgesses, and 30 assistants. It was a close, self-elective body, with no freemen, and an alliance for life, either from residents or non-residents. They possessed the exclusive privilege of returning 11 men, to the H. of C.; but this, of course, they were deprived of by the Reform Act, which opened the franchise to 104. householders resident within the limits of the par., which contains 3,150 acres. Registered electors, in 1838, 371. The revenue of the corporation (independent of church trusts) consists of tithes, chief rents, as lords of the manor, and tolls of fairs and cattle-market; in all about 12½ a year. A court of sessions is twice a year. There is also a court of record, which had fallen into disuse, but has recently been revived and made effective. The lighting, paving, and police, are managed by commissioners, of whom the corporation form a portion. It is the central town of a union of 33 parishes, and has a union workhouse. There is a chalybeate spring near the town; and on Crouch Hill, 1 m. W. of it, is a circular entrenchment, the site of an encampment of the parliamentary army in 1645, under Sir William Waller. The living is a vicarage, in the patronage of the Bishop of Oxford.

BANCA, an island of the E. or Indian archipelago, first or W. division, lying off the N.E. coast of Sumatra, between lat. 1° 30' and 3° 8' S., long. 105° 9', 106° 5' E.; length N.W. to S.E. 135 m., average breadth 35 m. Its most remarkable feature is its mines of tin, a mineral found in its common state of oxide, in the alluvial soil between the primary granitic mountains and a range of red iron-stone, of inferior elevation, in its N.W. quarter, but which is also prevalent in other parts. In 1813 the produce of tin amounted to 2,083 tons, and in 1836 there were shipped from Java 47,739 piculs, or 2,834 tons of tin, wholly from Banca. The produce of the Cornwall mines being at present (1839) about 4,500 tons, the importance of those of Banca is obvious. The inhab. are principally of two races, one residing on the shores, the other in the interior, with Malays and Chinese: the latter are the workers of the mines. Previously to 1812 this isl. belonged to the sultan of Palembang, in Sumatra; it was then ceded to the E. I. Company; and in 1816 was transferred to the Dutch. (*Hamilton's E. I. Gazetteer*, i. 129, &c.)

BANCALLAN, a town at the W. end of the island of Madura, E. archipelago; lat. 7° 2' S., long. 112° 45' E. It is large and populous, contains the residence of the sultan of the island, and a fort close to the palace. Its environs are pleasant, having good roads, interspersed with country seats and pleasure grounds. (*Hamilton's E. I. Gaz.* vol. i.)

BANDA, an isl. town of Hindostan, prov. Allahabad, cap. of the distr. of B. Buddacund, on the right bank of the Gane river, 80 m. W. Allahabad; lat. 25° 50' N., long. 80° 20' E. A few years ago it was a mere village, but has now become a considerable town; its cotton has of late years obtained a superiority over that of Jaloun in the European market.

BANDA, or **NUTMEG ISLANDS**, a group of 12 small islands, belonging to the third or E. division of the E. archipelago (see the art.), belonging to the Dutch; the principal, Banda Neira, lying in 4° 30' S. lat., and 130° E. long., 120 m. E. S. E. Ambuyna. Lantour, the largest of the islands, is only 8 m. long and 6 broad. Only six of them are inhabited. Pop. about 6,000, most of whom are slaves. These isles are all high, and of volcanic origin; one of them, Goonung Apl, contains a volcano, 2,000 feet above the sea, which is continually emitting smoke, and sometimes flame. Climate injurious to strangers: the W. monsoon brings rain and storms in December, and earthquakes occur from October to April. The soil is chiefly a rich black mould. Four of the larger and central islands are almost entirely appropriated to the growth of nutmegs: their growth in the other islands being prohibited. The nutmeg-tree grows to the size of the pear-tree; it yields fruit from the 12th to the 20th year, and perishes at 24 years old. About 2-3 ds

of the trees planted are barren; the produce of the rest is said to be about 10 lbs. each annually. The produce may be about 100,000 lbs. of nutmegs, and 30,000 lbs. of mace. These islands are divided into a number of parks or plantations, each with a certain number of slaves. The people consist mostly of Papuan negroes, Chinese, and Dutch. Sago forms the chief vegetable food, but the cocoa also contributes a part: the seas abound with fish.

The imports are various provisions for the Europeans, piece-goods, cutlery, and iron, from Batavia; sago, salted deer, &c., from Suram; pearls, birds' nests, tortoiseshell, and slaves, for the Chinese and Dutch merchants from Aroece. The chief export is nutmegs. The seat of government is at Banda Neira, which is fortified, and has a good harbour. A Portuguese, named Antonio Abreu, discovered these islands in 1512. In 1524 the Portuguese, in 1599 the Dutch, and in 1810 the English, successively possessed themselves of them. In 1814 they returned under the dominion of the Dutch. (*Crawford's Indian Archipelago*, p. 508. &c.; *Hamilton's E. I. Gazetteer*, 78, 79.)

BANDON, a river of Ireland, anciently called Glasheen, has its source in the Carberry mountains, 9 or 10 m. W. Bantry. From Dumanaway, where its main branches unite, it flows nearly W. to Bandon; it then winds N.E. to Imms-Shannon, whence it pursues a S.E. course to the sea, with which it unites a little below Kinsale, built on its estuary. Its course is wholly in the co. Cork. It is described by Spencer, as

"The pleasant Bandon crown'd by many a wood."

But most part of the timber that ornamented the country in the days of Elizabeth has been cut down, and its place is but very indifferently supplied by modern plantations.

BANDON, or **BANDONBRIDGE**, an inh. town of Ireland, co. Cork, prov. Munster, on the Bandon, 14 m. S. W. Cork. It was founded in the beginning of the reign of James I., and having obtained a charter from that monarch, conferring several valuable privileges, it increased so rapidly in population and wealth, that, on the breaking out of the war of 1641, it maintained four companies of foot and a corps of volunteers; and was the principal garrison of the English in these parts. On Cromwell's approach, in 1649, it declared for the par., and in the war of 1688 the inhab. expelled the troops of James II., and declared for the Prince of Orange. Pop. (1821) 10,179; (1831) 12,617. It is situated on the declivities of the hills on each side the river, which blend into a richly wooded valley, and consists of three parts, distinguished by the estates on which they are built; the old town being on that of the Duke of Devonshire, the Irish town on that of the Earl of Shannon, and the western portion on those of the Earls of Bandon and Cork. It is watched, and lighted with gas, under the General Municipal Police Act. It has two parish churches, a Rom. Cath. chapel and convent, a meeting-house for Presbyterians, and two for Methodists; a classical school, endowed by the Duke of Devonshire; a school for general instruction, on the foundation of Erasmus Smith, and several others maintained by private contributions, or by religious associations. It has also an infirmary, fever hospital, and dispensary; three public libraries, and two reading-rooms. Assemblies and concerts are held in a suite of apartments attached to one of the hotels. Large barracks are built on the hill over the town, and the constabulary have here a station.

By charter dated in 1614, the municipal government is vested in a provost, 12 burgesses, and an unlimited number of freemen, elected at the hundred court by the general body of freemen, who also elect a common council of 12 out of their own body for life. The borough sent 2 mem. to the H. of C., and now sends 2 to the imperial H. of C. The franchise is vested in the burgesses resident within 7 m. and the 104. householders. The new electoral boundary comprises 439 acres. Constituency (1838), 293. General sessions of the peace for the W. riding of the co. are held here in October in the court-house, a neat building, with a well-arranged bridewell. Petty sessions take place on Mondays, at which, through the courtesy of the corporation, the co. magistrates sit with the provost. Courts, holding pleas under B., are held every three weeks for the manors of the Duke of Devonshire, the Earl of Bandon, and the Earl of Shannon.

The woollen manufacture was carried on here to a considerable extent, and was succeeded by that of cotton: both are nearly extinct; but a manufacture of fine stuffs has been lately undertaken. Two distilleries paid duty in 1836, on 107,395 gall. spirits; and in the same year duty was paid on 25,351 bush. malt. There are also several breweries and tan-yards, and 2 large flour-mills. As the Bandon is navigable for small craft to Collier's Quay, within 4 m. of the town, a small external traffic is carried on, by which grain, flour, and other produce, is sent out, and timber, coal, wine, and groceries, received in return; but the domestic consumption is chiefly supplied from Cork, to which much of the agricultural produce of its neighbourhood is sent by land car-

riage. Markets are held on Wednesdays and Saturdays; and fairs on May 6, the Thursday before Easter-day, Oct. 29, and Nov. 8. Branches of the Provincial and Agricultural banks were opened in 1834. The post-office revenue was 775*l.* in 1830, and 1,205*l.* in 1836. The town is on the mail-coach road from Cork to Bantry. Three coaches and a car ply to Innis-Shannon, on the road to Kinsale, six days a week, carrying an aggregate average of 42 passengers each trip; a coach six days in a week, and a mail car every day, to Dunmanway, carrying 11 passengers; and a car to Timoleague, on Courtmerry Bay, every day, carrying 4 passengers. BANERES, a town of Spain in Valencia, 28 m. N.W. Alicante. Pop. 2,000. It has fisheries of wool, distilleries, and paper mills.

BANFF, a marit. co. of Scotland, having N. the Moray Frith, S. and E. the co. of Aberdeen, and W. Elgin and Inverness. Its length from Ben Macduh to Portsoy is about 36 m., but its average breadth does not exceed 12 m. Area, 647 sq. m., or 414,060 acres. Along the coast the surface is pretty level, and the soil, consisting of a sandy loam, is in many places well cultivated, and produces early and excellent crops. But in this exception, the surface is mostly rugged and mountainous with a few valleys interspersed. Oats is the principal crop; but the main dependence of the farmers is on their cattle, sheep being, in this co., comparatively scarce. Property in a very few hands: tillage farms mostly small, and agriculture, though in parts much improved, generally backward. Average rent of land, in 1810, 3*s.* 9*d.* an acre. There are some thriving plantations, particularly in the vicinity of Gordon Castle, the most magnificent seat in the N. of Scotland. It is partly separated from Elgin by the Spey, on which there are several productive salmon fisheries. (See *Seebeck*.) Minerals of little importance; but the crystals and topazes, commonly called cairngorms, are found in the mountains. Manufactures inconsiderable. Banff contains 24 parishes, and had, in 1831, 9,814 inhabited houses, 10,855 families, and 48,604 inhab. It returns 1 mem. to the H. of C. for the co.; and the burghs of Banff and Cullen unite with Elgin and others in returning a mem. Parli. constituency of co., in 1833, 710. Valued rent, 75,200*l.* Scotch: annual value of real property, in 1815, 88,942*l.*

BANFF (commonly pronounced, and sometimes written Banaf), a royal burgh of Scotland, cap. of the above co., on the W. bank of the Doveron, near the entrance of that river into the Moray Frith. Pop. in 1831, 2,935, viz., males, 1,329; females, 1,706. It may be said to consist of two parts, completely separated; of which the one is inland, and lies on a plain on the river side; the other (called the sea-town) stands on an elevation which terminates abruptly near the sea, by which it is bounded. The castle of Banff stands on a piece of table-land between these two places. The name of the town, which is found to have assumed several different forms at different times—Bainefo, Boinefio, Bainfio, &c.—is supposed to have been derived from the word Boyne, the name of the district in which Banff is situated. A stream named Boyne traverses the district; and the parish of Boyndie is contiguous. The privileges of a royal burgh were conferred on Banff by Robert II. in 1372, and were afterwards successively confirmed by James VI. and Charles II. The streets, though composed of houses of unequal size, are generally straight, and not deficient in width. Within the last few years, many of the old houses have been pulled down and replaced by others, so that there is scarcely a building now remaining to indicate the antiquity of the town. The streets were paved so early as 1551. The Carmelites (an order of friars, so called from Mount Carmel in Syria), or White Friars, had a convent in Banff, but at what precise period it was instituted cannot be ascertained. (*Spottiswood's Religious Houses*, p. 16.) Of the building no vestiges can now be traced, with the exception of some scattered arches and vaults, nor is its original extent, or exact position, known. Of the castle of Banff, alluded to above, nothing remains but the outer wall and the fosse. It was a constabulary, or lodging for the king when visiting this part of his dominions; and, in his absence, it was inhabited by the thane or constable who administered justice in his name. It was essentially royal property, and continued so till the middle of the 15th century, when James Stuart, Earl of Buchan, brother of James II., was created heritable thane, the castle of Banff being at the same time bestowed on him, as the official messuage of his family. Banff gave the title of peer to a branch of the family of Ogilvie, which became extinct in 1838, on the death of the eighth Lord Banff without male issue. Banff does not make a great figure in history. The Duke of Montrose plundered it in 1645, "no merchant's goods or gear," according to Spalding, "being left." The Duke of Cumberland's troops passed through the town in 1746, on their way to Culloden. They destroyed the episcopal chapel, and hanged a man, erroneously thinking him a spy. The names of two persons, eminent in very different walks of life, are connected with Banff. The famous James Sharp, who was originally a keen supporter of

presbytery, and who, having betrayed that faith, rose to the archiepiscopal see of St. Andrews, was a native of Banff, his father being sheriff-clerk of the county. He was assassinated on Magus Muir, near St. Andrews, in 1679. James Macpherson, having followed the lawless and predatory life of a gipsy, was apprehended (1700), tried, and condemned to be hanged at Banff. While he was a votary of the muses, he was a proficient as a player on the violin; and when brought to the place of execution, he carried his instrument along with him, and played his own march, which had been composed by himself while in prison. This composition was published after his death, and has ever since been a favourite in Scotland. Burns wrote a new and improved version of the song, which is well known under the name of *Macpherson's Lament*, or *Macpherson's Farewell*. (*Chambers's Edit. of Burns's Poetry*, p. 100.)

The trade of Banff is inconsiderable, and not increasing. Its harbour, though it can boast of a low-water pier, constructed in 1816, is not so ample, so convenient, or secure, as that of Macduff, a borough or barony situated on the opposite side of the Doveron, at the distance of about a mile. The number of vessels, in 1836, belonging exclusively to Banff was 31, of which the tonnage was 1,583 tons. The exports consist chiefly of grain, salmon, herrings, and cured pork. As a proof to what extent grain is shipped, we may state that, in 1834, 29,790 qrs. of oats, 1,174 qrs. of wheat, 976 qrs. of barley, and 194 bags of potato flour, were exported from Banff, exclusive of Macduff. In the same year 440 head of black cattle were sent to London by sea, 911 pigs, and 156 sheep and lamb. The herring fishery on the coast has not of late years been so productive as formerly. A Greenland whale fishery co., formed in 1819, and a thread and stocking manufactory, established fifty years ago, have been discontinued. Banff has no manufactory, if we except a brewery, an iron-foundry, a distillery, and a small manufactory of ropes and sails. There are four branch banking establishments; and the town has a weekly market on Friday, and four annual fairs.

The public buildings are the town-house, built in 1798, with a spire 100 feet high, the jail, the parish church, and the Relief, Episcopal, and Independent churches. The Wesleyan Methodists have also a small chapel here. Gas was introduced in 1831. There was a grammar-school in Banff so early as the year 1544. There are at present an academy, founded in 1786, at which all the branches of a learned and liberal education are taught; the commercial school, and a charity school founded by funds left (in 1804) by Alexander Pirie, merchant in Banff. There are, also, several seminaries for young ladies; another educational institution, founded by a legacy left by the late James Wilson, of the Island of Grenada, is about to be opened. There are several libraries of considerable extent and value belonging to different societies. Various sums have been left in mortmain for charitable purposes; and a legal assessment for the poor is unknown. The average number of prisoners, including criminals, revenue offenders, and debtors, is 45 annually. There are 38 inns or shops licensed for the sale of spirits and ale.

Banff did not escape the devastations caused by the great flood that took place in the north of Scotland in August 1829. Part of the town was inundated to the height of four or five feet; several houses were undermined and carried away; various kinds of property received serious injury. (*Sir Thomas D. Lauder's Acc. of the Morayshire Floods*.)

Banff unites with Elgin, Cullen, Inverury, Kintore, and Peterhead, in sending a member to the House of Commons. Macduff, which is rapidly rising to importance, chiefly owing to the excellence of its harbour, has, since the passing of the Reform Bill, been united to Banff in forming one parliamentary burgh, the joint constituency in 1838 being 215. There is a splendid bridge of seven arches over the Doveron, which connects the two towns in question. The amount of assessed taxes which Banff, exclusive of Macduff, yields is (1836) 463*l.* 17*s.* 6*d.* The municipal assessment for the poor is 480*l.* (*Scottish Reports*, 1832, p. 43; *New Statistical Account of Scotland*, No. xl. 1836; *Chambers's Gazetteer of Scotland*.)

BANG, an incl. town of Hindostan, prov. Malwah, dom. of Scindia; at the confluence of two tributaries of the Nerbudda river, on the chief road through Gujrat and Malwah; 62 m. S.W. Ootsein, and 145 m. N.E. Surat. Iron ore is fused here, and before the present century the town contained 3,000 houses; at present this number is much reduced. Bang is noted for some remarkable cave temples of Buddha origin, excavated in a range of low sandstone and claystone hills, about 34 m. S. of the town. Four caves exist; the most northerly of which is the most perfect, and is reached by a flight of 70 rudely formed stone steps, terminating in a platform overhanging by the hill, which has once evidently been formed into a regular verandah supported by columns; and at either end of which, there is a small apartment, containing some ill carved figures of modern workmanship, and one of them a bad representation of the Hindoo Ganesa. The cave within this

vestibule is entered by a rectangular doorway in a plastered and ornamented wall, and is a grand and gloomy apartment 84 ft. square and 14½ ft. in height; the roof, which is flat, and has been once ornamented with paintings, is supported by four ranges of massy columns. Around this apartment, on three sides, are a number of small cells, 9 ft. in depth, and as deep as wide, in which have been carved, in bold relief, some draped male and female figures: from one of the cells on the left hand, you enter through narrow excavations, five other similar cells, each in a plane elevated above the former, ascending through the hill. At the farther end of the principal cave, is an oblong recess supported by two hexagonal columns, through the centre of which a small doorway leads to an inner apartment, where the *dagop*, or "churn," supposed to contain a Buddhist relic, is seen, cut out of the rock, with the plain dome forming its summit, reaching nearly to the roof, to which it is joined by a small square ornament. The second and fourth caves of Bang, contain little worth notice; but the third is nearly as large, and has been somewhat similar in its arrangement to the first. The whole of the walls, roof, and columns, have been covered with a fine stucco, and ornamented with paintings in distemper of considerable taste and elegance. It contains the *dagop* in its inner apartment; but wants the recess, and carved sculptures mentioned in the first cave. It is considerably dilapidated, and a fifth cave, no further, so at its entrance as to be present inaccessible. (*Dangerfield in Bombay Trans.* li. 194–201.; *Hamilton's E. I. Gaz.* l.)

BANGALORE, an ind. fortif. town of Mysore, S. Hindostan; lat. 12° 57' N., long. 77° 38' E., 60 m. N.E. Seringapatam. Pop. (in 1806) said to be 60,000. It is built on a table-land, nearly 3,000 ft. above the sea, and is so salubrious that Europeans often resort thither for the benefit of their health. The thermometer seldom rises above 82°, or sinks below 59° Fahr. The monsoons have their force broken by the Ghauts; but this table-land is constantly refreshed by genial showers. The vine and cypress grow luxuriantly, and apples, peaches, and strawberries are raised in the gardens. The town is enclosed with double walls; but the chief fortress, which contained the palace of Tipoo Saib, is quite detached from the other, and is built in a solid manner, with a deep ditch and spacious glacis. The palace, though of mud, built in the Saracenic style, is still a striking building, and is used by the present rajah for public entertainments. There are good barracks, assembly and reading-rooms, European shops, &c. The houses are large, some being of two stories, built of red earth, and roofed with tiles; the chief bazar is wide, regular, and ornamented with rows of cocoa-nut trees. Most of the inhab. are Hindoos. Silk and cotton are the chief manufactures; the former, which is very strong, is made from raw silk imported, none being produced in the neighbourhood. Bangalore was founded by Hyder Ali, on the site of a small village; and under him it became a place of much importance. It was taken by Lord Cornwallis in 1791. (*Hamilton's E. I. Gaz.* l. 131, 132.)

BANG-KOK, or **BANKOK**, a city of Siam, having been the cap. of the kingdom, the residence of the sovereign, and seat of gov. since the destruction of Yuthia by the Burmese, in 1766. It stands on a swampy tract on both sides the Menam, lat. 13° 40' N., long. 101° 10' E., 15 m. N. from the Gulph of Siam. Pop. probably from 10,000 to 60,000. The Menam is here ½ m. wide, exclusive of the large space on each side occupied by floating houses, and from 6 to 10 fathoms deep: there is a bar of soft mud at its mouth, but vessels of from 200 to 250 tons burden may always reach Bang-kok without difficulty. The traffic above this city is trifling, though, from the want of roads, all the intercourse is by water. Bang-kok consists of three parts; the palace, the town, and the floating town. The first, built on an island, is of an oblong shape, surrounded by a brick wall of considerable height in some parts, and furnished with some indifferent bastions and many gates; it contains, besides the residences of the king and his chief officers, many temples, gardens, inferior shops, and much waste ground. The town without stretches for some distance along the banks of the river, but a very little way inland. The houses, most of which are of wood, or mere husks of palm leaf, are built on posts driven into the mud, being each provided with a boat. The floating town consists of a number of bamboo rafts bearing rows of 8 or 10 houses, with a platform in front, on which the wares for sale are exposed; and most of the trade is thus conducted on the river, where it is believed that half the pop. reside. There are many temples, all of which are built in a pyramidal form, with much gilding and paltry decorations: each contains a colossal gilded metal statue of Buddha, and a variety of others in clay or wood. The chief temple, or Ra-ehet-tap-poi, which is 200 ft. in height, contains as many as 1,500 of these images. The palace possesses a really handsome audience-hall, 80 ft. long by 40 broad, and 30 ft. in height, painted and gilded, and furnished

with English cut-glass lustres: it is surrounded by three different walls, and is built of brick; of which, or of mud, the palaces, temples, and a few of the chief residences only are constructed. Bang-kok has manufactures of tin and iron articles, and leather for mattresses, &c. Its trade is probably more extensive than that of any other emporium in the E. Canton excepted, not occupied by Europeans. It is principally carried on with China and the Malay archipelago, but mostly with the former. The great articles of export are sugar (from 10,000 to 12,000 tons), black pepper (4,000 to 5,000 tons), stick-lac, ivory, sapan wood, hides, &c. The trade with China employs about 180 Chinese junks yearly, some of 1,000 tons burden. The imports are porcelain, tea, quicksilver, lac-soy, dried fruits, silks, fans, and other native manufactures from China; with camphor, edible birds' nests, and other articles for the Chinese market from the Malay archipelago; and British and Indian piece goods, opium, and British woollens and glass from India. Half the pop. consists of Chinese; and besides them there are numerous Birman, Peguan, Laoan, Cambajan, Tavoyan, and Malay foreigners; some Christians of Portuguese descent; and a few Brahmans, who are supported by the king, and have a small number of their own. (*Crawford's Embassy to Siam, &c.*; *Finlayson's Mission, &c.*)

BANGOR, a city, sea-port, and par. N. Wales, co. Carnarvon, land. Inparvac, the Holyhead road, at the head of Beaumaris Bay, about 2 m. from the Menai bridge. It consists chiefly of one principal street, stretching E. and W. through a romantic vale, bounded on the S. by high precipitous rocks, on the N. by a more gradual acclivity, and opening on the E. over a splendid and extensive prospect, including the rocky shores of Anglesea and the town of Beaumaris. It has been mostly rebuilt, and otherwise very much improved, within the last few years. Pop. (1821) 3,899; (1831) 4,751; houses, last mentioned year, 1,171. The cathedral is an unadorned cruciform structure, having a low massive tower crowned with pinnacles. It stands in a spacious area, with a fine avenue, and has a very pleasing effect, from its situation and the just proportion and simplicity of its architecture; near it are some old endowed almshouses for 6 poor persons, and an endowed free school for 100 boys, built in recent times on the site of an ancient friary: it was founded in Elizabeth's reign, and its revenue is upwards of 250*l.* a year. There are also 4 national schools in the parish: 2 in the town (estab. 1822) for 200 boys and girls; 1 at Vaeuol for 75, and at Pentir for 60. The Baptists, Independents, Calvinistic and Wesleyan Methodists, have each a chapel; there is a town-hall and shambles in the centre of the town, and near it, on the London road, is the Carnarvon and Anglesea dispensary. The market is held on Fridays: during the summer on Tuesdays also. There are 4 fairs, April 5, June 25, Sept. 16, Oct. 28; besides which 4 large fairs for cattle (called "booth fairs") are held at the Menai bridge (which is in this parish, and about 2 m. S. W. Bangor) Aug. 25, 26, 27, 28, 29, 30, Nov. 10. They are the most frequented of any in N. Wales. It is accessible to vessels of 200 to 300 tons, which may enter the bay at any time of the tide: the trade, however, is comparatively insignificant, and is confined to the import of coals and other necessities. By the Reform Act, Bangor was constituted one of 6 contributory boroughs, which conjointly send 1 mem. to the H. of C.; the bailiffs of Carnarvon being returning officers. There are in Bangor about 170 houses of 10*l.* and upwards. It has been the seat of a bishopric from the remotest period, and has recently been united with that of St. Asaph (Feb. 1839). It previously comprised the cos. of Anglesea and Carnarvon (except 4 parishes) about half Merioneth, one deanery in Denbigh, and 7 parishes in Montgomery: in all 179 par. The income of the bishop, at an average of three years, ending with 1831, amounted to 4,464*l.* a year. The church is used both for cathedral and parish services; the former in English, the latter in Welsh. The living is a consolidated vicarage belonging to the vicars choral, the church of the township of Pentir being annexed to it as a chapel of ease. There is an episcopal residence and a deanery. The famous controversy between Drs. Hoadley and Sherlock took its name from this see: the former being its bishop from A. D. 1715 to 1721, when, on being translated to Salisbury, the latter succeeded him. The neighbourhood is for the most part unenclosed, and every where presents scenery of surpassing interest, having the Snowdon range on the S., and the Llanmannerau on the E., and the Menai Strait and bridge immediately contiguous to the town. The improvement of the Holyhead road, now the best in the kingdom, and the construction of the Menai bridge, have rendered Bangor a great thoroughfare, and made it be resorted to in summer by crowds of visitors. When Dr. Johnson visited the city in 1774, with Mr. and Mrs. Thrale, he complained that they found "a very mean inn, and had some difficulty of obtaining lodging. I lay in a room where the other bed

And two men. But modern travellers need fear no such difficulties. The inns in the town are very good; and there is a hotel outside the town, built by Mr. Penman, that ranks, in respect of size and accommodation, with the best in the kingdom.

BANGOR, a marit. town of Ireland, co. Down, prov. Ulster, on the S. shore of Carrickfergus Bay, 12 m. N.N.E. Belfast. Pop., in 1821, 2,943; in 1831, 2,741: pop. of par., in 1831, 9,355, of whom 787 were of the estab. church, 4,295 Prot. diss., and 250 Rom. Cath. The town took the name of Bangor, Beanoir, or "the White Choir," from a celebrated monastery which, about the year 820, was destroyed by the Danes, when upwards of 900 monks are said to have been massacred. It is much frequented as a sea-bathing place. The public buildings are a church, two Presbyterian, and two Methodist meeting-houses, and a market-house: there is also a dispensary, mendicity institution, savings' bank, and public library. It is a constabulary and coast-guard station. The corporation, under the charter of 1613, consists of a provost and 12 free burgesses. It returned 2 mem. to the Irish H. of C. till the Union, when it was disfranchised. A court leet is held once a year, and a mayor court, with jurisdiction to the amount of 20*l.*, every 2 weeks, and petty sessions every fortnight. There are two cotton factories; linen is also made for home consumption. The fishery is carried on to some extent, and in the neighbouring village of Groomsport, where the Duke of Schomberg's army landed in 1689, large oysters are taken in abundance. Markets are held on Tuesdays; fairs on Jan. 12, May 1, Aug. 1, and Nov. 22. Post-office revenue in 1830, 172*l.*; in 1836, 165*l.*

BANG-PA-SOE, a considerable town of Siam, cap. of a distr. on the left bank of the Bang-pakung river, near its mouth, 30 m. S.E. Bangkok. lat. 13° 40' N. long. 101° 11' E. It is populous, has a wooden stockade, and is considered by the Siamese important as a place of defence against the incroachments of the Anamese. The Bang-pakung river is here little inferior in size to the Menam; it has the same depth of water on its bar, and within it from 2½ to 3 fathoms. There is said to be a good carriage road from this town to Tung-yai, a distance of nearly 200 m. The distr. of Bang-pa-soe is an alluvial flat, very fertile in rice and sugar cane. (*Crawford's Mission to Siam*, p. 441, 442.)

BANJARMASSING, town and distr. on the S.E. coast of Borneo; the town is built on the river of the same name, in lat. 3° S., long. 114° 55' E. The river has a shallow bar at its entrance, over which even a light boat cannot float till after the first quarter's flood. Notwithstanding this, the town enjoys a considerable trade, especially with China; many Chinese being settled in and near it. There is some trade with Singapore, but it is discouraged by the Dutch, who have a factory, forts, and government buildings in Banjarmasin. The imports consist of opium, piece goods, coarse cutlery, gunpowder, and fire arms. The exports are chiefly gold, diamonds, and pepper; rattans to Java, camphor, wax, birds' nests, tripping, spices, and steel, of superior quality. (*Earl, Eastern Seas*, p. 336—338.)

BANN, UPPER and LOWER, two rivers in the N. of Ireland; the first, or Upper Bann, rises in the plain called the Deers or King's Meadow, in the N. part of the Mourne mountains, in Down. Its course, at first, is winding; but its general direction is N.W. After passing Gilford and Portadown, it falls into Lough Neagh at Banfoot Ferry. Near Portadown it is joined by the Newry Canal; and is thence navigable by barges to the lake.

The Lower Bann issues from Lough Beg, connected on the N.W. with Lough Neagh, and flowing N. with a little inclination to the W., falls into the sea 5 m. below Coleraine. The current of the Lower Bann is rapid; and in some places it is precipitated over ledges of rock. The salmon and eel fisheries on this river are important and valuable. It is navigable by boats as far as Coleraine, but only with difficulty.

BANNALEC, a town of France, dep. Finistère, cap. cant., 9 m. N.W. Quimperle. Pop. 4,377.

BANNOCKBURN, a village of Scotland, co. Stirling, par. St. Ninian's, 3 m. S.S.E. Stirling, on both sides of the small river Bannock, which, after a course of a few miles, falls into the Frith of Forth. The name of this village is imperishably associated with one of the most memorable events in British history. In its immediate vicinity, on the 24th of June, 1814, was fought the great battle between the English under Edward II., and the Scotch under Robert Bruce, which terminated in the total defeat of the former. The loss of the English, in the battle and pursuit, is estimated by the best informed historians at 20,000 men, including a great number of nobles, and persons of distinction. The loss, on the part of the Scotch, whose army was very inferior in respect of numbers to that of the English, did not probably fall short of 8,000. This decisive victory secured the permanent independence of Scotland, and established the family of the conqueror on its throne.

BANTRY BAY.

About 1 m. W. from the village, at Sauchie Burn James III. was defeated in 1465 by his rebellious subjects and his son, James IV.; and, after being wounded in the engagement, was assassinated at a mill in the vicinity.

In more recent and tranquil times Bannockburn has been distinguished in a very different department—that of manufactures. Various fabrics of woollen, particularly tartans, are successfully carried on in it; and it has produced all the tartan worn by the Highland regiments in the British army for upwards of half a century past. The manufacture of tartan shawls, so generally worn by females in the middle and lower ranks in Scotland, is also confined to it, and are hence known by the name of Bannockburn shawls. Carpets, particularly Brussels, and hearth-rugs, are produced here to a considerable extent; and of all these no small portion is sent to the English market. The manufacture of *Tweed*, or coarse striped woollen cloth for trowsers and plaids, such as that for which Galashiels and Hawick are eminent, has of late been introduced into Bannockburn, but is not carried to any great extent. Tanning is also a considerable branch of trade. Various villages in the neighbourhood have extensive emporia for the roasting of nails; but the inhabitants of Bannockburn have never introduced this branch of business, but have confined themselves to the manufactures noticed above. The portion of the parish of St. Ninian's in which this village is situated has recently been erected into a separate parish, under the name of Bannockburn; and a handsome parochial church has been built. It has also a dissenting church, an excellent school, a subscription library, and an annual fair for horses and cattle on the second Tuesday of June, old style. The village is not built on any regular plan. (Pop. 760.)

BANSTEAD DOWNS, in England, co. Surrey, 1st div. of Cophorne hund., par. Banstead; a tract of land remarkable for its verdure and excellent sheep pasturage, 12 m. S. by W. London, 576 ft. above the sea level. The Epsom Downs are a continuation of these on the W.: their geological position is between the London clay on the N., and the chalk formation on the S. The Brighton line of road from the metropolis crosses them.

BANSWARA, an inland town of Hindooon, prov. Gujarat, and cap. of a small rajpoot principality under British protection; 80 m. E. Ahmednuggur; lat. 23° 31' N., long. 74° 32' E. It is a handsome place for its part of India, and its walls include a large circuit; though much of the space is occupied by gardens. There are some handsome temples, and a tolerable bazar; at some distance is a pool of water with a stately flight of steps, overhung by palms, peepuls, and tamarind-trees; and beyond it, on the crown of a woody hill, the towers of a large castle, formerly the palace of Banswara. In 1820, there were 1,000 families of Ibrahimis, and a considerable number of Mussulmans in the town. In the wilder districts of its territory, the inhabitants are chiefly Bheels. The rajah is a branch of the family of the Odeypoor sovereign, and holds the highest judicial authority in his own hands. In 1820 he had a kind of feudal nobility of 32 subordinate rajpoot chiefs, who each furnished his quota of fighting men. In the same year the Banswara territory yielded a revenue of 20,786*l.* but it was then only recovering from a state of great desolation and misery, from which it had been relieved by the British. (*Hamilton's E. I. Gaz.* 1.)

BANTAM, a decayed town of Java belonging to the Dutch, once cap. of a distr., but "now of no greater importance than the smallest residence on the coast." Its bay, formerly a great rendezvous of European shipping, is choked up by coral reefs, and islands formed by the soil washed down into it from the mountains. The Dutch abandoned it in 1817 for the more elevated station of Sirang or Ceram, 7 m. inland. (*Earl, The E. Seas*, 1837, p. 1.)

BANTHY, a marit. town of Ireland, co. Cork, prov. Munster, at the bottom of Bantry Bay, 43 m. W. by S. Cork. Pop. (1821) 3,659; (1831) 4,276: pop. of parish, 14,666, of whom 948 are of the estab. church, and 13,717 Rom. Cath. The town is ill built: it has a church, a Rom. Cath. chapel, Methodist meeting-house, and a neat court-house, with a bridewell. General sessions are held in February, and petty sessions on alternate Fridays. A party of the constabulary is stationed here. Manufactures confined to that of herring, and there is a small porter brewery. The fishery of herring and sprats has been unproductive since 1828: pilchards were once abundant, but have deserted the coast since 1823. The trade of the port, which was once very considerable, is now confined to the export of grain, of which 1,143 tons, of the estimated value of 6,912*l.*, were exported in 1836: the value of the imports of the same year amounted to 17,293*l.*

BANTRY BAY, an inlet of the sea, in the S. W. extremity of Ireland, co. Cork, between Crow Point on the N. and Sheep's Head on the S. This is one of the finest and most capacious harbours in Europe. It stretches inwards in a N.E. direction above 25 m., with a breadth

varying from 4 to 6 m. Near the entrance of the bay, on its N.W. side, is Bear Island, separated from the main land by a crooked strait about a mile broad, having from 10 to 80 or 40 fathoms water, and affording a safe retreat for the largest vessels. Farther up the bay is Whiddy Island, on the S. side of which, nearly opposite to Bantry town, there is an admirable roadstead, where ships lie land-locked in from 24 to 40 f. water. Bear Island forms, as it were, a natural breakwater, protecting the bay from the S.W. winds. There is close to both its shores a considerable depth of water; it is not encumbered by any shoals or rocks that may not be easily avoided, even at night; and the anchoring ground being every where good, it furnishes, throughout its whole expanse, convenient shelter and accommodation for the largest ships.

Having no considerable town on its shores, which are wild and rugged, nor any communication with the interior, this noble bay is but little frequented by shipping. Occasionally, however, it has been resorted to by large fleets, and has been the theatre of naval warfare; an indecisive action having been fought in it on April 30, 1689, between a portion of the French fleet that conveyed King James to Kinsale, and the English fleet under Admiral Herbert, afterwards Earl of Torrington. It was in it, also, that the French fleet, with General Hoche on board, anchored in 1796.

BAPAUME, a town of France, dép. Pas de Calais, cap. cant., 15 m. S.S.E. Arras. Pop. 3,122. This town was originally fortified by Charles V., but having been ceded to France in 1659, its fortifications were enlarged and completed by Vauban. It is neat, well laid out, and well built. The parish church and the hospital are worth notice. There are manufactures of woollens, calicoes, and other cotton stuffs, and of the fine thread used in the manufacture of a species of lace carried to the markets of Lille and Amiens. It is itself the centre of all the lace trade of the vicinity. Being situated in a dry country, Bapaume laboured, for a long period, under a deficiency of water; but in 1723 an Artesian well having been sunk in the vicinity, furnished an abundance of excellent water, which, being conveyed into the town, supplies a handsome fountain. (*Hugo, art. Pas de Calais.*)

BAR, a town of European Russia, gov. Podolia, on the Row, 48 m. N. Moghilev. Pop. 2,500. It is defended by a citadel built on a rock. It was called Row, from the river on which it stands, till the reign of Sigismund I., who gave it to his lady, by whom it was called Bar, in honour of her native country, Bari. It is famous in Polish history from the confederation established in it in 1794, by the Pulawski and other Polish nobles hostile to Russia. (*Encyc. des Gens du Monde, art. Bar.*)

BAR, a fortified town of France, dép. Bas-Rhin, cap. cant., 19 m. S.W. Strasburg. It is situated at the foot of the Vosges, surrounded by hills planted with vineyards. An explosion of the arsenal, in 1794, destroyed most part of the houses, so that it is now almost new. It has some manufactures, and a considerable trade in wine, spirits, corn, and cattle.

BAR, an inland town, of considerable extent and trade, in Hindostan, prov. Baluchistan, on the S. bank of the Indus, 18 m. N.E. Babelugh. lat. 25° 28' N. lon. 85° 46' E.

BARAHAT, an ind. town of N. Hindostan, cap. rajah of Gurwal, but some years since a most wretched and paltry place, 48 m. W.N.W. Serinagar.

BARAITSCHIE, an inland town and district of Hindostan, prov. Oude; the district divided between the King of Oude and the British; the town belonging to the former, and pleasantly situated 50 m. N.E. Lucknow; lat. 27° 33' N., long. 81° 30' E. The N. tracts of the district are elevated and covered with forests; the more S. parts open, fertile, and tolerably well cultivated. Many of the old Patan race inhabit the Baraichie district.

BARBADOS, the most easterly of the Caribbee islands; it is 21 m. in length and 14 in breadth, and contains 106,470 acres, of which it is supposed about 80,000 are in cultivation, and that the remainder, 26,470, are occupied by roads, buildings, &c. Bridgetown, the capital, is in lat. 13° 8' N., long. 59° 41' W. The time of its discovery is not distinctly known, but the first permanent settlement on it was made by the English in 1625, and it has remained in their possession ever since.

The island, viewed from the sea, has nothing interesting in its appearance, and the land, as compared with the adjoining colonies, is low, not being discernible many miles from the shore. The surface is very irregular: on the N., S., and W. sides the land is low towards the sea, and rises abruptly by precipitous acclivities in terraces of greater and less extent, to the point of highest elevation. On the E. side it rises almost perpendicularly from the sea to a height of 80 and 80 feet. On the windward, or N.E. side, there is a ledge of rocks, called the Cobblers, at a short distance from the shore, which renders the approach to the island dangerous in the extreme, and has doubtless contributed greatly to protect it from hostile attacks in the wars in which Great Britain has been engaged.

It is highly cultivated: scarcely an acre upon it, on which a blade of grass can grow, remains unproductive; and a better system of agriculture is pursued than that followed in the other colonies. The base of the island is calcareous, consisting of the spalls of scaphites, of which there are several species. These are so cemented together, as in some places to form a hard compact limestone, which is quarried, and very extensively used for building; and in other places they exist as a dry soft marl, on which are found a great variety of shells, many of them in perfect preservation. Upon this formation there is a deposit of a strong stiff clay, in some places of considerable depth, which constitutes the soil of the most fertile districts. On the S. and W. sides, adjoining the sea, the soil is sandy and light; in other places it is strong, and admirably adapted to the growth of the cane. In one district, on the N.E. side, called Scotland, the scenery and soil are strangely contrasted with the flat and shelving table-land of the other parts. The scenery there is wild, irregular, and picturesque, and the soil composed of mineral substances belonging to the clay genus, particularly loam, potters' clay, and slate clay. Beds of bituminous shale are likewise frequent, and petroleum, or mineral oil, more or less abundant in this district. There are some remarkable instances of the soil in this district becoming detached from its original bed, and slipping down from a considerable elevation, carrying with it whole fields of cane, to a position below; in which extraordinary migrations rows of cocoa-nut trees have accompanied the moving masses. The highest point of land in the island is Mount Hillaby, which rises 1,147 feet above the level of Carlisle Bay.

The climate is very healthy. Except the bilious remittent fever, common to all the West India colonies, there is no malignant disease peculiar to it; and the island is free from any venomous reptile. The average quantity of rain amounts to 58 inches. The range of the thermometer, on an average of 5 years, was, —max. 87, med. 81, min. 75. Owing to the flatness of the island, and its being open in almost every part to the sea breezes, the heat is not so oppressive as the maximum range of the thermometer would seem to indicate. The prevailing wind is the N.E. trade. It begins generally about 10 o'clock a.m., and continues till sun-set, but it is very feeble during the night. In Jan., Feb., Mar., April, and May, it is strong and regular, and the climate, in these months, is peculiarly agreeable. In June the wind sets in, and from August to October, which is called the hurricane season, and during the month of Nov., the heat is very oppressive. The ratio of deaths among the white troops, according to Captain Tullock, for the last 20 years, were, 58.5 per 1,000 per ann. of mean strength. Among the black troops, only 46. The cane is the chief article of cultivation, but a considerable quantity of corn, arrow-root, cotton, ginger, and aloes, is also raised, and exported.

Barbados has been frequently visited by hurricanes, of which those of Aug. 10, 1674, Oct. 10, 1780, and Aug. 11, 1831, have been the most destructive in their effects. In that of 1674, 300 houses, 8 ships, and most of the sugar-works, were destroyed, and 300 persons killed: in that of 1780 the loss in human life was reckoned between 4,000 and 5,000, and the whole amount of damage, in buildings, cattle, and stock, was estimated at upwards of a million sterling; but the fury and violence of the last hurricane far exceeded that of either of the former; in it 2,500 persons were killed, and considerably more than that number wounded, and the loss in property amounted to two millions and a half sterling. The munificence of parliament, and the industry of the inhabitants, have, however, enabled the planters to recover from these heavy losses; and except the absence of trees, which gives a bare and naked appearance to the country, the effects of this severe visitation can now be traced only with difficulty. The island is divided into 11 parishes, and 5 districts. It contains, besides the principal town, a smaller town to leeward, called Speights Town, and two other towns, which are scarcely to be described as such: Orléans, or Charles-town, Saint James, or the Moletown, the spot first settled. Bridgetown extends along the shore of Carlisle Bay, and, previously to the hurricane, being skirted with a belt of cocoa-nut trees, it presented a very pretty and interesting appearance to the stranger. The population is large, and may be variously estimated: it is supposed to contain 20,000 inhabitants. The shops are very good, many of them equal to those to be seen in the second class of towns of England, and some buildings, especially the stores of the wealthier merchants, are equal to corresponding establishments in the city of London. The gnoi is a large and airy building, in which formerly the courts of law and equity were held, and the legislature assembled; but it is now exclusively used as a place of confinement. It is in contemplation to build a council-house in some other part of the town. The barracks at St. Peter's, about 3 m. to the S. of the town, are spacious and airy, having been all rebuilt

since the last hurricane: they will contain comfortably 1,300 men. There is an excellent parade-ground, a brigade of guns, and a very complete establishment for warlike purposes. The Government-house is about 1 m. from the town, situated on some rising ground, and commands a beautiful view of the town and bay. The market in Bridgetown is well supplied with poultry, mutton, and pork, of excellent quality, quite equal, if not superior, to the corresponding productions of England. Veal is good, but not in very great plenty. Beef is but indifferent. Many of the esculent vegetables of Europe are common. The quantity of tropical fruits grown in the island is small, but the quality excellent. The supply of fish is in general abundant. One description, the flying-fish, about the size of middling herrings, but firmer, and not so fat, are sometimes so plentiful, as to be undervalued by the opulent, and within the reach of the poorest inhabitants.

The whole population, as in the adjoining islands, may properly be divided into four classes: Creole or native whites; European whites; Creoles of mixed blood; native blacks. There has been no recent census of the island; the population, consequently, cannot be accurately given; but, from an estimate made previously to the abolition of slavery, it may be stated as follows:—whites, 12,797; coloured, 5,844; and if to these be added the number of emancipated slaves, ascertained by the last registration to be 83,140, the total population would be 102,581. It is conjectured, indeed, that the whole population amounts to 120,000; but this is much beyond the truth, as the same estimate which gives this return states the population of Bridgetown to be 37,000, which is an excess of at least 17,000 beyond what it really is. Of the whole population, only 1,100 enjoy the privilege of electing and being elected members to serve in the colonial assembly, and in the vestries: and of this class 446 are electors for the principal town.

Barbados is the residence of the bishop of Barbados and the Leeward Islands, and of one of the archdeacons. The clerical establishment is fixed upon a very liberal and effective scale. There is a rector resident in each parish, at a stipend of 333*l.* 6*s.* 8*d.* sterling, with an allowance of glebe land, and an excellent parsonage house, kept in repair at the expense of the parish. In Bridgetown, besides the cathedral and parish church, there is St. Mary's Church, and in the neighbourhood three other chapels of ease, with a minister appointed to each, and paid by the British government. The Christian Knowledge Society. The surplice fees, which are received by the rector, are upon a liberal scale. There are two Wesleyan chapels, and two Moravian chapels.

There are several public establishments for the education of the youth of the island:—Codrington College, Codrington Foundation School, Harrison's Free School, and the Central School: the two latter are in Bridgetown. Codrington College is situated 13 or 14 miles E. of Bridgetown, and was founded by Colonel Codrington, a native of the island, who died in 1710. The object of the founder was the education of a certain number of white youths, and the religious instruction of the blacks; for which purposes he bequeathed landed property, capable of clearing 3,000*l.* sterling a year, to the Society for Propagating the Gospel in Foreign Parts. This establishment is under the superintendence of the bishop of the diocese, who is visitor, a principal, and two tutors. It is open to all young men, for whatever profession intended, throughout the West India colonies. There are 12 theological exhibitions. The college expense to each commoner is about 30*l.* sterling per annum. The course of study embraces theology, the classics, logic, and mathematics. All candidates are required to be at least 17 years of age at the time of admission.

At the Central School about 160 white children are educated, upon the plan of the national schools in England. All the children are fed, and the major part clothed. From this class of boys, master tradesmen, mechanics, and overcoats, are supplied. A girls' school has also been founded under the auspices of Mrs. Coleridge and the ladies of Barbados.

The trade of the island has varied very much at different periods, owing to the uncertainty of the crops, occasioned by hurricanes and bad seasons. The maximum value of the exports in 15 years, from 1822, having been, in 1836, 1,307,892*l.*, and the minimum value, in the same period, in 1832, the year succeeding the last hurricane, 408,363*l.* The imports have fluctuated also in the same proportion, during the same periods. In 1826 they were 999,231*l.*, and in 1832, 481,610*l.* The total value of the exports, employing 74,497 tons of shipping, and 5,194 men, in 1834, was 624,686*l.* The exports of sugar, the staple produce of the island, have been, in 1833, 284,977 cwt*s.*; in 1834, 304,537 cwt*s.*; in 1835, 344,680 cwt*s.*; in 1836, 373,498 cwt*s.*; in 1837, 445,713 cwt*s.* Exclusive of sugar, there were exported, in 1837, rum, 914 galls.; molasses, 79,293 cwt*s.*; cotton, 107,811 lbs.; arrow-root, 63,823 lbs.; succades, 11,351 lbs. In the year ending January, 1839, the total value of the imports was 606,886*l.*, of which

350,508*l.* was from Great Britain and Ireland; and in the same period the value of the exports was 897,984*l.*, of which 778,077*l.* was to Great Britain and Ireland.

The government of the island is administered by a governor, who is also gov.-gen. of the islands of Grenada, St. Vincent, Tobago, Trinidad, St. Lucia, and their respective dependencies. There is a legislative council, consisting of 12 members, and a representative assembly, constituted by a return of 2 members from each of the parishes,—making 22 members. The duration of the assembly is 12 months. If there be less than 7 members of council resident in the island, the governor may fill up the number to 7 for the despatch of business. The governor is chancellor of the high court in chancery with the council, who act as judges both in the court of error and in equity. There is a court of common pleas held for each district, monthly, during 8 months of the year, but no court of king's bench. A general sessions of the peace is held twice a year.

The principal articles of import are dry goods of every quality and description; flour, corn, meal, and oats; pickled herrings, cod-fish, salt beef, pork, and butter; soap, candles, and all kinds of Irish provisions, with wood-lumber, horses, cattle, and live stock, hardware, and earthenware.

The revenue of the island, previously to the abolition of slavery, was raised by a poll-tax upon slaves, and by duties on spirituous liquors, licences, &c.; but it is now derived principally from duties levied upon American produce, on the tonnage of ships, and on spirituous liquors, licences, &c.: lately it has been as high as 40,000*l.* ster. per ann.; and the expenditure has been little more than 30,000*l.*

A banking establishment has been lately formed by a board of directors in London, incorporated by act of parliament, which is of the greatest utility to the colony.

The proportion of the 30,000,000*l.* voted by parliament for the abolition of slavery paid to the colony was 1,721,345*l.* 19*s.* 7*d.* The value of the slaves was estimated at 3,897,276*l.* 19*s.*; and the average value of a slave, from 1822 to 1830, was 47*l.* 1*s.* 3*d.*

BARBANTANE, a town of France, dép. Bouches du Rhone, near the confluence of the Durance and the Rhone, 4 m. S. W. Avignon. Pop. 2,926. Its environs produce excellent wine.

BARBARY, the name usually given in modern times to that portion of N. Africa which comprises the various countries between the W. frontier of Egypt and the Atlantic on the one hand, and the N. frontier of the Sahara, or Great Desert, and the Mediterranean on the other; or between 25° E. and 10° W. long., and 30° to 37° N. lat. It consequently includes within its limits the empire of Morocco and Fex, with the regencies of Algiers, Tunis, and Tripoli, including Barca. Under the Roman dominion, it was divided into *Mauritania Tingitana*, corresponding to Morocco and Fex; *Mauritania Cæsarica*, to Algiers; *Africa Propria*, to Tunis; and *Cyrenaica* and the *Regio Syrtica*, to Tripoli. Its extent may be taken from 650,000 to 700,000 sq. m.; and its population has been variously estimated at from 10,000,000 to 14,000,000.

The name Barbary has not, as has sometimes been supposed, been given to this portion of Africa because it is occupied by a barbarous and ignorant people. It is derived from the name of its ancient inhabitants, usually styled *Berber*s or *Kabyles*, and should, therefore, in strictness, be called Berberly. The Arabians call it *Maghreb*, or the region of the W.; but though this name correctly points out its situation in relation to Arabia, it would be incorrect if used by Europeans. If a new name were now to be adopted, it might be called the *Region of Atlas*, inasmuch as it includes the whole of that great mountain chain, with its numerous ramifications. This designation has, in fact, been given to it by some geographers; but there is but little probability of its displacing the common name; and, when properly explained, it is quite as good as any other.

In antiquity, this part of Africa was distinguished as being the seat of Carthage—that great commercial republic, that waged a lengthened, doubtful, and desperate contest with Rome herself for the empire of the world. After the fall of Carthage, it formed an important part of the Roman empire. It had many large and flourishing cities, and was long regarded as the principal granary of Rome. After being overrun by the N. barbarians, it was subdued by the Saracens; and under their sway acquired a lustre and reputation scarcely inferior to that of the most brilliant period of its ancient history. But the Saracenic governments in Barbary, like those in other countries, gradually lost their vigour, and became a prey to every sort of disorder; and this great country ultimately sunk into the lowest state of barbarism and degradation. A handful of Turks and roneaders acquired the government of its finest provinces, and subjected them to the most brutal and revolting despotism. Being unable to contend with the European powers in regular war, they had recourse to a system of piracy and ma-

rauding; which, though often partially abated, was not entirely suppressed till the conquest of Algiers by the French.

Barbary has far more of a European than of an African character. Owing to its being pervaded by the great chain of Atlas, it has every diversity of surface, and is remarkably well watered. The climate is excellent; and it produces all the grains and fruits of S. Europe, in the greatest perfection. In ancient times its fertility was such as to be almost proverbial:

Frumentum quantum metit Africa.

Hor. Sat., lib. ii. sat. 5.

and notwithstanding the wretched treatment to which it is now subject, the fertility of the soil continues unimpaired, and with no manure, except occasionally burning weeds and stubble, it produces the most luxuriant crops. No wonder, therefore, that the site of the famous gardens of the Hesperides should have been originally placed in Barca; and that they should afterwards have been carried farther W. according as the Greeks became better acquainted with the coast, and with the riches and capabilities of the country. (For a full account of this interesting region, the reader is referred to the articles on the different countries comprised within its limits and to those on *ATLAS*, *CONSTANTINE*, &c.)

BARBASTES, a town of Spain, Aragon, near the China, 28 m. S.E. Huesca. Pop. 5,000. It is surrounded by walls, is the seat of a bishopric, and has some tanneries.

BARBEZIEUX, a town of France, d^{ép.} Charente, cap. arrond., on the road from Angoulême to Bordeaux, 21 m. S. W. Angoulême. Pop. 3,013. It is advantageously situated on the declivity of a hill, at the extremity of an extensive and fertile plain. It is well built; has a court of original jurisdiction, a linen manufacture, and some trade in wine, corn, cattle, and especially poultry. *The champagne truffes* of Barbezieux are highly esteemed. (*Dict. Géog.*)

BARBUDA, one of the W. Indian islands, belonging to Great Britain, 27 m. N. Antigua, 15 m. in length by 8 m. in breadth. Pop. 400, almost all blacks. It is flat and fertile. It is a proprietary of government, and belongs to the Codrington family. Corn, cotton, pepper, tobacco, are produced in abundance, but no sugar. It has no harbour, but a roadstead on its W. side.

BARBY, a town of Prussian Saxony, on the Elbe, 14 m. S.E. Magdeburg. Pop. 3,100. It is well built, has an old castle, two Lutheran, and one Calvinist church, with fabrics of cloth, cotton, and flax, soap-works, breweries, and distilleries.

BARCA (*Bazyn*), a district of N. Africa, forming the E. portion of Tripoli, extending from 26° to nearly 33° N. lat., and from 19° to 25° E. long. The limits are, however, very uncertain towards the S. and E., the country, in the former direction, terminating in the Libyan Desert, and being, in the latter, divided from Egypt by wandering tribes of Bedouins, who acknowledge no authority in any settled government. On the N. Barca is bounded by the Mediterranean Sea, and on the W. by the Gulf of Sidra (the *Syrtis Magna* of the ancients), and the government of Sort or Sort. (*Beechy*, 210.; *Pacho*, 19.; *Beechy* and *Pacho's Maps*.) It extends 500 m. from N. to S., but the cultivated and inhabited portion terminates at about the 31st parallel, or 140 m. only from the farthest N. point of the coast. The greatest width from E. to W. is about 390 m., and the area may be estimated at about 78,000 sq. m. (*Beechy* and *Pacho's Maps*.)

A mountain range, at a short distance inland, fronts the whole extent of coast line: this range appears to have its greatest elevation near the 22d meridian (at the town of Cyrene), and to decline thence both towards the E. and W., terminating, in the former direction, in the plain of Lower Egypt; in the latter being continued round the gulph till it vanishes in a low swamp S. of Mesurata. The least elevation of these mountains is estimated at 400 or 500 ft., and the greatest at 1,800 ft. It is upon the sides and summits of these hills that the only population and production is found, though the great plain towards the S. is probably preserved from some of the worst features of the desert by a range of sand hills extending from the oases of Ammon to that of Maradeh, which must of necessity form some protection from the effects of the alrocco (*Beechy*, 107. 216. 252. 434. &c.; *Pacho*, 57. 83. 134. 272. &c.)

There are no rivers, but innumerable mountain torrents, and wells are also tolerably abundant, though many of them contain only salt or brackish water. On the whole, however, the mountain land is not very badly irrigated. Some years since, the Americans made a temporary settlement at Derna, where, taking advantage of the many flooded ravines, they built a *water-mill* of very simple construction, which, by a little skill in damming up the stream, works nearly all the year. (*Pacho*, 98.) The ancient sacred fountain of Cyrene is permanent (*Beechy*, 494.), and probably the only stream in Barca that is so, with the exception of a subterranean rivulet,

near Bengazi, which is supposed by Beechy (223.), on good grounds, to be the Lathion or *Lake* of Ptolemy (iv. 4.), Pliny (v. 5.), and Strabo (xvii. 436.), and the Ercus of Scylax. (*Perip.* 111.) Though stretching as far as 33° N., Barca has an equinoctial climate. The rainy season appears to commence sometimes as early as November, and at others to delay its violence till the end of December, or even till January: during such delay, however, the intermediate season is *showery*, and when the rains descend in their strength, the mountain roads become nearly, if not quite, impassable. The ravines pour down torrents, which, in their progress, carry with them earth, trees, and stones of enormous size, and convert the narrow belt of flat land between the mountains and the sea into enormous marshes. The temperature is, of course, generally high, but the powerful evaporation makes that of winter something lower than might be anticipated, and absolutely cold nights are not unknown. The wet season, as in other countries, is ushered in by storms. (*Beechy*, 41. 59. 247. 281. 247. &c.)

Notwithstanding the celebrity of this country in ancient times, it is only within these few years that any thing accurate has been learned concerning it. Its very outline was consequently marked in every map, and cited previously to 1828 (See *Syria*), and every account of its soil, climate, and fertility was nearly the direct reverse of what experience has shown to be the truth. The ancients, with the single exception of Herodotus, have combined to represent the coasts of the Syrtis as an irredeemable desert. At least such is the impression given by Strabo, Pliny, Scylax, and others of all the country W. of Berenice (*Bengazi*); while the moderns, following Leo Africanus and the Arab historians, have extended the same description to all the land between Tripoli and Alexandria, till the term *Barca* became synonymous in European language with barrenness. (*Strabo*, xvii. 438.; *Pliny*, v. 4. &c.; *Scylax*, *Perip.* 113. &c.; *Leo Afric.* v. 72. &c.) But, to say nothing of the gardens of the Hesperides, situated on this coast, it is impossible to reconcile this idea of utter barrenness with the pastoral life said by Herodotus to be led by the aborigines (*Melp.* 186.), or with the subsequent colonization of the country by the Greeks. Neither is it likely that Herodotus, who so accurately describes the "*east sandy desert*" in the interior (*Melp.* 181.), should have omitted all mention of the parched and barren soil, had any such existed on the islands and coasts of Barca. In fact, the prevalent descriptions of Barca have been, for years, little more than fables; the S.W. corner, indeed (joining on to the desert), seems fully to justify the accounts of utter desolation given of it; but E. and N. the country rapidly improves, and presents extensive crops of corn and large fields of excellent pasture. The mountain sides are in most cases thickly wooded, and covered with an excellent soil; and even the sand itself (on the shore) made, by little labour, luxuriantly productive during the rainy season. The trees consist of pines, olives, laurels, with a great variety of flowering shrub and climbers; such as roses, laurestinas, honeysuckles, myrtles, &c.; but the trees most in esteem here, as in every other Mohammedan country, are the various species of dates, palms, and figs, which flourish in great variety and abundance. The corn which this country produces is chiefly barley, or dhourra, and oats.* The fruit,—grapes, melons, pumpkins, melonran (or egg plants), cucumbers, and tomatas; a peculiar plant, called *Bauria*, is also raised, though not in great abundance; fine artichokes, and green and red pepper, are also very plentiful. The plant for which this country is the most remarkable is the Silphium, an umbelliferous perennial resembling the hemlock or wild carrot, of which the most marvellous tales are related by the ancients. Its origin was said to be miraculous; it perished under cultivation, but thrived in the most savage and neglected deserts. A liquor produced from it was esteemed an almost universal remedy for inward ailments; and various ointments, compounded of the stalk, leaves, and root, were held to be equally efficacious in outward applications. The silphium was an object of public, almost of divine, honour; it was an offering to the deified king of the country, and its figure was stamped upon the coins of Cyrene. (*Pliny*, xix. 3.; xxii. 22.; *Theophrastus*, iv. 3.; *Arrian*, *Hist. Ind.* xliii.; *Exp. Alex.* iii. 28. &c.) It does not, however, appear to differ essentially from other soporific plants of the same family. (*Beechy*, 409—410.; *Pacho*, 247—255.) Thus, though not very varied, the productions of Barca are sufficiently abundant, and nothing but industry seems requisite to restore this country to the state in which Herodotus beheld it, when three successive harvests, on the coast, on the sides, and on the summits of the mountains, occupied the Greek inhabit-

* Captain Beechy saw, in the neighbourhood of Bengazi, large quantities of oats, which he considered to be the spontaneous production of the soil. Their situation was, however, in open tracts among forests, apparently deserted cultivations (p. 247.), and the grain was, therefore, probably the product of the neglected crops. It is a singular fact, except in a few accidental instances like the present, a universal fact, that the bread crops are no *wheat indigenae*.

that its progress has been *de mal en peu* i.—from bad to worse i.—a consequence of oppressive and absurd political and commercial regulations. Mr. Townsend speaks in high terms of the foundry for brass cannon that existed in the city at the epoch of his visit. We are not aware whether it has been abandoned; but it is unlikely that such an establishment should be kept up in the present wretched state of the monarchy.

The trade of Barcelona has greatly declined since the emancipation of Spanish America; but it is still far from inconsiderable. The principal imports are cotton, sugar, of the sea, iron, tin, pepper, cinnamon, dye-woods, indigo, staves, cheese, bees' wax, coffee, horns, and specie, mostly from America, Cuba, and Porto Rico. The exports consist of wrought silk, soap, fire-arms, paper, hats, laces, ribands, and steel. The export of shoes, in the manufacture of which about 2,000 hands used to be employed, has entirely ceased. In 1831, 18 English and 110 other vessels, being in all of 15,130 tons burthen, entered the port. The harbour is formed by a mole running to a considerable distance in a S. direction, having a light-house and battery at its extremity. The depth of water within the mole is from 18 to 20 feet; but there is a bar outside, which has frequently not more than 10 ft. water. When in the harbour, vessels are pretty well protected; they are, however, exposed to the S. winds, and great damage was done by a dreadful storm in 1821. Large vessels are obliged to anchor outside the mole.

The Barcelonenses used to evince more superstition and ignorance than might have been expected in a city having so much intercourse with foreigners. Money is collected to the sound of little bells, at executions, to buy masses for the soul of the criminal; and large processions of masked penitents accompany him to the scaffold. In 1779, most of the insurance companies were ruined by underwriting the French West India men, relying on their partnership with various salts, when nobody else would take the risk at any price! (*Townsend*, i. 153.) And it would seem, from the statements of Mr. Inglis, that matters continue, in this respect, nearly on their old footing.

Barcelona is supposed to have been founded about 200 years before the Christian era, and 300 after the establishment of the Carthaginians in Spain, and to have been named after its founder, Hannibal Bareilly. After the Romans and the Goths, it was conquered by the Arabs, in the beginning of the eighth century; and was reconquered from them by the Catalonians, aided by Charlemaigne and Ludovico Pio, in 801. It was then governed by counts, who were independent sovereigns, till the end of the 12th century, when it was ceded, by marriage, to the crown of Aragon. Barcelona is distinguished in the history of the middle ages for the zeal, skill, and success with which her citizens prosecuted commercial undertakings. She singly rivalled the maritime towns of Italy in the commerce of the Levant, and was one of the first to establish consuls and factories in distant countries, for the protection and security of trade. She would seem also to be entitled to the honour of having compiled and promulgated the famous code of maritime law, known by the name of the *Consolato del Mare*; and the earliest authentic notices of the practice of marine insurance, and of the negotiation of bills of exchange, are to be found in her annals. She has been more celebrated as a commercial than as a manufacturing town; though in this, also, her progress has been very respectable.

Barcelona has sustained seven regular sieges since its recovery from the Arabs. During the greater part of the war of the succession, it adhered firmly to the party of Charles I; but, after a desperate resistance, it was taken, in 1714, by the forces of Philip V., commanded by the Duc de Berwick. The French got possession of it in 1808, and kept it all through the Peninsular war, in 1831 it was attacked by the yellow fever, which is said to have carried off a fifth part of the population. Thirteen councils have been held here, and above 24 assemblies of the Cortes, since the last, in 1706. It has had, also, many visits from the Spanish monarchs, as they were obliged by the laws of Catalonia to appear here in person to be crowned and take the oaths as sovereigns of this principality and of Aragon; which ceremony was observed down to the time of Philip V. (*Mitana*, *Diccionario Geograph.*, ii. 390—396., and *Suppl.*, art. *Barcelona*; *Inglis*, *Spain* in 1820, ii. 364—391.; *Townsend*, i. 114—138.; *Dict. of Com.* p. 119.)

BARCELONA (NEW), a town of Colombia, cap. prov., on the left bank of the Neveri, about 8 m. from the sea, and 40 m. S.W. Cumana; lat. 10° 6' 39" N. long. 64° 47' W. Its pop., in 1807, was 15,000, half of whom were whites; and at the beginning of the present century, it had a considerable trade with the W. India islands. It is still a place of some commerce, being well situated for the exportation of the cattle and other produce of the *llanos* to the W. India islands. Speaking generally, it is badly built; the houses being of mud, and ill furnished. The streets are unpaved, which makes them filthy during the rains, while in dry weather the dust is intolerable. It is said to be one of the most unhealthy places in S. America. It was founded in

1634; previously to which, the cap. of the distr. was Cumanaquito, 2 leagues higher up the river. (*Mod. Trav.* xxvii. 102—104.)

BARCELONETTA, a suburb of Barcelona, on the S.E. side of the river, often considered as a separate town. It was built in 1764, on a uniform plan; the houses are all of red brick. Pop. 5,000. (*Mitana*, i. 392.)

BARCELONETTE, a town of France, dep. Basses Alpes, cap. arrond., on the Ubaye, 30 m. N.E. Digne. Pop. 2,104. It is beautifully situated in a fine valley at the foot of the Alps, above 2,800 feet above the level of the sea. It consists principally of two main streets, which intersect each other at right angles; the houses are neat and good; and, altogether, this is perhaps the handsomest town of the French Alps. It has a court of original jurisdiction, a college, a primary normal school, and an agricultural society. Above 200 silk-loomers have recently been established here, and it has also some manufactures of cloth, and fulling mills.

Barcelonette is believed to occupy the site of a Roman town. Being on the frontier of two states frequently at war, it has been repeatedly taken and retaken; but was definitively ceded to France by the treaty of Utrecht. It was the native place of Manuel, the liberal deputy, to whose memory a monument has been constructed in the principal square. It consists of a fountain, surmounted by a funeral urn, and having on one of its sides a bust of Manuel, with the inscription, taken from Beranger, "*Bras, tete et coeur, tout était peuple en lui.*" (*Hugo*, *France Pittoresque*, art. *Basses Alpes*.)

BARCELOS, a town of Portugal, prov. Minho, on the Cavedo, 10 m. N. Oporto. Pop. 3,892. It is surrounded by walls flanked with towers and broad and straight, houses well built: it has a fine bridge over the river, a grammar-school, an hospital, and a workhouse. It is very ancient.

BARDSEY, a small island of N. Wales, in the Irish Sea, near the N. point of Cardigan Bay, co. Caernarvon; lat. 52° 45' N., long. 4° 46' W. Pop., in 1831, 84. Length about 2 m.; breadth 1 m. It contains 370 acres, of which is a mountain ridge, feeding a few sheep and rabbits; the rest a tolerably fertile clay soil, growing good wheat and barley. Its rental does not exceed 1000. a year, in three distinct holdings. It is accessible only on the S.E. side, where there is a small well-sheltered harbour for vessels of 30 or 40 tons. On the N. and N.E. it is sheltered by the promontory of Brach-y-Pwll, 24 m. distant. In the channel between them is a very rapid current, rendering it unsafe, except to experienced hands. The perpendicular and projecting cliffs are a great resort of puffins and other migratory birds in the breeding season, and their eggs form a considerable trade, being gathered by men suspended from the summits of the promontory. There is a lighthouse on the island (and with fixed and revolving lights), established in 1821, under the Trinity House, having the lantern elevated 141 ft. above the sea. It is said to owe its present name to its forming a refuge for the last Welsh bards. It had an ancient and celebrated abbey, the annual revenue of which, at the general suppression, was 46*l.* 1*s.* 4*d.* The site is traceable only from numerous walled graves, and a building called the Abbot's Lodge. In a ruined antique oratory, with an insulated stone altar at the E. end, the church service is read on Sundays by one of the inhabs. to the rest, when the weather does not permit them to resort to the parish church of Aberdaron, on the promontory.

BAREILY, an ind. distr. of Hindostan, prov. Delhi, mostly between 28° and 29° N. lat.; having N. the distr. of Pilibheet, E. and S.E. Shahjehanpore, and W. and S.W. Salawan and Moradabad: area 6,900 sq. m.; surface generally level and well cultivated: the Ganges bounds it W., and the Ranguna and many small streams intersect it. In summer the heat is intense, but during winter, with N. winds, the thermometer falls below 36° Fahr., and water freezes in the tanks. A few years ago there were said to be 4,458,360 kucha bags of land in cultivation, assessed with a land-tax of 2,566,280 rupees, or a little more than 8 annas per bega; most of which is realised, though the gov. not resorting to sales of land for arrears of taxation, as in the lower provinces it has always been difficult to collect, and much depends upon the decision and judgment of the collector: 3,263,022 begas are fit for culture, but not in actual tillage; and 3,658,899 begas are reported as waste. To the N. there is much jungle, and between Bareilly city and Amroha extensive wastes prevail, consisting of lands which were formerly cultivated, but are now covered with long grass which parches and infames in summer, and swarms with foxes, jackals, hogs, and game. Bishop Heber says, that the soil and climate generally are very fine; in most parts date-palms and plantains are common, as well as walnut, apple, and pear-trees, vines, &c. This distr. is noted for a fine species of rice, called *basmatti* (pregnant with perfume), superior to the best of Patna. Husbandry, in general, is superior to that of Oude, and the articles produced of a better quality: the sugar, rice, and cotton, are

the highest priced in India. The roads and bridges are better than in most parts of the British provinces; and the cart commonly in use is a larger and more convenient vehicle than that of Bengal. Formerly a great deal of salt, called *kurrah salt*, was made collaterally with nitre, in this distr., and exported in large quantities. The imports from the lower prov. are chiefly chintzes, gudjoes, salt, coarse sugar, and cutlery, cottons, cheap trinkets, coral, beads, and slave-girls; articles from the hill region, and even from Tibet, were formerly imported thither on the backs of goats. The inhab. are pretty equally divided into Hindoos and Mohammedans: the tribe of Banjarees (carriers and bullock drivers), estimated at 14,000, have been all converted from the former to the latter faith. Not long since Bareilly distr. was overrun by clans of Mohammedan warriors, or rather banditti, ready to join any leader who chose to hire them, and many thousands of whom served under Holcar, Jeewant Row, &c.; they were disaffected to the British gov., and for many years disturbed the country by robberies and other crimes; they have at length mostly either dispersed or settled down into more quiet lives; but Bareilly is still a distr. from which judicial appeals to the supreme courts are very frequent. In 1827 there were 108 Persian and 105 Hindoo schools in this distr., entirely supported by the pupils. Hindoos and Mussulmans have no scruples as to mixing together in these establishments: reading, writing, arithmetic, and Persian, constitute the principal branches of tuition. The original Sanscrit name of this territory was Kuttair, till incorporated with Rohildand; with which it was ceded, in 1774, to the nabob of Oude: since 1801 it has been under the British presid. of Bengal. (*Hamilton's E. I. Gazetteer*, pp. 137, 138.; *Reports on the affairs of the E. I. Comp.*, 1830-32.)

BAREILY, a city of Hindostan, cap. of the above distr., seat of a court of circuit and appeal, head of a judicial division, and one of the 6 chief provincial cities in the Bengal presidency; on the banks of the united Joach and Sunkrah, lat. $26^{\circ} 22' N.$, long. $79^{\circ} 16' E.$, 42 m. N.W. of the Ganges, and 700 m. N.W. Calcutta. Pop. (1824) 66,000. The principal street is nearly 2 m. long, and tolerably well built, but the houses are only one story high. There are several mosques, and an old fort, crumbling to ruin: the British civil station and cantonments, consisting of a quadrangular citadel, surrounded by a ditch, stand S. of the town. The chief manufactures are brzen water-pots, decorated with varnish and a remarkable imitation of gilding; other household articles; with saddlery, cutlery, carpets, embroidery, hookahs, &c. There are 131 Persian and Hindoo schools in Bareilly, 300 minarets, attended by about 3,000 pupils, and an established English college with 60 students; 11 persons teach Arabic, and 3 others medicine, and in the vicinity there are 9 Hindoo, and 13 Persian schools. In 1816 an alarming insurrection broke out in this city, occasioned by an attempt to impose a police tax, which was not quelled without much difficulty and bloodshed. The lands in the vicinity are but 8 feet above the waters of the Ramganga, and are annually inundated.

BARENTON, a town of France, dep. La Manche, cap. cant., 7 m. S. E. Morlaix. Pop. 3,047.

BARFLEUR, a sea-port town of France, dep. La Manche, 16 m. E. Cherbourg. Pop. 1,185. Its harbour, which was once considerable, is now choked up with sand.

BARGA, a town of Tuscany, cap. vicariat, near the Serchio, 16 m. N. Lucca. Pop. 1,800. There are fine Jasper quarries in its environs.

BARGA, a town of the Sardinian States, div. Coni, 28 m. S.S.W. Turin. Pop. 3,700. It is situated at the foot of the Alps, near the left bank of the Grandon. It has a manufactory of arms, and a pretty active commerce. There are established schools in the vicinity.

BARGEMONT, a town of France, dep. ar. 7 m. N.N.E. Draguignan. Pop. 1,944. It stands on a hill covered with vines and olives, and sheltered by mountains. Moreri, the original author of the famous historical and biographical dictionary (*Le Grand Dictionnaire Historique*), was born here in 1643. At his death the dictionary was completed in 1 vol.; whereas, in consequence of successive enlargements, the last and best edition, in 1769, is in 10 vols. folio. Moreri can, therefore, be looked upon merely as the projector of the existing work.

BARI (an. *Barramus*), a sea-port and city of Naples, cap. prov. Terra di Bari, on the Adriatic, 50 m. N.W. Tarentum; lat. $41^{\circ} 7' 52'' N.$, long. $16^{\circ} 53' 2'' E.$ Pop. 19,000. It occupies a tongue of land of a triangular form, and is defended by double walls and a citadel. The views from the rampart above the harbour are extremely fine. Streets narrow, crooked, and filthy; houses mostly mean; water brackish and bad. Principal public buildings;—cathedral, with a steeple 363 feet high; the old priory of St. Nicholas, founded in 1067, restored to 40 thousands of pilgrims; the college, founded in 1817 for the education of nobles; the Lyceum, the new theatre, and the vast building of the

diocesan seminary, which admits 120 scholars from 4 provinces, who are fed, lodged, clothed, and instructed for 8 ducaats a month each. It is the seat of an archbishopric, and of a civil and criminal court. Besides the cathedral, it has several parish churches, and convents for both sexes, an orphan asylum, 2 hospitals, and a large arsenal, including within it corn magazines and a *mont de piété*. It has fabrics of cotton, cloth, silk, hats, soap, glass, &c. The *acqua stomachica*, a liquor made of herbs and spices, and used all over Naples as *chasse caffè*, is prepared here in great perfection. The port, which is encumbered with sand, only admits small vessels; but in the roads there is good anchorage in from 16 to 18 fathoms. Nearer the shore, in from 10 to 12 fathoms, the ground is foul and rocky.

This is a very ancient city. It is referred to by Horace, *Barr' mœnia piscos* (Sat. 1. 8.). In more modern times it fell successively into the possession of the Saracens and Normans. It has been three times nearly destroyed, and as often rebuilt on the same place. (*Swinburne's Two Sicilies*, i. p. 191. 4to.; *Craven's Naples*, p. 169.; *Diction. Géographique*, &c.)

BARILE, a town of Naples, prov. Basilicata, 4 m. S.S.E. Melfi. Pop. 3,000. It stands on an agreeable hill, and has 3 churches. It was founded by a Greek colony of the Lower Empire.

BARJAC, a town of France, dep. Gard, cap. cant., 19 m. E. Alais. Pop. 2,186.

BARJOLIS, a town of France, dep. Var, cap. cant., 12 m. N.W. St. Raphaël. Pop. 3,470. It has a flature of silk, with fabrics of paper and earthenware, distilleries, and tanneries. The subterranean chapel of the *cité-dévent* convent of the barefooted Carmelites has some very curious stalactites.

BARKING, a town and par. of England, co. Essex, hund. Beacontia, on the Roding, 8 m. E. London. Pop. of the town, in 1821, 2,580; in 1831, 3,404; houses at the latter date, 632. Pop. of the entire par. in 1831, 8,036; houses, 1,587. The town is situated at the head of Barking Creek (see the Roding, below the town, is usually called when it widens and rises to the side of the Thames, 3 m. above its influx into that river. The Roding contracts much immediately above the town, but has been made navigable for small craft to Ilford. The church was formerly attached to the celebrated abbey, and has many curious monuments. The living is a vicarage, with two chapels (one at Ilford, the other at Epping Forest) annexed: it is in the patronage of All Souls' Coll., Oxford. There is a free school and market-house; a court is held by the lord of the manor every third week, where causes of trespass, and of debts under 40s., are tried. The inhabitants are chiefly farmers, or engaged as hawsmen, and market-carriers to London, &c. The parish contains 10,170 acres, about 1,500 of which are occupied by the forest of Hainault, where is the famous Fripp Oak, round which an annual fair is held on the first Friday in July. Another portion, called the Level, is so low that high tides are only kept out by an embankment; and it has been subject, in former times, to frequent inundations. The last serious one occurred in 1707, when 1,000 acres of rich land were lost, and a sandbank formed at the broad end of the long, stretching half across the river. After an unsuccessful attempt by the proprietors, parliament took it up, as a national concern, and a fresh embankment was made, which cost 40,000*l*. This has been since kept in repair under commissioners appointed for the purpose. The bank is from 8 to 14 ft. high, and has a pathway on its summit. Great quantities of vegetables are supplied, from this parish, to the London markets. Under the Poor Law Amendment Act, the whole parish is placed in the Romford union, and has eight guardians; its average rates are 4,817.

The abbey was one of the richest, and most ancient in the kingdom. It was founded about 670, for nuns of the Benedictine order, and several of its abbesses were canonised. In 870 it was destroyed by the Danes, and in the 10th century rebuilt and restored to its former splendour by Edgar. Subsequent to the Conquest, its government was frequently assumed by the English queens. Its abbess was one of the four who held baronial rank, and lived in great state. At the general suppression, its annual rev. was, according to Speed, 1,084*l*. 6*s*. 2*d*.; according to Dugdale, 862*l*. 12*s*. 3*d*.. The abbess and 20 nuns were pensioned off. There is scarcely a trace left of the building.

BAR-LE-DUC, or **BAR-SUR-ORNAIN**, a town of France, cap. dep. Meuse, on the Ornaïn, 128 m. E. Paris. Pop. 13,383. It stands partly on the summit and declivity, and partly at the foot, of a hill. Its castle, of which only the ruins now remain, was burnt down in 1649, and its fortifications were dismantled in 1670. The lower town, traversed by the Ornaïn, over which there are three stone bridges, is the best built, and is the seat of manufactures and trade. Among the public buildings are the hotel of the prefect, the town-house, college, and theatre. In one of the churches is the celebrated monument of René de Chalons, Prince of Orange, by Richier.

pupil of Michael Angelo. Besides the college, the town has a nunnery, a normal school, a society of agriculture and of arts, and a public library; it is also the seat of tribunals of original jurisdiction and commerce, and of a council of *prud'hommes*. The establishments for spinning cotton produced, in 1834, 500,000 kilograms yarn; and there are fabrics of cotton stuffs, handkerchiefs, hosiery, hats, and jewellery, with tanneries, works for dyeing Turkey-red, &c. The Ornaïa being navigable from the town, it has a considerable trade in forwarding timber, wine, and other articles, for the supply of Paris. Its *confitures de groseille* are highly esteemed. (*Hugo, art. Meuse &c.*)

BARLETTA, a sea-port town of Naples, prov. Terra di Bari, on the Adriatic, 34 m. N.W. Bari; lat. $41^{\circ} 19' 26''$ N., long. $16^{\circ} 18' 10''$ E. Pop. 18,000. It is encompassed by walls, and defended by a citadel; streets wide and well paved, but slippery; houses large and lofty, built with hewn stone, which, from age, has acquired a polish little inferior to that of marble. Principal public building—the cathedral, a Gothic structure, remarkable for its high steeple, elegant exterior, and the antique granite columns in its interior; there are also several other churches and convents for both sexes; an orphan asylum; a college, founded by Ferdinand IV.; and a handsome theatre. Near the church of St. Stephen, in one of the principal streets, is a colossal bronze statue, 17 ft. 3 in. high, representing, as is supposed, the Emperor Heraclius. Barletta is the residence of a sub-intendant, a *juge d'instruction*, and an inspector-general of the adjoining salt-works. A magnificent gateway communicates from the town to the harbour. This is formed by a mole running out from the shore with a breakwater lying before it. On the latter is a low light-house. The harbour only admits small vessels; but there is good anchorage in the roads, with off-shore winds, at from 1 to 3 m. N. by W. of the light-house, in from 8 to 13 fathoms, not muddy bottom. It carries on a considerable trade with other ports of the Adriatic, and the Ionian Islands. Principal exports—wine, oil, salt, corn, wool, lamb and kid skins, almonds, and liquorice. Mr. Keppel Craven says that Barletta appeared to him infinitely superior to most Neapolitan towns. In winter the climate is exceedingly mild; but, during part of the hot months, it is unhealthy. There are very productive salt springs about 7 m. N. from the town, managed on account of government. (*Swinhurne's Two Sicilies*, i. 176., 4to. ed.; *Craven's Naples*, p. 86.; *Purdy's Sailing Directory for the Adriatic*, &c., p. 4. &c.)

BARMEN. See ELBERFELD.

BARMOUTH, or **ABERMAW**, a town and sea-port of N. Wales, co. Merioneth, hund. Ederion, par. Corwen, 55 m. W. Shrewsbury; lat. $52^{\circ} 40'$ N., long. $4^{\circ} 13'$ W. Pop. of par. in 1821, 1,742; in 1831, 1,980. It is situated on the N. side the entrance of the Maw, in Cardigan Bay, where that river opens to an estuary (of about 1 m. in breadth at high water), which forms its harbour. The houses are built in successive ranges up the steep acclivity of a bare rocky mountain, from the base to about the summit, and are sheltered on the N. and E. by other mountains. The whole has a singularly romantic appearance. There is a chapel of the established worship (with 470 sittings, half of them free), built in 1831. The Independents, Calvinists, and Wesleyans, have each a chapel. It ranks high, as a favourite place of resort, among the watering towns of this coast. There is an excellent hotel, with sea-water baths, billiard and assembly-rooms, &c., and numerous respectable lodgings-houses. The entrance to the harbour is partially closed by the small island of Ynys-y-Brawd, or Friar's Island, and by a galled beach on the S. There are shifting sands, called the N. and S. bars, which make the entrance difficult; and it is accessible only to vessels of any great burden at spring tides. In 1802 it was greatly improved by building a small pier, on which there is a beacon. There are weekly markets on Tuesdays and Fridays, and four fairs, held on Shrove-Monday, Whit-Monday, Oct. 7th, Nov. 21st. Shipbuilding and tanning are carried on to some extent in the port. Previously to the last French war, it traded with Ireland and the Mediterranean, but the coasting trade is now the only one. It exports timber, bark, copper, lead, and manganese ores, and slates; and imports corn and flour, coals, limestone, hides, and groceries. The river is navigable for barges of 20 tons to within 2 m. of Dolgelly. There is a large turbary in the vicinity, through which a walled canal is formed, and by it and the Maw fuel is conveyed to both towns. Barmouth is a creek of the port of Aberystwith: *Abermaw* is the Welsh name, indicative of its locality: the English one was adopted at a meeting of masters of vessels, in 1768. From the harbour to where the *Astro* joins the sea, there is a smooth sandy beach, the view from which is magnificent. On the W. are the opposite shores of Caernarvon; on the N. high mountains protrude into the sea; above which, in the distance, Snowdon may be seen in clear weather. The line of road to Dolgelly, 10 m. E. of Barmouth,

comprises, perhaps, the most magnificent scenery in Wales.

BARNARD CASTLE, a market-to. of England, co. Durham, on the Tees, 227 m. N.N.W. London, and 25 m. S.W. Durham. Pop. in 1821, 2,581; 1831, 4,430. It derives its name from its founder, Barnard, an ancestor of John Balliol, and a native of the place, who erected a strong castle, which afterwards became the property of Rich. III. when Duke of Gloucester, in right of his wife, Anne Neville. During a rebellion in the time of Elizabeth it was taken by the insurgents, after a stubborn defence. The town, situated on a steep acclivity over the Tees, consists principally of one street, nearly a mile long, well paved, and supplied with water, and of a very cheerful appearance, from the houses being built of a white freestone. St. Mary's church is an ancient structure, with a square embattled tower. The Wesleyan and Primitive Methodists and the Independents have places of worship. It has, also, a national school, formed and supported by voluntary subscriptions; an hospital for widows, founded by John Balliol; and a mechanics' institute, with a library. A jury, chosen at the court baron, of Darlington manor, which has jurisdiction for debts under 40s., together with the steward of the manor, have the government of the town. It is a station for receiving votes at elections for members for the S. division of the Co. The manufacture of Scotch carriages, which was carried on to a considerable extent, has lately declined; but the manufacture of carpets, hats, and thread, for spinning which there are several mills on the river, is in a thriving state. N. of the town was Marwood, once a considerable town, and giving name to an extensive tract of country, but now to be traced only in the ruins of the church, which is converted into a barn. About 2 m. distant there is a chalybeate spring. The corn market, which is one of the largest in the N. of England, is held on Wednesdays, that for cattle on alternate Wednesdays; fairs on the Wednesdays in Easter and Whit-sun weeks, and on St. Magdalen day. Branches of the National Provincial Bank of England, and of the Yorkshire Banking Co., two private banking houses, and a savings' bank, are established here. (*Surtees' Hist. Durham*; *Hutchinson's Hist. Durham*.)

BARNAUL, a mining town of Siberia, gov. Tobolsk, circ. Tomsk, near the Altai Mountains, lat. $53^{\circ} 20'$ N., long. $83^{\circ} 26'$ E. Pop. 8,000. It is the seat of a board for the administration of the mines, and large quantities of lead and silver ore are smelted here. Considerable quantities of furs are obtained from the latter.

BARNES ('CHIPPING'), a town and town of England, co. Hertford, hund. Cashio, 11 m. N.N.W. London. Pop., 1821, 1,755; 1831, 2,369. It crowns a hill on the line of the great N. road from the metropolis; and, being a considerable thoroughfare, has usually a bustling appearance. The church is ancient, with an embattled tower. There is also an independent chapel; a free grammar-school, founded by Elizabeth; another free school, founded 1720; and 2 sets of almshouses, each for 6 poor women. A weekly market is held on Monday, and annual fairs April 2, and September 4; the latter a cattle fair. The annual value of real prop. in 1815 was 6,720. It is the central town of a poor law union of 9 parishes; its own rates average 618d. The enclosure of Barnet Common, subsequent to 1821, is the chief cause of the increased pop.

On the 14th April, 1471, the decisive battle took place between Edward IV. and the Earl of Warwick, on Glads-muir Heath, in the vicinity of this town; when the latter, at the head of the Lancastrian forces, was totally defeated and slain. An obelisk was erected in 1740, in commemoration of the event.

BARNESVELD, a town of the Netherlands, prov. Guelderland, 15 m. N.W. Arnhem. Pop. 5,000.

BARNESLEY, a market-to. of England, W. riding co. York, on the Dearne, 145 m. N.W. by N. London, 34 m. S.S.W. York, and 9 m. S. Wakefield. Pop. in 1811, 1821, 1831, 6,014, 8,294, and 10,330. The to. (in Domesday Book called *Bernesley*) is situated on the side of a hill. Streets generally narrow, and houses old, but latterly it has been much improved, and is paved, lighted with gas, and well supplied with water. It has two episcopal places of worship, with a Rom. Cath. and several dissenting chapels. A free grammar-school was founded in 1665; there is also a national school, a subscription library, and a scientific institution. A court baron is held annually, under the Duke of Leeds, lord of the manor; a court leet, for the honour of Pontefract, with jurisdiction to the amount of 5s., every third Saturday; and petty sessions on Wednesday. The meetings are held in the new town-hall. This is one of the places for receiving votes at general elections for the riding. Linen is extensively manufactured, as is also excellent steel wire for needles. There are three foundries, in which steam engines are made, and bleaching and dyeing are carried on. The place is surrounded with coal pits. Markets are held on Wednesday and Saturday. Fairs on the last Wednesday in Feb., 12th May, and 11th Oct. A canal, connecting the Calder and Don, passes by the

town. (*Allen's Hist. of Yorks.*; *Baine's Hist. and Direct. of Yorks.*)

BARNSTABLE, a sea-port town of the U. States, Massachusetts, cap. of same name, on the narrow isthmus bounding Cape Cod Bay to the S., 63 m. S.E. Boston. Pop. 3,374. It has harbours on both sides the isthmus; that on the S. side, called Hyannis Harbour, is protected by a breakwater, formed at the expense of the general government. There are extensive salt marshes in the neighbourhood, whence large quantities of salt are obtained, and the inhabitants are largely engaged in the fishery and coasting trades. In 1827 there belonged to Barnstable 47,019 tons of shipping, of which 27,428 tons were employed in the coasting trade, and about 18,000 in the cod and mackerel fisheries.

BARNSTABLE, a port of entry, bor., and town of England, co. Devon, hund. Braunton, on the E. bank of the Taw, where it is joined by the Yeo, and at the point where it begins to expand into an estuary, 166 m. W. by S. London; lat. $51^{\circ} 12' N.$, long. $4^{\circ} 4' W.$ Pop. in 1821, 5,079; in 1831, 6,840: houses at the latter date, 1,116. The town is situated in a vale, sheltered on the E. by a semicircle of hills, and contains many good open streets, and well-built houses; it is adequately supplied with water, and paved and lighted under a local act. The communication with the opposite side the river is kept up by means of an ancient bridge of 16 arches, which has recently been much improved. Besides the estab. church (a spacious old structure with a spire), the Baptists, Independents, and Methodists, have each a chapel. The guildhall is a handsome modern building, the under part of which is occupied as a market-place. There is a good theatre and billiard and assembly-rooms; a free grammar-school (endowed in 1649), in which 47 boys are educated; two other endowed charity-schools: in the 50 boys and 20 girls are clothed and instructed, in the other 30 girls are taught to read and knit; and a national school (supported by subscription), for 150 children. There are 3 sets of almshouses in the town for aged poor: Paigle's, founded in 1553; Litchdon's, in 1624; and Hornwood's: they provide for about 60 individuals. The N. Devon Infirmary is near Barnstable: it is an extensive establishment, supported by subscription, for the medical relief of the district. The town has a weekly market on Friday; monthly cattle-markets on the same day, which are numerously attended; 2 great markets on the Friday preceding April 21st, and the second Friday in December; and a large annual fair for horses, cattle, and sheep, held on the 19th of Sept. and two following days. In the town are manufactories of serge, inferior broad cloths, and lace, which employ about 800 hands; and in the immediate vicinity 6 or 7 tan-yards, a paper-mill, and an iron-foundry: considerable quantities of earthenware, tiles, and bricks, are also made in the neighbourhood. The quay is only approachable by the smaller classes of vessels; and the only deep water within the bar, for vessels to ride in, is at the Pool of Appledore: this bar, which is at the outer entrance to the estuary of the Taw (7½ m. W. of Barnstable), has, at low water springs, not above 2 ft.; at high water do., 27 ft.; and at high water neaps, about 14 ft.; so that the passage is somewhat dangerous, and should not be attempted, except in cases of necessity, by vessels drawing more than 12 ft. The imports of the town consist chiefly of timber and deals from Canada and the Baltic, coals and culm from Wales and Bristol, and groceries. The exports consist of the manufactured and agricultural produce of the town and district. The amount of customs in 1835 was 13,632. 16s. 8d.; in 1836, 12,005. 18s. 7d. In Jan. 1838 there belonged to the town 37 vessels, of the burden of 2,063 tons. The new borough comprises the whole parish of Barnstable, and portions of that of Pilton, on the N., and Bishop's Tawton, on the S.; it is divided into 2 wards, and governed by a mayor, 6 aldermen, and 18 councillors. Courts of pleas, and sessions, are held quarterly in the guildhall, but neither has much business. The average annual revenue of the corporation, arising from lands, town dues, &c., amounts to 650*l.* In conjunction with other freeholders, they are trustees of a considerable estate, for the support of the bridge. Barnstable has returned 2 mem. to the H. of C. since the 23d of Edward I.: the right of election, previously to the Reform Act, having been in the corporation and common burgesses of the old borough, which was co-extensive with the parish. At present there are within the limits of the new borough 421 houses of the annual value of 10*l.* and upwards. The number of registered electors in 1838 was 813.

Barnstable is of great antiquity, having been a burgh in the reign of Athelstan. It had a castle, built in the reign of William I., at the Domedey river there were 40 burgesses within, and 9 without the borough. It furnished 3 ships against the Spanish armada, and in the latter part of Elizabeth's reign, it is mentioned as a considerable depot for wool, and as trading largely

with France and Spain. It had a monastery of Clunian monks, founded soon after the Conquest, which continued till the general suppression. The present living is a vicarage, in private patronage. Barnstable is the central town of a union, under the Poor Law Amendment Act. The poor-rates levied in the borough in 1836 were 1,901*l.*

BAROACH, or **BRACH** (*Barigasha*), a marit. British distr. of Hindostan, prov. Gujrat, presid. Bombay, chiefly between lat. $21^{\circ} 25'$ and $23^{\circ} 20' N.$, and long. $72^{\circ} 50'$ and $73^{\circ} 23' E.$; having N. Kaira distr., E. Baroda, S. Surat, and W. the Gulph of Cambay: area 1,800 sq. m. Pop. (1828) 229,500. It is one of the best cultivated and most populous tracts in the W. of India; its aspect is, however, rendered rather unpleasant from the absence of trees, and the ill-built villages of unburnt bricks. Cotton is one of its chief products. The people are in a tranquil state, and free from any heavy burdens: the revenue of 1829-30 was 157,060*l.* sterl. Three-fourths of the pop. are Hindoos; the rest Mohammedans. It has formed, since 1803, part of the British dominions.

BAROACH (an. *Barigaza*, *water of wealth*), cap. of the above distr., on the N. bank of the Nerudda, 25 m. from its mouth; lat. $21^{\circ} 40' N.$, long. $73^{\circ} 14' E.$ Pop. (1812) 32,710, but now probably much less, as it has greatly declined. Town poor and mean; streets narrow and dirty, and considered unhealthy. The Nerudda is here 2 m. across, very shallow, and abounds with carp and other fish. Baroach maintains a considerable trade in cotton, grain, and seeds, with Bombay and Surat. Two-thirds of the inhab. are Hindoos. The Brahmins have a hospital for sick and infirm animals, supported by voluntary gifts, taxes on marriages, &c. The vicinity of Baroach is very fertile. It was taken by storm by the British in 1772. (*Hamilton's E. I. Gaz.*, i. 289, 290.)

BARODA, or **BKODERA**, an Inl. distr. of Hindostan, prov. Gujrat, between lat. $21^{\circ} 23'$ and $23^{\circ} 45' N.$, and long. $73^{\circ} 12'$ and $74^{\circ} 8' E.$; belonging to the Gulcwar's dom., but almost wholly enclosed by the British territory, except N.E., where it joins Scindia's dom. Area about 12,000 sq. m. Mr. Forbes observes, "If I were to decide upon the most delightful part of that province (Gujrat), I should without hesitation prefer the pergunnahs of Brodera and Nerlad." It is fertile, generally well cultivated, and, down to 1821, was decidedly one of the most flourishing tracts in India. "The crops in other districts," says Mr. Forbes, "may be equal in variety and abundance, but the number of trees which adorn the roads, the richness of the mango-trees round the villages, the size and verdure of the tamarind trees, clothe the country with uncommon beauty." The sugarcane, tobacco, indigo, corn, oil, pulse, opium, flax, hemp, and cotton are grown; the latter being the staple commodity. Provisions are abundant and cheap; deer, hares, partridges, quails, and water-fowl extremely cheap and plentiful. The fields are divided by high green hedges. The numerous villages look more in the European than the Indian style; and large stacks of hay are piled up every where; a custom which increases a resemblance to European scenery, and is not found in E. India.

More than half the inhab. are Coolies; the wilder tracts are peopled by Bheels: the remainder of the pop. are a race of Rajpoots, Hindoo Banyans, and a few Mohammedans around Baroda city. Agriculture is the prevailing occupation, especially of the Coolies; who, though a turbulent race, ranging themselves under different chiefs, yet, when properly restrained, are not bad tenants. They wear a petticoat, like the Bheels, round the waist, a cotton cloth round the head and shoulders, and a quilted kirtle, or leban, which they wear with a shirt of mail; they are armed with sword, buckler, bow and arrow, and the horsemen with a spear and battle-axe: they often undertake secret nocturnal marauding expeditions. They are but little subject to the laws; and the magistrates are obliged to oppose force to force, by maintaining large bodies of armed men in their employ. The local administration of justice, and the collection of the revenue in Baroda, are in the hands of the *mamulders*, or head farmers, subject to the control of the prince or his ministers. Both person and property are more secure, and the cultivation in a better state, in the adjacent districts, which have been ceded to the British. Of late years the produce of this distr. has greatly diminished, the land lost a third part of its former value, and the revenues been considerably depressed, through the misgovernment and rapacity of the reigning prince, Syajee Row Gulcwar. In 1802 the turbulence of the Arab soldiery, and the involved state of the finances, induced Anund Row to beg the assistance of the British gov. of Bombay. It continued under British protection, and in a comparatively flourishing state, till 1820, when Syajee ascended the throne. (*Reports on the Affairs of the E. I. Comp.*, 6th *Polit. Divis.* part i. 16-19. 32-36, ii. 160, 180, 190, 245, &c.; *Mod. Trav.* x. 124-126, 132, 133.)

BARODA, an Inl. city of Hindostan, cap. of the above distr. and of the Gulcwar dominions, and the seat of a

British resident, with a body of troops; lat. 22° 21' N., long. 73° 23' E.; 45 m. N.N.W. Baroach, and 230 m. Bombay. The pop., in 1818, was estimated at 100,000. It stands in a marshy situation, on the left bank of the Viswamitra river, and is surrounded (says Tieffenthaler, who calls it a handsome city) by a double wall, the inner existing under the Mogul dynasty, the outer built by the Maharattas when they took the city, in 1725. The walls are low, of mud, have round towers at intervals, and several double gates. It is divided into four equal parts, by two spacious streets, which, intersecting it at right angles, meet in the centre in the market-place, which contains a square pavilion, with three arches on each side, and a flat roof, adorned with seats and fountains. This is a Mogul building, and, like some others of that kind, not devoid of beauty; but the Maharatta structures are all very poor. In the reign of Aurungzebe this was a large and wealthy city, and still enjoys a considerable trade. In its vicinity are many gardens and groves, the latter adorned with the remains of Mahomedan mosques and tombs. In the vicinity is a stone bridge, over the Viswamitra, remarkable as being the only one in Gujrat; and some celebrated wells, with handsome flights of steps and balustrades in the environs: the largest of these, Solimau's well, is famed for the purity of its water, though that obtained within the city is said to be unfit for use. (*Hamilton's E. I. Gazetteer*, i. 139, 140; *Mod. Trav.* x. 124, 125.)

BARQUESIMETO, an ind. town of Colombia, prov. Venezuela, at the extremity of a table-land enclosed by still higher eminences, 92 m. W.S.W. Valencia, and 90 m. N.E. Truxillo; lat. 9° 55' N., long. 69° 25' W. In 1807 it contained 15,000 persons; but it suffered severely from the terrible earthquake of 1812, which scarcely left a house entire, and buried 1,500 individuals in the ruins. The pop. of the town and its environs is now perhaps 10,000 or 12,000; but we have seen no recent account on which much reliance can be placed. (*Mod. Trav.* xxvii. 249.)

BARRA, an island of Scotland, one of the Hebrides, being the most S. of the Outer Hebrides, or group forming what is called the Long Island. (See HEBRIDES.)

BARRA, a village of Naples, 3 or 4 m. E. from the city of that name. It has many country houses belonging to inhabitants of the metropolis.

BARACKPOOR, a seat of the British gov. gen. of India, and a military cantonment, in a beautiful and healthy spot, on the E. bank of the Hooghly river, 16 1/2 m. N. Calcutta. Bishop Heber observes, "It has what is here unexpected, a park of about 250 acres of fine turf, with spreading scattered trees of a character so European, that if I had not been on an elephant, and had not from time to time seen a great cocoa-tree towering above all the rest, I could have fancied myself on the banks of the Thames instead of the Ganges." The park grounds are four miles in circumference, contain an aviary, menagerie, &c. The cantonment is a large military village, with superior bungalows for the officers.

BARAKMALL, a subdiv. of the prov. of Salem, Hindostan, presid. of Madras. (See SALEM.)

BARBARA, an ind. town of Hindostan, prov. Gujrat, cap. of a small indep. principality, 75 m. E.N.E. Cambay; lat. 22° 44' N., long. 74° E. It stands near the right bank of a tributary of the Maye, and is neatly built, many houses are of brick. Its territory is wild, covered with jungle, and inhabited by only a few wandering and predatory Bheels: the revenues of the rajah are almost entirely derived from compensations from his neighbours to abstain from plundering, together with certain moderate duties on trade.

BARÈGES, a watering-place in France, dép. Hautes Pyrénées, 12 m. S.S.W. Bagnères-de-Bigorre. It is situated in the narrow valley of the Bastan, in the centre of the Pyrenees, about 4,200 ft. above the level of the sea. The valley is gloomy and desolate, being annually devastated by the torrent, or Gave of Bastan, which frequently threatens destruction to the town. This consists of a single street of about 60 houses, mostly temporary fabrics of timber. It is frequented only on account of its hot baths, the most celebrated in Europe for the cure of scrofula, gont, rheumatism, and the effect of wounds. In consequence of this latter property, Barèges is much resorted to by the military, and an hospital is provided for their use capable of accommodating 500 officers and men. The baths did not attain to celebrity till the reign of Louis XIV., when they were visited by Madame de Maintenon and the Duc de Maine. The springs, like those in the other Pyrenean depts., are under the control of government. The supply of water being sometimes insufficient for the demand, it is distributed with the strictest impartiality. The temperature of the water reaches 10° Reaumur: it has a disagreeable smell and taste. The season begins at the end of May, and ends at the beginning of October. The town is then entirely, or all but entirely, deserted; the wooden houses are taken down; and sometimes, indeed, it is buried 15 ft. deep under the snow! Government incurs a considerable

expense in the annual repairs of the roads and baths. (*Hugo, France Pittoresque*, art. *Hautes Pyrénées; Angles's Switzerland*, &c. p. 254.)

BARROW, a river of Ireland, being, next to the Shannon, the most important in that island. It rises in the Sbleebhonn mountains, barony of Tinnemich, Queen's co.; its course is first N.E. to Portlannington, then E. to Monasteraven, and thence nearly due S., past Athy, Carlow, Graig, and New-Ross; about 8 m. below which it falls into the estuary of Waterford harbour, of which it forms the right arm. Considering its moderate magnitude, the Barrow is navigable to a great distance; large ships ascending it as far as New-Ross, which is its port, and barges as far as Athy (above 60 m. in a direct line from the sea), where it is joined by a branch from the Grand Canal. This length of navigation has been partly affected by artificial means, that is, by removing obstructions and deepening the bed of the river; and notwithstanding it is occasionally liable to impediment, it has been of singular advantage to Kildare, Queen's co., Carlow, and Kilkenny, by giving them access not only to the important markets of New-Ross and Waterford, but also to those of Dublin.

BARROW'S STRAITS, in N.W. America, the Sir JAMES LANCASTER'S SOUND of Baffin, is the connecting channel between Baffin's Bay, on the E., and the Polar Sea, on the W. It lies, in a direction parallel to the equator, between the lat. of 73° 45' and 74° 40' N., and is about three or four miles in breadth at Wellington Channel, in long. 91° 47' W., the mouth, in Baffin's Bay being nearly on the 80th meridian. It is therefore about 900 m. in length from E. to W., and between 60 and 70 m. in average width. Both shores are broken by a great number of inlets, and that of the Prince Regent, on the S., is of very considerable extent. It was found by Ross to terminate in a great gulph, called by him Boothia. Wellington Channel is even wider at its mouth than Prince Regent's Inlet. It divides a large tract of land (North Devon), the W. continuation of Greenland, from Cornwallis Island, the first of a succession of islands terminating at Melville Island. The coasts are generally rugged, consisting of high mountains and sometimes table-lands, with bold bluff headlands, but in all cases extremely sterile. The stratification is horizontal: the composition generally limestone, but mixed with older formations, as claystone, hornblende, granite, &c. The water of this strait is exceedingly deep, the soundings frequently giving upwards of 300 fathoms, and very often no bottom can be found. The tide upon the shore rises about three or four feet, but of current there is very little appearance in any direction, and what there is does not seem to be uniform in its set. Perhaps the most remarkable circumstance connected with this strait is the sluggishness of the compass in its waters. This is so great, that after advancing a short distance W., no alteration of course produces a change of more than three or four points in the direction of the needle; a fact the observation of which led first to the conclusion that the magnetic pole would be found in its neighbourhood. Whales and other natives of the northern seas are very abundant; but in this respect, as also in general productions, the strait does not differ from Baffin's Bay, which see. (*Parry's First Voy.* 29—52. 264—269; *Befin-jin; Purchas's Pilgrimage*, iii. 847.)

BARSAÇ, a village of France, dép. Gironde, on the Garonne, 21 m. S.E. Bordeaux. Pop. 2,846. It is famous for its white wines: they are of the same class, and sell for about the same price, as those of Sauternes. "Ils en diffèrent," says Julien, "par une peu moins de finesse, de séve, et de bouquet; mais ils sont plus spiritueux." (*Topographie des Vignobles*, p. 214.)

BAR-SUR-AUBE, a town of France, dép. Aube, cap. arrond., on the right bank of the Aube, 28 m. S.E. Troyes. Pop. 3,940. It is agreeably situated at the foot of a mountain, in a fine valley; but is generally ill laid out and ill built. It was formerly much more considerable than at present, as is evinced by the numerous remains of thick walls, and fosses not yet entirely filled up. There is a fine promenade along the river. It has a tribunal of original jurisdiction; manufactures of cotton, cotton hosiery, and serges; with nail-works, tanneries, distilleries, &c. The vineyards in its neighbourhood produce white and red wine, in considerable estimation. An obstinate conflict took place here on the 24th May, 1814, between the French, under Mortier, and the allied forces under Prince Schwartzberg, when the latter were repulsed. (*Hugo*, art. *Aube*.)

BAR-SUR-SEINE, a town of France, dép. Aube, cap. arrond., on the Seine, 19 m. S.E. Troyes. Pop. 2,380. It is situated in the middle of rich vineyards, at the extremity of a narrow valley; it is well built and well laid out; and has some fine promenades on the banks of the Seine, which is here crossed by a handsome stone bridge. It has a court of original jurisdiction; and has fabrics of paper, cotton, hosiery, cutlery; with tanneries, &c. Its principal trade consists in the corn and wine of the neighbourhood.

This town was formerly fortified, and was, in consequence, repeatedly taken and retaken in the Burgundian wars. In 1596 the inhabitants destroyed the fortifications, and it has since enjoyed comparative tranquillity. (*Hugo, art. Aube.*)

BARTEN, a town of the Prussian states, prov. E. Prussia, 10 m. N. Rastenburg. Pop. 1,500. It is well built, and is defended by a fort.

BARTENSTEIN, a town of the Prussian states, prov. E. Prussia, on the Alle, 34 m. S.E. Königsberg. Pop. 3,700. It is the seat of a court of justice and of domains, and of an ecclesiastical inspection; has 3 churches, a college, an hospital, tanneries, and fabrics of cloth, linen, and pottery.

BARTFA, or **BARTFELD**, a free town of Hungary, co. Sarosch, on the Tisza, at the foot of the Carpathian mountains; 15 m. N.N.E. Zelen; lat. 49° 10' 10" N., long. 21° 18' 51" E. Pop. 6,500. It is well built, has several Catholic churches, and the Lutherans have a church and a school. It formerly enjoyed considerable distinction as a seat of learning; and in the 18th century several esteemed works proceeded from its presses. It has a valuable collection of old records, and is the residence of several noble families. It has some trade in wine, linen, and woollen yarn. In its vicinity are two chalybeate springs much resorted to, and the waters of which are carried to other parts, like those of Seltz.

BARTH, a sea-port town of the Prussian states, prov. Pomerania, reg. Stralsund, on the Binnen-Zee, which communicates with the Baltic, 17 m. W.N.W. Stralsund. Pop. 4,000. It has a chapter for ladies, founded in 1733, and 3 hospitals. It carries on some trade in corn, wool, &c., and in ship-building.

BARTHELEMY DE GRONIN (ST.), a village of France, dép. Isère, 15 m. S. S.W. Grenoble. Near this is the "*burning fountain*," one of the 7 wonders of the *ci-devant* Dauphiné, where a spring issuing from a calcareous plateau, about 8 ft. long by 4 in breadth. The water, though at the temperature of the atmosphere, is always bubbling and boiling; and when it is stirred, or a burning body is approached to it, it takes fire, as it sometimes does spontaneously after summer rains. This phenomenon is supposed to be produced by the escape of hydrogen gas, generated by the decomposition of iron. The gas is easily collected, and is at first very inflammable, but speedily loses this quality. There are no volcanic phenomena in the vicinity. Of late years spontaneous combustions are said to be rarer than formerly. (*Diet. Géographique, Hugo, art. Isère, &c.*)

BARTHOLOMEW (ST.), one of the lesser N. Caribbee islands, belonging to Sweden, 30 m. N. St. Christophers; lat. 17° 55' 35" N., long. 62° 50' W. It is of an oblong shape, its greatest length being from E. to W., and contains about 30 sq. m. Pop. from 8,000 to 9,000, of whom two thirds are blacks. It is abundantly fertile, producing sugar, tobacco, cotton, and indigo; but it has no springs nor fresh water of any sort, except such as is supplied by the rain. Being surrounded by rocks and shoals, it is difficult of access; but its harbour, *i.e.* Carénage, on the W. side of the island, is safe and commodious. Contiguous to the harbour is the principal town, Gustavia. This island was settled by the French in 1664, and was ceded by them to the Swedes in 1784.

BARTIN, a town of Asiatic Turkey, Anatolia, near the mouth of the river of the same name (the anc. *Parthenius*), in the Black Sea; lat. 41° 33' 52" N., long. 28° 14' E. It is surrounded by a ruinous wall, has 12 mosques, 5 khans, and 4 baths. There is deep water in the bay at the river's mouth; but there being no more than 7 ft. water over the bar, small vessels only can come up to the town: these load with timber, fruit, eggs, &c., for Constantinople. The principal import is silk. (*Purdy, p. 221., &c.*)

BARTOLOMEO IN GALDO (ST.), a town of Naples, prov. Capri, 10 m. S.W. Capri. Pop. 4,800. It is situated on an elevated hill to the E. of the Fattore; has a collegiate and some other churches, and a diocesan seminary.

BARTON-ON-HUMBER, a market-town of England, co. Lincoln, N. dir. wap. of Yarborough, on the S. side of the Humber. It includes the parishes of St. Peter and St. Mary; area, 6,710 acres. Pop. 3,233. The main body of the town is about 1 m. from the river, but a portion called "*Barton water-side*," is quite contiguous to it. Formerly it was a place of very considerable importance, and was surrounded by a rampart and fosse; but at present it is principally known by the well-frequented ferry on one of the great N. roads, leading hence across the Humber to Hull. It has some pretty good streets and inns, and two churches, St. Peter's and St. Mary's; the former being very ancient. It has some trade in corn, and a considerable portion of the inhabitants are engaged in the making of bricks and tiles, ropes and sackings. The weekly market is held on Mondays and once for cattle is held once a fortnight.

BARWALDE, a town of the Prussian states, prov. Brandenburg, on a lake, 32 m. N. Frankfurt, on the

Oder. Pop. 2,650. Gustavus Adolphus signed here, in 1631, a secret treaty with France.

BASILLICE, a town of Naples, prov. Sannio, cap. cant., 21 m. S.E. Campobasso. Pop. 2,500. It is situated on the declivity of a mountain, has an hospital, and 2 *grids de pitié*, established to portion and marry poor girls.

BAS-EN-BASSET, a town of France, dép. Haute Loire, cap. cant., on the Loire, 12 m. N. Isengaux. Pop. 5,418. It has manufactures of blond lace, ribands, and earthenware.

BASHEE ISLANDS, a cluster belonging to the E. Archipelago, 5th division (*Craufurd*), lying due N. of Luzon (Philippines), between lat. 20° and 21° N. They are rocky, and five in number, with four smaller islets. Dampier visited them, and called the largest *Grafton Isle*; it is about 13 leagues in circuit, and has good anchorage on the W. side. It produces fine yams, sugar-cane, plantains, and vegetables, besides hogs and goats in plenty. Good water close to the beach is found in abundance. Gold in considerable quantities is washed down by the torrents in the Bashee island, which the inhabitants work into a thick wire, and wear as an ornament: iron is the favourite medium of exchange. The natives are civil, inoffensive, and social. These islands belong to Spain; the governor resides on Grafton land, with about 100 soldiers, some artillery, and a few priests.

BASIL, or **BASILE**, a canton in the N.W. of Switzerland, the 11th in the Confederation, between 47° 28' and 47° 37' N. lat.; having N. France and the g. d. of Baden, W. France and Solothurn, S. the latter canton and Berne, and E. Argovia: shape very irregular; the greatest length is 24 m., and the greatest breadth from 13 to 17 m.: area 8 G., or 169.6 E., sq. m. The Jura chain runs through the country, its surface displaying, of course, mountains and valleys, with a level tract in the vicinity of the city of Basel. The mountains reach an elevation of from 2,000 to 3,000 feet above the level of the sea. The most elevated is the Hauenstein, over which there is a much-frequented excellent new road, leading from Basel to Aarau and Zurich. The Rhine flows through the N. part of the canton, separating a small district from its main body. Near the city of Basel the Rhine, which rises in the canton of Berne, falls into the Rhine: it is not navigable, but teems with fish. Besides this, there are various rivulets descending from the Jura chain to the Rhine. Climate mild. Since 1831, when the country population revolted successfully against the aristocratic rule of the city, the cant. has been divided into Basel city and Basel country. Pop., cant. of Basel city, 24,321; Basel country, 41,103. The territory of the former comprises, besides the city of Basel, that portion of the canton lying on the right bank of the Rhine. The valleys and the plain near the city are well cultivated, and the country produces corn enough for its consumption. There are 32,560 acres of arable land, 16,817 do. meadows, 3,410 do. vineyards, and 15,520 do. of wood. Wine is made of pretty good quality, the best being that of St. Jacob, called *Schweitzcrblut* (Swiss blood). The live stock amounted, in 1829, to 9,540 head of black cattle, 1,814 horses, 6,920 sheep, 6,400 swine, and 1,740 goats. Manufactures form the principal employment of the people. Ribbon making had, so early as the commencement of the 17th century, become an important business in Basel. After the revocation of the edict of Nantes, great numbers of French emigrants settled in the town, who gave a fresh impulse to the manufacture. In 1836 the number of looms amounted to about 4,000; and at present (1838) there are not less than 15,000 persons, principally in the city of Basel, but partly also in other cantons, engaged in this department, on account of the Basel manufacturers. In addition to the riband manufacture, silk thread, taffetas, with satins and cotton ribands, are made on a small scale. Fustians were formerly introduced from France, but now 14 or 15 persons are kept to provide designs for the manufacturers. The value of the exports of ribbons amounts to about 400,000*l.*, nearly half of which goes to the U. States, and the other half to Germany, France, Holland, Denmark, and Sweden. Salt-springs were discovered in 1838 in Basel country, and salt-works either have been, or are to be, established. Each of the two divisions of the canton has half a vote in the Swiss diet; and each has its independent government, consisting in both of a grand council and a petty council, the former with a president, and the latter, in Basel city, with a burgo-master, and in Basel country, with a president, at the head. About 9-10ths of the inhab. are Prot., and 1-10th Catli. Primary and secondary schools have been generally established. Previously to 1832, the only university of Switzerland was in Basel. It was founded in 1459 by Pope Pius II.; but at present it has no great reputation. The budget of Basel city was, for 1836, — income, 19,810*l.* sterl.; expenditure, 20,110*l.* The public debt amounts to 95,070*l.* The canton contributes 22,950 Sw. fr. to the treasury of the confederacy, and furnishes 918 men to the federal

army. The communes are obliged to provide for those poor persons who have the right of citizenship; but, as charitable institutions and private subscriptions commonly suffice for this purpose, a poor-rate is seldom necessary. The inhab. of Basil city are aristocratical, and attached to their ancient laws, customs, and manners; those of Basil country, on the other hand, have democratical tendencies, and instead of being averse from, are prone to, innovations: violent animosities have existed between the two divisions.

The country which forms the canton of Basil belonged, in the times of the Romans, to the territory of the *Rauraci*. In the middle ages it formed part of the Burgundian empire, till 1026, when it came into the possession of the German emperor Conrad II. Basil was subsequently governed by an imperial bailiff; but the bishop of Basil shared with the citizens in the government. By degrees the city acquired the same immunities as a free city of the empire. Basil assisted the Swiss in the Burgundian war, and was admitted a member of the confederacy in 1501. (See *Hilvetick Almanack*; *Lutz's Description of Basil*; and *Dr. Bowring's Report on the Manufactures of Switzerland*.)

BASIL (city of), one of the principal in Switzerland, cap. of the above canton; lat. $47^{\circ} 30' 36''$ N., long. $7^{\circ} 35' E.$; 35 m. N.N.W. Berne; on both sides the Rhine, where its course turns N., near the French frontier, and on the S. side the river is called Great, and that on the N. Little Basil, the communication between them being kept up by a bridge 600 ft. long. Pop. of city only 20,450, of city and cant. 24,321, of whom 20,518 are Protestants. This city presents to the visitor a peculiar mixture of the gaiety of a French, with the sombre Gothic air of a German town: "It looks," says Dr. Beattie, "like a stranger lately arrived in a new colony, who, although he may have copied the dress and manner of those with whom he has come to reside, wears still too much of his old costume to pass for a native, and too little to be received as a stranger." It is surrounded by some unimportant fortifications, and is tolerably well built. The cathedral built 1319, on the spot where the Roman emp. Valentinian originally erected the strong fortress called *Basilia*, contains the tombs of Oecolampadius, Erasmus, and the Empress Anne, consort of Rodolph of Hapsburg. The other public buildings are, the arsenal, the town-house, with some fine stained glass windows, the hall where the Council of Basil was held, &c. There is a university (see preceding article), a gymnasium, and numerous other public schools; a pub. library, with 63,000 printed vols. and many valuable MSS., medals, and paintings by Holbein; a botanic garden; museums of natural hist. and anatomy; literary and philanthropic societies, &c. Basil is the richest town in Switzerland; its inhab. are industrious and well instructed. About 1-5th part of the state revenues are applied to pub. education. Its trade is flourishing; manufactures consist chiefly of ribbons and other silks; those of leather, paper, gloves, and stockings, are comparatively inconsiderable. The taxes are heavy, owing to the considerable public debt: the annual cost of the executive gov. is about 2,000*l*. Basil was a distinguished city throughout the middle ages: near it, in 1444, a few hundred Swiss made a heroic resistance to an army of 40,000 French. It was the birth-place of Holbein, Erasmus, Bernoulli, &c. (See *Le Nouvel Ebel*; *Lutz's Descr. of Basil*; *Bowring's Rep.* pp. 54—56.)

BASILICATA, a prov. of the kingdom of Naples, which see.

BASINGSTOKE, a par., bor., and town of England, co. Hants, div. and hund. Basingstoke, 45 m. W.S.W. London. Area 3,970 acres. Pop. par. in 1821, 3,165; 1831, 3,881. It is a neat, respectable town, in the midst of a fertile, well wooded district, at the junction of five roads, one of which is the great W. line from the metropolis. The line of the London and Southampton Railway also passes close to the N. of the town, and will have a station there; so that it usually wears the appearance of much bustle and activity; it is well paved and lighted, and has had many new houses added to it within the last few years. A stream, called the Town-brook, flows past it to join the Loddon, of which it is a principal branch; a canal, formed in 1796, at an expense of 180,000*l*., extends from the town to the Wey: which river communicates with the Thames, and so completes the water-line betwixt Basingstoke and London. The church is a spacious structure of the reign of Henry VIII. The Friends, Independents, Wesleyans, and followers of Whitfield, have chapels in the town. There is a free grammar-school, in which 12 boys are educated; blue-coat school for the same number, supported by the Skinner's Company, of London; and a national school, for 300 boys and girls: there are also almshouses for 11 poor people, and several charitable benefactions; the principal being an estate left by Sir James Lancaster, the annual proceeds of which amount to 260*l*. a year. Near the town is a tract of 108 acres, on which every householder has a

right of pasture, from May to Christmas. There is a good town-hall, built in 1829; at which period the market-place was enlarged. The weekly market is held on Wednesday, and 4 annual fairs on Easter Tuesday, Whit Wednesday, 23d Sept., and 10th Oct., chiefly for cattle. On the first introduction of the woollen trade into the kingdom, this town obtained a good share of it, and was for a long period noted for druggists and shalloon; but at present there are no manufactures. The malting and corn trades constitute its chief business; and being the centre of a rich agricultural district, its markets are very well attended, and its retail trade considerable. Under the Municipal Reform Act there are 4 aldermen and 12 councillors, and the boundaries of the borough, which were previously co-extensive with the parish, are restricted to the area on which the town stands. It was incorporated by a charter in the 20th James I., confirmed by another in 17 Charles I. Courts of petty and of quarter sessions for the bor. are held, and there is a court of pleas, which has now scarcely any business. The revenues of the corporation are derived from lands and tenements in the parish, and average above 1,000*l*. a year. Under a local assessment for paving, lighting, &c., about 350*l*. are annually collected. The poor-rates of the town, in 1836, were 1,634*l*. 10*s*. It is the central town of a poor law union of 37 parishes, and a polling town for the northern division of Hampshire.

The town is mentioned in Domesday as having a market. From 23 Edward I. to 24 Edward II. it sent 2 mem. to the H. of C., but thenceforth the privilege ceased to be exercised. John de Basingstoke, a distinguished scholar of the 13th century; Sir James Lancaster, the navigator; and Joseph and Thomas Warton, were born in the town. (*Beauties of England and Wales*; *Warner's Coll. for a Hist. of Hampshire*; *Camden's Brit.*)

BASLEVILLE, a town of France, dép. Seine Inférieure, on the Vienne; 10 m. S.S.W. Dieppe. Pop. 2,810. It has fabrics of linen and serge.

BASILAH. See BUSBORA.

BASS, a rocky islet of Scotland, 5 $\frac{1}{2}$ m. of Forth, about 3 m. from Tantallon castle, coast of Haddingtonshire. It is of a circular form, about 300 ft. in diameter, and nearly 400 ft. high. Some parts not less than from 200 to 300 ft. in height, project in lofty terrific precipices over the sea: the summit resembles an obtuse cone. The continual beating of the waves has opened vast excavations all round the lower sides. The sea is of great depth on the N., E., and W., but shallow on the S.; towards which also the rock declines, and is accessible in calm weather. It is perforated by a cavern, running N.W. and S.E.; it is quite dark in the centre, where there is a deep pool of water, whence it widens towards both apertures; that to the S.E. being the highest. There is a spring of water near the centre, high on the rock, and grass for a few sheep kept on it. Various corallines and lucid sea products in the surrounding sea. Vast quantities of solan geese resort to the Bass in March, for the purpose of breeding, and depart in September. There was here formerly a castle, afterwards converted into a state prison, where various individuals have been confined. After the Revolution, a party of the adherents of James VII. having obtained possession of the castle, held out after the rest of the kingdom had surrendered. But their boats being at length seized or lost, and not receiving any supply of provisions, they were compelled to capitulate, when the fortifications were destroyed. This islet is a very conspicuous object, and is visible from a considerable distance.

BASS' STRAITS, the name given to the strait separating New Holland from Van Diemen's Land. It is so called from Mr. Bass, a surgeon, by whom it was explored in 1798, while on a sealing voyage from Port Jackson in an open boat. Where narrowest, it is about 105 m. across, and is much encumbered with islands and coral reefs, so that its navigation requires great attention. The prevailing winds are from the W. The tide rises from 8 to 12 ft., running at from 1½ m. to 2½ m. an hour.

BASSAIN, a marit. town of the Birman empire, cap. of a prov., and resid. of its governor; on the left bank of the Birman river (the right branch of the Irrawadi); lat. $16^{\circ} 49' N.$, long. $94^{\circ} 45' E.$; 100 m. W. Rangoon, and 360 m. S.S.W. Ava. Pop. (1826) 3,000. It is one of the 3 principal ports of the Birman empire.

BASSANO, a town of Austrian Italy, prov. Vicenza, on the left bank of the Brenta, 17 m. N.N.E. Vicenza. m. N. by W. Padua. Pop. 12,000. It is situated in a salubrious hilly country, suitable for the culture of the vine and the olive; is surrounded by walls, and is well built of stone: it is joined to a suburb on the opposite side of the river by a fine bridge, 180 ft. in length. Some of its churches are handsome, and adorned with pictures by Giacomo da Ponté and his son, natives of the town. There are here 4 convents for nuns, an hospital, a *mont de piété*, and barracks. The mineralogical cabinet and

botanical garden of M. Parolipi deserve the traveller's attention. Bassano has manufactures of cloth, straw hats, and copper utensils, with extensive silk flatures, tanneries, &c. But the printing establishment of Remondini is not merely the most important work in the town, but is one of the most extensive establishments of the kind any where to be met with. It employs 60 presses and about 1,000 hands, and has attached to it paper-mills and an engraving department, which has produced Volpato and other distinguished artists. The town carries on an extensive trade in silk, the produce of its territory, cloth, wool, iron, corn, wine, cattle, &c. A great deal of charcoal is shipped here for Venice. There is a great deficiency of spring water, and that of the Brenta is not good.

BASSEE (LA), a town of France, dép. du Nord, cap. cant., 14 m. W. Lille, on the canal of the same name. Pop. 2,485. It has establishments for spinning cotton, combing wool, with soap-works, distilleries, and potteries. Owing to its position, it is the entrepôt of the arrondissements of Bethune and St. Pol, and has, in consequence, a considerable trade. It was formerly fortified; but Louis XIV. having taken it from the Spaniards, made the works be dismantled.

BASSEIN, a marit. town of Hindostan, prov. Aurangabad, distr. N. Concan; separated from Saleette by a narrow channel, and about 20 m. N. Bombay; lat. 19° 20' N., long. 73° 56' E. It was taken possession of by the Portuguese in 1531, who fortified it with ramparts and bastions, and supplied it with no fewer than 7 churches. It was captured by the Maharattas in 1750; and it was here that the peace with the poishwa, which annihilated their federal empire, was signed, Dec. 31st, 1802, since which it has belonged to the British.

BASSE-TERRE, the cap. of St. Christophers, in the W. Indies, which see.

BASSE-TERRE, the cap. of Guadaloupe, in the W. Indies, which see.

BASTIA, a sea-port town of Corsica, cap. arrond., on its E. coast, within 23 m. of its N.E. extremity; lat. 42° 43' N., long. 9° 26' E. Pop. 12,846. This town, which was formerly the cap. of the island, is built amphitheatrically on a rising ground, and has a fine appearance from the sea. But on entering, it is found to be ill-built, and the streets narrow and crooked. It is defended by a citadel, and by walls and bastions; but these are of no use, except for the defence of the port, being commanded by the heights, at the foot of which the town is built. The harbour, formed by a mole, is fit only for small vessels; its entrance is narrow and difficult, and vessels are exposed to the land-winds, which sometimes blow violently from the N.W. There is anchorage outside the mole, in 10 or 11 fathoms. It is the seat of a royal court for the island, and of tribunals of commerce and of primary jurisdiction; and has a communal college, a model school, a society of public instruction, and a theatre. It produces soap, leather, liqueurs, and wax; and exports oil, wine, goat-skins, coral, wood, and hides. It was taken by the English in 1794, but was soon after recovered by the French, of whose possession it has ever since remained. At the entrance to the port is an insulated rock, called *le Leone*, from the striking resemblance it bears to a *lion couchant*. (Dict. Géog.; Hugo, art. *Corse*; Norrie's *Mediterranean*.)

BASTIDE DE CLERENCE (LA), a town of France, dép. Basses Pyrénées, cap. cant., near the N. bank of the Joyeuse, 13 m. E.S.E. Bayonne. Pop. 2,209.

BASTIDE DE SEROU (LA), a town of France, dép. Ariège, cap. cant., 9 m. W.N.W. Foix. Pop. 2,858. Bastide is the name of several other small towns in different parts of France.

BATAVIA, a sea-port and city of Java, cap. of that noble isl.; seat of the gov. of the Dutch possessions in the E., and the principal emporium of the E. Archipelago, on an extensive bay on the N.W. coast of the isl.; lat. 6° 13' S., long. 106° 54' E. The pop., according to a census taken in 1824, consisted of 8,025 Europeans and their descendants, 23,108 natives, 14,708 Chinese, 601 Arabs, and 12,419 slaves; in all 83,861, exclusive of the garrison. As the pop. has increased since, it may now be estimated at from 60,000 to 70,000. Batavia is built in a marshy situation, at the mouth of the Jacatra river; several of its streets being intersected by canals, crossed by numerous bridges, and their banks lined with trees in the Dutch fashion. But these canals, being receptacles for the filth of the city, contributed, together with the nature of the ground, to render it very unhealthy. In this respect, however, it has been materially improved since 1815, partly by building a new town on the heights, a little more inland, where the government functionaries and principal merchants have their residences; and partly by the demolition of useless fortifications, the filling up of some of the canals and the cleaning of others, and the widening of several of the old streets. The older parts of the town are now, in fact, principally occupied by Chinese and natives, and, though intermittent fevers are still said to be prevalent, we doubt whether it be much

more unhealthy than most other places on the island. The existing fortifications consist only of a few small batteries and redoubts in and about the city. The houses, of brick and stuccoed, are spacious and neat; the ground floors in the principal houses are formed of marble flags; the chief street lies along both sides of the river, and consists of the offices and warehouses of the principal merchants, none of whom, as already stated, pass the night in Batavia. The Stadthaus, in which the courts of law are held, is on the S. side of the city; at the opposite quarter is the citadel, a square fortress with a bastion at each angle, containing the residence of the gov. and some warehouses: there are 3 churches, and a theatre. The Jacatra is navigable for 3 m. inland for vessels of 40 tons burden; the harbour, or rather road, which is very extensive, is protected by a range of small islands, and affords good anchorage for ships of from 300 to 500 tons, about 1½ m. from the shore. Batavia is the depôt for the produce of all the Dutch possessions in the E. archipelago; as spices from the Molucca Islands; coffee and pepper from Celebes and Sumatra; gold-dust and diamonds from Borneo; tin from Banca; tortoise-shell, bees' wax, dye-woods, &c. from Timor and Tumbura. Quaintly, no Dutch ship was suffered to proceed homeward without first touching here. Many junks from China and Siam formerly traded thither; but since the establishment of the British at Singapore, their trade with Batavia has greatly decreased. The manufactures, as those of leather, lime, earthenware, sugar, and arrack, are mostly in the hands of the Chinese: their *camping*, or peculiar quarter, is the chief seat of bustle and activity; and the trade of the town, except in the articles monopolised by Europeans, is wholly in their hands. Many of them are wealthy; they are governed by their own laws and magistrates. The British, according to Mr. Earl, form an important body of merchants here, and possess about 2,000 sq. m. of land on the island, much of which is cultivated. The sugar: there are said to be about 200 English subjects in Batavia, including those serving in the Dutch mercantile navy.

Perhaps no colony in the world, not even excepting Cuba, has made so rapid a progress as Java, during the last ten years, in the production of all the great colonial staples, but especially in those of coffee, sugar, and indigo. The trade of Batavia has, in consequence, been very greatly increased; but the recent statements of the imports and exports that we have seen refer to the island generally, and we have no means of specifying exactly how much belongs to Batavia. At an average of the three years ending with 1830, the value of the imports into Batavia amounted to 18,237,500 fl., and that of the exports to 17,694,900 fl. Since then, however, we have little doubt that the trade of the port has been at least doubled. The value of the exports from Java, in 1836, amounted to 42,261,642 fl., or 3,521,603l. (See JAVA.)

A large portion of the trade of Java is in the hands of the Netherlands Trading Company; and the probability seems to be that it would be still greater, were it left wholly to individual competition. We must be cautious, in the absence of specific information, how we censure a system that has been productive of such striking results.

A bank has been established at Batavia, with a capital of 2,000,000 fl., with branches at Samarang and Sourabaya. It seems to be a most advantageous concern, having realised, according to the official statement, a profit of 33½ per cent. during the year ended 31 March, 1834.

Mr. Earl, who is better informed as to the manners and habits than the trade or policy of the Dutch, makes the following statement:—"The mode of life pursued by the European residents at Batavia is rather monotonous, but is easily supported by those who have great pecuniary advantages in view. Early rising is generally practised, the morning being by far the most agreeable part of the day. The time before breakfast is spent in riding or gardening, according to the taste of the individual; and after a substantial meal at 8 o'clock, they repair to their town offices. At the conclusion of the business of the day, they retire to their country houses to a 5 o'clock dinner; and a drive round the suburbs occupies the interval between that repast and the closing of the night; when they either return home, or proceed to spend the evening at the Harmonie, an establishment formed upon the same principle as the large clubs of London: the majority of the European residents, Dutch and foreign, being members. The regulations are particularly favourable to strangers; a resident, who is not a member, cannot be admitted, but a visitor, after being introduced by a member, may resort to it whenever he pleases during his stay at Batavia. The evenings at the Harmonie are spent in conversation, or in playing at cards and billiards, and it is perhaps the more frequented at night, when the gentlemen from their having little intellectual amusement at home. The greater number of the Dutch females have been born on the island, and are rather deficient in point of education. They are often remarkably

fair, owing to their being seldom exposed to the weather; the heat of the climate renders them extremely listless, and they soon attain that embonpoint which we are apt to associate with the idea of Dutch beauty.

"There are few public amusements. On Sunday evenings a military band performs on the Koning's Plain, which attracts the residents, who attend in carriages or on horseback; and the community is occasionally entertained by an amateur play, or a grand ball given by one of the public functionaries. The annual races, which are always well attended, were established and are principally supported by the English. Some very good half-bred Arabs are occasionally run; but the race between the country horses, ridden by native jockeys, is by far the most amusing, and the riders jockey and are out-jockeyed in a style that would not disgrace Newmarket." (*Eastern Seas*.)

Batavia was built by the Dutch, in 1619; in 1811 it was taken by Sir S. Auchmuty, and belonged to the British till 1816, when it was restored to its former possessors.

BATAVIA, a town of the U. States, New York, Genesee co., 40 m. N.E. Buffalo. Pop. in 1836, 4,430. This flourishing village was laid out in 1800. It has a court-house, gaol, and other public buildings; a weekly newspaper, &c.

BATE ISLE, an island belonging to Hindostan, prov. Gujrat, and off its W. extremity; lat. 22° 27' N., long. 69° 19' E. It has a good harbour, and contains about 2,000 houses; but is chiefly noted for a celebrated temple dedicated to the god Runchor, and much frequented by pilgrims.

BATH, a city of England, N. E. part co. Somerset, 102 m. W. by S. London, on the Avon, along which its buildings extend for upwards of 2 m., ascending the acclivities, and crowning some of the summits of the adjoining range of hills. Pop., in 1801, 33,150; in 1831, 50,817. This city is distinguished for its architectural elegance, and the beauty and extent of its public promenades. The fineness of the freestone, of which its edifices are mostly built, and the noble scale and symmetrical arrangement of the ground plans, fully equal the taste displayed in their elevations. Amongst the most prominent places are the Circus, in which the Doric, Ionic, and Corinthian orders are combined, and from whence 3 spacious streets, of corresponding character, diverge; the N. and S. parades, which have noble terraces, raised on arches, and commanding extensive views; Kingston Square, and the new streets and fine esplanade formed along the river side, beneath the terraces last named; Queen Square, of the Corinthian order, with an obelisk in the centre; the Royal Crescent, with Ionic columns springing from a rustic basement, and crowned by a rich entablature; with Lansdown and Cavendish crescents; Belle Vue, Portland, and 2 or 3 other places: Paragon buildings, Belvedere and Marlborough buildings: in the level plain, extending on the N.E. side, are the fine ranges of Kensington, Grosvenor Place, and Walcot Terrace; lastly, the structures in the new town, on the river. The latter, which winds through, and adds greatly to the beauty of the city, is spanned by 2 stone bridges (one of ancient, and one of modern construction), a handsome iron bridge, connecting Bathwick with Walcot, and affording a direct access from the London road to the finest parts of the city; another iron bridge, connecting the North Parade with the Pulteney Road, and three suspension bridges.

The famous thermal springs, on which the prosperity of the place is so dependent, rise in the midst of the limited plain skirted on the E. and S. by the Avon, from three distinct sources, at a small distance from each other. The waters of each are received into four extensive reservoirs, to which, suitable baths are attached: that called the King's Bath is the principal, and is supplied by a spring rising about 150 ft. S.W. of the abbey. The Queen's Bath, which is much smaller, adjoins this, and is supplied from the same source. The Cross Bath is supplied from a distinct spring, rising at a short distance S.W. of the former; and the Hot Bath from another, 120 ft. further on, in the same direction. The grand pump-room,

connected with the King's Bath, a very handsome building, erected in 1797, forms the principal centre of attraction during the fashionable season: It has an orchestra, and a fine statue of Naah. Like the King's, the Hot Bath has a pump-room, on a smaller scale, and each has a public pump connected with its spring, of which the gratuitous use is allowed during the day. Besides the public baths (which are principally used by the hospital patients and the poorer class of invalids), there are private baths, belonging to the corporation, and others, called the Abbey Baths, belonging to Earl Manners: these are chiefly resorted to by the wealthier classes, and are amply provided with auditors, and every accommodation. The medicinal waters of these springs, when fresh drawn, are quite transparent and destitute of colour and smell, the temperatures being—of the King's Bath, 116°; of the Cross Bath, 112°; of the Hot Bath, 117° Fahr. They contain carbonic acid and nitrogen gases, sulphate and murate of soda, sulphate and carbonate of lime, and siliceous earth, with a minute portion of oxide of iron. Respecting both the gross amount and relative quantities of these there is much discrepancy in the numerous treatises on the subject, by which, occasional variation may be inferred: the impregnation, both chalybeate and saline, is greatest in those of the King's and the Hot Bath; the water of the Cross Bath has most earthy contents. Large quantities of gas pass up with the water, in bubbles of considerable size. Taken internally, the waters act as stimulants, raising the pulse considerably, and exciting the nervous system: they are considered peculiarly efficacious in cases of gout and of biliary obstructions; as lithas, they are used for various chronic and cutaneous disorders; their topical application, by forcing a stream on the diseased part (called dry pumping), is also much in request. The morning is the usual time both for drinking and bathing. The reservoirs are discharged, at regular intervals, through channels connected with the Avon.

The principal buildings devoted to religious purposes are,—the abbey church (the latest specimen of the ecclesiastical Gothic in the kingdom), a beautiful structure, once called, from the large size and number of its windows, the lantern of England; it was founded on the site of a more ancient church, A. D. 1495, and was completed in 1608; its tower is 162 ft. in height: St. Michael's Church, a Gothic structure, with a handsome spire, erected in 1836; St. James's Church, re-built in 1768; that of Walcot, a very spacious building, recently much enlarged, with free sittings for the poor; Christ Church, a fine structure, erected by subscription in 1798; with other churches and chapels connected with the established church, and mostly raised within the last century. Catholics, Moravians, Friends, Baptists, Independents, Methodists, and Unitarians, have also places of worship. Of the establishments devoted to charitable purposes, the principal are,—Bath Hospital (completed in 1742), for the reception of sick poor from all parts of the kingdom (except the city itself), who come for the benefit of the waters; it is incorporated by a charter, and supported by donations and subscriptions: the Bath United Hospital, containing the same objects as the previous institution, and those of a casualty infirmary; it is supported like the last: Reliott's Hospital, endowed in the reign of Jas. II., for the same purpose as the Bath Hospital, but for men only; it provides lodging and bathing for about 18: Black Alms, endowed by Edw. VI., for the support of 10 poor persons of the place: St. John's, endowed in Hen. II.'s reign, for the support of six poor men and as many women: Partis's College (a large quadrangular range on the upper road to Bristol), for the support of 30 decayed gentlemen, 10 of whom must be widows of clergymen: each has a house, garden, and handsome annuity. The chief establishments for education and literature are,—a free grammar-school, endowed by Edw. VI.; its mastership (which carries with it the rectory of Charlcombe) is in the gift of the corporation: the Blue Coat charity school, founded A. D. 1711, for clothing, and teaching 50 boys and 50 girls reading, writing, and arithmetic; two other free schools for girls only; one, for the instruction of poor children of Bath and Bath-forum; a national school; the Catholic and the Methodist free schools. The Bath and West of England Society, established in 1777 for the encouragement of agriculture, arts, manufactures, and commerce, has devoted itself chiefly to the first of these objects, and published several volumes of transactions: the Bath Literary and Philosophical Institution, established in 1820; it is a handsome Doric building, (occupying the site of the Lower Assembly Rooms, which were then burnt down,) and comprises a library, museum, laboratory, and lecture-room: the Public Subscription Library, established in 1800, has an extensive collection of books; and there are many circulating libraries. A mechanics' institute was established in 1828. The public buildings appropriated to business or amusement are,—the Guildhall, the seat of the quarter sessions and the courts of record and request; the two

first named by the corporation, the last by commissioners appointed under an act of 45th Geo. III., for recovery of debts under 10*l.*; its jurisdiction extends over the city, and several parishes in the hundreds of Bathford and Wellow: this court, which sits every Wednesday, has nearly absorbed the business of the court of record. The prison is a spacious building in Bathwick, chiefly occupied by debtors, and by delinquents previously to their being fully committed. Commercial rooms were established in 1839. The market-house is an extensive range of buildings behind the Guildhall; market days, Wednesdays and Saturdays. The theatre, in the Grecian style, finished in 1806, towers over the surrounding structures, in the central part of the city; the Freemason's Lodge (built in 1817) is also conspicuous. The Subscription Club House, and the Bath and West of England Subscription Rooms, are establishments similar to the London club houses. The Upper Assembly Rooms are a superb suite of apartments, in which the subscription balls and concerts of the season are held, under the direction of the master of the ceremonies. The city assemblies are occasionally held in the banqueting room of the Guildhall. These concerts and assemblies constitute the chief amusements of the place; besides which, however, there are two spacious riding-schools, for exercise in bad weather: when fine, Lansdown and Claverton Down are the favourite equestrian resorts. There are annual races on the former, the week subsequent to those of Ascot, and a spring meeting in April for half-bred mares. Besides the various promenades, and the Slidley Gardens previously mentioned, 10 acres of the Bath common have, within the last few years, been laid out in public walks and pleasure grounds, named the Royal Victoria Park.

Bath no longer boasts its ancient pre-eminence in the gay world as a fashionable resort. It is now surpassed by Brighton, and, perhaps, also, by Cheltenham, which attracts a large portion of the company by which it used formerly to be visited. In consequence, its increase has lately been comparatively slow, and it has become much more a place of permanent residence than formerly; the facilities for education and the numerous railways which it affords, with its greater cheapness, making it a desirable residence for numerous families whose finances might not bear the greater expenditure of London. It is still, however, much resorted to during its season. It is favourably situated for trade; the Avon being navigable to Bristol on one side, and the Avon and Kennet Canal on the other, enabling it to maintain a water communication with the metropolis, and places intermediate; two branches of this canal extend from Bath into the coal district S.W. of the city. But business and pleasure do not often amalgamate, and the only manufacture is the coarse woollen cloth called Bath coating, and Kersey-mere, made in the immediate neighbourhood. At Twerton, $\frac{1}{2}$ mile from the city, are three clothing and one brass mill, worked by the Avon. There are two fairs, one held on the 14th Feb., the other July 10th, but they have lost most of their ancient consequence, which was mainly attributable to the woollen manufacture, first introduced here, under the auspices of the monks, in the reign of Edw. I., who granted the charters by which the fairs are held; the line of the Great Western railway passes through Bath, and will, of course, greatly increase its facilities of communication. It stands on the lias and oolite formations; in the latter (which bounds it on the N.E. and a portion of the S.) the noble freestone quarries occur whence its building materials are derived; both formations also afford lime and fuller's earth, and abound in fossil remains, as well as in fine springs, which rise to within 40 or 50 feet of the summits of the surrounding hills, and furnish an ample supply of water to every part of the city, conducted thither from various reservoirs, by pipes, the greater part of which have been laid by the corporation. The par. and munic. boundaries of Bath comprise the parishes of St. James, St. Michael, Sts. Peter and Paul, Walcot (the portion S. of Charlcombe), Bathwick, and Lyncombe and Widcombe. Pop., in 1821, 46,700; in 1831, 50,802; of these, at the last census, 591 were employed in manufactures, and 4,368 in retail trades and handicraft. The tendency of the city to increase is, at present, chiefly in Walcot, and in Lyncombe and Widcombe: the former constitutes its most extensive and wealthy portion; the latter is the residence of a large portion of the manufacturing population. Bath claims to be a borough by prescription, confirmed by charter: it is now divided into 7 wards, and governed by a mayor, 14 aldermen, and 42 councillors, under the Municipal Reform Act. It has sent 2 members to the H. of Com. since the reign of Edward I. It was supposed, in 1831, to have 7,300 qualifying tenements, or tenements worth 10*l.* a year and upwards; but owing to a large proportion of these being let as furnished lodgings, it had, in 1833, only 3,036 registered electors. Previously to the Reform Act, the elective franchise was exclusively vested in the mayor, aldermen, and common council, who were also self-elected. Conjointly with Wells, Bath gives name to a diocese, co-extensive (excluding Bedminster)

with the co. of Somerset. The see was fixed at the latter A. D. 905, and has since been transferred, successively, to Bath and to Glastonbury, and again restored to Wells, whose dean and chapter now elect the bishop. (*Gibson's ed. Camden's Brit.* pp. 186, 187; & 6 & 7 W. 4. c. 77.) The bishop's revenues amounted, at an average of the three years ending with 1831, to 5,546*l.* a year.

The present city may almost be called a creation of the last and present centuries; for previously it was comprised in an area of about 80 acres (on the limited plain amidst which the hot springs rise), and surrounded by walls in the form of an irregular pentagon, its suburbs consisting then merely of a few detached cottages; so that the parishes now forming its most important and populous portions had, at the close of the 17th century, scarcely an inhabitant; whilst the three small ones within the walls (judging from the church registers) could not have contained a fourth part of their present numbers. Its rapid extension, celebrity, and magnificence, are chiefly attributable to the exertions of two individuals: one, the remarkably adroit and clever person known as *Jacov Nash*; the other, Mr. Wood the architect. The former was elected master of the ceremonies in 1710, and thereafter ruled as *artifex elegantiarum* for upwards of 50 years (the most flourishing period of its fashionable annals); using the influence his peculiar talents gave him in the promotion of objects of permanent importance to the city. The other commenced his architectural labours with Queen's Square, the foundations of which were laid in 1729. This, and the streets diverging from it, as well as the N. and S. parades, he lived to finish, and also to plan and commence the Circus. All these remain as monuments of his genius, unexcelled by any subsequent achievements.

Bath was founded, and its first walls built, by the Romans, in the reign of Claudius: they named it *Aqua Solis*, and retained the place between 3 and 4 centuries. The walls and gates (which remained till the 18th century) were built during the later Saxon period, on the Roman foundations, and partly from the ruins of their temples, arches, &c. Camden gives many inscriptions from fragments thus imbedded (*Brit.* pp. 188, 189, &c.) and in Warner's *History of Bath* (pp. 23, 29, 32), the remains of Roman temples, baths, colonnades, &c., that have been discovered at various times many feet beneath the present surface, are figured and described. Hand-mills of stone, &c., relics of the British; and coffins, coins, &c., of the Saxon period, are also given by these authors. Its first charter, making it a free borough, was granted by Richard I. The manufacture called Bath beaver had attained much repute at the close of the 15th century, at which time three guilds of artificers—namely, weavers, tanners, and shoemakers—existed, to whom Bath owed its then importance. (*Leland's Itin.* ii. 67.) It was first made a corporate city by a charter of 32d of Eliz. This and the charters of 9th and 34th Geo. III., extending the limits of its jurisdiction, were the governing ones, previously to the late municipal act. The gross revenue of the corporation, in 1832, amounted to 14,554*l.*, chiefly derived from the rents and renewals of their estates, water-rents, market-dues, and profits of the baths. (*Municipal accounts, Report, 1835*, Appendix, p. 1109, &c. seq.) The immense thickness of its walls must have made it a strong hold in the earlier period of its history; but in later times it has never been a station of any military importance. It was fortified and held for the king at the outbreak of the civil wars; and after being taken and retaken several times, was ultimately ceded to the parliament in 1645. Christopher Anstey, author of the *New Bath Guide*, and John Palmer, author of the plan for conveying mails by coaches, with other distinguished persons, were natives of Bath. (*Solinus, Polyb.* c. 22; *Hen. of Huntingdon, Itin.* i. 245, c. 10; *Leland's Coll.* v. 2; *Dugdale's Monast. tom.* i. *Madox's Hist. Ex.* &c. referred to for the earlier history and trade of the place. The *Fourth Report*, pp. 363, &c. seq.; and the *Knight's*, p. 567, &c. seq., of *Comm. on Charities*, contain an account of those of Bath.)

BATH, a town and port of the U. States, Maine co., Lincoln, on the W. side of the Kennebec, about 10 m. from the sea, lat. 43° 55' N., long. 69° 49' W. Pop. 3,773. It is pleasantly situated, and is one of the most commercial towns in the state. The river, which is seldom frozen over, admits vessels of considerable burden. Bath is the name of several other towns, and also of several countries in the U. States.

BATHGATE, a town and par. of Scotland, co. Linlithgow. Pop. 3,593. The town is situated on the middle road between Edinburgh and Glasgow, 18 m. W. S.W. the former, and 6 m. S. Linlithgow. It stands on the S. declivity of a ridge of hills extending across the co., and comprises an old and a new portion; the former consisting of narrow crooked lanes, on a steep declivity, and the latter of more modern and better built houses, on more level ground. The streets are well paved and lighted, and it is abundantly supplied with good water, brought from a distance. The church, a

BATHURST TOWN.

clumsy edifice, was erected in 1739; and there are 3 or 4 disesteating meeting houses. Bathgate was created a free burgh of barony in 1824. The inhab. are principally employed in the weaving of cottons for the Glasgow manufacturers, and in the adjacent coal and lime works. It has an excellent academy, liberally endowed by a native of the town, who acquired a fortune in the W. Indies, which furnishes education, of the best sort, gratis, to all natives of the par. It has six annual fairs, two of which, at Whitstide and Martinmas, are of very considerable importance, as cattle fairs. A weekly market is held on Wednesday. The par. is generally in a high state of cultivation.

BATHURST TOWN, a town of W. Africa, on the S. side of the mouth of the river Gambra; cap. of the British possessions on that river, and seat of a civil lieutenant-governor; lat. 13° 28' N., lon. 16° 32' W. It stands on the E. end of St. Mary's Island, a fertile, but low and swampy spot, about 4 m. in length, and 3 m. in breadth. Pop. (1836, of the town and island) 2,625, of whom 36 only are Europeans; the rest being liberated Africans, Mandingoes, Jolofs, &c. The main street facing the river is occupied with European warehouses and private dwellings; the other streets are laid out in straight lines, but unpaved, and are lined mostly with African huts, inclosed within small gardens. The Government-house, like the other European buildings, consists of one floor, raised upon brick pillars, furnished with verandahs, and approached by a long flight of steps. There is a spacious hospital for liberated Africans near the town; there are three Wesleyan chapels and a missionary school: the number of the armed force here, in 1836, was 321. Most of the European settlers are merchants, trading chiefly in gum Senegal, bees' wax, hides, ivory and gold; the other principal exports are tortoise-shell, rice, cotton, African teak, camwood, palm oil, country cloths, &c.: the import duties, in 1834, amounted to 3,016*l.*; and 127 vessels, tonnage 11,738 tons, entered the port. This settlement was established in 1816; it was several years ago threatened by the neighbouring Barra, chieftain, but friendly relations have since been entered into with that nation. (*Alexander's Voyage to the Colonies of W. Africa, in 1835*, pp. 65-72. *Martin's History and Statistics of the Colonies*, 1839.)

BATINDAH, a large inland town of Hindostan, prov. Rajpootana; lat. 30° 12' N., lon. 74° 48' E. Its vicinity has been celebrated for its breed of horses.

BATLEY, a town and par. of England, W. R. co. York. The par. which contains 6,390 acres and 11,359 inhab., is principally in the wapentake of Agbrigg, but partly also in that of Morley; the town, which has 4,841 inhab., is in the former. The pop., both in the town and the contiguous district, is principally engaged in the woollen trade, especially in the manufacture of what is called white cloth. The church, built in the reign of Henry VI., has several monuments of the Fitzwilliam, Saville, and other principal families in the vicinity. There is here also a well endowed free school, founded in the reign of James I.

BATOUM, a sea-port town of Turkey in Asia, prov. Trebizond, near the Russian frontier, on the E. shore of the Black Sea, 4 m. N. from the mouth of the Tchokor, lat. 41° 38' 40" N., lon. 41° 38' 55" E. Pop. 2,000. It is built in a straggling manner, and is not fortified. The harbour, which is open to the E. N. E. and N., is defended on the W. by a projecting tongue of land, and has deep water, large ships anchoring within a few ft. of the shore. The contiguous country is fertile in fruits, corn, and rice; but it has very little trade. (*Klaproth, Tableau du Caucase*, p. 162.)

BATTAGLIA, a village of Venetian Lombardy, prov. Padua, on the canal of Monselice, 10 m. S. by W. Padua. Pop. 3,000. It has hot-water baths, which, with commodious buildings and agreeable promenades along the canal, attract a considerable influx of company.

BATTALAH (*Valata*), a large town of Hindostan, prov. Lahore, considered the healthiest place in the Punjab; in an open plain, 36 m. N. E. Umrits; lat. 31° 48' N., lon. 75° 9' E.

BATTECOLLAH (*Batucala*, the round town), a maritime town of some size in Hindostan, prov. Canara; lat. 18° 56' N., lon. 74° 37' E.

BATTERSEA, a par. and town of England, hund. Brixton, co. Surrey, 4 m. S. W. St. Paul's. Pop., 1821, 4,992; 1831, 5,540: houses at the latter date, 1,022. Area, 3,090 acres. It comprises a low level tract on the S. bank of the Thames, and forms one of the suburbs to the metropolis; a wooden bridge connects it with Chelsea: it contains many respectable houses and detached villas. The parish church is a modern brick building, with tower and spire, beside the river; another has been erected within a recent period, by the commissioners appointed for such purposes. There is a free school for 20 boys, and a national school for 180 boys and girls. The

BAVARIA.

367

Southampton Railway passes through the parish; a part of which (on the E. side) is an undivided tract of pasture, the rest chiefly market-gardens, for the supply of vegetables to the metropolis, for which the parish is noted; especially asparagus, said to have been first cultivated there. The place is called Patricery in Domesday, and the manor was given to the abbey of Westminster, in exchange for that of Windsor, by Wm. I., which was the present name. It was granted by the crown, in 1027, to the St. John family, and the celebrated Lord Bellingbrooke was born and died in their mansion (since removed). It is now the property of Earl Spencer.

BATTLE, a par. and town of England, co. Sussex, rape Hastings, hund. Battle, 52 m. S. E. London. Pop., 1821, 2,852; 1831, 2,999: houses at latter date, 516. The town is pleasantly situated amidst woody knolls, which bound it on the S. and S. E., and enclose it in a vale which winds on to the sea, at Hastings. The principal street (about $\frac{1}{2}$ m. in length) is terminated by the magnificent gateway of the old abbey. There are a few good modern structures, but the greater part of the houses are ancient, and of mean appearance. The church, partly in the Roman and partly in the Gothic styles, is many centuries old, and derives the glass of its windows. There is an endowed school for 30 girls and boys, and a charity school for 40 boys, supported by subscription. A weekly market is held on Tuesday; a monthly one, on the same day, for cattle; and 2 annual fairs, on Whit Monday and Nov. 22. Gunpowder is the only manufacture, for which there are several extensive mills in the vicinity: its excellence is surpassed only by that made at Darford. Battle is the central town of a poor law union of 14 parishes. The ancient name of the town was Epton: its present name is derived from the great battle between Harold and William of Normandy, in 1066, of which it was the scene. In the following year the Conqueror found the abbey in commemoration of his victory, the ruins of which still sufficiently attest its ancient magnificence. On the completion of its church, he deposited in it the famous roll in which the names of all the leaders who had accompanied him on the expedition were inscribed. Copies of it are still extant, though not free from the suspicion of being interpolated and falsified. Benedictine monks from Normandy were its first occupants: their abbot was mitred, and a peer of parliament. The abbey was built on a gentle acclivity, overlooking a fine extent of woods and meadows, and was endowed with all the lands for a league round, besides various manors and churches in other counties. Many subsequent royal and private donations were added to the original endowment, and its prerogatives and immunities were placed on the same footing as those of Christ Church, Canterbury. In the reign of Edw. III. leave was obtained to fortify the abbey. At the general suppression its annual revenue was, according to Speed, 997*l.* 0*s.* 10*d.*: Dugdale makes it 800*l.* 14*s.* 7*d.* Sixty monks were pensioned off. The remains occupy three sides of a large quadrangle. (*C Camden's Brit.; Dugdale's Monas.; Penant's Tour; Gilpin's Coast of Sussex.*)

BATUMIN, a town of European Russia, government of Tchernigoff, beautifully situated on the Seim, an affluent of the Dnepr. Pop. 5,000. It is chiefly remarkable for the castle in its vicinity belonging to Count Rasoumofski, who has established manufactures in the town of cloth and wax candles.

BAVARIA (Germ. *Baiern*; Fr. *Bavière*), a country in the S. W. of Germany, anciently a duchy, afterwards an electorate, and now raised to the rank of a kingdom, being one of the principal of the secondary European states. It is composed of two distinct parts, commonly designated the "Territory of the Danube and Maine," and the "Territory of the Rhine." The former, which comprises about 7-8ths of the monarchy, extends from 47° 19' to 50° 41' N. lat., and from 8° 51' to 13° 44' E. long., and is bounded N. by the kingdom of Saxony, the principalities of Hesse, and the states of ducal Saxony; E. and S. by the states of the Austrian empire; and W. by the territories of Electoral Hesse, Hesse-Darmstadt, Baden, and the kingdom of Wurtemberg. The Rhine territory lies on the W. side of that river, by which it is partly bounded, and is completely separated from the rest of the Bavarian dominions by the interposition of the territories of Baden and Hesse-Darmstadt: it extends from 48° 57' to 49° 50' N. lat., and from 7° 6' to 8° 31' E. long.

Extent, Population.—Considerable discrepancies have prevailed in the statements respecting the superficial extent of Bavaria. According to Hassel, it contains 32,834 Brit. sq. m.; others have reduced it to 28,435 sq. m.; and Berghaus, in his late work, estimates it at 1,398 German, or 29,537 Eng. sq. m.

Provinces, and their former Designation.	Area in sq. m.	Pop. Jan. 1. 1855.	Pop. to sq. m.	Chief Towns and Pop.

Total	29,637	4,515,469	145	

Movement of Population.—An average of 11 years from 1824 to 1855 gave the following results:—Deaths, 116,519; marriages, 27,570; leg. births, 59,190 males, 55,158 females; illeg. births, 14,508 males, 14,995 females; leg. births to 1st March, 4. Legit. to illegit. births, 4 to 1. Average annual increase of pop. 25,068.

In 1837 the total pop. was 4,315,469.

Surface.—*Mountains.*—Bohemia has on the whole a mountainous character, being not only walled in by lofty mountains on the N. and S., but having extensive chains running through its interior. The loftiest mountains are the Noric Alps, on the S., which separate it from the Tyrol; their most elevated points are the Zugspitz, circle of Isar, 9,989 ft., and the Wetterhorn, 9,387 ft. The Allgäu-Alps, in the prov. of Upper Danube, extend from Kempten, in a N.E. direction, to near Mindelheim. The Hochvogel in this range is 9,476, and the Teufelskuppe, in the same prov., 9,383 ft. The high lands on the N. side of the Danube contain the finely-wooded chain of the Spessart, which commences on the Main, at the place where that river separates it from the chain of the Odenwald, and traverses the prov. of Lower Main from N. to S., covering an area of 147 sq. m. The loftiest summits of this range, such as the Engelsberg and the Geyersberg, rise to the height of about 2,000 ft. The most common rocks in the Spessart are granite, gneiss, syenite, and porphyry, which serve as a support for sandstone, argill. and calcareous rocks. S. of the Main, and along the frontiers of the Lower and Upper Main and the Regau, is the range of the Steiger-Wald, which reaches nearly to the chain of the Spessart, and is only separated from it by the course of the Main. The Rheno-Gebirge, a bleak and desolate chain of mountains in the circle of Lower Main, unite on the W. with the chain of the Vogelsberg, and on the E. with the Thuringer-Wald; they are more extensive and more elevated than the range of the Spessart, and are covered half the year with snow. The Fichtel-Gebirge, which connect the Rheno mountains with the Bohemer-Wald, lie in the N.E. part of the Upper Main. They consist chiefly of granite, gneiss, quartz, and claystone. The highest point in the range is the summit of the Ochsenkopf or Ox's Head (5,280 ft.). The chain of the Bohemer-Wald, which commences at the sources of the Eger, and running along the E. confines of Bavaria, terminates at the Moravian mountains, throwing out several branches into the circles of the Lower Danube and Regau, may be about 200 m. in length. The most elevated summits are the Baber, 4,924 ft.; the Roher, 4,720 ft.; and the Drasel, 4,054 ft. The Bavarian mountains are in general well wooded. In the flat country along the Danube there are some very extensive marshes.

Rivers.—Bavaria is watered by the largest rivers of Germany. The most considerable of these is the Danube, which, on entering Bavaria from the Würtemberg dominions, is of sufficient size to be navigable, and afterwards flows through the heart of the kingdom, making, with its windings, a course of about 270 Eng. m. In its course through the Bavarian territory, it flows past the towns of Günsburg, Hochstadt, Donauwörth, Neuburg, Ingolstadt, Ratisbon, Straubing, Wilschhofen, and Passau, and receives no fewer than 24 rivers: the chief of these, on the right bank, are the Iller, the Lech, the Isar, and the Inn, all having their source among the Alps. The Iller, before its junction with the Danube, receives the Bleibach; the Isar is joined by the Loisach, Amper, and Würm, and falls into the Danube below Deggendorf: the Inn, which rises in Switzerland, flows through the Tyrol, and is navigable before it enters Bavaria: it receives the Ais, the large river Salza, &c., and joins the Danube near Passau. The streams on the left or Franconian side, which are by no means so large as those on the opposite bank, are the Würnitz, the Altmühl, which has its source in the Steiger-Wald and falls into the Danube near Kehlheim; the Rohrbach, near Babenheim; the Naab, which descends from the Fichtel-Gebirge and discharges itself into the Danube above Ratisbon; and the Regen, that flows from the Bohemer-Wald, and traversing the circle to which it gives name, joins the Danube opposite Ratisbon.

The only considerable river in the N. part of Bavaria is the Main, formed by the junction of the Red and White Main, the former originating in the vicinity of Neubau, and the latter descending from Ochsenkopf, part of the Fichtel-Gebirge, in the circle of the Upper

Danube. These unite near Culmbach, and traverse Franconia in a W. direction, receiving in their progress the Rodach, the Linn, and the Franconian Saale, which flow from the Rheno-Gebirge, the Regnitz, and many smaller streams. The Rhine forms the E. boundary of the Bavarian province which bears its name.

Lakes.—The lakes are numerous, and some of them large. Besides the Lake of Constance, only a small portion of which is situated in Bavaria, the most extensive are the Ammer, about 12 m. long and 97 in circuit; the Würm, 14 m. in length and 4 in breadth; and the Chiem, about 35 m. in circuit. The Staffen or Staffel, the Walchen, the Kochel, and the King's or Bartholomæus lakes, are also of considerable extent. Most of these lakes abound in fish, and several valuable fisheries have been established on them.

Bavaria possesses few complete canals of any great magnitude. A canal was made in 1807 between Rosenheim, 7,400 ft. long and 36 ft. broad. Another canal was finished in 1818 between Würth and Kuttlingen, 10,624 ft. long and 62 ft. broad. There is a canal in the W. part of the circle of the Isar 13,000 ft. in length, which saves a distance of 5 m., and avoids the dangerous navigation of the Ammer Lake. A grand canal is now in progress for joining the Danube with the Rhine. It is to extend from Dietfurth, on the Altmühl, a navigable affluent of the Danube, to Bamberg on the Main, a distance of 234 German, or about 112 Eng. m. It is on a large scale, and is estimated to cost from 800,000, to 900,000. This magnificent undertaking, which appears to be destined to realise the project of Charlemagne for joining the Black Sea to the German Ocean, is carried on at the instigation and with the assistance of the Bavarian government. It is already far advanced; and will, no doubt, when completed, be of the greatest importance, not to Bavaria only, but to Europe.

Climate.—The climate of Bavaria is in general temperate and salubrious, but the temperature is considerably modified by local differences in the elevation of the soil. In the mountainous regions it is cold and bleak, but milder in the low country. In the plains and valleys the summer heats are sometimes oppressive.

Forests.—The Bavarian forests are very extensive and valuable; a considerable portion of the kingdom being still covered with natural woods. The most common trees are oak and beech in the plains, and pine and fir on the mountains. The most extensive forests are situated on the Spessart and Rheno mountains, and in the neighbourhood of Kempten, where they cover a surface of 258,143 acres. The annual product of the Bavarian forests is estimated at 2,370,000 klafters; and timber is one of the most important articles of export.

The following table exhibits an approximate view of the extent, in acres, of the forests in the different circles, distributed among the classes to whom they belong:—

Circles.	Forests belonging to the State.	To Towns, Burghs, Villages, and Foundations.	To Individuals.	Total Number of Acres.
Isar	681,560	101,096	815,555	1,486,209
Regen	326,010	125,681	451,723	798,404
Lower Danube	175,583	785	481,558	656,926
Upper Danube	217,927	160,999	374,949	753,125
Lower Main	235,611	10,374	190,266	736,251
Upper Main	416,545	100,542	197,529	714,716
Regau	225,286	151,943	165,067	542,296
Rhine	366,067	208,550	76,880	704,706
Total	2,412,239	1,245,898	2,704,649	6,362,876

The gross annual value of the woods and forests belonging to the state amounts to nearly 350,000*l.*; but, in consequence of the heavy expenses attending their management, the net produce received by the state amounts only to little more than half that sum.

Minerals.—The mineral products of Bavaria are important and valuable; but notwithstanding the encouragement held out by government, they have hitherto been comparatively neglected. The principal products

are salt, coal, and iron. Salt is a royal monopoly, and produces a considerable revenue. According to Rau, the consumption is about 88,745 tons a year, the retail price being 6 fl. 9 ks., or 10s. per cwt. in the country; whereas about 4,200 tons are annually sold to Switzerland, at 2 fl. 29 ks., or about 4s. 6d. per cwt. There are a considerable number of iron-works and coal-mines in operation; but the quantities produced are comparatively inconsiderable, not being a tenth part of what they might easily amount to: they belong partly to the crown, and partly to private individuals. Black lead is obtained in some places; and small quantities of copper and quicksilver are also produced. There are an immense variety of marbles. The porcelain clay of Bavaria is probably the finest in Europe.

Cattle, &c.—The pastures of Bavaria are extensive, and generally good. According to Hooek, the stock of cattle, horses, and sheep, in the different circles, in 1828, was as follows:—

	Horses.	Horned Cattle.	Sheep.
Isar - - -	105,683	298,298	159,000
Regen - - -	29,160	121,313	91,198
Upper Danube - - -	66,687	307,010	97,327
Lower Danube - - -	11,078	214,633	35,550
Rezat - - -	31,850	240,000	180,000
Upper Main - - -	7,295	208,659	131,491
Lower Main - - -	11,286	260,000	210,000
Rhine - - -	84,998	104,459	183,504
Total - - -	224,991	1,895,687	1,136,100
In 1837 - - -	350,920	2,350,266	1,484,080

This, however, would seem to be a most inadequate stock compared with the extent and capacities of the country. Generally speaking, too, the quality of the stock used to be very inferior. A good deal of improvement has, however, been effected in this respect within the last ten years by the establishment of veterinary schools, the institution of prizes, &c., and more than all, in so far as least as sheep are concerned, by the high price of wool of late years, and the advantages seem to accrue from the improvement of the breed, to the wool-growers of Saxony, Silesia, and other German countries. Although, therefore, neither the stock of cattle, horses, nor sheep, be at present so extensive or good as in some of the contiguous countries, it is satisfactory to know that it is in a progressive state of improvement; and the extensive market that the accession of Bavaria to the German Customs' Union has opened to her products will most probably lead to new efforts for the improvement of this amongst other branches of industry. The stock of hogs is estimated at 870,000. Poultry and wild fowl are plentiful; and in the circles of Rezat and Upper Danube the peasantry carry on a profitable trade in honey. The wolves, that formerly infested the Bavarian forests, are now nearly extinct.

Agriculture.—The soil of Bavaria, where it is not covered by morasses or mountains, is generally good; and, in the plains and valleys, it is very fertile, and capable of producing all kinds of crops. Owing to the ignorance and prejudices of the peasantry, agriculture is still, in most parts, in a very backward state, and large tracts of arable land continue uncultivated. It was recently, and probably still continues to be customary, in cases of sickness or disease among cattle, for the husbandman, instead of applying to a veterinary surgeon, or administering remedies, to drive them to the shrine of some saint! But, thanks to the spread of education, the confiscation and sale of the greater part of the church lands, and the introduction of a more liberal system of government, the prejudices of the people are rapidly relaxing; a great deal of waste land has been reclaimed; and an improved system of cultivation has been introduced into various districts, and is diffusing itself over the whole country. Government has zealously exerted itself to promote improvement, not merely by the reforms it has effected in the systems of administration and education, but by the drainage of extensive marshes, and by its efforts to improve the breed of sheep, &c.

Agriculture is most improved in the valley of the Danube, the circles of Rezat, and of the Upper and Lower Main. The plain lying to the S. of Munich has, on account of its productiveness, been styled the granary of Germany. Principal crops—rye, wheat, oats, and barley; but rice, maize, and buckwheat, are also partially cultivated. No accurate estimate can be formed of the productiveness of the crops, varying, as they must necessarily do, not only according to the quality of the soil, but also according to the skill with which it is cultivated, and the nature of the seasons.* But Englishmen who have been in Bavaria state, that under proper culture, the produce of corn and turnips is equal to what it is in the

* It is stated in a very good article on Bavaria, in the Penny Cyclopædia, that the average produce of the Bavarian crops is about 24 bushels an English acre! But a crop of this sort would do little more than replace the seed: 25 bushels an acre would be nearer to, but probably under, the mark.

best cultivated districts of England: and notwithstanding the vast consumption of corn in the breweries, Bavaria has invariably a large surplus for exportation.

The following table exhibits the prices of the four principal sorts of grain within each of the circles of Bavaria, at an average of the six years ending with 1836, in shillings and pence sterling per imperial quarter:—

Circles.	Wheat.	Rye.	Barley.	Oats.
Isar - - -	25 0	21 0	14 3	10 8
Lower Danube - - -	25 0	19 4	14 3	9 6
Regen - - -	25 0	19 6	13 5	9 8
Upper Danube - - -	29 6	23 1	16 11	10 4
Rezat - - -	27 1	20 10	17 6	10 4
Upper Main - - -	28 1	21 9	17 4	8 4
Lower Main - - -	27 6	21 3	17 4	10 8
Whole kingdom - - -	27 7	20 11	16 6	9 11

* The hop-plant is cultivated to a considerable extent, particularly in the circles of Rezat and the Upper Danube: the quantity raised varies from 30,000 to 40,000 cwt. a year, of which about a half is exported. The culture of the vine is well understood in Bavaria. The best vineyards are in the circles of the Lower Main and the Rhine. The former produces the wines of Franconia, known by the names of the Main, Werra, Saale, and Tauber wines. The famous Steinwein and Liestenwein are produced on the banks of the Leiste, not far from Steinberg, in the mark of Würzburg. The best wines in the circle of the Rhine are those produced near Deidesheim, and Wachenheim. The average yearly produce is estimated at about 800,000 cwt. Hemp and flax are grown in some districts, but the supply is not sufficient for home consumption. Madder and liquorice are very extensively produced, and form considerable articles of export. The culture of the potato has rapidly increased during late years, particularly in the N. provinces, and its produce is now estimated at above 11,280,000 scheffels. Beetroot is raised in considerable quantities, and there are several factories for its conversion into sugar. Tobacco is grown in considerable quantities in the circles of Rezat and Rhine. Silk has been raised of late years, but not to any great extent. Considerable portions of ground have been laid out in nurseries and flower-gardens, and large quantities of fruit are exported from the territories of Main and the Rhine.

According to Berghaus the average annual amount of the principal articles of agricultural produce in Bavaria, is

Rye - - -	2,962,500 scheffels	Wine - - -	798,751 cwt.
Wheat (wheat) - - -	1,239,367	Hops - - -	34,902 cwt.
Barley - - -	1,278,980	Hemp and flax - - -	337,801
Oats - - -	1,977,563	Tobacco - - -	85,437
	4,750,818	Rapeseed - - -	50,792 scheffels
		Poppy - - -	8,483
Total grain - - -	16,278,848	Madder - - -	47,265 cwt.
Potatoes - - -	11,282,149	Fodder - - -	53,811,131
Peas - - -	55,810	Timber - - -	2,460,046 fathoms
Lentils - - -	74,992		

It has been estimated that 53 per cent. of the entire surface of the kingdom is occupied by tillage and pasture lands, 29 per cent. by forests, and that 18 per cent. is waste. But it is needless to say that these estimates are but little to be depended on; and that at best they are never more than rude approximations.

Bavaria is mostly divided into very small properties. In the circles of Isar, Regen, Lower and Upper Danube, Rezat, and Upper Main, there are 2,254,603 estates, possessed by 606,989 proprietors; but in the first three circles the land is not so much subdivided as in the others. The property possessed by the state amounts to about a sixth part of the entire value of the landed property of the kingdom. In consequence of this great subdivision of the land, there are but few hired farms, and few hired labourers; where, however, the latter are hired, their wages may amount, at an average, to about 8d. a day, with provisions in harvest. In towns wages vary from 8d. to 16d. a day, according to the trade and the skill of the workman. Throughout Bavaria all sorts of field labour are performed indiscriminately by men and women.

Manufactures are generally in a backward state, and manufacturing establishments mostly on a small scale. The beer manufacture, and breweries, must, however, be excepted from this remark. Bavaria would certainly appear to be the paradise of beer-drinkers. "No individual in the world," says Mr. Strang, "not excepting a London coal-heaver, drinks so much beer as a Bavarian. I am credibly informed that the majority of the mechanics of Munich are rarely satisfied with less than 10 or 12 tankards daily. There are two kinds of beer, the brown and the white: it is neither so strong nor so sweet as our Scotch ale, but its hop flavour is more delicate. It is not only a pleasant, but a very wholesome beverage; and from its universal use, you may easily believe that, with the exception of the English metropolis, there is no city where so much beer is brewed as in Munich. The

establishment of Herr Pechorr, built like a citadel, almost rivals the works of our Meux's, and Barclay and Perkins'. In every corner of the city you find beer-houses; and when you see a Bavarian peasant not working, you are sure to find him with a can of beer in his hand." (*Germany* in 1831, II. 377.) According to Mr. Murray, the "amount and quality of the annual brewing" is a subject of as earnest discussion among the Bavarians as the vintage or harvest in other countries! We therefore need not be surprised to hear that it is estimated that there are in all about 5,500 breweries in the kingdom; that they consume annually from 750,000 to 800,000 quarters of malt; and that their produce amounts to about 90,000,000 gallons! If this estimate be at all accurate, it gives, supposing 20,000,000 gallons to be exported, an average supply of 17 gallons a year to every individual, young and old, male and female, in the kingdom; and as there is comparatively little beer drunk in the Rhine province, the consumption of Bavaria Proper will be really greater than it appears to be, even on the face of this statement! It may be supposed, perhaps, that this enormous consumption of beer must be injurious to the labouring population; but this does not seem to be the case. The desire to possess this luxury stimulates their industry; and notwithstanding their indulgence in it, they are well clothed and well fed; there is no appearance of abject poverty amongst them, and beggars are never seen.

Next to beer, the staple products of manufacturing industry are coarse linens, woollens, cottons, paper, glass, earthenware, jewellery, iron-ware, basket-ware, and wooden articles. Coarse linens are manufactured to a considerable extent; but the supply of woollen stuffs, worsted hose, and cotton goods, is inadequate to the consumption. The leather manufacture is extensive and important, and leather is largely exported. There are above 130 paper-mills, about 50 glass-houses, 2,000 saw-mills, many establishments for the manufacture of wooden clocks, toys, &c., and of porcelain and earthenware. Ironware, especially nails and needles, is extensively manufactured, and the exports are considerable. The optical, mathematical, surgical, and musical instruments, made at Munich, are highly prized on the Continent, especially the telescopes of Fraunhofer, which are superior to those made anywhere else. There are also foundries for cannon, and manufactories of muskets and other small arms, &c.; and considerable quantities of jewellery are exported to most European markets. The principal manufacturing towns are Augsburg, Nuremberg, Furth, Schwabach, Hof, Bayreuth, &c.

Commerce.—The central situation of Bavaria renders her well suited for the transit and carrying trade, and to this Augsburg, Nuremberg, Ratibon, and Spire, owed the greater part of their wealth and celebrity during the middle ages. But in modern times the means of profiting by the natural advantages of the country in this way have been comparatively neglected. Within these few years, however, they have begun to attract the attention they so justly deserve. Besides the great canal already alluded to, for uniting the Danube with the Rhine, a joint stock company established in 1838 a regular steam communication between Ratibon and Linz, in Austria, which was extended in the present year (1839) to Donaueschingen and Ulm. The first railroad with steam carriages introduced upon the Continent was that between Nuremberg and Furth, opened in 1835; but notwithstanding that the decided success of this undertaking called forth many similar projects in many parts of the kingdom, this line continues to be the only one of the kind. Bavaria has a great resource for commercial undertakings, in the credit enjoyed by the bankers of Augsburg, which is still one of the principal places of the Continent for the negotiation of bills. A banking company for the issue of notes, the discounting of bills of exchange, and the advance of loans on mortgage, has been established at Munich. Though sanctioned by government, the latter is not responsible for its engagements.

The exports consist chiefly of corn, timber, wine, cattle, sheep, and hogs, butter, salt, iron, leather, glass, hops, fur, beer, wool, optical and mathematical instruments, wooden toys, jewellery, maps, &c. Their value is estimated by Holm at about 14,000,000 fl. (1,325,000*l.*) a year. According to the same authority, the quantities of the principal articles exported are at an average:—

Horned cattle	-	-	190,000 to 200,000 head
Horses	-	-	12,000
Sheep	-	-	225,000
Hogs	-	-	565,000
Cheese and butter	-	-	100,000 cwts.
Wool	-	-	19,000
Hops	-	-	22,000
Dried Fruit	-	-	35,000
Wheat	-	-	200,000 qrs.
Wine (value)	-	-	1,250,000 fl.
Timber (value)	-	-	2,500,000 —

The imports consist principally of sugar, coffee and

other colonial products; spices and dye stuffs; cotton stuffs, silks, woollens, and fine manufactures of all kinds; drugs, hemp, and flax, &c. The imports of cattle are also extensive, and those of horses exceed the exports. The total value of the imports is estimated at 10,000,000 fl. (875,000*l.*); but every one acquainted with the merest elements of political economy knows, that if the value of the exports amounts to 14,000,000 fl., that of the imports, instead of being less, must, in ordinary years, be considerably greater. Were this not the case, commerce would be a means of impoverishing the country. The duties on goods imported into Bavaria are, with few exceptions, those of the Prussian Customs' Union, of which it forms a part. (*See* PRUSSIA.) Its proportion of the joint revenue of the league is 16-94, or 17 per cent.

Until the formation of the Prussian league, which has opened a vast extent of country to the products of Bavaria, its natural facilities for commercial intercourse were defeated by its own prohibitory regulations, and those of most of its neighbours. Sounder and more enlightened views, as to commerce, are now, however, beginning to prevail all over Germany; and it is but justice to add, that the Bavarian government has given a powerful impulse to industry by establishing mechanics' schools, annual exhibitions, and prizes; and still more by the abolition of the pernicious privileges of guilds and corporations. But a vast deal still remains to be effected before industry can make any real progress in this and most other German states. The English reader will be surprised to learn that here the number of labourers permitted to reside in towns, the number and distribution of trades, the prices of bread and meat, and even the introduction of new machinery, are all determined by artificial arrangements, dependent on the calculations and estimates of the minister of the interior, and enforced by the institution of passports and of a preventive police! The wonder is not, where such regulations prevail, that industry should be in a depressed condition, but that it should exist at all. And, in point of fact, the progress it has made is principally ascribable to the fact of Bavaria having within her limits Augsburg, Nuremberg, and other towns that, being formerly free imperial cities, have been but little injured by these preposterous regulations. The roads in Bavaria are generally bad; and we agree with Mr. Murray in thinking, that how laudable soever the encouragement given by the king to the fine arts, he would confer a much more solid and important benefit on his dominions were he to apply his energies, and divert a portion of his expenditure to their improvement. The public roads, such as they are, extend upwards of 5,500 miles.

The Bavarian florin is equivalent to 21*d.* sterling; the elmer, or measure of wine, to 9½ gallons; and the scheffel, or measure of corn, to 76*l* imp. quart.

Law as to Marriage, &c.—Considering the lengthened period of tranquillity that Bavaria has enjoyed, and the stimulus given to industry by the secularisation of the property of the monasteries, and the abolition of guilds and corporations, the progress of population has been slower than might have been expected. This slow progress seems to be, in part at least, ascribed for by the law which enacts, that "no marriage between people without capital shall be allowed without the previous permission of the poor institutions;" that is, of the principal persons in each provincial district elected to superintend the management of the poor, who are bound to refuse such permission, unless they see a reasonable prospect of the parties being able to provide for the children that may be expected to spring from the proposed union. To insure their vigilance, it is enacted, that the members of poor institutions neglecting to enforce this law "are to answer for the maintenance of the said families, should they not be able to maintain themselves." Undoubtedly, a law of this sort must tend powerfully to prevent improvident unions; and we are assured that it has retarded the increase of population, and had a most salutary effect in averting extreme poverty and consequent misery. (*See Appendix F. to Poor Inquiry Returns*, p. 22.)

In Bavaria all destitute persons have a legal claim to relief; and no doubt it was the wish to prevent the abuse of this right that led to the institution of the above law. That it has been effectual to this end, is universally admitted; but different opinions are entertained as to its influence on public morals. We are not sure, however, that it can be successfully impeached on this ground. At Munich, indeed, half the births are illegitimate; but the residence of the court, and of a numerous garrison, and the great influx of strangers, seem sufficiently to account for this. In the country, we believe, the morals of the Bavarians are, in this respect, quite on a level with those of the other German states. The proportion of illegitimate to legitimate births is, however, very high, being as 1 to 4-4.

Notwithstanding their immoderate consumption of beer, and in some degree also of spirits, the Bavarians are really sober and industrious; and though ignorance,

superstition, and vice still prevail in some districts, they are fast disappearing, and the Bavarian character is most respectable.

Character, &c.—The Bavarians, though all Germans, differ essentially in character, according to their descent from the different tribes of that people, and the different circumstances under which they have been placed. The inhab. of the Rhenish prov. are the most lively, active, gay, and enterprising. The Swabians are remarkable for a certain good-natured indolence, which has exposed them to much undeserved ridicule. The Franconians are diligent, intelligent, and steady, but vary in their social habits according to the influence which Protestantism has exercised upon the inhab. of the Upper Maine, or the dominion which the Catholic prelates of the empire have had upon their brethren in the fertile valley of the lower portion of that river. The population of the provs. S. of the Danube retain more characteristic peculiarities; and the Bavarians, though equally brave and well disposed with the rest, are heavier, more superstitious, and less active, though not less industrious. In the valleys of the Alps, the dress and manners of the Bavarians and Swabians bear a great resemblance to those of the Tyrolese; and the climate inclines them to prefer pasture to arable husbandry. The women are here more in the fields, and partake more of the out-door labour of the men than is the case in the N. provs. They drive the cattle up to the hills in summer; and their robust health manifests itself in the zeal with which they join in the waltz, and in their peculiar manner of singing, called "*Jodeln*." The character of their songs is not unfrequently rather free; but the indispensable requisites of a favoured lover, according to the "*Schnaderkühn!*," are superior agility and skill as a sportsman and wrestler, which must be proved by the possession of sundry trophies of the chase, such as chaino beads or feathers of the rarer birds, which, when worn on his pointed hat, form a challenge to rival heroes, who not unfrequently attempt to wrest them from their owner by force, according to the laws of village chivalry. The wealth of the large towns on the navigable rivers in the middle ages, and the expensive habits which it produced, may yet be traced in the costumes of the wives and daughters of the burghers. The hood of rich gold lace, and the bodice ornamented with gold or silver chains, from which a number of medals hang, form the common dress of the richer portion of this class, and are ambitiously displayed by servants and the poorer tradespeople on Sundays and holidays.

According to Hassel, the taxed houses in the kingdom amount to 652,000; but Hadhart computed them in 1836, at 619,482. Of these, 494,000, and 447,000 buildings connected with them, were insured against fire in 1834, for 38,573,235 florins. The number of buildings of all descriptions amounted, in 1833, to 1,271,567; and the number insured against fire was 1,136,577; the estimated value of which was 551,026,798 florins.

Constitution and Government.—According to the constitutional act promulgated in 1818, Bavaria is declared an integral part of the German confederation; the domains of the state inalienable, and the crown hereditary. The executive power is in the hands of the king, whose person is inviolable. The legislature consists of two chambers; one of senators, and one of deputies. The former is composed of princes of the royal family, the great officers of state, the two archbishops, the barons, or heads of certain noble families, a bishop nominated by the king, the president of the Protestant consistory, and any other members whom the king may create hereditary peers or members for life; but the latter cannot exceed one third part of the hereditary senators. The lower house consists of a variable number of members, there being 1 deputy to every 7,000 families, or 35,000 persons. At its last meeting it had 123 members, distributed in 5 classes: the first consisted of 14 representatives of knights, or proprietors possessed of territorial jurisdiction, and of all the rights of nobility: the second class consisted of 3 representatives of the universities; 1 for each; the third class consisted of 11 representatives of the Catholic, and 5 of the Protestant clergy; the fourth class comprised the representatives of cities and burghs; Munich sending 2, Augsburg 1, Nuremberg 1, and the others 26 in all: and the fifth class consisted of 60 representatives of landed proprietors, without jurisdiction.

The elections are very complicated, and far from popular. All candidates must be free and independent citizens have completed their thirtieth year; be members of the Roman or Reformed church; and pay taxes on a property of 8,000 fl. (700*l.*) a year at least. Owing to the extreme sub-division of property in most districts, this last condition narrows the number of candidates extremely.

The members are chosen every six years, unless the king choose to dissolve the chambers in the interim. They are generally convened once a year, and must be assembled at least once in three years. The session

usually lasts two months, but it may be extended or adjourned. In case of a dissolution, a new election must take place within three months. No taxes can be levied or augmented, and no law be passed or repealed, without the sanction of the legislature. But the accession of Bavaria to the Prussian customs' league is understood to have exempted the regulation of the customs, duties, and other indirect taxes from the control of the chambers. The king has also (in 1837) denied their right to inquire into the appropriations of grants; and the authority to be given to ordinances issued by the king is not well defined.

The cabinet is composed of five members—the presidents of the departments of foreign affairs, justice, home affairs, finance, and the army. The ministers are not necessarily members of the chambers, but they have a right to be present at their deliberations. At the commencement of each session, they must lay before parliament an account of the appropriation of the public revenue; and the national debt cannot be increased without its consent. The privy council which is at the head of public affairs, consists of the king, certain princes of the royal family, the ministers of state, the field marshal, and six counsellors appointed by the king. The king has power to grant pardons and mild gate punishments, but in no case to stop the progress of a civil suit or criminal inquiry. The code Napoleon is in force in Rhenish Bavaria; but in other parts of the kingdom there is an extreme difference in the procedure as to civil matters; and a new, improved, and uniform code is much wanted. The penal code, introduced in 1813, might be much improved both in its regulations and in the form of its procedure. There is a high court of appeal and cassation at Munich; and in each of the provs. an inferior tribunal, to which an appeal lies from the courts of primary jurisdiction in the towns, and the seigniorial and cantonal courts of the country districts. A law has been passed providing for the purchase of the seigniorial jurisdictions on paying an equivalent to their proprietors.

Each of the eight circles into which Bavaria is divided is under the superintendence of two provincial boards; one for the management of the police, schools, &c.; the other takes charge of all financial matters. Each circle is subdivided into districts, which have assemblies, whose duties are to decide all local questions respecting public burdens and district rates.

According to the fundamental principles of the constitution, all citizens are eligible to the different offices of the state, without any regard to birth or rank in society; all are liable to personal service in the national defence; religious liberty and freedom of opinion are practically granted to all; and no one can be imprisoned or condemned but by the sentence of a judge. Personal slavery is also abolished, and all religious and charitable endowments are placed under the superintendence of the state. It may also be mentioned that every considerable provincial town has one or more journals; and the *Augsburg Gazette* has the most extensive circulation of all the German newspapers. But unhappily the real palladium of a free government—an unfettered press—is unknown in Bavaria; a rigid and jealous censorship is established; and political discussion, literature, and education feel its envenomating and destructive influence.

Religion.—The classification of the inhabitants, in 1838, according to their religions gives, for the number, of the different sects—Roman Catholics very near 3,000,000, Lutherans about 1,250,000, the remainder being Calvinists, Jews, Moravians, Anabaptists, &c. The small number of Calvinists is explained by the fact of the Calvinists of the Palatinate, where they were most numerous, having united with the Lutherans in 1818, so that they now form one religious community under the designation of "The Protestant, Evangelical, Christian Church." The Catholic is the religion of the court and the state; but the constitution guarantees the perfect equality of the three Christian confessions of Catholics, Lutherans, and Calvinists.

According to the last concordat, Bavaria is divided into two archbishoprics of Munich and Bamberg, and into six dioceses: Augsburg, Ratibon, Passau, Würzburg, Eichstädt, and Spire. There are also 111 deaneries, and 2,756 curies of souls, belonging to the Roman church. The incomes of the clergy arise principally from estates and endowments. The Archbishop of Munich receives 20,000 florins (1,700*l.*), and the Archbishop of Bamberg, 15,000 florins (1,250*l.*). The bishops of Augsburg, Ratibon, and Würzburg, 10,000 florins (875*l.*) each; and those of Passau, Eichstädt, and Spire, 8,000 florins (700*l.*) each. The dean of Munich has 4,000; of Bamberg, 3,500; in the first set of bishoprics, 3,000; and in the second, 2,500 florins a year. The incomes of the canons vary from 1,400 to 2,000 florins. An annual grant of about 1,000,000 florins is made by the state, for the support of the inferior clergy. It is to be regretted that the present sovereign has allowed a very consider-

able number of convents and monasteries, which had been wholly suppressed, to be re-established: luckily, however, they are deprived of the greater portion of the wealth they once possessed. By the concordat above-mentioned, the right of nominating all the higher orders of the clergy is ceded to the king.

The highest ecclesiastical court among the Lutherans is the general consistory at Munich; the president of which has a seat in the chamber of senators; and they have also consistories at Anspach, Bayreuth, and Spire. The Protestant church has 46 deantries and 990 par. In the Palatinate, which was left in possession of many valuable privileges at the peace, the Protestant church is a completely organised body with Presbyteries and Synods as in Scotland. It will be seen from the subjoined accounts that the support of the Protestant clergy costs the state above 295,000 florins (25,812*l.*) a year.

Education.—Of late years the Bavarian government has made the most praiseworthy efforts to diffuse knowledge among the mass of the people. The system pursued is similar to that of Prussia. A school has been established in every parish, under the superintendence of the ministers and elders. Over these are the inspectors of district schools, who are subordinate to the chambers of the interior, in the several provincial governments. The superintendence of all the educational institutions in the kingdom is committed to a board attached to the ministry of the interior, entitled, "The Superior Board of Education and Ecclesiastical Affairs." Attendance at school is imperative on all children who have not received permission to be instructed by private tutors. Bavaria has 1 lyceum, 25 gymnasiums, 34 grammar schools, 7 seminaries for the education of teachers, 31 local school commissions, and about 5,000 primary schools. There are 9 seminaries for educating Catholics for the ministry.

Bavaria has three universities—those of Munich, Würzburg, and Erlangen: the two former are Roman Catholic, the latter Protestant. The university of Munich is attended by above 1,300 students, the others, respectively, by about 400 and 300 each. In 1828 a new and improved system of study was adopted in the Bavarian universities, and a number of injurious regulations were suppressed. Besides these seminaries, there are in Munich numerous literary associations: such as the Royal Institute; an academy of arts and sciences; another of the fine arts; an agricultural society; a military and veterinary school, &c.; and there are a number of literary and scientific institutions in Würzburg, Erlangen, Nuremberg, Ratisbon, Augsburg, &c. The National Library in Munich, formed chiefly of those belonging to the suppressed monastic establishments, contains 940,000 volumes, including an extensive collection of curious manuscripts, pamphlets, &c.; and the university library contains 160,000 volumes. In this city there is also an extensive Sunday school, in which there are upwards of 1,600 scholars, with 16 masters, who teach their pupils morals, the principles of physics, geography, natural history, chemistry, and geometry. The whole sum voted annually by the Bavarian legislature for the support of education is 767,811 florins (about 73,000*l.*). Munich, as is well known, has recently become a principal seat of the fine arts.

Prison System.—The system pursued in the prison of Munich is peculiarly worthy of attention. The principle of the establishment is that every one in prison shall support himself. Every prisoner, therefore, is obliged to work at his own trade; and those who have not learnt a trade are permitted to make choice of one, which is taught to them. Whatever the criminal earns by his labour more than is sufficient for his maintenance, is kept until the term of his imprisonment expires, and is then

given to him, deducting a quota for the expenses of the establishment. The surplus thus preserved for the benefit of the prisoners themselves, after the expenses of the establishment have been defrayed, usually amounts to nearly 50,000 florins (4,370*l.*) per annum. Instances have been known of persons at the expiry of their term of punishment receiving no less than 800 florins (70*l.*) upon leaving the prison. The number of persons confined in the prison is generally between 600 and 700. It is gratifying to learn that the system has produced the most satisfactory results. In but few cases are offenders committed a second time, and those who have been dismissed with the largest sums have in no instance returned. Many of the young, who have been taught trades in the prison, have afterwards become respectable handicraftsmen and tradesmen; and crime is yearly on the decrease. The proportion of capital punishments in Bavaria is as 1 to 20,000 persons.

Revenue and Expenditure.—At the conclusion of the war in 1815 the financial affairs of Bavaria were in a very embarrassed state; but through the judicious economy and measures of the sovereign and the legislature, they are now greatly improved. In 1819, the excess of the expenditure over the income was 2,007,800 florins; but in 1831-32, the revenue amounted to 29,217,000 florins, while the expenditure was only 27,095,883 florins. The gross annual revenue for the period, from 1831 to 1837, was fixed at 28,185,139 florins. The national debt amounts to about 130,000,000 florins.

Taxation.—The direct taxes are levied as follows;—For every class, an excess is decreed for taxation in every district by royal commissioners and tax assessors, named by the district itself. The estates thus chosen are supposed to represent the *mean* of the surrounding lands, and according to their produce the tax is levied. Land of all kinds is divided into classes, differing from each other, in their ascertained production, by about 1 bushel per acre, and one third being deducted for fallow, a rate called a *simpulum*, of 1 kreutzer in the florin, or 1*l.* per cent, is calculated on the remainder. Rents, rent charges, services, and tithes, are considered as part of the produce of the land, and the rate is apportioned between the holders of these charges and the cultivator of the land, who pays a smaller share, in proportion to the heaviness of his burdens. The value of houses is estimated according to existing contracts of rent: where no such contracts exist, the value of a house is found by appraisement, in the same way as the land. The total rate at present levied on land and houses is 5 *simpula*, or 8*l.* 5*sh.* per cent, on the produce. The family, or rather capitation tax, is paid by the whole pop. in 12 classes. The first class embraces the widows of labourers living on their labour, who are rated at 10 kr., or about 4*d.* annually; labourers paying 8*d.*; the highest class pays 1*l.* per annum. The industry tax is paid by every individual or company carrying on trade or manufactures, according to 5 classes, each with five subdivisions. The classes are fixed according to the number of inhab. in the place where the trade is carried on. The lowest rate is 1*sh.* per ann. for common labour in villages; the highest is 15*l.* per ann., paid by bankers, merchants, wholesale dealers, and innkeepers, in towns containing more than 2,000 families. The direct taxes are less heavy in Bavaria than in most of the other German states. For the indirect taxes we refer to the article GERMANY, in which the various customs' duties are treated of.

The expenses of collection are heavy, amounting to about 26 per cent. on the gross revenue. The expenditure nearly corresponds with the income.

Subjoined is an account, from the official returns, of the yearly revenue and expenditure of Bavaria, as fixed by the budget for 1837-43.

Receipts.				Disbursements.

In addition to this, the county rates or special provincial disbursements amount to upwards of 4,500,000 *fl.*

Army.—The army consists of 16 regiments of infantry, in 2 battalions each, and 4 battalions of sharpshooters,

making in all a force of about 43,000 men. The cavalry consists of 2 regiments of cuirassiers, and 6 of light

cavalry, in 6 squadrons each; making a total of 8,750. The artillery corps consists of 4 regiments, in 2 battalions each, and 2 companies of sappers, 1 of miners, 1 of pontoon men, and 1 of artificers; in all about 4,600. The full war complement of the Bavarian army is, therefore, about 87,000; but of these a large proportion is generally absent on furlough.

The contingent which Bavaria furnishes to the German confederation, has been fixed at 35,800 men.

The army is raised by conscription; every male (the clergy and nobility only excepted) being liable to bear arms in defence of his country. The period of military service is limited to 6 years. Permission is given to serve by substitute, and certain exceptions are usually granted to students and persons indispensable to the maintenance of their families: a curious regulation, which, however, squares well with the law as to marriage already alluded to, provides that all individuals drawn for the military service shall neither marry nor obtain a settlement for a certain number of years. Besides the permanent army, there is a reserve destined to reinforce it. There is also the *Landwehr*, or militia, composed of all Bavarians (excepting noblemen and clergymen), between the ages of 19 and 60, who have not been drafted into the army or into the reserve. In cases of emergency, they may be called upon to reinforce the army, but only in the interior. There is a corps of gendarmes, composed of 9 companies, making in all about 1,700 men.

The military establishment would seem to be disproportioned to the number of inhabitants and the means of the country; but we have not heard that it is complained of. In fact, not more than a third part of the troops are permanently embodied, the rest being disbanded after the drills in spring, return home to their families. The pay of a cavalry soldier is 10½ kr., about 4d. a day, with rations; that of an infantry soldier is 9½ kr., also with rations. The total cost of the war department amounts to about 7,000,000 fl. a year.

Principal fortresses: Landau, circle of the Rhine; Passau, on the Danube; Würzburg, with the citadel of Marienberg; and Ingolstadt, at the confluence of the Schutter and the Danube. (*Communication from Munich.*)

History. — The earliest inhabitants of Bavaria of whom tradition has preserved any account were the Boii, a tribe of Celtic origin: from them its old Latin name *Boiaria*, and the German name *Baiern*, are derived. About the reign of Augustus it was subdued by the Romans, and formed part of what they termed *Raetia*, *Vindelicia*, and *Noricum*. After the downfall of the Roman empire, the Bavarians fell under the dominion of the Ostrogoths and Franks, and after a protracted resistance, it acknowledged the sovereignty of Charlemagne. After the death of that monarch, the kings of the Franks and Germans governed Bavaria by their lieutenants, who bore the title of margrave, till 920, when the ruling margrave was raised to the title of duke. His successors continued to bear this title till 1023, when they were raised to the electoral dignity. In 1054 Bavaria passed into the possession of the family of the Guelfs, and in 1180 it was transferred by imperial grant to Otto, Count of Wittelsbach, whose descendants branched out into two families, the Palatine or *Rodolpliche*, and the Bavarian or *Ludovician*; the former inheriting the palatine of the Rhine, the latter the duchy of Bavaria. During the war of the Spanish succession, Bavaria suffered severely from following the adverse fortunes of France; but it received a great accession in 1777, when, upon the extinction of the younger line of Wittelsbach, the palatinate, after a short contest with Austria, was added to the Bavarian territory. During the late war with France, Bavaria, being long the firm ally of Napoleon, was rewarded with large accessions of territory from the spoils of Austria and Prussia; and the Bavarian monarch having contrived to change sides at a critical moment, when the fortunes of Napoleon were still doubtful, was confirmed in his extensive acquisitions by the treaties of 1814 and 1815; for though Austria recovered her ancient possessions in the Tyrol and the districts of the Inn and Hansruck, Bavaria received equivalents in Franconia and the vicinity of the Rhine.

BAVAY (an *Bagacem*), a town of France, *dép.* du Nord, cap. cant., 19 m. E. S. E. Valenciennes, pop. 1,650. The streets are neat and clean; and it has fabrics of iron plates, agricultural implements, with tanneries, &c. This is a very ancient town, having been made the cap. of a prov. by Augustus, and destroyed by the Huns in 385. It was formerly surrounded by walls; and in the middle of the market-place is an obelisk with seven faces, indicating the direction of the Roman roads that terminated at this point. This obelisk is modern, but it replaces a Roman column, which is said to have existed in the 17th century. The remains of a circus and an aqueduct are still discoverable. (*Histo. art. Nord.*)

BAUD, a town of France, *dép.* Morbihan, cap. cant., 14 m. S. by W. Pontivy, Pop. 5,310.

BAUGE', a town of France, *dép.* Maine et Loire, cap. arrond., on the Couaouan, or Couernon, 23 m. E. N. E.

Angers. Pop. 3,400. It is agreeably situated in a fine valley, and has some good houses, but is built with the greatest irregularity. The bridge over the Couaouan is new and handsome. It has a tribunal of original jurisdiction, a college, or high school, and manufactures of cloth and coarse linen. The English forces, under the Duke of Clarence, were totally defeated in the neighbourhood of this town in 1421, and the duke killed.

Not far from Bauge' is the village of Bauge'-le-Vieux, with the ruins of an old castle that formerly belonged to the dukes of Anjou.

BAULEAH, an inland town of Hindostan, prov. Bengal; on the N. side of the main trunk of the Ganges, 20 m. N. E. Moorshebadab. It is large, populous, and has considerable trade, and is the seat of a commercial resident on the part of the E. I. Company.

BAUMANSHOHLÉ, a celebrated cavern in the duchy of Brunswick, near Blankenburg. It abounds with stalactites, and is interesting to the geologist from the variety of fossil bones found in it; among which are those of the great cave bear, now extinct.

BAUMEAN, or **BAUMIAN**, a town of Caubul, the Thebes of the E., country of the Hazanreh, on the face of the Koh-i-Baba range of mountains; lat. 34° 34' N., long. 68° 42' E., 56 m. W. N. W. Caubul. The valley, on the fertility of which it stands, contains many earthenware dug in a soil of indurated clay and pebbles, and in which rings and relics, coins, &c., bearing Cufic inscriptions, are found; but Baumean is chiefly celebrated for two gigantic male and female figures, cut in *alto-relievo*, on the face of the mountain. The male figure is the largest, and about 120 ft. high; it is without much symmetry or elegance, and is considerably mutilated, the Mohammedans that pass that way always firing a shot or two at it. The lips are large, the ears long and pendant, and there appears to have been the resplendence of a tiara on the head; the body is covered by the remains of a mantle, which has been formed of a kind of plaster, and fixed on with wooden pins. The female figure is more perfect than the other, and has been dressed in the same manner; it is about half the size, and cut in the same hill, 200 yards from the former. The niches in which both are situated have been at one time plastered and ornamented with paintings of human figures, but these have nearly disappeared. These images are supposed to be Buddhis. Sir A. Burnes says the head of the large one is not unlike that of the greatly trifled idol of Elephanta, and near the celebrated tops of Mankya (Punjab) he found an antique exactly resembling this head. Another antiquary, from an inscription above the head of one of them, has believed them to have been cut about the 3d century of our era, while the Sassanides filled the throne of Persia. They are not mentioned by any of the historians of Alexander the Great; but both the idols and excavations of Baumean are referred to by those of Timour or Tamerlane. (*Elphinstone's Caubul, introd.*; *Burnes's Trav.*, II. 157–162; *Journal of the Asiatic Society of Bengal*.)

BAUME-LES-DAMES, a town of France, *dép.* Doubs, cap. arrond., on the Doubs, 18 m. N. E. Besançon. Pop. 2,519. It is a handsome little town, finely situated in a basin formed by hills planted with vines; has a court of original jurisdiction, a college, and a small public library, with paper-mills and tanneries. It derives its name from a rich and celebrated convent for nuns, founded in it during the 5th century, and destroyed at the Revolution.

BAUTZEN, a town of Saxony, cap. Upper Lusatia, on a height at the foot of which is the Sprée, 33 m. E. N. E. Dresden; lat. 51° 10' N., long. 14° 30' E. Pop. 12,000. It is surrounded by walls, except one of its suburbs on the left of the Sprée, and is well built, with straight, broad, and well-paved streets. Its cathedral, founded in 1213, is appropriated partly to Catholics and partly to Protestants: there are four other churches. The *Ortenburg*, formerly a royal palace, is now used for public offices; it has also a fine town-hall, a *Landhäuser* or house of assembly for the states, an orphan asylum, and four other hospitals, a house of correction, theatre, &c., with a gymnasium, a catholic chapter-house, a normal school, a mechanics' school, and other establishments for the purpose of education, and two public libraries. There are considerable manufactures of woollen, linen, and cotton stuffs, tobacco, wax, paper, &c.; a brass work, with breweries and distilleries, tanneries, &c. The town is the centre of a considerable commerce, particularly in woollen and linen articles.

Near Bautzen, on the 21st and 22d May, 1813, was fought the battle which bears its name, between the French army under Napoleon, and the army of the allies. The French were victorious; the carnage on both sides was great, and the allies effected their retreat in good order. Duroc, the intimate friend of Napoleon, was killed by his side in this engagement. About 7 m. E. by S. from Bautzen, is Hockkirch, the scene of one of the great battles of the seven-years' war.

BAUX, a small town of France, *dép.* Bouches du

Rhone, 10 m. N.E. Arles. It stands on the summit of a steep hill, and is remarkable only for the ruins of its castle, formerly the residence of the counts of Baux, who contested the sovereignty of Provence with the counts of Barcelona.

BAWTRY, an old town of England, W. R. co. York, on the border of Nottinghamshire, 9 m. S.E. Doncaster. Pop. 1,149. It is situated on a declivity, sloping to the tide, which is navigable for barges, and is traversed by the great N. road from London to York. It has a national school. Market day, Thursday.

BAYAZID, a city of Armenia, cap. sanjack, 65 m. N.N.E. Van, and 32 m. S.S.W. Mount Ararat, lat. $36^{\circ} 24'$ N., long. $44^{\circ} 36'$ E. It stands on the declivity of a high hill, at the top of which is the citadel, containing a well-built mosque, and the palace of the pacha. It is surrounded by a wall and ramparts; and besides 3 mosques and 4 churches, has the monastery of Karu Kilecan, celebrated for the beauty of its architecture, antiquity, and grandeur. Messrs. Smith and Dwight, the American missionaries, by whom it was visited in 1832, represent the town as being in a miserably ruinous state, and without one decent house except the pacha's. "Most of them were constructed like the underground cabins of the villages; the streets were obstructed by every species of filth; and nearly all the shops in the bazar, originally very few, were deserted." (p. 415.) Künner estimates the pop. at 30,000 (*Mém. Pers. Empire*, p. 327.), but this, doubtless, is now greatly beyond the mark. The missionaries previously referred to estimate the Moslem inhab. at 300 or 400 families, and the Armenians at 190 families; and if so, the pop. must be considerably under 5,000. Large numbers of the Armenians have emigrated to the territories now occupied by Russia.

BAYERSDORF, a town of Bavaria, circ. Rezat, near the Regnitz, 14 m. N. Nuremberg. Pop. 1,300. It is well built. In its vicinity are considerable copper-works.

BAYEUX, a town of France, dép. Calvados, cap. arrond., 17 m. W. by N. Caen; lat. $49^{\circ} 17'$ N., long. $0^{\circ} 44'$ W. Pop. 9,676. This is a very ancient city, and, with the exception of the principal street, is meanly built, with narrow and crooked streets. The fortifications by which it was formerly surrounded have almost entirely disappeared; and it has been enlarged by the junction of several suburbs. Principal public buildings—the cathedral, a large and venerable Gothic edifice in the form of a cross. In the ancient episcopal palace, now the Hôtel de Ville, is preserved the famous *tapissierie de Bayeux*, representing the principal incidents in the history of the conquest of England by William the Conqueror. It is supposed to have been executed by Matilda, the Conqueror's wife, or by the empress Matilda, daughter of Henry I. It consists of a linen web 214 ft. in length and 20 in. broad; and is divided into 72 compartments, each having an inscription indicating its subject. The figures are all executed by the needle; and it is valuable alike as a work of art of the period referred to, and as correctly representing the costume of the time. This remarkable monument narrowly escaped destruction during the frenzy of the Revolution. (See an excellent article on the Bayeux Tapestry in the *Penny Cyclopædia*.) Bayeux is the seat of a bishopric, and has tribunals of original jurisdiction and commerce, a college, and a public library containing 7,000 volumes. The lace manufactures in the town and neighbourhood employ a large number of females; and there are also manufactures of table linen, calicoes, serges, hats, earthenware, &c., with establishments for cotton spinning. The country round is undulating, and affords good pasture: large quantities of excellent butter are made in the vicinity, sent partly to Paris, and partly shipped for the French colonies.

Bayeux existed previously to the invasion of Gaul by the Romans. Under their sway it was successively called *Arægonia*, *Bajoca*, and *Civitas Bajocassium*, whence its modern name. It belonged for a considerable period to the English, and was twice burned down in the contests of the latter with the French; it also suffered severely during the religious wars. (*Hugo, France Pittoresque*, art. *Calvados*; *Diction. Géographique*, &c.)

BAYLEN, a town of Spain, prov. Jaén, at the foot of the Sierra Morena, 22 m. N. Jaén. Pop. 4,000. It is surrounded by old walls; commands the road leading from Castile into Andalusia; has a parish church, a palace belonging to Count Baylen, and an hospital. It has also numerous oil mills, with manufactures of coarse cloth, glass, bricks, soap, &c.

Baylen derives its principal celebrity from the events which took place in its vicinity, and which led to the capitulation of Baylen, signed the 20th June, 1808, by which General Dupont, and about 16,000 French troops under his command, surrendered to the Spaniards on condition of their being conveyed to France by the Spanish gov.; but the latter part of the capitulation was not carried into effect. The incapacity of Dupont was mainly instrumental in bringing about this result, which inspired the

Spaniards with confidence, and was always regarded by Napoleon as the principal source of his disasters in the Peninsula.

BAYONNE, a sea-port town of France, dép. Basses Pyrénées, cap. arrond., at the confluence of the Neve with the Adour, about 4 m. from the embouchure of the latter; lat. $43^{\circ} 29' 15''$ N., long. $1^{\circ} 28' 36''$ W. It is divided into three nearly equal parts, which communicate by bridges. On the left bank of the Neve is the great Bayonne; on the right bank of that river, and the left bank of the Adour, is the little Bayonne; and on the right bank of the Adour, in the dép. Landes, is the suburb of St. Esprit, joined by a long wooden drawbridge to the rest of the town. The pop. of the two former is 16,912, and of the latter 5,997, making in all, 21,909. It is strongly fortified; the citadel, one of the finest works of Vauban, in the suburb of St. Esprit, commands the town and harbour; and recently the fortifications have been still further augmented and strengthened. It is well built; the streets, without being regular, are broad, and set off with good houses. There are some fine public places, of which that called de Grammont is the best. Its quays are superb, and though a little interrupted in parts by the new fortifications, afford the finest promenade in France. Principal public buildings—cathedral and mint. Bayonne is the seat of a bishopric, of tribunals of original jurisdiction and of commerce; it has also a chamber of commerce, a diocesan seminary, schools of navigation and design, a public library, theatre, &c. A mint is established here, the coins issued from which are marked L. This mint had ceased, from the introduction of the decimal system to the 1st of January, 1832, 90,576,291 fr.: attached to the mint is an assay office. About two thirds of the population of the suburb of St. Esprit consist of Jews, most of whose ancestors had been, at different times, expelled from Spain. They have three synagogues, and there is one in the body of the town. There are vast yards for the building of ships of war and merchantmen, with distilleries, sugar refineries, glass works, and fabrics of cream of tartar, chocolate, liqueurs, &c. Exclusive of these articles, the Adour brings down supplies of timber, masts, pitch and tar, cork, and other articles, from the Pyrenees, many of which are largely exported. The hams of Bayonne have long enjoyed a high celebrity, and its wines and brandies are also much esteemed. It used formerly to fit out a considerable number of ships for the cod and whale fisheries, but these sorts of enterprises, though not abandoned, has latterly fallen off. It is the seat of an extensive contraband trade with Spain.

The river is rather dangerous, at least in rough weather, or when there is a strong current of fresh water. It can only be entered at high water, when there is from 12 to 15 feet over the bar at springs, and from 9 to 11 at neaps. The sea without is usually rough; and as the bar is liable to shift, a pilot is always required.

The military weapon called the bayonet takes its name from this city, which it is said to have been first invented, and brought into use during the siege of 1823. Though often besieged, Bayonne has never been taken; and hence the motto, *nunquam polita*. It was invaded by the British in 1814; who sustained considerable loss from a sortie made by the garrison. At the castle of Mercat, in the vicinity, the transactions took place between Napoleon and Charles IV. and Ferdinand VII. of Spain, that led to the invasion of the Peninsula by the latter. Mr. Inglis was highly pleased with Bayonne, which, he says, he should prefer as a residence to almost any place in the south of France. (*Hugo, art. Basses Pyrénées and Landes*; *Dict. Géographique*, &c.)

BAYTÖÖR (*Vaypöör*), a maritime town of Hindostan, prov. Malabar, 7 m. S. Calicut; lat. $11^{\circ} 10' N.$, long. $75^{\circ} 52' E.$ Teak ships of 400 tons are built here.

BAYREUTH, a town of Bavaria, cap. circ. Upper Mayne, on the Iled-Mayne, 26 m. E. Bamberg; lat. $49^{\circ} 57' N.$, long. $11^{\circ} 40' E.$ Pop. 14,000. It is partially surrounded by old walls, and has 6 gates and 3 bridges; is well built, with broad well-paved streets, fountains, and promenades; but it has not withstanding a "cheerless deserted character"; (*Murray*), the absence of the court, on which it formerly depended, not being sufficiently compensated by manufactures or commerce. It has two palaces; the oldest, burnt down in 1753, but again rebuilt, is now converted into public offices; the new palace, a handsome edifice, the residence of Duke Pius of Bavaria, has a gallery of indifferent pictures; in the square before it is an equestrian statue of the Margrave Christian Ernest, and behind it is a public garden. Among the other public buildings is the opera house, the *manège* or riding school, the gymnasium, founded in 1664, &c. It has several churches, and a synagogue; with a public library, hospitals, a lunatic asylum, &c. In its suburb, called the Georgam See, now a dried lake, is a penitentiary, where a great variety of marbles from the Fichtelgebirge are polished and wrought up. Besides being the seat of the administration, and tribunals for the circ., it has a Protestant consistory. The geological cabinet and collection of fossils

belonging to Count Munster, in Bayreuth, is one of the finest in Germany. There is here an extensive manufacture of porcelain, and tobacco-pipe heads; parchment, linen, cottons, &c. are also produced, and there are breweries and tanneries. About 2 m. to the E. is the Hermitage, a fanciful building erected in the early part of last century, at an immense cost, with gardens containing temples, terraces, statues, fountains, &c.; and a fine park, now much out of order. The Margravine, sister to Frederick the Great, wrote her memoirs in the Hermitage.

Bayreuth formerly constituted the cap. of an independent principality, the margravate of Bayreuth. On the death of the last margrave without issue, in 1701, his possessions devolved on the King of Prussia, who ceded them to France in 1807. In 1810, Napoleon transferred them to Bavaria; and their possession has been confirmed by subsequent treaties. (*Murray's Handbook*; *Reichard, Guide des Voyageurs*, &c.)

BAZA, a town of Spain, Granada, near the Guadalquivir, in an extensive, well watered, and fertile valley, 54 m. E. by N. Granada; lat. 37° 30' N., long. 2° 50' W. Pop. (including two castles in its jurisdiction) 5,817. (*Milano*). It has a cathedral, 3 parish churches, 6 convents, an ecclesiastical seminary, an hospital, &c. The inhab. are entirely dependent on agriculture, and consequently experience, in bad years, *una estremada miseria*. Baza is either on the site of the *Bastis* of the Romans, or very near it, and vases and other interesting Roman remains are dug up in its vicinity. It was taken from the Moors after a long siege, in 1489.

BAZAS, a town of France, dep. Gironde, cap. arrond., on a rock 35 m. S.S.E. Bordeaux. Pop. 4,444. It is old and ill-built. It was formerly the seat of a bishopric; and the ancient cathedral, now the parish church, though not large, is a remarkable monument of Gothic architecture. It has a court of original jurisdiction, and an agricultural society; with a royal salt-petre manufactory, a glass-work, tanneries, &c. Bazas is very ancient. It is the country of the poet Ausonius, who flourished in the 4th century, and was also, for a lengthened period, the residence of the dukes of Gascony. (*Hugo*, art. *Gironde*, &c.)

BAZOCHE-SUR-PERCHE-GONET, a village of France, dep. Eure et Loire, 15 m. S.S.E. Nogent-le-Rotrou. Pop. 2,120. Bazoches is the name of several other small towns in France.

BAZZANO, a town of the Papal States, 15 m. W. Bologna, on the Samoggia. Pop. 1,200.

BEACHY HEAD, a conspicuous bold promontory on the E. coast of England, co. Sussex; lat. 50° 44' 24" N., long. 0° 13' E. It is formed of chalky white cliffs, that project perpendicularly over the beach, whence it derives its name, to the height of 564 ft. A lighthouse of the first class was erected, in 1828, on the summit of the second cliff to the W. of the Head, 285 ft. above the level of the sea, and caverns have been cut in the cliffs, between the Head and Chickmore Haven, in the view of affording places of refuge to mariners wrecked on this dangerous coast.

BEACONSFIELD, a market town and par. of England, co. Buckingham, hund. Burnham; area of the par. 3,710 acres. Pop. 1,200. The town is situated on an eminence, on the high road from London to Oxford, being 24 m. W. by N. of the former. It consists of 4 streets, arranged in the form of a cross, and its houses are mostly constructed of a mixture of flint and brick. The remains of Edmund Burke are deposited in the church, formerly a part of the monastery of Burnham; and the church-yard has a marble monument in honour of the poet Waller, to whom the manor belonged. Bullstrode, formerly a celebrated seat of the Portland family, is within a short distance of Beaconsfield. Market-day, Wednesday. It has fairs for the sale of cattle, sheep, &c. on Feb. 13. and Holy Thursday, at which a good deal of business is done. (*Beauties of England and Wales*.)

BEAMINSTER, a par. and town of England, co. Dorset, hund. Beaminster-Forum, div. Bridport, on the Birt, 123 m. W.S.W. London. Area of par. 4,350 acres. Pop. of par., 1821, 2,406; 1831, 2,558; houses at latter date, 688. The town is surrounded by hills, whence the springs, forming the river, issue. It has a clean respectable appearance, and is paved, and lighted by gas. The church is a large structure, on an eminence on the N. side, being a chapel of ease to that of Netherbury. A free school, founded in 1684, educates 100 boys; the ann. amount of its endowment is 160*l.* a year. There are almshouses for 6 poor women. The weekly market on Thursday, and ann. fairs Apr. 14., Sep. 10., and Oct. 9. There is a manufactory of sail cloth, and tin and copper wares are made in the town. It is the centre of a union of 26 parishes: the average of its own rates, for the 3 years ending 1835, was 1,457*l.*; it has 3 guardians. Beaminster is a town of considerable antiquity; but it has been several times wholly or partly destroyed by fire; to which its modern appearance is attributable.

BEAR LAKE (GREAT), a very irregularly-shaped and extensive sheet of fresh water, in the N.W. part of

N. America; between about 66° and 67° N. lat., and under the 120th deg. of W. long. The Bear Lake river flows from it to the Mackenzie river. Its waters are very pure, and it is said to be well supplied with fish.

BEAT (ST.), a town of France, dep. Haute Garonne, on the Garonne, 13 m. S. St. Gaudens. Pop. 1,403. It is built of marble furnished by the neighbouring quarries; but being situated in a narrow valley, between mountains which conceal the sun for a part of the day, it is *triste*. It is the *entrepôt* of the contiguous valley of Arran, in Spain.

BEAUCALIRE (an. *Ugernum*), a town of France, dep. Gard, cap. cant., on the right bank of the Rhone, opposite to Tarascon, 14 m. E. Nîmes; lat. 43° 48' 32" N., long. 4° 38' 50" E. Pop. 9,601. As a town, Beaucalire is nothing remarkable, and has no public building worth notice; but its command of internal navigation afforded by the Rhone, and its communication with the sea by the canal of Beaucalire, which also unites it with the canal du Midi, make it favourably situated for an *entrepôt*. Its entire consequence and celebrity is derived from its fair, which commences on the 24th and finishes on the 28th, July. This was formerly the greatest of European fairs, and though much fallen off, it is still attended by a vast concourse of people, not from France only, but also from Germany, Switzerland, Italy, Spain, and the Levant. Almost every sort of article, whether of convenience or luxury, is then to be met with in the town. It is said that the influx of visitors still amounts to nearly 100,000, and that the business done exceeds 150 millions of francs; but we suspect that both these estimates are materially exaggerated, and that they would be nearer the mark were they reduced a half. The accommodations in the town and at Tarascon not being nearly sufficient for the great and sudden influx of strangers to the fair, large numbers of them are lodged in tents and other temporary erections in the meadow where the fair is held, along the Rhone. All bills due at this fair are presented on the 27th, and protested on the 28th. A tribunal, instituted for the purpose, takes cognisance of and immediately settles, all disputes that grow out of transactions at the fair. Detachments from the garrisons of Nîmes and Tarascon assist in keeping order, and every thing is conducted with the greatest regularity. The prelect of the dep. is always present, and entertains the leading merchants.

The communication between Beaucalire and Tarascon used to be kept up by a bridge of boats, but this has been replaced by a suspension bridge. This great work consists of 4 arches, each 130 metres (426 ft. 6 in.) in span. This is the statement of Hugo; other authorities say that the bridge has only 3 arches, and that its total length is 431 metres, and is alike substantial and handsome. There is at Beaucalire a public library, of 14,000 volumes. (*See Hugo*, art. *Gard*; *Encyc. des Gens du Monde*, art. *Beaucalire*.) The article on this fair in the *Dictionnaire du Commerce*, &c., is as poor as can well be imagined.

BEAUFORT, a town of France, dep. Maine et Loire, near the Couesnon, 16 m. E. Angers. Pop. 5,000. It has a college, or high school, two workhouses, a large market-place, and manufactures of canvass and coarse linen.

BEAUFORT, a small sea-port town of the U. States, S. Carolina, on Port Royal Island, 75 m. S. Charleston, and 58 m. N. Savannah; lat. 32° 28' N., long. 80° 32' W. It has a deep and sp. ciuous, but little frequented, harbour. This also is the name of an inconsiderable sea-port town of N. Carolina, on Gore Sound. Its harbour admits vessels drawing 12 ft. water.

BEAUFORT, a town of the Sardinian states, Savoy, cap. mand. near the Doron, 30 m. E.N.E. Chambery. Pop. 3,000.

BEAUGENCY, a town of France, dep. Loiret, cap. cant., on the right bank of the Loire, 16 m. S.W. Orleans. Pop. 4,949. This is a very ancient town, and occupies a conspicuous place in the history of the foreign, civil, and religious wars of France. It fell successively into the hands of the Huns, Saxons, Normans, and English; but it suffered most from the religious wars of the 16th century. It was surrounded by walls, flanked with towers and bastions, part of which are still standing, the rest having been pulled down, and converted into promenades; it was also defended by a castle, of which nothing now remains but a massive tower, 115 ft. high. It has a bridge over the Loire of 39 arches; with fabrics of cloth, distilleries, and tanneries, and a considerable trade in wine, corn, and wool. (*Hugo*, art. *Loiret*.)

BEAUJEU, a town of France, dep. Rhone, cap. cant., on the Ardère, 30 m. N.W. Lyons. Pop. 2,813. It is situated at the foot of a hill, on the top of which are the ruins of an old castle. It has manufactures of casks and lanterns, and is the *entrepôt* of all the products exchanged between the Saone and the Loiret.

BEAULIEU, a town of France, dep. Correz, cap. cant., on the Dordogne, 22 m. S. Tulle. Pop. 2,547. It

has some trade in wine. Beaulieu is the name of at least 24 other small towns in France.

BEAULY, a sea-port and village of Scotland, co. Inverness, on the N. side of the Beaulie Frith, where it falls into the bottom of the Beaulie Frith, 9 m. W. Inverness. It is small, but finely situated. The Beaulie is here crossed by a bridge of 5 arches, and the village has some trade.

BEAUMARIS, a bor. and sea-port town of N. Wales, co. Anglesea, hund. Dendathwy, near the N. entrance to the Menai Strait, in Beaumaris Bay 4 m. N.N.E. of the Menai bridge; lat. 53° 17' N., long. 4° 5' W. Pop. (1821) 2,205; (1831) 2,497; houses at the latter date, 427. It is finely situated near the edge of the bay, in a low level tract, which, however, commands some of the finest views in Wales. It is neatly built. The castle, erected by Edward I., though in a dilapidated state, is a fine ruin: it is surrounded by a fosse, flanked by 12 circular bastions. The building is nearly quadrangular, with a round tower at each angle. The par. church is at Llandefan, but there is a chapel of ease in the town, in which service is performed in English and Welsh. There are 4 chapels, belonging to Calvinistic Methodists, Baptists, and Wesleyans, all well attended; a free grammar-school, well endowed, the head master of which must be of the Established Church and M.A.; a national school, for 240 boys and girls, in the town, and another in Llandegvan (endowed by the Duchess of Kent), for 60 scholars; each of the religious sects have also large Sunday schools; and in all the English language is now taught. The town-hall is a commodious modern structure, with rooms for the bor. business, courts of justice, and a spacious ball-room. There are also a co. hall, a co. prison, and a custom-house. The weekly markets are held on Sat. and Wed.: annual fairs on Feb. 13, Holy Thurs., Sept. 19., Dec. 19., all for cattle. No particular manufacture or trade is carried on in the town. There is good anchorage in the bay, opposite the town, in 7 fathoms stiff clay; or vessels (as is often done) may be grounded near it on soft mud. The W. passage may be entered at any time of tide. Vessels often resort thither for security in hard gales; and occasionally some are repaired on the beach. Beaumaris is the chief port of the island and of the Menai Strait, and comprises in its jurisdiction those of Conway, Amlwch, Holyhead, Pwllheli, Barmouth, and Caernarvon. What trade the town itself possesses is chiefly coastwise. There is a regular steam-packet communication between Beaumaris, Liverpool, Caernarvon, and Dublin. There belonged to the port, in 1836, 401 ships, of 22,856 tons burthen. The pier, quays, and warehouses, are protected by extensive sea walls. The place derives considerable advantage from visitors from Liverpool and elsewhere, who resort to it for sea-bathing, in which respect it can scarcely be surpassed. There are many bathing machines, and the fine firm sands of the beach form a delightful promenade, from whence, as well as from the green, a magnificent prospect presents itself. Baron Hill, the seat of the Bulkeley family, is on an eminence near the town, and its fine grounds slope towards it: there are several other good mansions in the neighbourhood. The hotels and inns in the town are excellent. There is a fine road from the town to the Menai Bridge (4½ m.), which also commands splendid views.

Since the Municipal Reform Act, the limits of the bor. have been restricted so as to comprise only the town and its immediate neighbourhood. The ancient bounds included its own parish, and parts of 6 others, for an extent of upwards of 10 m.: it has now 4 aldermen and 12 councillors. Its governing charter, previously, was granted in the 4th of Edw.: this quotes, by *insuperimus*, 10 others, the earliest being in 24 Edw. I. The government was vested in a self-selective body, consisting of a mayor, 2 bailiffs, and 21 burgesses, who had the privilege of returning 1 mem. to the H. of C. The Reform Act divested them of this privilege, and made Beaumaris the principal of 3 contributory bors., which jointly return 1 mem. to the H. of C. There are 340 houses of 10l. and upwards; and it had, in 1838, 336 registered electors. The poor-rates of the bor., in 1836, amounted to 1,677l. 1s. The corporation revenues are derived from rents of lands, tenements, &c., oyster-beds, and harbour dues: they average about 566l. The town derives its origin from Edw. I., who, after founding the castles of Caernarvon and Conway, built that of Beaumaris, in 1295.

BEAUMONT-DE-LOMAGNE, a town of France, dép. Tarn et Garonne, cap. cant., on the Gimone, 21 m. S.W. Montauban. Pop. 4,211. This little town is alike remarkable by the regularity of its plan, the neatness of its houses, and the beauty and fertility of its territory. It is built round a spacious square, and its streets, which are broad and straight, intersect each other at right angles. It has fabrics of coarse cloth, hats, and tanneries (*Ateliers, see Tarn et Garonne*).

BEAUMONT-LE-VICOMTE, a town of France, dép. Sarthe, cap. cant., on the Sarthe, 17 m. N. Mans. Pop. 2,878. It has manufactures of druggets and other

descriptions of woollen cloth; and has a considerable trade in corn and fat geese. There is a fine promenade on an adjoining hill. Beaumont, either singly or with some addition, is the name of a vast number, at least 45, small towns in France. The most considerable is Beaumont sur Oise, dép. Seine et Oise, 21 m. N. Paris. Pop. 1,874. It stands on a hill, and has glass-works, and a manufactory of saltpetre.

BEAUNE, a town of France, dép. Côte d'Or, cap. arrond., in an agreeable country, at the foot of a hill which produces excellent wine, on the small river Boursoise, 20 m. S.S.W. Dijon. Pop. (town ex cant.) 9,958. It is well built; streets broad, straight, and watered by the fountain de l'*Aigüe*. The church of Notre Dame is handsome; but the finest building in the town is the magnificent hospital, founded in 1444, and endowed by Nicholas Rollin, chancellor to Philip Duke of Burgundy. Beaune is the seat of tribunals of commerce and primary jurisdiction; has a communal college, and a public library with above 10,000 volumes. Its ramparts, which are planted, afford fine promenades; and it has an extensive public garden, public baths, a theatre, &c. It produces cloth, cutlery, leather, vineyards, and casks, &c.; and has dye-works and large nurseries of fruit trees. But the principal celebrity of Beaune is derived from its being the centre of the trade in the wine that bears its name; that is, in the best of the second growths of Burgundy. M. Julien says, that "*les vins de la côte de Beaune ont la réputation, bien acquise, d'être les plus francs de goût de toute la Bourgogne*."

BEAUNE-LA-ROLANDE, a town of France, dép. Lot-et, cap. cant., 16 m. W. by N. Montargis. Pop. 2,128.

BEAUPREAU, a town of France, dép. Maine et Loire, cap. arrond., on the Evre, 28 m. S.W. Angers. Pop. 3,288. It has a court of original jurisdiction, with dye-works and tanneries. In 1793 the Vendéens obtained, in the vicinity of this town, a complete victory over the republicans under General Ligonier.

BEAUSSET, a town of France, dép. Var, cap. cant., 9 m. N.W. Toulon. Pop. 3,050. It has fabrics of hats and tiles, with tanneries, a glass-work, and a considerable trade in oil, wine, spirits, soap, and coarse cloth and linen.

BEAUVAIS, a town of France, cap. dép. Oise, on the Thérain, where it is joined by the Avélon, in a valley surrounded by wooded hills, 42 m. N. by W. Paris; lat. 49° 26' 7" N., long. 2° 5' E. Pop. 13,082. This is a very ancient city, and has undergone many vicissitudes. So late as 1803 it was surrounded by ramparts and fossés, but these have been since partly levelled, and converted into agreeable promenades. It is ill built, the houses consisting, for the most part, of wood, clay, and mortar; the streets are not narrow, nor dirty, but they are badly planned. Had the cathedral been finished on its original plan, it would have been the finest Gothic edifice in France, but the choir only is complete. It contains a fine monument of Cardinal de Janson, bishop of Beauvais. The church of St. Stephen, erected in 997, is celebrated for its fine painted glass windows. The episcopal palace, now the hôtel de préfet, is very large and ancient, and has the appearance of a Gothic castle. Previously to the Revolution there were in Beauvais, besides the cathedral, 6 collegiate churches, 12 parish ditto, with 6 convents for men and 2 for women! Now, however, the convents have ceased to exist; and all the churches, save two, and two chapels of ease, have either been pulled down or applied to other purposes. The other public buildings are the college, theatre, hôtel de Dieu, with 40 beds, poor-house, royal manufactory of tapestry, &c. It is the seat of a bishopric, of courts of *première instance*, and, besides the college has a diocesan seminary, with 145 pupils, gratuitous courses of geometry and mechanics applied to the arts, and a public library with 15,000 volumes. Beauvais has considerable advantages, in the command of water-power, and in the cheapness of turf fuel for the prosecution of manufactures; but though those carried on in the town be considerable, they are not flourishing. The principal is that of a sort of flannel (*mollétons*); at present, however, it is said to be in a retrograde condition, owing to the want of capital and enterprise in those engaged in it. A good deal of cloth is made of a medium quality. There is also a royal manufactory of tapestry, established in 1684; but these establishments are of little or no use, except as works of art, their products being too dear to come into general demand. The fabrics of printed cottons are much fallen off; but the art of dyeing is still successfully practised, and there are extensive bleach-works, with flour-mills, tanneries, &c. The trade of Beauvais is extensive. Large quantities of corn, and of linen, called *demi Hollande*, manufactured in its vicinity, are disposed of in its markets.

Beauvais existed under the Romans, and has since been held by the Normans and the English, from the latter of whom it was wrested in the 15th century. In 1477 it was besieged by Charles le Téméraire, duke of

Burgundy, and though without garnison, the citizens, led on by the famous heroine, Jeanne Hachette, repelled the enemy. An annual festival is still celebrated in honour of this event, when the ladies take the part of the gentlemen. (*Hugo, art. Oise; Dictionnaire du Commerce, art. Beauvais.*)

BEAUVOIR, a town of France, dép. Vendée, cap. cant. opposite to the island of Noirmoutier, about 3 m. from the sea, with which it is united by a canal. Pop. 2,357. Vessels of from 60 to 80 tons come up to the town, to load with corn and salt, produced in the salt marshes in the vicinity. This town was formerly fortified, and had a castle: it was besieged by Henry IV. in 1588, who having fallen into an ambuscade, was involved in the greatest danger.

BECLES, a bor., par., and town of England, N.E. border co. Suffolk, on the Waveney, 95 m. N.E. London. Area of par., 1,740 acres; pop. of par., in 1821, 5,493; 1831, 3,862. The town is well built on the S. side of the river, and consists of several streets, diverging from a central area where the market is held. The church, with a modern detached steeple, is an ancient structure on the edge of a cliff, overlooking the level pastures through which the Waveney flows. There are two dissenting chapels: a free school, founded under James I., for 100 boys; a grammar school, endowed in 1713, which has 10 exhib. to Emanuel Coll. Cambr.; a national school; a good town-hall, theatre, and assembly-rooms. The weekly market is on Saturday. Annual fairs are held on Whit-Monday, June 29, and Oct. 2; the last being a horse fair. The river is navigable for sea-borne vessels of 100 tons to the town, and by it an active trade is carried on in coals, &c. There are no manufactures, but malting is carried to a considerable extent. In 1832, when its communication with the sea was first opened, and a new dock was formed, there were 3 vessels, of 231 tons, entered inwardly, in the foreign trade; and in the coasting trade 64 vessels, of 3,596 tons, inward, and 36 vessels, of 2,034 tons, outward.

In 1836 there were 6 vessels, of 415 tons, belonging to the town, but registered at Yarmouth, of which it is an out station. The annual value of the rateable property in 1835 was 11,204*l.* A rate for lighting, paving, &c., under a local act, averages 240*l.* a year. The poor-rate, 1,471*l.* 10*s.* Since the Municipal Reform Act the limits of the bor. have been contracted so as to include only the part on which the town stands, an area of 350 acres. It was previously co-extensive with the parish, and was first incorporated in 34 Hen. VIII., when Beccles Fen, consisting of 1,400 acres of pasture, was granted. The governing charter was granted in 2 James I. The privilege of depasturing stock on the fen extends to every householder; and, of the original grant, 940 acres remain unalienated. The corporation also possesses an estate, called the Hospital Hill, and a lease of the tolls of markets and fairs, &c.; making the average amount of their annual revenue upwards of 1,100*l.* Their business is transacted in the town-hall, where quarterly sessions for the neighbourhood are also held by the co. magistrates. (*Parl. Papers and Reports; Beauties of Eng. and Wales, ii. 14.*)

BEDALE, a market town and par. of England, N. R. co. York, on an affluent of the Swale, 34 m. N.N.W. York. Area of par. 7,070 acres. Pop. of ditto, 2,707; of town, 1,265. The town is well built, and the church is a large and handsome edifice, constructed in the reign of Edward III. The living, which is a rectory, is one of the best in the county, having been worth, at an average of the 3 years ending with 1831, 2,000*l.* a year. It has a grammar-school, and some charities. The country round is very fertile, and it has a well-supplied market.

BEDAREUX, a town of France, dép. Hérault, cap. cant., on the Orb, 20 m. N. Beziers. Pop. (town ex cant.), 5,760. It is neat, and well built, and is one of the most industrious towns of France. It has manufactures of fine and coarse cloth, of stuffs, of silk and wool, woollen and cotton stockings, hats, oil, paper, and soap, with dye-works and tanneries. (*Dictionnaire du Commerce.*)

BEDFORD, an inland co. of England, having N. and N.W. Huntingdon and Northampton shires; E. Huntingdon and Cambridge; S. Hertford; and W. Buckingham and Northampton. Area, 256,320 acres, of which about 250,000 are supposed to be arable, meadow and pasture. Surface diversified with low hills, valleys, and extensive level tracts. On the S., the Chiltern hills rise to a considerable elevation. Principal rivers, Ouse and Ivel. It has every variety of soil, from the stiffest clay to the lightest sand. In the vale of Bedford, the soil is clayey; the sandy soil is well suited for the turnip husbandry, and garden culture; and, on the whole, the co. may be said to be of about an average degree of fertility. It is chiefly under tillage, which is in a medium state of improvement—not so far advanced as in some counties, nor so backward as in others. Wheat and beans are the principal produce of the clays, and turnips and barley of the sandy soils. Large quantities of vegetables are raised in various places, for the supply of the markets of

London and Cambridge. Cattle of a mixed breed. Stock of sheep estimated at about 300,000. There are some large estates; but property is notwithstanding a good deal subdivided. Average size of farms, 180 acres; average rent of land, 18*s.* 4*d.* an acre. Fullers' earth is dug up in considerable quantities in the vicinity of Woburn. Excellent straw platt for ladies' hats is made at Dunstable: the manufacture of pillow lace, once widely diffused through the county, has much declined, and there is no other manufacture of any importance. Principal towns, Bedford, Biggleswade, Leighton-Buzard, and Luton. Bedfordshire contains 9 hundreds, and 123 parishes; and had, in 1831, 17,573 houses, 20,016 families, and 95,433 inhabitants. It returns 4 members to the H. of C.; viz. 2 for the co., and 2 for the bor. of Bedford. Sum expended for the relief of the poor in 1838, 35,380*l.* Annual value of real property in 1815, 364,277*l.*; profits of trade and professions in ditto, 94,797*l.*

BEDFORD, a bor. and town of England, cap. co. Bedford, on the Ouse, 45 m. N.N.W. London. Pop., 1821, 5,466; 1831, 6,959; houses at the latter date, 1,491. It is situated in a pleasant vale, on both sides the river, which is spanned by a handsome five-arched stone bridge, built in 1810. It consists chiefly of a wide street, between 1 and 2 m. long, intersected by several smaller streets at right angles. The houses on the S. side the river are handsome modern structures; the rest, an intermixture of ancient and modern, but mostly well built and neat; the whole is paved, lighted by gas, and amply supplied with water. There are 4 churches: St. Peter's, the most ancient, has a Norman porch and a fine tower; St. John's, St. Mary's, and St. Paul's, are all in the Gothic style, with good towers. The Baptists, Independents, Wesleyans, Jews, and Moravians, have each a place of worship; the last have also a female establishment. There is a grammar-school, founded in 1556, which educates between 70 and 80 of the town boys free; and about the same number who board with the head master, and pay: it has 8 exhib., of 80*l.* a year each, to Oxford, Cambridge, and Dublin: another free school, founded in 1727, for 10 boys and 10 girls; and a blue-coat school, founded in 1760, for clothing and educating 25 boys: this last is now united with the national school, but the endowment is kept distinct. The charities, amounting to 100*l.* a year, of the town, exceed in amount those of any other in the kingdom. The principal charity consists of property in Bedford and London, left by Sir Wm. Harpur, who was born in the former, and became lord mayor of the latter. The rental of this property has increased, so that its annual amount in 1833 was 13,500*l.* The trustees are—the lord-lieut.; the members for the co. and the bor.; the first and second masters of the grammar-school; 18 persons chosen by the inhabitants of Bedford; and the corporation; the last being, in fact, virtually its managers. The revenue is distributed amongst the free grammar, English, national, and commercial schools; 58 almshouses; and in marriage portions, apprentice fees, premiums, and donations amongst the poor. Besides this, the principal charity, there is the hospital of St. John, founded in the reign of Edward II. for a master and 10 poor brethren; and 8 almshouses, endowed in 1679, for decayed single folks of either sex. There is a sessions-house, a theatre, and a public library; reading, lecture, billiard, and assembly-rooms, all in one handsome structure, recently built. There is also a new building in the Tudor style, erected by the trustees of the Bedford charity, with rooms for the English and national schools, a committee room, &c. The co. gaol and house of correction are at the N. entrance to the town. The co. lunatic asylum, and the co. infirmary, are also near the town, on the Amphill road: the infirmary, a large fine building, was erected in 1833, chiefly from funds bequeathed by the late Samuel Whitbread, Esq.; but the Marquis of Tavistock subscribed 2,000*l.* towards its completion. It has penitentiary (a large estab.) on the Kettering road. The chief market is held on Saturday: the weekly sale of wheat averages about 600 quarters. There is a smaller market on Monday, chiefly for pigs. Annual fairs are held first Tuesday in Lent, April 21, July 8, Aug. 21, Oct. 12, Nov. 17, and Dec. 19. That in Oct. is called the statute fair, and is the most important: the others are cattle fairs. The Ouse is navigable from hence to Lynn Regis, and a considerable traffic is carried on between the two towns, chiefly in malt, coals, timber, and iron. Lace-making formerly employed a great many of the women and children, and now straw-plaiting. There are no other manufactures. The bor. is co-extensive with the 5 parishes of Sts. Peter, Paul, Cuthbert, Mary, and John; the area of the whole is 2,164 acres, the town being in the midst, with a fertile belt of land all round. It is divided into 2 wards, and governed by a mayor, 3 aldermen, and 18 councillors. The annual revenue of the corporation is derived from lands and houses in the bor., and averages about 440*l.* a year. There are local courts of petty and quarter sessions, and of pleas. The co. sessions and assizes are also held in the town; the number of committals for the

whole co. in 1837 was 172; of these, 42 were tried at the assizes, 121 at the co. quarter sessions, and 10 at the local courts. The value of rateable property in the town in 1816 was 2,184*l.* a year; in 1835, it was 8,892*l.* The borough-rate amounts, on an average, to 22*4**l.* 5*s.* a year.

Under the Poor Law Amendment Act Bedford is the union town for 24 parishes. The average of its own poor-rates for 3 years, ending 1834, was 2,774*l.* It is represented by 6 guardians. The bor. has returned 2 members to the H. of C. since the 23 Edw. I. Travelling to the Reform Act they were elected by the burgesses and freemen, both bodies consisting of an indefinite number. In the contest of 1830 (gained by 1 vote), 100 polled, of whom 61 only were resident. There are 183 houses of the ann. value of 10*l.* and upwards. Registered voters for 1837, 878; of whom 91 were freemen. It is the principal polling town, also, of the co. Its modern is a contraction of its Saxon name, *Bedan ford*. A strong castle was built here soon after the Conquest, which, in subsequent reigns, endured many sieges: part of its entrenchments may still be traced. Near the town are the remains of Caldwell and Newnham priories. John Bunyan, author of the *Pilgrim's Progress*, was pastor of the Independent congregation at Bedford, from 1671 till his decease, in 1688. The Russell family derive their title from the town. (*Lysons's Mag. Brit.*; *Parl. Reports*; *Brayley and Brillon's Beauties of England and Wales*.)

BEDFORD LEVEL, a distr. on the E. coast of England, comprising the greater portion of a flat marshy tract, called the Fens, which extends from Ely, in Cambridgeshire, and is bounded on the N.E. by that great inlet of the German Ocean, known as the Wash; and in all other directions by ranges of hills that enclose it in the form of an ellipse. It includes about 400,000 acres of this fen country, and extends N. and S., from Tydd St. Giles to Milton, 33 m.; and from Peterborough to Brandon, in an E. and W. direction, 40 m. Its boundaries are irregular; but, commencing from Peterborough northerly, the line extends by Peakirk, Crowland, Whaplode Drove, Farnon Drove, Gughlun, Salter's Lode, and Methwold, to Brandon; and thence, on the S. side, by Mildenhall, Milton, Earith, Ramsey, Wood Walton, and Yaxley, to Peterborough. This comprises the whole Isle of Ely (the N. division of Cambridgeshire), and also a few parishes in the S. division of that county; 30,000 acres of Suffolk; 63,000 of Norfolk; 87,000 of Huntingdon; between 7,000 and 8,000 of Northamptonshire; and the S.E. portion of Lincolnshire. The whole tract appears to have been gradually formed, by sedimentary depositions. In an inlet of the ocean, brought thither by the tidal currents, from the *effluvia* of the coast, and by torrents from the surrounding uplands. Eight principal rivers, or drains, originally traversed the level, three of which had their outfalls in the sea: the Welland, in Foss Dyke Wash; the Nene, in the Sutton Wash Way; and the Ouse, at Lynn Regis: of the rest, the Glen joined the Welland, near its outfall; the Wisbeach was a branch of the Nene; the Cam, the Lark, and the Little Ouse, fell into the Great Ouse on its E. side. The Romans appear to have been the first who formed sea embankments, and shut out the tide: subsequently to which, for a prolonged period, it was a very fertile and populous tract. The roots of large trees grew grass lying in swathes, as when first mowed, boats, shoes of a pattern worn in Rich. II.'s reign, &c., have been discovered in various places at the depth of several feet under silt or peat. At the setting down of Skirbeck sluice, near Boston, a blacksmith's shop was found under 16 ft. of silt. These changes, therefore, were occasioned by the continued operation of the same causes to which the formation of the district is originally attributable; and which are still in ceaseless action on the coast. By shutting out the tide also, its scouring action would be greatly limited; and, consequently, the channels and outfalls of the streams would silt up and contract more rapidly, unless prevented by some artificial means. This process, however, would be gradual; and, down to the time of Stephen, we find the district round Thorney described by Henry of Huntingdon as most beautiful and fertile; whilst, at the period when Francis, Earl of Bedford, and his coadjutors, undertook the drainage of the great level that is named from him, this tract, comprising 18,000 acres, was an inundated morass, with the exception of a small hillock on which the abbey stood. As early, however, as the reign of Edward I., the silting up of the rivers, and the want of adequate drainage, had become an evil of great magni-

tude; and as a large proportion of the fens then belonged to rich religious establishments, they made many vigorous efforts to obviate the increasing evil. But it was not till the era of Elizabeth that the drainage of the fens was viewed in its true light, that of an important national concern; and an act was passed for effecting it in the 44th of her reign. In consequence of the queen's death, nothing was attempted till 1634, when a charter was granted by Chas. I. to Francis, Earl of Bedford (who had succeeded to the property of Thorney Abbey), and 18 other adventurers, who undertook to drain the level, on condition of being allowed 95,000 acres of the reclaimed land: this was partially accomplished within three years, at the cost of 100,000*l.* The principal cuts then made were, the Old Bedford River, 6 m. long, 20 ft. wide; Sam's Cut, of the same length and size; Bevil's Loam, 10 m. long, and 40 ft. wide; and Peakirk Drain, of the same length, and 17 ft. wide. The old drains were also repaired and enlarged, and four sluices formed to keep out the tide: two at Tidd, one at Wisbeach, and one at Salter's Lode. After all these works had been accomplished, at so great a cost, by the corporation, the contract was set aside, and the instigation of government, under the plea of the drains being inadequate. An offer was then made by the king to undertake the drainage of the fens, on being allowed 182,000 acres, which was 87,000 more than were to have been allotted to the corporation for effecting it. This disgraceful attempt to swindle the latter out of the advantages likely to result from their outlay and labours, however, defeated itself, by the numerous disturbances that shortly after broke out. But the neglect consequent on the distracted state of the country rendered what had been effected in a great measure useless, so that the district remained a waste, till 1649, when William, Earl of Bedford, had all his father's rights restored by the Convention parliament: another effort was then made, under his direction; and at the cost of 300,000*l.*, the original adventurers were enabled to claim their 95,000 acres. The principal cut last made was that of the New Bedford river, 100 ft. wide, a short distance from and running nearly parallel with, the old one. In 1668 a corporation was established by an act (15 C. 2. c. 17.), to provide for the maintenance and repair of the works, and to levy assessments on the proprietors for the sums necessary to defray the expenses. The corporation consists of a governor, 6 bailiffs, 20 conservators, and a community, consisting of all who possess 100 acres within the level. The conservators are required to have 200, the bailiffs and governor, 400 each; the officers are elected annually. Several subsequent acts have been passed to explain, alter, and amend the original one; but its main outlines have been preserved, and continue to form the basis of the government of the Fens. In 1687 the level was divided into three parts,—the N., Middle, and S. levels: the first comprises the lands between the Welland and the Nene; the second, those between the Nene and Old Bedford rivers; the third extends from Old Bedford river to the southern limits.

In 1705 an act passed for improving the outfall of the Ouse, and for making a cut from Ely, to Lynn; this was not effected till 1820, and has proved highly beneficial. To enumerate the various cuts and drains that have been made at various times would be tedious and useless. The water, in the rivers and great artificial cuts, is mostly above the level of the lands they pass through, and is confined by embankments: the water, therefore, collected in the smaller land-drains and ditches, has to be lifted into these main channels by pumps, which are mostly worked by windmills, but in a few instances by steam-engines. The most recent, and the most efficient, improvement in the drainage, made in the drainage and navigation of the Fens, has been accomplished under acts passed in 1827 and 1829, "for improving the outfall of the Nene; for draining the lands which discharge their waters into the Wisbeach river; and for improving the navigation of that river, from Kindersley cut to the sea; and embanking the salt marshes." A new tidal channel was cut for the discharge of the Nene: this begins about 6 m. below Wisbeach, and extends to Crabhole (54 m.); thence the river has shaped for itself a natural channel (1½ m. in length) to the Wash. The surface width of the new cut varies from 200 to 300 ft.; its depth, from the surface of the adjacent land to the bed of the stream, is 24 ft. throughout: the spring tides rise about 22 ft. at the end nearest the sea, and 18 ft. where it joins Kindersley cut. A bridge has been thrown over this channel at Sutton Wash, 8 m. below Wisbeach, and an embankment made across the sands, forming a new and safe line of road between Norfolk and Lincolnshire. Between 7,000 and 8,000 acres of marsh will ultimately have been reclaimed from the sea, and brought to a cultivated state by these operations. An uninterrupted communication with the sea from Wisbeach (the emporium of a large district) has been effected for small vessels at all times of tide, and in any

weather; and at springs, for large vessels; where, previously, those drawing 6 ft. could only reach with a spring tide and favourable wind. But the most important result is, the improved drainage that has been effected. In this new channel the tide ebbs nearly 10 ft. lower than in the old one, immediately opposite the S. Holland and N. Level sluices, which are the outlets for the water of about 100,000 acres of fen-land. A new main drain and sluice has been formed, to take the proper advantage of this; and also several minor drains. The Nene outfall was finished in 1835, at a cost of 200,000*l.* The drainage of the N. Level, under an act obtained in 1830, cost 150,000*l.* Following the example of his ancestors, the Duke of Bedford has been the chief supporter of both those undertakings, which have rendered pumping, either by wind or steam, unnecessary in the N. Level; and proved, that by due skill and exertion, all the waters of this important tract might have an adequate outfall created for them. (*Elstob's Hist. of Bedfordshire*; *M. Collock's Statistical Acct. of the British Empire*; *Smeaton's Tracts*; *Penny Cyclopaedia*.)

BEDNORE, a town of Hindostan, cap. of a district of Mysore, lat. 13° 50' N.; long. 75° 6' E.; 150 m. N.W. Seringapatam, 360 m. W.N.W. Madras. It is situated on one of the best roads in the W. Ghauts, which leads from Mangalore. When Hyder Ali took it in 1763, it was said to be 8 m. in circ. it afforded him considerable plunder. In 1783 it was taken by the English; but in the following year the troops in possession were either destroyed or dislodged by Tipoo. At his death it had but 1,500 houses,—some additions have, however, been made to it since. Its trade is increasing, but it has no manufactures. (*Hamilton's E. I. Gaz.* 1. 156.)

BEDWIN (GREAT), a bor. and par. of England, co. Wilts, hund. Kindwardstone, 64 m. W. by S. Loud. Area of par., 10,420 acres. Pop. of par. in 1831, 2,191. The town, which is old, stands on an elevated site, on a chalky soil. Its church exhibits specimens of the style of various eras (from the Norman to Henry VIII.), and is a cruciform structure, with a fine embattled tower rising from the intersection. The market-place (a very old building) is still standing in the principal street; but the market has long been disused. Fairs are held, April 23. and July 26. The place is in the jurisdiction of the county magistrates, being merely a nominal borough, with a portreeve, bailiffs, &c., elected at the mayor court. It sent 2 mem. to the parliaments of Edward I.; thence, with some interruptions, to 9 Henry V., and thence, continuously, till the Reform Act, by which it was disfranchised. There is a fine relic of St. on earth-work, called Chisbury Castle, about a mile N.E. of the town; it encloses an area of about 15 acres. Some Roman remains have also been found about $\frac{1}{2}$ a mile S.W. of the town. The Kennet and Avon Canal passes through the parish, and furnishes coals. The living is a vicarage, with the chapel of East Grafton annexed.

BEDDER, a considerable prov. of Hindostan; part of the Deccan; chiefly between lat. 17° and 20° N., having N. Aurangabad and Berar; E. Hyderabad and Gundwana; S. Hyderabad and W. Bejapoor and Aurangabad; it is included in the nizamat's domin., and divided into 7 districts; viz. Calahga, Naldroog, Akulotta, Calliany, Beeder, Nandere, and Patore. It is hilly but not mountainous, and watered by many rivers, of which the Majura and Godavery are the chief, and is generally fertile. It is but thinly inhabited, the Hindus being to the Mohammedans as 3 to 1; before the conquest by the latter it was comparatively populous. Three languages, the Telinga, Maharatta, and Canarese, are spoken in this prov., and their mutual point of limit is somewhere in the neighbourhood of the principal town, Beeder. The Bhamenee dynasty reigned here after the Moham. conquest, and other small states were subsequently founded, one of which was fixed in Beeder as the capital. The Moguls conquered it at the end of the 17th, and the nizamat early in the 18th century, since which it has always been occupied by the successors of the latter.

BEDDER, a city of Hindostan, cap. of the above prov., in lat. 17° 49' N., long. 77° 46' E.; 73 m. N.W. Hyderabad, and 325 m. E.S.E. Bombay. It stands in an open plain, except to the E., where it rests on ground having a declivity; is fortified by a stone wall, with many round towers, and a dry ditch; has remains of some good buildings, and was formerly famous for its tinsmiths ware. (*Hamilton's E. I. Gaz.* 1. 157, 158.)

BEER ALSTON, a bor. of England, co. Devon, hund. Roborough, par. Beer-Ferris, 211 m. W. S.W. London. Pop. of the par., 1821, 2,198; 1831, 1,876; houses, 344; area, 5,850 acres. The village is situated between the Tavy and Tamar, 1 m. from the latter: its market and fair (granted in 1255), have been long discontinued. Silver-lead mines were opened in the reign of Edw. I. contiguous to the place, which owes what im-

portance it possessed to them; they have been worked within the last 30 years, but are now discontinued, though some smaller ones are, or recently were, in work. The bor. claimed by prescription, but did not return mem. to the H. of C. till the reign of Eliz., from which period two were regularly elected, till the passing of the Reform Act, by which it was disfranchised. The ann. val. of prop. in 1816, in the entire parish, was 25,550*l.* In its ancient church are some curious monuments of the old families of Champenove and Ferris.

BEERBOOM, or BIRBOOM, (*Virbhumi*, the land of heroes,) a distr. of Hindostan, prov. Bengal, chiefly between lat. 23° 25', and 24° 25' N., and long. 86° and 88° E.; having N. the distr. Bhagulpore; E. Moorshedabad and Nuddea; S. Burdwan and the Jungle Mehals; and W. Rangpur. Area, 3,870 sq. m. Pop. (1822) 1,267,068. Much of it is hilly, covered with jungle, and thinly inhabited; there are no navigable streams, which impedes its cultivation and trade; but the roads and bridges are kept in good order by government convict, and its pop. and prosperity are increasing. Good coal and iron ore are found; the latter is worked in numerous native forges, supplied with fuel from extensive forests. The other most important products are rice, sugar, and silk. The land revenue in the year 1829-30 was 691,876 rupee. Highway depredations are frequent, especially by the petty hill chiefs in the W.; the head-quarters of the judicial establishment are at Sonry; the other chief towns are Nagore, Noony, and Serampore. In 1801 the Hindus were to the Mohammedans as 30 to 1. (*Hamilton's E. I. Gaz.* 1. 246; *Reports on E. I. Affairs*, Append. iii.; *Revenue Map*, 1. 762.)

BEER-REGIS, a par. and market town of England, co. Dorset, hund. of same name. Pop. of par. 1,483. The town is situated on an affluent of the Piddle, 7 m. N.W. Wareham. It has a good church, with some monuments. Its annual fair, held on Woodbury Hill, 18th cent. and 2 following days, used to be one of the most important in the co. for the sale of cattle, horses, &c.; and is still very considerable.

BEES (ST.) HEAD, a cape of England, being the most westerly point of the co. of Cumberland, about 3 m. S.W. Whitehaven; lat. 54° 30' 55" N., long. 3° 37' 24" W. It is composed of abrupt, high, rocky cliffs; and is surmounted by a lighthouse, exhibiting a fixed light, having the lantern elevated 338 ft. above high water mark.

BEESKOW, a town of Prussia, prov. Brandenburg, on the Spree, 18 m. S.W. Frankfurt on the Oder. Pop. 3,000. It is the seat of a court of justice, and has manufactures of cloth and linen, with breweries, tanneries, and lime-kilns.

BEFORT, or BELFORT, a town of France, dep. Haut-Rhin, cap. arrond., on the Savoureuse, 34 m. S.S.W. Colmar. Pop. 5,687. When this town was ceded by Austria to France, in 1648, it was not fortified; but the importance of its position for the defence of the plain to the E. of the Vosges being obvious, works were constructed on new principle, by Vauban, which made it a fortress of the second class. It consists of two parts—the high and low town; is well built; has large barracks, a handsome church, a college, a public library, containing 20,000 volumes, and a tribunal *de première instance*. Belfort has iron-foundries, with fabrics of iron-wire, printed calicoes, hats, paper, &c.; and is the entrepôt of most part of the trade of France with Alsace, Lorraine, Germany, and Switzerland. (*Hugo, art. Haut-Rhin*.)

BEG (LOUGH), a small lake of Ireland, about 2 m. from the N.W. corner of Lough Neagh, with which it is connected by the river Bann. (*See LOUGH NEAGH*.)

BEGARD, a town of France, dep. Cotes du Nord, cap. cant., 3 m. N.W. Guingamp. Pop. 3,603.

BEHABAN, a town of Persia, prov. Fars, on an extensive and fruitful plain, about 3 m. E. from the ruins of the ancient city of Aragian, and 130 m. W.N.W. Shiraz. Mr. Kinneir says that the walls are about 3 m. in circumference, and that he was informed by the governor that the pop. amounted to about 10,000. It is the residence of a Beglerbeg. (*Kinneir's Persia*, p. 72.)

BEHRING'S STRAIT, the channel which separates the N.E. corner of Asia from the N.W. corner of America, and which connects the N. Pacific with the Arctic Ocean. It is formed, in its narrowest part, by two remarkable headlands, the extreme points E. and W. of the continents to which they belong; Cape Prince of Wales, on the American coast, in lat. 66° 46' N., long. 156° 15' W., and East Cape, on the shore of Asia, in lat. 66° 6' N., long. 169° 38' W. The distance between these points is about 36 m.; but N. and S. of them, the land on both sides rapidly recedes, and, on the N. especially, it trends so sharply, that the name of Strait is not very applicable to any part beyond the Capes in that direction. It is usual, however, to regard it as extending along Asia from Tchukotokol Noss, in 64° 13' to Serde Kumen, in 67° 3' N., which gives it a length of 400 m.; its

width between Tchukotkoi Noss (179° 24' W.) and Cape Rodney, on the opposite shore of America (160° 8' W.), is about 350 m.

The land on both sides is considerably indented, the Asiatic shore especially exhibiting several extensive and commodious bays, as St. Lawrence, Motchickma, and others; but the country is not of a kind to tempt navigators to its coasts, which are generally steep and rocky, very bare of wood, and not at all abundant in other vegetation. The water has an equal, but not great depth. Cook remarks, that, on both sides of the Strait, the soundings are the same, at the same distance from the shore: that near land, he never found more than 23 fathoms; and by his chart it appears that he *no where* found more than 30. Shal water appears to be principally confined to the bays and inlets on the American side. There are a few small islands scattered here and there along the Strait; and one of some size, St. Lawrence or Clarke's Island, lies at a short distance S. from its entrance. The temperature is low; by the end of August the thermometer sinks to the freezing point, and N. of the two Capes, there is always a store of ice which the heat of summer is quite powerless to disperse. It need scarcely be added, that the Strait is frozen over every winter. Fogs, and hazy weather, are very common, almost indeed perpetual; for though the summer sun is above the horizon for a very considerable time, yet he seldom shines for more than a few hours, and often is not seen for several days in succession. The animals on both sides the Strait are similar, as might be expected from the proximity of the coasts, and the annual froesing of the water; they consist of the common fur bearing tribes and birds of the Arctic regions, but not in great numbers. It might be reasonably presumed that a corresponding similarity would have been observed in the human race on each side of the channel; but this is not the case: the Tchutski (Asiatics) are long-faced, stout, and well made; while the Americans are of low stature, with round chubby faces, and high cheek bones. The Asiatics, also, appear to possess more arts, to be more refined, in short, to be of a superior race. On both shores, the principal occupations appear to be hunting and fishing, for the latter of which the waters are well fitted, being much more abundant in life than the barren land. Whales frequent the strait, and the walrus (*morse*) seems to be more abundant here than in any other part of the world. The flesh of the latter creature is fit for food (*Cook's Third Voy.*, ii. p. 457.), and it appears probable that the natives of the coasts feed also upon the whale.

In 1728, Vitus Behring, a German in the service of the Empress Catherine, sailed from Kamchatka, in the view of discovering whether Asia were or were not terminated by the sea towards the N.E. He reached the Serde Kinnen, and laid down the Asiatic coast in a manner to call forth the unqualified approbation of Cook. In a second voyage to explore the American shore, he unfortunately perished under circumstances of great misery. Behring may be considered as having settled the fact of the existence of this strait, and therefore it is most properly called by his name; but the complete discovery was reserved for Cook, who in 1778 surveyed the whole length of both coasts, with a precision and accuracy which left nothing for after voyagers to perform, and which has made the geography of this remote and barbarous region as precise as that of our own country. It may, perhaps, be interesting to know, that a very old *Japanese* map of the world, now in the British Museum, lays down the leading features of this strait with surprising accuracy. (*Russian Voyages and Discoveries*, p. 48.; *Cook's Third Voyage*, p. 458, 457—476, &c.; iii. p. 242, &c.; *Billings*, p. 239—265, &c.)

BEHRING'S ISLAND, a small isl. in the Pacific; lat. 56° N., long. 165° E., the most W. of the Aleutian chain. It is rocky and desolate, without inhabitants, and only remarkable as the place where the great navigator, whose name it bears, breathed his last. After suffering great hardships in his attempt to explore the coast of America (*see last article*), the scurvy broke out among his men, and in the attempt to return to Kamchatka, he was wrecked on this barren rock, where was neither food, except marine animals, nor covering, except fine sand, in which the captain and crew attempted to scorch themselves from the effect of an Eastern winter. In which the former died worn out by disease and disappointment, Dec. 8. 1741. (*Russian Voy. and Discov.*, p. 97.)

BEILAN, or BELA, an isl. town of Beloochistan, cap. prov. Lus, on an elevated rock on the N. bank of the Poorally, lat. 26° 11' N., long. 66° 36' E., and 50 m. N. of the Indian Ocean. It contains about 2,000 houses, 300 of which belong to Hindoos. The streets are narrow, but the bazar is neat, and the town generally clean and dry; on the N.W. it is protected by a tolerably good mud wall; elsewhere it has no external defence. (*Pottinger's Travels*, p. 19.)

BEJAPOOR.

BEILAN, a town of Syria, near the sea, 9 m. S.E. Iskenderoon; lat. 36° 29' 30" N., long. 36° 17' E. Pop. uncertain, but, as the town is the residence of many rich families, it cannot be inconsiderable, probably from 4,000 to 5,000.

The houses are of stone, with flat roofs, occupy both sides of a mountain gorge, and are so disposed that the terraces of the lower buildings serve as streets to those above. A large stream rushes through the middle of the town, and in winter cascades pour down on every side. A considerable number of aqueducts, some of them very ancient, conduct this abundant supply of water to the houses of the inhabitants.

Beilan gives name to the mountains among which it stands (an. *Amanus*), the S.W. termination of the Taurus. The summits of these mountains are usually snow-topped; hence the winter cold is very severe, but the summer climate delightful, and, at all times, the atmosphere is pure and salubrious.

The town was formerly much frequented by the inhabitants (especially Europeans) of Aleppo and Iskenderoon, as a refuge from the burning heats and unwholesome vapours of the plains during the summer. The decline of these places has affected Beilan, but its natural advantages have drawn to it a great many wealthy Turks, who find a further inducement to reside here, in the fact, that, though nominally a part of the pachalic of Aleppo, the town is really governed by a sheikh, elected by the inhabitants from among themselves. In 1832 Beilan was the scene of a decisive battle between Ibrahim and Hussein pachas. (*Votary*, ii. 135, 136.; *Robinson*, ii. 279—281.)

BEJA (an. *Paz Julia*), a town of Portugal, prov. Alentejo, cap. Comarca, 85 m. S.E. Lisbon. Pop. 5,450. It is surrounded by walls, flanked with 40 towers, and defended by a castle. It has a cathedral, a rich hospital, a Latin school, a fabric of earthenware and tanneries.

BEJAPOOR, a large prov. of the Deccan, Hindostan, comprised partly in the British dom. and partly in those of the rajah of Sattarah and the Nizam, and containing the Portuguese territ. of Goa. It extends from 15° to 18° N. lat., and between 73° and 78° E. long., having N. prov. Aurangabad; E. the same prov. and that of Hyderabad; S. the Toombuddra and Wurdia rivers, and distr. of Canara; and W. the Indian Ocean: length 320 m., by 200 m. average breadth.

Its W. districts are very mountainous, being intersected by the W. Ghauts; and there are numerous strong hill positions on isolated eminences, with perpendicular sides, often crowned by fortresses. The principal rivers are the Krishna or Kistnah, Toombuddra, and Benna. The Krishna is remarkable as forming the boundary between two regions in which distinct languages and species of building prevail; N. of that stream the Maharatta tongue is spoken, and the roofs of the ordinary houses are pitched and thatched; S. of its banks the Canara language prevails, and the houses are flat-roofed, and covered with mud and clay. The Ramooses, a tribe resembling the lower castes of the Maharattas, with the thievish habits of the Bhels, but more subdued and civilised, inhabit the hills joining the Ghauts in Sattarah, between Poona and the N., Colapoor S., and Bejaapor E. They are robbers by trade, plundering the country when not kept in subordination; addicted to hunting, &c., and neither tilling the ground, nor disposed to any fixed or laborious employment. They do not eat beef, but are without caste.

After the dissolution of the Bhamene empire of the Deccan, in 1480, Adil Shah established a dynasty in Bejaapor, which lasted till 1690, and was singular in conferring Hindoo titles of distinction, which, among other Mohammedan governments, was always Arabian. It next became nominally subject to Aurangzeb, then really subject to the Maharattas, after suffering all the evils of anarchy from 1804 to 1818, most part of it became, in the latter year, subject to the British; but portions of it have since that period been again entrusted to the rule of subsidiary native princes. (*Hamilton's E. I. Gaz.*, pp. 159—162.)

BEJAPOOR (*Vijayapura*, the impregnable city), the anc. cap. of the above prov. under the Adil Shah dynasty, stands near the right bank of a tributary of the Krishna, 115 m. S. E. Sattarah, lat. 16° 46' N., long. 75° 47' E. In the beginning of the 17th century it was a city of great size and strength; but at present it consists merely of an immense number of mosques and other public buildings, many of which are in a state of partial decay; and a scanty population scattered among their ruins, and occupying miserable huts. "As the traveller approaches the city from the N., the great dome of Mahomed Shah's tomb is discerned from the village of Kunnoor, 14 m. distant. A nearer view gives the idea of a splendid and populous metropolis, from the innumerable domes and spires and buildings which meet the eye." "On entering, the illusion vanishes, jungle has shot up in the partly obliterated streets, and the visitor may now lose himself in the solitude of ruins, where crowds

were formerly the only impediments to a free passage." It comprises an outer fort, or old city, and an inner fort or citadel, partly enclosed by, and lying E. of, the former: the space between the walls of these two is said to have been sufficient for the encampment, in 1689, of 15,000 of Aurangzeb's cavalry. The walls of the outer fort are 8 m. in circ., and but little dilapidated, though the out-works be in great part destroyed; the inner fort, on the contrary, is fast crumbling away. The old city (besides a stone bazar, its only frequented spot) contains the mausoleum and mosque of Ibrahim Adil Shah, built on a basement 130 yds. long, by 52 yds. broad, covered by an immense dome raised on arches, and so elegant as to bear a favourable comparison with the most celebrated Mogul sepulchres of Upper Hindostan. This structure, as well as others in Bejapoor, is distinguished by rich overlapping cornices, and small minarets peculiar to this place, and terminating in a globe or pinnace, instead of the open square turrets common in the N. of India. The inner fort, the S. wall of which bound Bejapoor in that direction, encloses the ruins of the palace, the great mosque, an imposing edifice in good repair, the celebrated mausoleum of Mahomed Shah, and a multitude of other tombs and mosques. Sir James Mackintosh, who visited this city, says, that the elaborate stonework in some of these is exquisite, and not surpassed by that of any cathedral he had ever seen. Here, also, is a low Hindoo temple, the only building of the kind in or about Bejapoor: it is in the earliest and rustic style of art, and popularly thought to have been raised by the Pandoo (a mythological race): the military Khajoes (*treasurers*) has massive stone chains cut out of solid blocks suspended from its angles. Excepting the palace, little wood having been used in the construction of the public buildings, they are in tolerable preservation. Two parallel streets (one nearly 3 m. long and 50 ft. wide, paved throughout and regularly built), intersect the inner city, the most populous part of which adjoins the great mosque. Mud hovels are stuck up here and there among the ruins, and the spaces within the walls is mostly a wilderness covered with grass and shrubs. There are here some enormous brass guns, formerly belonging to the fort, one of which would require a ball weighing 2,546 lbs. For 5 m. W. of the fort the country is studded with ruins, chiefly Mohammedan tombs. (*Hamilton's E. I. Gaz.* i. 162, 163; *Mackintosh's Memoirs*, 2d edit. i. 463.)

BEJAR, a town of Spain, prov. Salamanca, 48 m. S. Salamanca. Pop. 4,700. It is distinguished by its woollen manufactures, which have been much improved and extended since 1824. A large fair is held here on the 25th of Sept. and the two following days. (*Midano*.)

BEJETSCH, a town of Russia in Europe, gov. Tver, cap. district, on a lake near the Mologa, 62 m. N.N.E. Tver. Pop. 3,000. It is an old town, *de triste apparence*, with 13 churches and 2 convents. *Schnitzler, La Russie*, &c.)

BEIRA, a prov. of Portugal, which see.

BEIT-EL-FAKIH, orig. *Beit-fakieh*, a town of Arabia, cap. of an ancient name to, one of the 6 depts. of the Tehama of Yemen. Proper, about 100 m. E.S.E. Lohela, and 90 m. N. Mocha; lat. 14° 31' N., long. 43° 23' E. A large and strong citadel (the residence of the dala), and a mosque, are the only public buildings. A few of the houses are of stone; but the majority are mere huts of wicker-work or clay. It is unwall'd. There is no account of the pop.; but it may, perhaps, be estimated at from 7,000 to 8,000. It is the great centre of the coffee trade of Yemen; the berries are brought from the neighbouring mountains half a day's journey distant; the best in May, but the general supply is almost constant throughout the year. The ports of Lohela, Hodocia, and Mocha, are supplied from hence (the last taking annually about 22,000 tons); in addition to which, caravans from El-Hedjaz, Oman, Persia, Syria, Egypt, &c. resort to the town, in which merchants of almost every trading nation are settled. All purchases are made for ready money.

Beit-el-Fakih (that is, *house of a saint*), derives its origin and name from a famous sheikh, whose tomb in this neighbourhood became an object of veneration; and to whose memory an annual festival of three days is observed, during which miracles are sometimes said to be performed. The town, which rose in consequence of pilgrimages to the tomb, gradually drew to itself the coffee trade, which before had centred in Zebid, a town about 20 m. to the S. (*Nicbuhr, Descr. de l'Ar.* 197, 198; *Voy. en Ar.* i. 253-254.)

BEITH, a par. and town of Scotland; the latter is situated in the co. of Ayr, 9 m. S.W. Paisley, but the par. extends into Renfrew. Pop. of par. 5,113, of which about two-thirds belong to the town. The latter, which is pleasantly situated on a rising ground, has grown into importance since the earlier part of last century. It was at one time famous for its manufacture of linen; it was afterwards no less eminent in the department of silk gauze; but cotton has of late constituted its staple manu-

facture. In this respect it may almost be regarded as a suburb of Glasgow. It has also two flax and three cotton mills. A great number of the female inhab. are engaged in tambering and flowerin maulin for the markets of Paisley and Glasgow. The line of the Glasgow, Paisley, Kilmarnock, and Ayr Railway, which is now (1839) being constructed, passes close by Belth; a circumstance which will give a great impulse to the prosperity of the place. The limestone, freestone, ironstone, and coal, with which the neighbourhood abounds, will, when the railway is open, become more available, and find a ready market. The parish of Belth, which borders on that of Dunlop, is famous for its dairies; and the one parish produces as much of what is called *Dunlop cheese* as the other. Belth has a town house, built by subscription, a parish church, and two dissenting chapels, two branch banks, and a subscription library.

BEKES, a town of Hungary, cap. of an extensive co. of the same name, at the confluence of the Black and White Koros, 40 m. S.W. Grosswarden; lat. 46° 46' 16" N., long. 21° 7' 33" E. Pop. 20,000. It has 3 churches, and a considerable trade in cattle, corn, and wine, the produce of the surrounding country. It was formerly fortified.

BELALCAZAR, a town of Spain, prov. Cordova, 48 m. N.N.W. Cordova. Pop. 2,800.

BELASPOOR, an incl. town of N. Hindostan, cap. of the Calhore rajah, on the left bank of the Sutejle, 1,465 ft. above the level of the sea; 180 m. N. Delhi, 300 m. N. N. W. Agra; lat. 31° 19' N., long. 76° 45' E. In 1810, it contained 3,000 houses: it is regularly built; the houses of stone, cemented with mortar, and the streets roughly paved. The Sutejle is here about 100 yards broad, when its waters are lowest. In 1822, this town, with the rest of the Calhore territory, devolved to the British government, on the death of its previous sovereign. (*Hamilton's E. I. Gaz.* i. 164.)

BELBEIS, a town of Lower Egypt, on the most W. arm of the Nile, 29 m. N.E. Cairo. It was occupied in 1798 by Napoleon, who repaired its fortifications; but there are now of little importance, the walls consisting chiefly of mud. It is ill built, has several mosques, and its pop. has been estimated at 5,000. It is supposed by D'Anville to occupy the site of the ancient Pharbetus; but the preferable opinion seems to be that the site of Pharbetus is identical with Horbegt. Belbeis is a place of considerable importance, from its situation on the road to Syria.

BELCASTRO, a town of Naples, prov. Calabria Ultra, 15 m. N.E. Catanzaro. Pop. 3,400. It is situated on a rock, is the seat of a bishopric, has a cathedral, a diocesan seminary, and a *mont de piété*. Large quantities of cattle are bred in its vicinity.

BELIEM, a suburb of Lisbon, which see.

BELFAST, a seaport town of Ireland, co. Antrim, prov. Ulster, at the confluence of the Lagan with Carrickfergus Bay, 102 m. N. Dublin; lat. 54° 36' N., long. 5° 59' W. At a very early period it was known as a fortified station, and on the arrival of the English it was further secured by the erection of a castle, of which, however, no trace now exists. It owes its present importance to its commerce and manufactures, which have raised it to the first rank among the great marts of Ireland. The pop. in 1821 was 37,277, and in 1831, 58,287, being an increase of 21,010 in 10 years, or at the rate of 42·948 per cent. A census taken in 1834, but believed to be very incorrect, gave a pop. of 60,763, viz. of the estab. church, 16,388; Rom. Cath. 19,712; Presbyterians, 23,576; other persuasions, 1,137. At present (1839) the pop. is supposed to amount to about 70,000. There were, in 1831, 7,750 inhabited houses, giving 6·875 individuals to each house.

Though lying low, a great portion of the town not being more than 6 feet above high water mark, it is very healthy. The Lagan forms its S. boundary, separating it from the adjoining county of Down, in which is the district of Ballymacarret, considered as a suburb of Belfast. The river is crossed by 3 bridges; one, the oldest, consisting of 21 small arches, the others of modern construction.

The town has a cheerful and lively appearance. The houses, mostly of modern construction, are of brick; the streets are wide, airy, well paved and flagged, clean, and lighted with gas.

Its principal ecclesiastical buildings are the parochial church, with a tower of the Ionic order; St. George's Church, or chapel of ease, with a very fine portico; Christ Church; 2 Rom. Cath. chapels, 9 Presbyterian places of worship, one of very elegant architecture; 3 meeting-houses for Seceders, 2 for Covenanters, 6 for Methodists, 1 for Independents, and 1 for Quakers; exclusive of 5 places of worship in Ballymacarret.

Of the buildings erected for the purposes of education, the principal is the Royal Academical Institution, which originated in a voluntary subscription of the inhabitants in 1807, by whom a fund of above 25,000*l.* was raised for the buildings, and the endowment of professors and teachers. It was afterwards incorporated by act of parliament, and receives an annual parliamentary grant of 1,950*l.*, taken at an average of the 7 years ending with 1837. It consists of two departments; one elementary, the other for the higher branches of literature and science. The 8 professors of natural philosophy, moral philosophy, logic and belles-lettres, anatomy and physiology, mathematics, church history, Hebrew, and Greek and Latin, receive annual salaries of 150*l.*, besides students' fees; and 2 professors of divinity, 100*l.* each, with fees. The professors of chemistry, midwifery, materia medica, surgery, and botany, and 2 of biblical criticism, derive their incomes solely from fees. There are also 2 head masters of the classical and English elementary schools. The number of pupils averages about 400. The affairs of the institution are conducted by a board of managers, and another of visitors, elected by and from among the subscribers. The building is of plain appearance, and is surrounded by a large enclosed area. The Belfast academy was also founded by private subscription some time previously to the academical institution. It consists of well-conducted classical and mercantile schools. The Lancasterian school is a large building; there is also a public school in Brown Street, and another connected with the board of national education. The private schools, both male and female, are numerous. The number of pupils in the free and charity schools is about 2,800, and of those in private schools 6,500. The other literary and scientific institutions, all of which are wholly supported by the voluntary contributions of the members, are the Society for Promoting Knowledge, founded in 1788, with a library of about 10,000 vols.; the Literary Society, for the discussion of subjects of general literature, science, and art, founded in 1801; the Natural History Society, founded in 1821—the meetings of this institution are held in a very elegant building, erected by the contributions of the members, who have also formed a large botanic garden near the town. There are also four public news rooms, and *seven* newspapers, some of them very ably conducted, are published in the town.

The poor house, for the reception of aged and infirm paupers and destitute children, is the principal charitable institution. It is a large building, erected by means of a lottery and a public subscription, in an elevated situation, at the N. extremity of the town, and is incorporated by act of parl. It maintains about 500 inmates, of whom those capable of work are employed in useful manufactures, or in its domestic arrangements. The funds amount at an average to 2,500*l.* per ann. The House of Industry is a mendicity asylum, in which paupers are employed in useful branches of industry, and occasionally assisted with food and clothing; strangers are also relieved and assisted in proceeding

to their respective places of destination. The Fever Hospital, with a dispensary attached to it, is a handsome building, and can accommodate 220 patients: its annual income averages 1,000*l.* A lying-in hospital, also a new and handsome building, is maintained by public subscription. The district lunatic asylum, for the cos. of Antrim and Down, and the town of Carrickfergus, situate about 1 m. from the town, in an enclosed area of 33 acres, has accommodation for 250 inmates: the number of patients on the 31st March 1839 was 205, 107 being males and 98 females: the total expense of the establishment, including salaries, during the year ending as above, was 3,722*l.*, the average cost of each patient being 19*l.* 1*s.* 6*d.* There are also 2 female penitentiaries. The only places of amusement are a theatre, occasionally opened for dramatic performances, and a suite of rooms in the Commercial Buildings for balls, assemblies, and concerts. The exchange building, erected at the expense of the Marquis of Donegal, is now used only for the election of magistrates and other corporate purposes. Adjoining the town are barracks for infantry and artillery.

Belfast was incorporated by James I. in 1613. The corporation consists of the sovereign of the town, the lord and constable of the castle, and 12 free burgesses, privileged to make an unlimited number of freemen, of which class there are now none. The borough returned 2 m. to the Irish parl.: at the Union it obtained leave to send 1 m. to the H. of C., and in 1832 the Reform Act conferred on it the privilege of returning 2 m. The right of election, which had been previously confined to the members of the corporation, was at the same time given to the householders, and a new and somewhat more extended boundary was laid down for electoral purposes. The parl. constit. in 1837-8 was 2,767. General sessions for the co. are held here 4 times a year; there is also a court of record for pleas of debt to the amount of 20*l.*; a manor court, a court leet, and a petty sessions court twice a week (at which last the sovereign presides). The town is a constabulary station, and is the residence of the stipendiary magistrate for the co., who holds a court of petty sessions twice a week. Persons committed for graver offences are sent to the co. gaol in Carrickfergus; those on slighter charges, to the house of correction, a plain brick building, where the prisoners are employed chiefly in breaking stone for the roads. Notwithstanding its limited accommodations, there being but 36 cells for an average of 73 prisoners, its character for internal economy, both as to cleanliness and discipline, stands high. The paving, lighting, and cleaning of the town is superintended by a board of police, empowered to levy a local rate for these purposes, the annual average amount of which is about 9,000*l.*

The linen manufacture has been the chief source of the present prosperous state of Belfast. To accommodate the trade of which it is the centre, the White Linen Hall, a large quadrangular building enclosing a spacious area, was erected by subscription in 1785; and about the same period, the Brown Linen Hall, an uncovered area of smaller dimensions, was opened for the sale of unbleached liens. There are now (1839) in the town and its vicinity 20 mills for spinning linen yarn, which employ in all nearly 7,000 hands: and there are several factories for the weaving of linen cloths, employing about 1,000 hands. The cotton manufacture, introduced in 1777, is carried on in four factories, which employ about 1,100 hands; but the business is declining, and the probability seems to be, that at no very distant period it will be entirely given up. Four large and several smaller foundries are employed, chiefly in making the machinery and implements for the linen and cotton works. There are two vitriol works. The tanning of leather, formerly one of the chief trades, is on the decline; but the manufacture of ropes, canvases, and sail-cloth is carried on with much vigour. There are two large ship-yards, in which vessels of all dimensions, up to 400 or 500 tons, are built. There are 2 distilleries, 12 breweries, several large flour and corn mills, with numerous manufactories for minor articles of consumption, such as soap, candles, starch, &c., and a paper mill. In 1836, 50 steam engines, of the power of 1,274 horses, were employed in Belfast and its immediate neighbourhood.

The increase of trade and commerce has kept pace with that of manufactures. The situation of the town—at the bottom of Carrickfergus Bay—has made it the chief mart for the circulation of foreign produce through the most populous and wealthy portion of Ulster. To improve this advantage, a line of inland navigation was

commenced in 1787, to connect the town with Lough Neagh, partly by still water and partly in the bed of the river; but the unavoidable casualties attending this latter mode of conveyance have so retarded the progress of the vessels employed in it as to render it comparatively useless; and the inland trade is mostly carried on by the roads, which are kept in an excellent state of repair. A railroad is in progress, for the conveyance of stone from the Cavehill to the quays; and the Ulster railway, by which the communication of the town with the interior will be greatly facilitated, will be open as far as Lisburn in the course of the present summer. There are two fairs; one on the 1st and 21st August, the other on the 28th and 29th October. The charter market-day is on Friday, but well-supplied markets are held every day. There are three native banking establishments; the Northern, Belfast, and Ulster; each of which has branches in the country, and branches of the Bank of Ireland, and of the Provincial Bank, have also been established here. The Savings' Bank, commenced in 1811, was one of the first institutions of the kind in Ireland: its affairs are now transacted in a building erected in 1830 out of the accumulations of the fund. The deposits amounted, on the 20th November, 1834, to 94,513*l*.

Previously to 1637 Belfast was a creek of the port of Carrickfergus; but the privileges of the latter place having been purchased in that year by the crown, the custom-house was transferred to Belfast. The bay is also peculiarly favourable to the purposes of commerce, being safe and easy of access. Large vessels lie at the Pool of Garmylee, about 4 m. from the town; those of smaller draught discharge at the quays, which are numerous and convenient. Within the last few years several docks have been opened, one of which, 1,200 ft. in length by 360 in breadth, admits vessels adapted for the liner trade. The superintendence of the harbour is vested in the Ballast Corporation, established under an act passed in 1831, which gives it large powers towards the improvement of the quays and harbour. A plan is in contemplation of carrying out embankments or quays to the Pool of Garmylee, so as to facilitate the loading and discharge of large vessels. The Chamber of Commerce, a voluntary association of merchants, founded in 1783, was revived in 1802. Mercantile transactions were formerly carried on in the Exchange, but latterly in the Commercial Buildings, a fine range of apartments erected in 1822, at an expense of 20,000*l*., by a joint-stock company of 200 shareholders: the buildings, as already stated, contain, besides the portion appropriated to commercial purposes, an hotel, news-room, and assembly-rooms.

The trade of Belfast is greater than that of any other town of Ireland. The value of its imports and exports (foreign and coastwise), in 1835, amounted to 8,637,232*l*., while the value of the imports and exports of Dublin, during the same year, was only 6,958,864*l*. Of the exports from Belfast, in 1835, amounting to 4,341,794*l*., the principal articles were:—

	Quantity.	Value.
Corn, Meal, and Flour	285,955 cwt.	£144,957
Provisions	340,226	906,597
Linen Yarn	43,525	40,360
Feathers, Flax, and Tow	73,652	186,894
Cotton Manufactures	7,363 pack.	146,260
Linen do.	53,881,000 yards	2,694,000
Horses	2,374	35,580
Eggs	2,850,000	5,930

The imports, amounting, for the same year, to 3,695,438*l*., consisted principally of linen yarn (960,000*l*.) cotton and woollen manufactures, and raw cotton; tea, sugar, and other colonial products, haberdashery, coals, iron, &c. (*Reference to p. 75.*)

The most important branch of commerce is the cross channel trade, which, since the introduction of steam navigation, has increased to an extraordinary magnitude.

Numerous steam-boats ply regularly between Belfast and the principal British ports. The passage to Liverpool, Glasgow, and Dublin, is made by them in 14 hours each, at an average, and to London in 140 hours. There is an extensive trade with the U. States and the British colonies in N. America, and with the W. Indies, Mediterranean, Baltic, and Archangel. The number of vessels that entered inwards in 1835 was 2,445, and in 1836, 2,730; that of those which cleared outwards in the same years, 1,391 and 2,047. In 1833 there belonged to the port 25,151 tons shipping, and in 1836, 34,596 tons. The customs duties, including those of Larne and Donaghadee, in the undernamed years, were—

	£	1834	£
1829	259,599	1835	287,756
1830	254,044	1836	275,575
1831	301,281	1837	366,718
1832	216,281	1838	374,856
1833	228,945		316,175

In the excise department Belfast forms part of the Lisburn district, the amount of duties of which, in the undernamed years, were—

	£	1834	£
1829	242,064	1835	165,374
1830	309,547	1836	213,677
1831	167,045	1837	219,750
1832	296,301	1838	197,309
1833	179,487		308,129
1835	151,267		

The post-office revenue for 1834 was 10,312*l*., and for 1836, 11,785*l*.

In the appearance of the town, and in the habits of the people, the character of Belfast is almost exclusively commercial and manufacturing. There are in it few of the landed aristocracy: its higher classes are formed chiefly of those who have attained an elevated position in society by their personal exertions, or those of their immediate progenitors. There is, therefore, little of external show, but much of internal comfort, in their domestic arrangements. The middling classes enjoy all the comforts, and many of the luxuries, of civilisation; the working classes have suffered less from the pressure of distress, arising from temporary stoppages of trade, or manufacturing employment, than those of most of the other great towns similarly circumstanced: on the whole, there is to be seen here little of the aspect of destitution which marks the suburbs of most other Irish towns. The official and other documents, which have supplied the data already given, show, by a review of its condition at different periods, that it is steadily and rapidly advancing in manufacturing, commercial, and literary improvement. (*Private Correspondence.*)

BELFAST, a sea-port town of the U. States, Maine, on the N.W. angle of Penobscot Bay, 224 m. N.E. Boston. Pop. 3,077. It has an excellent harbour, and is a thriving town.

BELFORD, a market town and par. of England, co. Northumberland, Banborough ward. The par. contains 9,380 acres, and 2,030 inhab., of which the town is 1,354. The latter is finely situated on the great road from York to Edinburgh, and has a considerable corn-market.

BELGARD, a town of Prussia, prov. Pomerania, cap. circle, 16 m. S.S.W. Coeslin. Pop. 3,000. It is situated at the confluence of the Leitznitz with the Porsante, and is almost entirely surrounded by water. It has an old castle, 3 churches, 2 hospitals, and fabrics of cloth.

BELGAUM, an inh. town of Ilindostan, prov. Beja-poor, presid. Bombay, distr. Darwar, in a small subdivision of which it is the capital, 105 m. S.W. Bejapoor, 55 m. N.W. Darwar; lat. 5° 52' N., long. 74° 42' E. Pop. (1820) 7,650. It is strongly fortified, with massive and solid walls, ramparts flanked by bastions, a broad and deep ditch, and is surrounded by an esplanade. Its interior is extensive, but covered with ruins of native buildings, amongst which are two ancient temples. This town is well supplied with water, and held out against the British longer than any other garrisoned by the peishwa's forces: it was, however, taken in 1818. The subdivision of Belgaum has a healthy climate; but all external trade is stopped for six months a year by the violence of the rains. A third part of the inhab. are Maharattas, and about one sixth Mohammedans, one eighth Jains, and one ninth Brahmans. (*Hamilton's E. I. Gaz. i. 165.*)

BELGERN, a town of Prussia, prov. Saxony, on the Elbe, 7 m. S.E. Torgau. Pop. 2,800. It is very ancient, has an hospital, and a town-house, before which is a triumphal column. It has some trade in corn.

BELGIOJOSO, a town of Austrian Italy, prov. Pavia, cap. distr., 9 m. E. Pavia, and 23 m. S.E.E. Milan. Pop. 3,000. It is situated in a fruitful plain, between the Po and the Olona; is well built, has a magnificent aqueduct, and a fine castle, in which Francis I. spent the night subsequent to the battle of Pavia.

BELGIUM (KINGDOM OF) is situated between France and Holland, and has been established since the separation of its provinces from those of Holland by the revolution of 1830. Its territory is small as compared with the great European states, being only about one eighth of that of Great Britain, while its population but little exceeds four millions. However, the important position which this country has occupied in the political, military, commercial, and agricultural history of Europe — its former celebrity in manufactures and the fine arts — and its present rapid progress in every industrious pursuit and social improvement, give it a peculiar interest.

Extent, Boundaries, Area, &c.—Belgium extends from 49° 27' to 51° 31' N. lat., and from 2° 37' to 6° E. long. On the N. the boundary line is formed by Holland, along a line of 380,000 metres*; on the E. by Prussia,

* A metre = 3·281 English feet.

377,000 metres; on the S. by France, 591,000 metres; and on the E. by the North Sea, 69,000 metres.

The general outline of the territory, as determined by the treaty signed in 1811, by the allied courts of Great Britain, Austria, France, Prussia, and Russia, forms a triangular figure, of which the longest side extends on the frontier of France, from a point midway between Furnes and Dunkirk to one 9 m. S.E. of Arlon, or 5 E. from Longwy. The parts agreed by the treaty to be ceded to Holland are, first, a portion of the province of Luxembourg, on the E. of an irregular line drawn from the point just mentioned to one on the Prussian frontier, about 17 m. S. of Malmédy; and, secondly, the portions of Limburg on the W. of the river Meuse, including the city of Maastricht, in a deviating curve, and on the N. of a line from Stevenweert, on the Meuse, to one on the Dutch frontier, 4 m. W. of Weert. Since the revolution of 1830, the Dutch have retained possession of the cities of Maastricht and Luxembourg; of the communes of Bar le Duc, in the province of Antwerp, and of Saint Pierre, in Limburg; also of the forts of Lillo and of Liefkenshoek, on the banks of the Scheldt. If the treaty of the 15th of November, 1831, be executed, the towns of Maastricht, Sittard, Ruremonde, Venloo, and Weert, with 124 communes in Limburg; and the towns of Luxembourg, Grevenmacher, Remich, Diekirch, Echtenach, Vanden, and Wiltz, with 119 communes in Limburg, will belong to the king of Holland. The greatest length of the territory of Belgium from N.W. to S.E. is 64 leagues, of 5,000 metres, about 193 English miles; and the greatest breadth from N.E. to S.W. is 42 leagues, or about 127 miles. The whole area contains 3,422,574 hectares*, including the portions of Luxembourg and Limburg, which, though claimed by Holland, still continue to be the subject of diplomatic arrangement. The area of these disputed sections contains 477,000 hectares, so that, if appropriated by Holland, the Belgic territory will be reduced to 2,945,574 hectares, or to about two-thirds of its present area.

The kingdom consists of nine provinces — Antwerp in the N., East and West Flanders and Hainaut in the W., Brabant in the centre, Limburg and Liege in the E., Namur in the S., and Luxembourg in the S.E. These formerly constituted the duchy of Brabant, the marquisate of Antwerp, the principality of Liege, the seigneurie of Mechlin, the comtés of Flanders, Hainaut, Louvain, and Namur, and the duchies of Limburg and Luxembourg. At the time of the Belgic revolution, in 1830, the nine provinces of Belgium formed, in conjunction with those of Holland, the kingdom of the Netherlands, which by that event was dissolved into the present kingdoms of Holland and Belgium.

Civil Divisions. — Brussels is the capital, and seat of government, for the administration of which the kingdom is divided into the 9 provinces above enumerated, 44 arrondissements, 98 towns, and 2,640 rural communes. For military purposes it is divided into 9 commanderies, corresponding to the 9 provinces; and, lastly, for judicial proceedings, it is divided into 29 arrondissements, and 237 cantons.

The following Table exhibits the Numbers of these Divisions in each Province.

Province.	Chief City.	No. of Towns.	No. of Villages.	No. of Administrative Arrondissements.	No. of Judicial Arrondissements.	No. of Judicial Cantons.	No. of Communes.
Brabant	Brussels	8	365	3	3	34	336
Antwerp	Antwerp	4	138	4	4	19	141
W. Flanders	Bruges	10	279	3	3	36	253
E. Flanders	Ghent	11	279	3	3	34	235
Hainaut	Mons	21	308	6	3	72	404
Liege	Liege	7	380	4	3	28	219
Limburg	Maastricht	3	309	3	3	30	211
Luxembourg	Luxembourg	17	940	8	4	31	320
Namur	Namur	5	242	3	2	21	338
9	9	96	5,339	44	28	224	2,655

Belgium possesses 21 fortified towns, besides forts vis., in W. Flanders, Ostend, Nieupoort, Furnes, Courtrai, Ypres, and Menin; in E. Flanders, Audenarde and Termonde; in Antwerp, the city of that name and Lierro; in Hainaut, Mons, Tournai, Ath, and Charleroi; in Namur, the city of that name, Philippeville, and Marienburg; in Limburg, Maastricht, Hasselt, and Venloo; and in Luxembourg, the city of that name. At present the fortresses of Maastricht, Venloo, and Luxembourg, are garrisoned by Dutch and Prussian troops, as being claimed by Holland and the German confederation.

General Aspect of the Country. — The north and west provinces of Belgium, in their flatness, fertility, dykes, and canals, may be regarded as a continuation of Holland. This portion of the kingdom is so densely peopled, that it presents to the traveller the appearance of one vast continuous village. The south and east provinces

* A hectare = 2·471143 English acres.

have an opposite character: they are generally more thinly peopled, and less cultivated, and exhibit a most irregular, mountainous surface, with tracts of marshy land, and extensive forests. With the exception of these hilly districts in the south and east, the whole territory presents a series of nearly level plains, traversed by numerous streams, delightfully diversified by woods, arable lands, and meadows of brilliant verdure, enclosed by hedge-row trees, and thickly studded throughout with towns and villages.

In surveying the general face of the country, and proceeding from W. to E., we observe that the coast is uniformly flat, and formed of fine loose sand, which, by the frequent action of the sea winds, is raised into gently undulating downs, or *dunes*. These banks are sand extended, nearly without interruption, from Dunkirk, along the entire coasts of Belgium and Holland. In breadth they vary from one to three miles, and rise in the highest parts to 40 or 50 feet. They are formed entirely by the operation of the sea winds, in elevating the dry sands of the shore; and since they serve as a natural barrier to the encroachments of the ocean, it is an object of great importance to check their constant tendency to advance inland. For the purpose, therefore, of rendering the sand compact and stationary, the *dunes* are sown with a species of reed, *Arundo arvensis*, until a sufficient stratum of vegetable mould is collected to support plantations of firs (*Pinus maritima*), with which most of the Belgic *dunes* are thickly covered.

Though no part of the surface of Belgium be actually below the sea level, like that of Holland, yet, in common with the latter, its shore, in some parts, is defended from the encroachments of the sea by broad and elevated dykes; and whole districts, which formerly were alluvial morasses, have been drained and embanked, or have been raised entirely from the bed of the ocean. The embanked enclosures of this description are called *poolders*. On the sea coast, and along the lower banks of the Scheldt, they are very numerous, and some contain above 1,000 acres of rich alluvial soil, which is appropriated with great advantage to the purposes of agriculture, under which head will be found some further account of them.

To the S.E. of the *dunes* the provinces of West and East Flanders, and Hainaut, form a far-stretching plain, of which the luxuriant vegetation indicates the indefatigable care and labour bestowed upon its cultivation; for the natural soil consists almost wholly of barren sand, and its great fertility is entirely the result of very skilful management, and judicious application of various manures.

The undulations in the surface of the northern districts are so slight that, from the lofty top of the cathedral of Antwerp, the view, on a clear day, extends on every side over a radius of nearly 50 miles, including, on the E., the city of Turnhout; on the W. that of Ghent; and on the S. the city of Mechlin: the whole panorama towards the W. and S. displaying a beautiful succession of vivid, verdant fields, varied by masses of wood, streams, and picturesque villages. Around the cities of Antwerp and Mechlin are great numbers of elegant and highly ornamented country mansions, belonging to the wealthy classes. The northern parts of the provinces of Antwerp and Limburg are less varied and fertile than any others. The soil is for the most part composed of pure sand, very partially mixed with argillaceous earth. The largest unbroken plain in the kingdom is called Campine, and comprises the N.E. portion of Antwerp, and the N.W. of Limburg. It consists of marshes, desolate moors, peat bogs, and extensive tracts of sand, covered with heath, broom, and stunted firs. Some parts, however, contain natural prairies, and serve for pasturage to herds of excellent horses; and the portion of Limburg near the banks of the Meuse is fertile and carefully cultivated. The scenic character of Brabant resembles that of Flanders, with respect to its beautiful fields, and gardens, and luxuriant trees; but the surface is more varied by hills and valleys. In the province of Liege the N. bank of the Meuse overlooks a fertile plain, producing all kinds of grain and vegetables, and affording excellent pasturage for cattle, and for dairy husbandry; but the country on the S. bank of the river belongs to the mountainous district which constitutes the provinces of Luxembourg and Namur. Much of this comparatively wild and rugged region is covered with dense forests, which still furnish an asylum for the wild boar, the roe-buck, the bear, and the wolf. The surface is very irregularly varied, in some parts by large tracts of barren heath and marshy lands, and in others by ridges of hills, mantled on the slopes and summits with masses of dark woods, and by precipitous rocks, whose bare escarpments form a striking contrast with the brilliant verdure of the well-cultivated valleys they enclose. The hills are often intersected in different directions by deep ravines and rapid streams; and the romantic beauty of the scenery is much heightened by numerous ruins of old feudal castles. The course of the Meuse, from Dinant to Maastricht, offers some

very picturesque combinations of landscape and rock scenery. The river is closely shut in by lofty cliffs of various hues, some of which are surmounted by ruins of modern villas. Here they overhang the river and are beautifully shrouded with bushes of box, wild myrtle, and ivy; these they slope away to its margin, or vertically are cleft asunder, and present through the chasm a delightful view of highly cultivated farms and villages half hidden by trees in the distant uplands. The wild state of nature in Namur, Liege, and Luxembourg; the various fossil and mineral products; and the charms of the scenery, have long made this part of the country a favourite resort of the naturalist, the geologist, and the painter. All around the city of Liege, and the celebrated springs of Spa, ornamental villas of the rich are thickly stationed, where vineyards occupy the declivities of the hills, and hop-gardens flourish in the valleys.

Climate, Meteorology.—The climate of Belgium is less chilly and damp, and more temperate and favourable to health, than that of Holland; however, it is certainly humid, compared with France and Germany and may be considered as very similar to England, except that it is still more subject to frequent variations, with a tendency to excess. The provinces differ considerably in the character of their atmosphere. In general, the air in the more elevated central and N.E. districts is clear, fresh, and salubrious; but in the low N.W. plains it is damp and hazy. In the provinces of Flanders and Antwerp the N.W. winds from the sea produce a cold and ungenial temperature throughout the winter, which is long and often wet; and their influence upon the currents of the rivers, which are wholly unsheltered by hills, renders the adjacent country liable to disastrous inundations. The great atmospheric humidity, produced by fogs from the sea, and the unwholesome miasma exhaled from extensive tracts of low marshy and alluvial lands enclosed by dykes and ditches, and in almost stagnant canals, occasion annual visitations of dangerous fevers. The neighbourhood of Fumes, in West Flanders, is rendered especially sickly by the miasmata from these sources. The provinces of Hainault, Namur, and Luxembourg are accounted most worthy of preference, with regard to healthiness; and the two Flanders, though first in cultivation, must, in point of salubrity, be placed last. The air of the polders is generally unhealthy, and affects those not inured to it with fever and ague. Speaking of the whole kingdom, it may be stated that the winter, or rather the rainy season, often comes on precociously and continues late; and that the summers are either very hot and dry, or extremely wet. November and April are nearly always rainy; the transitions of temperature are frequent and sudden, so that in the same day are experienced oppressive extremes of heat and cold. The most violent winds are from the S.W., and the most frequent from the N. and the W. A W. wind most frequently, and E. wind most rarely, brings on rain. From observations made at Brussels during three successive years, the medium height of rain which fell in one year was 633 millimetres*; the extremes were 761 and 511. The number of rainy days in 1834 was 166; in 1835, 161; and in 1836, 198. The medium temperature of the year is 10.52 centigrades, and it is well represented by that of October and April. The temperature of the hottest month is 20.36°, and of the coldest 0.85°; difference, 19.51°. At Brussels which is nearly the centre of the kingdom, the medium height of the barometer, in 1836, was 754.82.

Mountains.—No elevation in Belgium is properly entitled to the appellation of mountain. A ramifications of the chain of the Ardennes extends in a N.E. direction through Luxembourg, Namur, and Liege, and forms a mountainous crest, which separates the waters of the Meuse from those of the Moselle, towards each of which it gradually descends. Another offshoot of the Ardennes rises parallel with this, on the N. banks of the Sambre and Meuse, between Mons and Maestricht. The highest points of elevation are about 2,300 ft. above the sea; and one of these is the hill which overlooks the celebrated springs and town of Spa.

Forests and Woods.—A space of nearly 650,000 hectares, or one fifth of the whole surface of the kingdom, is covered with forests and woods. All the common trees of Europe are abundant; as the oak, poplar, pine, fir, larch, ash, beech, maple, aspen, plane, linden or lime, chestnut, birch, elm, alder, and numerous others. Plantations for hop-poles, oak bark, and firewood, occur frequently throughout the western provinces. Hainault has several forests of fine oaks; but by far the most thickly wooded provinces are Namur and Luxembourg, in many parts of which the soil is less fertile, and better adapted for the growth of timber trees than for the cultivation of corn and grasses. The forests belonging to the state, to the communes, and public institutions, occupy 194,000 hectares, and are submitted to an established system of public management. From the oak timber of the forests of Luxembourg are derived immense supplies of charcoal,

* A millimetre = 0.03937 in. English.

for the iron-works in that part of the country. The bark forms a considerable branch of commerce, and is principally exported to England.

The forest of Solignies, between Brussels and Waterloo, so interestingly associated with the memorable battle in that locality, is 9 m. in length by 8 in breadth, and contains 11,988 hectares, or 29,041 acres. The timber is valuable for building, and a thousand acres of it are possessed by the Duke of Wellington, in connection with his title of Prince of Waterloo. The forests in the provinces of Namur, Liege, and Luxembourg, are remains of the immense ancient forest of Ardennes, which covered a great extent of the country between Bonn and Rheims. "Sylvæ Arduenna, quæ ingent magnitudinè flumine Rheno ad initium Rhenorum pertinet." (*Cæs. Com. v. 3.*) The romantic forest of St. Hubert, on the W. side of the province of Luxembourg, between Marche and Neufchâteau, is Shakespeare's "Forest of Arden." A general woody appearance is given to even the most cultivated parts of Belgium, by the custom of planting trees in the hedge enclosures of the fields; the principal roads are also lined by double rows of majestic lindens, and the canals are usually shaded by rows of poplars, beeches, and willows. The Belgian proprietors of land derive a large and secure income from the produce of timber and underwood, independent of rent; and planting is, therefore, sometimes prosecuted to a greater extent by the landlords than is consistent with the convenience and advantage of the occupiers of farms. The latter, however, are remunerated by the use of a certain share of the wood.

Extensive artificial woods of Scotch pine are created by sowing about six pounds of seed to an acre, generally on the poorest soil, which is prepared by burning the heathy surface, and scattering the ashes. In six years many barren tracts are converted, in this way, to flourishing plantations of firs, from 5 to 9 ft. in height. The preservation of trees is very strictly enjoined, not only by proprietors, but by the government. Every farmer is compelled to destroy caterpillars, and remove every other cause of injury to the trees on his premises. All the trees on the public roads, besides those of the numerous royal forests, belong to the government, and the laws for their management are enforced with great vigilance by inspectors appointed for that purpose.

Rivers.—Belgium is one of the most efficiently watered countries in Europe. All its streams belong to the North Sea. The Scheldt, in the W., and the Meuse, in the E., can alone be properly denominated rivers. They traverse the kingdom generally in a direction from N. to S. Minute descriptions of the country enumerate about 40 rivulets, which form the lateral branches of these two principal streams; but though their utility, in fertilising the soil by irrigation, and as feeders of canals, is highly important, they can hardly be entitled to special notice in a general account of the physical features of the territory.

The Scheldt rises in France; flows through Cambray, Valenciennes, and Condé; and enters Belgium on its confluence with the Scarpe, a few miles S. of Tournay; through which town it passes, and pursues a northerly course to Ghent, where it receives the Lys. Thence it flows tortuously to Termonde, whence, turning northward, it is augmented by large tributary streams on each side, and becomes, before the walls of Antwerp, a majestic river, 2,000 ft. in width, and navigable for fleets of the largest ships. The length of its course in Belgium is 212,000 metres, and the upper half, and several of its affluents, are navigated by boats of 200 tons. The Meuse also rises in France, and enters Belgium on the S. of Dinant, through which town it flows to Namur, where it receives the Sambre; then turning eastward it passes Andenne and Huy, to the city of Liege: there resuming its northerly course, it continues through Maestricht, and winds across the N. W. of Limburg into Holland and the North Sea. The length of its course in Belgium is about 126,000 metres. It is navigated by large strong boats, from 100 to 150 tons. From Liege to Venloo the navigation is particularly difficult. The affluents of the Meuse at Liege descend in some parts of their courses at an angle of 40°, and the long narrow boats, which shoot down with the velocity of an arrow, are drawn up by ropes and pulleys. The principal affluents of the Scheldt, on the E., are the Dendre, and the Seneffe, Dyle, Geste, Demer, and Nothe, which unite below Mechlin, and flow into the Scheldt, in the channel of the Rupel. On the W. it receives the Lys and Durme, and communicates with several canals.

Of these rivers, belonging to the basin of the Scheldt, the following are each navigable to the extent expressed in metres:—

The Demer, in Limburg and Brabant	- - -	31,000
Dendre, - Hainault and East Flanders	- - -	67,650
Durme, - West Flanders	- - -	22,200
Dyle, - Brabant and Antwerp	- - -	22,900
Scheldt, - Hainault, E. Fland., & Antwerp	- - -	212,000

The Lys, - West and East Flanders - - 90,000
 Nethe, - Limburg and Antwerp - - 13,000
 Itupel, - Antwerp - - - - 12,000
 The Meuse on the E. is joined by the Semois, Lesse,
 Ourthe, Ambieve, Vesdre, and Roer; and on the W.
 by the Sambre, Jaar, and several smaller streams.
 The rivers belonging to the basin of the Meuse are
 navigable as follows:—
 The Meuse, in Namur, Liege, & Limburg - - 125,000

The Ourthe, - Luxemburg and Liege - - 102,000
 Sambre, - Hainault and Namur - - 94,356
 Vesdre, - Liege - - - - 30,000
 Ambieve, - Liege - - - - 10,000
 The Our, Sure, and Azette, in Luxemburg, flow into
 the Moselle, near the town of Treves, and belong to the
 basin of the Rhine. The Sure is navigable in Belgium
 62,000 metres, the Moselle 37,000, and the Yser 41,540.
 The total length of navigable rivers is 992,746 metres.

The following TABLE, constructed from recent official documents of the Belgic Government, exhibits, in hectares, the Space occupied by each Division of the Surface, and the different Objects to which the Soil is appropriated:—

	Antwerp.	Brabant.	W. Flan- ders.	E. Flan- ders.	Hainault.	Liege.	Namur	Limburg.	Luxem- burg.	Whole Kingdom.
Superficial extent -	293,310	328,322	323,449	299,787	372,206	289,319	366,181	460,000	700,000	8,422,574
Arable Lands -	118,413	227,933	199,114	209,625	236,423	130,620	145,226	250,000	200,000	1,717,354
Prairies and Meadows -	35,190	35,792	66,509	34,926	48,256	79,933	30,328	37,000	77,700	439,594
Gardens and planted Grounds -	6,321	-	5,316	7,096	7,891	5,014	5,744	6,700	5,350	66,002
Hop Fields -	-	428	-	40	568	221	5	-	-	1,262
Vineyards -	-	30	-	13	-	164	2	-	700	929
Forests and Woods -	32,632	42,996	33,546	30,137	60,810	54,300	125,541	55,000	215,000	649,952
Ponds and Reservoirs -	1,398	661	279	1,200	770	82	283	1,300	350	6,223
Sites of Buildings, Yards, and Courts -	2,301	2,612	2,916	3,961	3,261	1,675	1,277	1,800	1,600	21,385
Roads, Canals, Streets, and Squares -	6,787	8,060	5,665	7,388	8,766	7,505	7,523	9,100	14,060	74,844
Rivers and Brooks -	3,027	804	757	2,437	7,721	2,023	1,558	1,700	2,000	15,126
Spaces devoted to various public purposes -	1,777	83	4,740	1,839	1,100	212	251	500	210	10,712
Uncultivated Tracts -	75,554	1,262	4,607	1,126	3,661	13,608	48,943	97,000	183,130	428,291

It hence appears that the whole extent of surface under cultivation is nearly 2,220,000 hectares; that one half is arable, and nearly one eighth is prairie and meadow; that forests and woods cover 650,000 hectares, or above one fifth; the sites of buildings about 1-160th part, and the uncultivated lands about one eighth. Thus 15-17ths of the territory are occupied in a profitable manner, without including roads, canals, &c., which cannot be deemed unproductive.

Geology, Mineral Products.—West and East Flanders are composed of horizontal strata of white, yellow, and grey sand, and clay, separate, and mixed in different proportions. When the stratum of sand forms the surface, the soil is arid, and of difficult cultivation; and it is rich and fertile in proportion to the depth at which the sand lies below the vegetable deposit. Numerous beds of turf prove the ancient existence of marshes. The only mineral product of these provinces is clay, for the manufacture of tiles, bricks, pottery, and pipes. In some localities it contains oxide of iron. The sand stratum, in W. and E. Flanders, is deep, and constitutes one fourth of the area. In deep wells, descending to the primitive formation, alternate beds of sand and clay are found mixed with marine shells, which are evidently deposits of the ocean, and prove that, in remote ages, this whole region was submerged under its waters. Four or eight feet below the surface, where it is of clay, are the beds of peat or turf, varying in depth from 4 to 12 ft. To the poorer classes it supplies a cheap fuel, and its ashes, mixed with sand, are much used as a very successful manure for clover and grain. Turf is also produced plentifully in the province of Luxemburg, and in several other parts of the kingdom. Silicious pebbles, agates, calcadons, and red cornellans, are found in the sand and clay of E. Flanders, and many vegetable and animal petrifications. Among the latter are large antlers of deer, and horns of oxen; with bones of the horse, ox, dog, and wolf. Vegetable fossils, consisting of various productions of the soil, are frequently obtained by the peasants for fuel. They include numerous trunks of the oak and ash, which are hard, black, and pollable, and polished ashes in combustion. The geological character of the province of Antwerp and of the N. part of Brabant, is similar to that of the western region; and the ocean apparently once covered the whole northern half of the kingdom, as well as the plains of the W., for the hill on which Brussels is built contains many marine remains.

The rock strata of Hainault exhibit three successive formations: the first, or lowest, is composed of porphyry and quartz; the second of calcareous earths, coal, and schist; and the third comprehends argillaceous earth, with deep deposits of sand, and various debris.

In the high south-eastern districts strata of red sandstone and limestone, containing organic remains, are incumbent upon rocks of granite, quartz, and slaty schist, which have generally an inclination or dip from N.E. to S.W. Descending thence towards the N.W., the rocks of sandstone, limestone, quartz, and schist, containing vast beds of anthracite, form a basin extending about 40 m. around the city of Namur. The strata of these rocks are often nearly vertical, so that the large coal pits in the vicinity of Namur and Mons require to

be worked by shafts resembling wells. Namur produces, besides coal, abundance of carbonated lime, siliceous, excellent clays for the manufacture of porcelain, common pottery, and pipes, and a sand from which crystal is obtained. Pebbles susceptible of a beautiful polish are found about Flours. The S. and E. portions of Belgium, comprehending Hainault, Namur, Luxemburg, and Liege, are especially interesting to the mineralogist, as containing almost every article in the geological inventory, especially iron, coal, marble, various kinds of stone and slate, copper, lead, zinc, manganese, calamine, sulphur, alum, &c. Curious animal fossils are found in the province of Liege, where numerous caverns in the hills furnish bones of the bear, hyena, elephant, rhinoceros, and fragments of the human skeleton. Near Maestricht is a subterranean labyrinth, extending several miles in length and breadth, in rocks of soft yellow stone under the hill of St. Peter, where are found the shells of large crabs and turtles, and the bones of gigantic lizards above 20 ft. in length. The numerous rocky valleys, by which the south-eastern half of the territory is intersected, have apparently been formed, not by the corrosive action of water, but disruption of rocks, which subsequently afforded channels for the present rivers and streams. At the village of Han, on the river Lesse (Hansur-Lesse), in the S.E. of Namur, an immense cavern extends nearly a mile through the limestone rock, and forms the subterranean channel of the Lesse. The numerous and spacious compartments of this remarkable cavern are naturally ornamented with clusters of glistening stalactites, and offer combinations of the grotesque and wonderful that remind the spectator of the celebrated grotto of Antiparos. Scientific descriptions of it have been given by Quetelet, Klxx, and Vander Maelen.

The working of mines constitutes a most important part of the national industry of Belgium. The mining districts form three divisions of the territory. The first is in the province of Hainault, and contains 155 mines, occupying an area of 102,415 hectares; the second, in the provinces of Namur and Luxemburg, contains 89 mines, covering an extent of 30,000 hectares; and the third, in the provinces of Liege and Limburg, comprehends 136 mines, and 34,777 hectares: total 382 various mines, occupying 165,922 hectares, or 65 square leagues of 5,000 metres. In estimating the relative value of the mineral products of Belgium, coal must be considered first in order, and of the highest national importance, as furnishing the greatest amount of advantages to the country. This branch of industry is in full prosperity, and its immense produce amply supplies the manufacturing and domestic consumption of the kingdom, and is largely exported to France. The annual quantity extracted from the coal fields of Hainault alone is larger than the whole produce of France.

The three great centres of the coal mines, which are at Mons, Charleroi, and the city of Liege, produce annually 3,200,000 tons, besides other considerable mines in Namur and in Limburg, where, at Kerkraede, the value of the annual produce of one mine is 240,000 francs. In 1836 the extraction of coal was carried on in Belgium in 457 stations, established on 250 mines, which employed the labour of 31,190 workmen, and produced 22,000,000 hectolitres, worth, at least, 32,000,000 francs. In France,

at the same time, the number of coal mines in operation was 198; workmen, 17,500; quantity produced, 20,000,000 hectolitres; and value, 19,000,000 francs.

Previously to 1836 the maximum price of a ton of coals at Charleroi was 6 francs, and in 1837, it was 19 francs. The words *houille* and *houillères*, the common Belgic expressions for coal and coal pits, are derived from Houille, the name of a blacksmith, who, in 1798, first discovered coal in the province of Liege.

Mines of iron are numerous in the district between the Sambre and the Meuse; and many are worked in the provinces of Luxembourg, Liege, and Limburg. In quality the metal resembles that of Franco, but the price is lower. In 1836 the forges of the country wrought up 456,000 tons of prepared ore, which corresponds to double that quantity, or 912,000 tons, as taken from the mines.

Copper is found in the provinces of Hainault and Liege; and lead in Liege, Namur, and Luxembourg. The lead mine of Longvilly, in Luxembourg, is the largest in the kingdom. Zinc is obtained in Namur and Hainault; manganese in Liege; and pyrites, calamine, sulphur, and alum, in Namur and Liege.

The region included between the frontier of France and a line drawn from Ostend to Arlon, in the S. of Luxembourg, abounds in excellent materials for building. — freestone, limestone, granite, paving slabs, slates, &c. there are also many quarries of excellent marble of various kinds. The black marble of Dinant is highly valued, and a species called *petite granite*, in which are found many marine organic remains. Superior large slates are quarried in the provinces of Namur and Luxembourg. At Herbemont, a little to the W. of Dinant, is the most important slate quarry in the kingdom, producing annually above 8,000,000 slates. The price at the quarries is about 14 francs per thousand. Sandstone is quarried in Liege and Limburg, but chiefly in Hainault. Ample supplies of excellent millstones, grindstones, whetstones, &c., are furnished from the stone quarries of Liege and Luxembourg; and the hones from the quarries near Spa are not exceeded in quality by any in Europe, to all parts of which they are exported.

Mineral Waters. — Belgium possesses several springs of medicinal mineral waters. Those of Spa, on the S. W. of the city of Liege, are celebrated throughout Europe. They issue from seven different sources, of which the one named the Pouhon is the principal. The water is perfectly clear, but gives, after standing, a slight deposit of ochre. It has an acid, ferruginous taste, and bubbles of gas continually escape at the surface. The quantities of iron and carbonic acid which it holds in solution are greater than in any other known mineral water. Its temperature is 50° Fahr., and the specific weight 1.0068. Numerous maladies are believed to be removed by using it for drinking and bathing. About a thousand bottles of it are daily sent to foreign parts, and the annual number of visitants at the spring amounts to between two and three thousand. The establishments for their accommodation are convenient and elegant; and the scenery of the vicinity affords ample amusement for the admirers of the picturesque; but as Spa is the favourite resort of speculating and reckless votaries of fashion, it is too true that the authorised system of gambling produces a great amount of evil to oppose to the good effected by the virtues of the water.

The hot springs of Chaudfontaine, in the same locality, but nearer to Liege, are also much visited, and others at Morimont, near Namur. At the ancient town of Tongres, near Maestricht, is a mineral fountain of a temperature about 60°. Pliny thus describes it, and it still retains its ancient properties: — "Tungri, civitas Gallie, fontem habet insignem pluribus bullis, stilantem, ferruginei saporis quod ipsum non nisi in fine potas intelligitur. Purgat hic corpora, tertianas febres discutit, calculorumque vitia."

Animal Productions. — All the domestic animals of the other countries of Europe are found in Belgium. Among the wild animals are a few boars, roebucks, bears, and wolves, which still find refuge in the immense forests of Luxembourg. Foxes are not numerous, but all the common kinds of game, quadrupeds, and birds, are plentiful in the woody parts of the country; especially in Namur, Luxembourg, Liege, and Limburg. The heaths of Verviers, in the province of Liege, are believed to be the only spot in Europe where the great heath cock, *grand coq de bruyère*, can be found.

Horses. — Flanders has long been famous for its breed of work-horses, and by their frequent importation into England, the English draught-horse breed has been much improved. The Suffolk punch-horse very nearly resembles the species most common in Flanders. The colour of the Flemish horses generally is chestnut, in all its shades, and roan. They are of the true working character, remarkably docile, and possessed of superior bulk and strength. The chief defect occasionally observable in their form is, a want of depth in the girth, and a dip

behind the withers, but in all other respects they are finely shaped. A small head and pricked ear rising neck and crest, short back and couplings, great strength over the loins, round hips and lengthy quarters, open chest, a good arm, short legs of powerful sinew, short pasterns, semicircular hoofs, with a round frog and open heel — these points, comprised in a compact form, with a height of about 15 hands, constitute a work-horse of great merit, which, when three years old, can be purchased at 20 or 30*l*. They are kept in excellent condition, and are shod with so much care that the defective foot or lame horse is never to be seen. A dietary system is observed with great precision and regularity. Chopped straw is invariably given with oats, and the water is always well whitened with meal of rye, oats, or barley. Clover is the common fodder in summer, and carrots in winter, never omitting the chopped straw and meal-water. Of late the Belgic horses have been materially improved by propagating from select breeds, and judicious crossing. Every farmer in Flanders breeds his own work-horses; but the business of breeding is only a subordinate and accessory branch of husbandry. The polders and prairies of Antwerp afford pasturage to numerous Flemish horses; and there are in E. and W. Flanders a great many fairs, at which they are sold for exportation to France and England. Belgium produces several other varieties of the horse, among which the Luxembourg cob is a valuable breed, and has been imported into England for its excellent qualities, as a very compact and powerful little horse, short-legged, well-boned, about 13 or 14 hands in height, and equal to carrying the heaviest rider, as well as fit for hard work in harness. The Belgic government, with the view of improving the native breeds of horses by crossing them with those of England, has formed, at Evreux, a beautiful stud of about 40 stallions, and appointed stations for them in all the provinces. The beneficial result of this expedient, which has been in operation since 1834, is already apparent in the production of a very superior race of horses, which in future will prevent the necessity of importing, as hitherto, the greater part of those required for the road and saddle. The government also awards premiums to the proprietors of winning horses at the public races.

In Flanders the eager thriftiness of the farmer induces him to put his colts to hard work often at the age of 18 months, which is long before the requisite strength is acquired; and the consequence is very injurious. Horses are employed for all kinds of work in harness; but the peasantry commonly prefer making use of asses for riding, especially in the sandy districts along the sea shore. At an average of the last 14 years, the horses in each province were: —

Antwerp	-	14,396	Liege	-	23,618
Brabant	-	31,604	Limburg	-	26,030
W. Flanders	-	23,986	Luxembourg	-	34,386
E. Flanders	-	27,475	Namur	-	21,547
Hainault	-	47,303			

In 1830, the number of draught horses in the whole kingdom was 213,512.

Horned Cattle. — The breeding and management of all kinds of live stock in Belgium are much less exemplary than the culture of the soil. The cattle are the short-horned Dutch breed, but they are not in general so well formed as in Holland. Indeed, but little attention appears to have been devoted to the niceties of breeding, and the advantages of selection. The colour is, for the most part, black, and black and white. Flanders, W. and E., contain more than 252,000, many of which are fattened and sold. The oxen are larger than the cows, and weigh, when fattened, from 6 to 8 cwt.; but the same eagerness for gain which occasions the too early working of the horses, induces the farmer to hurry his oxen to market at about two years of age, before they are perfectly fattened. The same penurious spirit is apparent in the practice of having, in general, only 1 bull to 150 cows; and in some localities to upwards of 200. Numerous herds of cattle are reared on the wild herbage of the large forests in the central, S., and E. parts of the kingdom, and are finally fattened on oil-cake, at a very small expense. No part of Belgium produces better oxen and calves than the prairies of the great Campine plain, between Antwerp and Maestricht. Cows are kept in great numbers on the pastures about Furnes and Dixmude, in W. Flanders, and a large quantity of butter is made for exportation. In their cow stables, the Flemish farmers preserve the temperature of the month of May; indeed, so much attention is paid to the state of these places, that Mr. Ratcliff, in his *Agricultural Survey of Flanders*, speaks of having taken coffee in one of them, with the proprietor, in the middle of winter, without having been in the least incommoded by cold, dirt, or offensive odour. For the preservation of cleanliness, they adopt an odd expedient, which is very common in Holland, keeping the cows' tails erect, by means of a cord which passes over a pulley in the roof. The usual food in summer is

chiefly clover; and in winter, turnips, which are rather poor and small, with carrots, potatoes, a very little hay and straw, and the white soup which is given to horses; consisting of tepid water, thickened with oat, rye, or barley meal, and a small portion of oil-cake. However, not only the breed, but the treatment of cows in Flanders is regarded, by English writers, as very inferior. They are constantly confined to the stalls; and as the clover and other forage crops are there consumed in their green state in the summer, a deficiency of roots in the winter reduces their diet to dry straw, so that, as M. Vandermaelen remarks, they are often so emaciated in the month of May as barely to be able to walk; and Mr. Pryse Gordon, in his work on Belgium, states, that their wretched state in the spring is almost incredible; that they resemble those of Shetland, which, in scanty seasons of the year, are fed on dried stockfish; or the cows of the N. Cape, which are occasionally kept alive on pickled salmon! In the forest of Solignee, and other parts of Brabant, the cattle are large and coarse. The Belgians, in fact, do not yet appear to be generally aware that animals of a moderate size are more profitable than those of larger dimensions; that light, compact, and short-legged horses are most enduring for work requiring not strength alone, but activity; and that small and slight-framed cows, such as the Alderney, Suffolk, and Ayrshire breeds, produce more and richer milk than many larger kinds.

The Belgic government has, for some years, taken much pains to introduce superior breeds of cattle; and the proprietors are gradually becoming convinced of their interest in effecting a change in their kind of stock, though the characteristic tenacity with which they cling to old-established notions, still greatly retards the beneficial accomplishment of the government plans of improvement.

On an average of the last 14 years, the annual produce of cattle in the whole kingdom was 898,076; and, on the same average, there were in each province the following numbers:—

Antwerp	-	88,412	Liège	-	83,576
Brabant	-	98,234	Limburg	-	104,340
W. Flanders	-	132,096	Luxemburg	-	120,360
E. Flanders	-	120,917	Namur	-	54,327
Hainault	-	92,414			

In 1830, the number of draught oxen employed in agricultural labour was 28,169.

Sheep.—On the farms of Belgium, the sheep stock is generally a secondary object of attention. There are two principal indigenous breeds, the Flemish and the Ardennaise. The indigenous Flemish sheep is a tall, thin, long-eared animal, furnishing a coarse long wool, and the worst kind of mutton. The Ardennaise breed is smaller, and, from ranging over the sweet wild herbage of the hills of Liège and Luxembourg, the mutton acquires an excellent flavour, but the wool is not of superior quality. The mode of feeding sheep in Flanders accounts for much of their bad qualities: they are housed at night, and during the day are followed by the shepherd and his dogs, along the lanes, pathways, and margins of arable fields, where they barely pick a subsistence, and never enjoy the range of a sweet and wholesome pasture. In winter they are let out, for a short time, but once a day, and are fed upon rye, straw, and hay; and though three or four years would be required to fatten them, they are slaughtered at one year old, in a condition, says Mr. Ratcliff, very nearly that of carrion. The sheep which are fed on the prairies of the Campine plain produce the best wool of the kingdom; and that of the Ardennaise breed is next in quality. The wool and mutton of the flocks of Namur are considered comparatively good. Some fine specimens of the Leicester and Cotswold breeds, which have recently been imported from England, are expected to produce a much improved race, that will supersede the present inferior kinds. The total number of sheep in the kingdom is about 750,000; but the country is capable of feeding a much larger number, for, while subject to the dominion of the French empire, when agriculture suffered great disadvantages, it possessed upwards of a million.

The following are the numbers of sheep in each province, on an average of the last 10 years:—

Antwerp	-	23,719	Liège	-	115,149
Brabant	-	34,884	Limburg	-	127,942
W. Flanders	-	39,673	Luxemburg	-	181,929
E. Flanders	-	36,393	Namur	-	109,800
Hainault	-	79,884			

Pigs.—The Belgic swine are similar to those of France, and have more resemblance to the greyhounds than the hogs of England. Their long and thin bodies are mounted upon fleet and lengthy legs, and the ridge of their back describes the arc of a circle. Herds of these animals are turned into the forests, where they feed abundantly upon the beech mast and acorns that strew the ground. They make very good pork and bacon after having been long and well fed; but this kind of

meat is the dearest in the market. Better breeds have been imported from England; and, from the prolific nature of the animal, they will probably soon become numerous and beneficial. A few pigs are reared by every farmer in Flanders for domestic supply of pork, which is the common animal food of the working classes; but the markets are supplied by distillers and millers, who have great facilities for feeding with the refuse of their establishments.

Fish.—Fresh-water fish abound in most of the larger streams. Those of the finest quality are found in the S. parts of the kingdom. The principal kinds are pike, trout, carp, perch, tench, eel, lamprey, sturgeon, salmon, barbel, shad, gudgeon, whitebait, anchovy, and eelgrass, or fresh-water lobster.

In the fishery off the sea-coast, and in the mouth of the Scheldt, are taken skate, plaice, bret, soles, turbot, dab, angeli, whiting, smelts, lobsters, crabs, pilchards, shrimps, &c.; and from the deep sea fishery are supplied cod, herrings, oysters, mussels, &c. The dog-fish (*chimaera*) does much mischief to the fishery of the Scheldt, that the government gives a reward for its destruction. About 200 boats are employed in the cod and herring fisheries, the produce of which has always been the subject of a considerable commerce. In 1837, the importation of cod at the port of Ostend was 8,175 tons. The national fishery is rapidly increasing, and premiums, amounting to 40,000 francs, are annually awarded by the government for its promotion.

Agriculture.—In consequence of the new political system adopted in Belgium since the Revolution of 1830, every branch of industry has been greatly improved and extended. The construction of numerous roads, railways, and canals, has produced an enormous increase in the value of land and buildings, amounting, in several whole districts, to 4th of former estimates; and the government has established an especial council, charged with the care of ascertaining the means of promoting the interests of agriculture. At Brussels has been formed a veterinary and agricultural college on a large and liberal scale, which is expected to effect many beneficial improvements, especially in the breeds of live stock. The natural soil of Belgium is composed of moor sand and clay, combined in various proportions. The clay alone contains the nutritive properties required for the support of vegetation, but without a due admixture of sand, to render it porous and friable, it is perfectly sterile, from its too great adhesiveness, retention of water, and liability to become baked by the sun. The artificial soil, in Flanders and many other highly cultivated parts of the country, is rich, black, and loamy, and possessed of great fertility, through the vast quantities of manure, vegetable and animal, which for ages have been constantly intermixed with the natural sand and clay. Although in Belgium the cultivation of the earth is carried to a great extent, 1-11th of the whole surface remains still uncultivated: 1-8th consists of grass-lands, the best of which are in the two Flanders; and the arable lands occupy one-half. The best are in the two Flanders, Hainault, and Brabant. In these provinces no waste land whatever is to be seen; but in Antwerp, Limburg, and Luxembourg, it covers a large extent of country. However, commercial associations are already formed for the purpose of cultivating the waste lands of the great Campine plain in Limburg, and for clearing some of the forests of Luxembourg.

Agriculture of the Polders.—The name polders is given to tracts of low alluvial soil, artificially gained from the sea or the Scheldt, by lofty embankments, and drained by numerous intersecting ditches, from which, in some instances, the superfluous water is continually pumped by the agency of windmills. These embanked enclosures are highly cultivated, and form an extensive chain of silted groves islands along the whole margin of the Scheldt and its affluent the Rupel, in the provinces of Antwerp and E. Flanders, and on the sands of the sea-shore. Twice a day the tides reach the broad and high dikes or embankments, which bound, on each side of the Scheldt, a wide extent of alluvial ground, and protect the adjacent country from inundation; and while the waters remain upon this surface they deposit a fine argillaceous and calcareous mud, the *débris* of various vegetable and animal substances, collected in their drainage of the loose and rich soils of Flanders, and brought from the ocean. These alluvial accretions, when first enclosed by dykes, become naturally covered by a fine tender grass, and are called in Flemish *schoors*. They are first sown with *colza*; that is, oleaginous colewort, *Brassica olivacea arvensis*, not the *Brassica Napus* of Linnaeus, but the *Brassica campestris* of De Candolle. The crops of this vegetable on the polders are always very abundant. When these enclosures have been completely brought into cultivation, which requires several years, they consist partly of natural meadow, affording excellent pasturage for numerous herds of cattle, and partly of arable lands, on which are raised the finest crops of all kinds of grain; especially

barley, 8 or 10 quarters per acre, and oats 10 or 12 quarters per acre. Two crops in the year are commonly obtained; no repose is given to the soil, and it needs no manuring; but in the course of time it becomes too compact and adhesive, and greatly decreases in fertility, if not renovated by artificial assistance, so that the older lands of this description are fallowed once in six years, and the rotation is winter barley, beans, wheat, flax, clover, and potatoes. The colour of the soils, in their primitive state, is a bluish grey, which is owing to the presence of a considerable quantity of the oxide of iron. The embankments are made in some instances by the government, in others, by companies or individuals, under a grant and tenure of the enclosures, from government, for about 20 years, either rent free, or for small annual payments. It is calculated that about 4-5ths of the surface which, in the sixteenth century, was submerged by the Scheldt and the sea, now produces agricultural crops, and is studded with numerous farm establishments. The area of each polder, the chemical analysis of their soils, and various other particulars, are given in M. Vandermaelen's *Géog. Dict. of the Provinces of Belgium*. There are very few, 50, and 100 acres, up to 1,000. The polder of Snaerskirke, on the sea-coast, near Ostend, contains 1,300 acres, divided by ditches into rectangular fields of 13 acres each. The bank or dike is 15 ft. high, 30 ft. in breadth, at the base, and 19 ft. at the top. The fatal devastations which have been occasioned by the concurrence of high winds and tides in rupturing the dikes that are reared as barriers to the rivers and the sea, render it an object of great importance with the government to superintend the maintenance of their efficiency. A system of public regulations for this purpose is therefore enforced with great vigilance and promptitude.

Agriculture of the Bruyères.—The sterile heaths which extend over the N.E. parts of the provinces of Antwerp, and the N.W. of Limburg, as well as over many sq. m. of the surface of the S.E. portion of the kingdom, are called *bruyères*, from the fact of their chiefly producing the heath-plant, *bruyère*, *Erica Brabantica*. It grows spontaneously and abundantly in the most arid sands, as well as in humid marshes; and it naturally possesses so much vitality and prolificness, that its complete eradication cannot be effected without considerable trouble. In summer its profusion of flowers very agreeably varies the dreary aspect of the level wastes on which it flourishes; and they also afford plenty of food for the bee; but the honey it produces is not of a good description. The plant is browsed by sheep; gathered for littering cattle; used in tanning; and applied to several other useful purposes. The great obstacle to the cultivation of the heath lands, or *bruyères*, is the frequent occurrence of beds of ferruginous turf and stiff clay near the surface, however, many extensive tracts have been brought into profitable cultivation by the plentiful application of rich manures, and the laborious attention and management for which the Belgic husbandman is so proverbially distinguished. The surface on which he begins to operate is a very thin external coat of black mould, consisting of vegetable putrefactions. This, in some parts, is sufficiently deep to recompense the labour of ploughing it into the subjacent sand, with copious quantities of dunghill manure; and from this combination are obtained crops of potatoes, barley, oats, clover, and buckwheat. Sheep are remarkably fond of the scattered blades of natural grass on the *bruyères*, and cattle are fed in great numbers on those parts of them which are laid out in pasture, consisting for the most part of spurry, *Spergularia arvensis*, which is their favourite food.

Agricultural Produce and Practice.—Corn, flax, hemp, and timber, constitute the most important materials of the agricultural wealth of Belgium. The soil, artificially enriched, produces commonly more than double the quantity of corn required for the consumption of its inhabitants, which is computed at 6 millions of hectolitres (each 2½ bushels) per annum. The annual quantity of grain sold in the markets throughout the kingdom represents a value of 2 millions of francs. The following table exhibits the quantity and medium price per hectolitre, of grain and potatoes, sold at the principal markets in 1855.

	Hectolitres.	France.
White wheat	371,025	14.03
Red wheat	478,181	15.08
Rye	395,437	9.04
Buckwheat	76,185	10.02
Oats	336,445	6.57
Barley	344,506	8.86
Potatoes	208,756	3.50

The medium price of wheat throughout the year 1836, was 15 fr. 15 ct.; and of rye, 10 fr. 5 ct. per hectolitre.

The kinds of agricultural produce in Belgium are very numerous, including the following grains and plants, all of which are cultivated in Flanders:—Wheat, (white and red), rye, barley, oats, clover, buckwheat, hemp, flax, potatoes, tobacco, hops, turnips, red carrots, parsnips,

peas, beans, clover, spurry, lucerne madder, saintfoin, chicory, beet, vander, and poppies.

The central part of the kingdom, contained within a line passing through Meeklin, Termond, Tournay, Mons, Namur, and Louvain, includes much of the richest portion of the soil; but it does not, on the whole, exceed the average fertility of the inland counties of England, and must decidedly be considered inferior to the rich alluvial soils denominated the *carsoes*, in Scotland. The land in general is not so neatly tilled as in the best English agricultural counties. The husbandry of the central parts differs considerably from that of Flanders. The farms are larger, and less carefully cultivated. The spade is less used in the fields, and they have consequently not the same resemblance to gardens. In Hainault and Antwerp the cultivation of flax and hemp is becoming a primary object; but these valuable crops are produced to far greater extent in the two Flanders, the agriculture of which is so highly reputed as to require a separate notice, which hereafter is given. In the richer parts of Brabant, flax, hemp, and colza, are extensively cultivated, with much manuring, and a succession of crops. There is thus produced a very large crop, for bread and distillation. The *craginous* plants, *dourin*, in all the provinces, and the culture of hops is very successful in Brabant, Flanders, and along the valley of the Meuse, in the province of Liège. Malze has been partially introduced, and found to succeed. Madder is grown chiefly in Flanders and the province of Antwerp. Most of the principal farms throughout the kingdom possess distilleries, and the stalled cattle are fed upon the refuse wash. With the exception of Flanders, no particular rotations of crops are adhered to. The fields are cropped according to the wants of the farmer, and the state of the land. An abundance of manure allows of rapid returns of white straw crops. All the clover, and other forage crops, are used green, in the stalls and stables, as food for cattle and horses. Little hay is made, in proportion to the number of cattle kept throughout the winter; so that, on the failure of green food, the chief recourse is to roots, namely, turnips, carrots, and potatoes. The stall-fed cattle furnish ample supplies of manure, the liquid part of which is collected in large tanks of brickwork, and is either carried out and poured over the land, or is used to moisten and accelerate the fermentation of the dry dung-heaps and composts.

Implement of husbandry are few, and of simple construction. The light Flemish swing plough is generally used, and also the old, heavy, and clumsy turnwrest, or Walloon plough, which is still retained from a prejudiced preference of antiquated disadvantages. The harrows are triangular, with wooden tines, set at an angle of 45 degrees. A stone roller is used for breaking the argillaceous clods; and the machine for winnowing grain is similar to those commonly used in England. The mould-board is noticed in the following account of Flemish agriculture, which includes many particulars equally appertaining to the other Belgic provinces.

Flemish Husbandry.—Flanders, in consequence of its great commercial prosperity, was remarkable for the advanced state of its agriculture long before improvement in this important art was observable in any country N. of the Alps and Pyrenees. Bruges and Ghent were important commercial towns in the 11th century, and supplied the various courts of Europe with the rich silks and tapestries which then were their chief luxuries. The commerce and agriculture of Flanders grew together; and in order to account for the remarkable excellence of the Flemish husbandry, which has been celebrated for upwards of 600 years, it is necessary to keep in view the close connection which in that country exists between the farmer, the manufacturer, and the merchant; and the efforts of a continually increasing population, in stimulating the exertions of those who produce the necessities of life. In Flanders, as in every country densely populated, where the villages are thickly scattered, and where, by means of water carriage on rivers and canals, manure can be transported to the land at a trifling expense, fallowing and laying down to pasture are necessarily superseded by increased tillage and manuring. It is remarkable that, in China, where a similar density of population exists, there prevails the same anxiety as in Flanders to collect every substance and liquid that can possibly serve to increase the fertilizing powers of the soil; and that in both these countries ordure of all sorts is carefully collected, sold as a most valuable article of commerce, and applied in the fields and gardens as the *ne plus ultra* of stimulating manure. Were the whole of Flanders laid out in large farms, and a third or fourth part fallowed every year, or a half left in natural grass, the population could not be fed; and instead of exporting agricultural produce, as at present, a great importation would be requisite, to supply the demand of internal consumption. Besides, the poor soils of Flanders could never be recruited by such a course. Without repeated manuring, there could be no vigorous vegetation; and the land left to nature would return to its original state

of health. The necessity of providing for constantly increasing numbers of inhab. produced the agricultural perfection for which Flanders has long been renowned; and the demands of commerce and manufactures have so multiplied the objects of cultivation, that flax, hemp, the oleaginous seeds, and various other plants required for the arts, very often produce a greater profit to the farmer than the farinaceous grains. The very large produce obtained by the Flemish farmer is solely attributable to indefatigable industry, for the soil is naturally poor, and the climate is by no means especially favourable, the winters being longer and more severe than in England. Three or four ploughings, and two or three harrowings, are commonly bestowed upon each crop. The collection and application of manure is also a great principle of Flemish husbandry. In Flanders nothing can be effected without abundance of manure; and, consequently, the greatest care is taken to procure it. The maxim is, no forage no cattle; without cattle no manure; and without manure no crops. The stall-fed cattle are the principal source of supply, but every expedient is resorted to, in order to increase the quantity and improve the quality. All kinds of animal and vegetable matters are carefully collected in pits, walled with brickwork, where they undergo the putrefactive process, by being mixed with substances already partially decomposed. Another indispensable and universal auxiliary of the Flemish farmer, is the tank of liquid manure, collected from the drainings of the stables, cow stalls, and dung-hills, and from sources which in England fill the cesspool (*vidange*). In Ghent, the sum received by house servants, for liquids collected for manure, often amounts to as much as their wages. The liquid manure is carried to the field in water carts, and carefully distributed over the surface of the land shortly previous to the sowing of seed, especially that of flax. Every farm-yard possesses one of these tanks, which are commonly of large dimensions—about 40 ft. in length, by 14 in breadth, and 8 in depth; and usually constructed beneath the stalls for cows. An acre is usually destined for flax, receives very commonly 2,500 gallons of this animal liquid subsequent to an abundant application of solid manure, which is deeply ploughed into the soil. The efficacy of the liquid is often heightened for flax, by dissolving in it large quantities of rape cake. Every distillery of moderate extent has 50 or 60 head of cattle constantly stalled, and fed upon the grains and refuse wash. These establishments were formerly very numerous; but the duty on spirits, and the interference of the government, have much reduced their number, and consequently occasioned a deficiency of manure and of crops; as it is estimated that every beast produces annually 10 or 12 tons of solid, and 26 hogheads of liquid manure. Large quantities of peat ashes, imported from Holland, are used as a dressing for clover; and lime powdered bones, marl, and the dung of pigeons, &c., are used in particular districts.

The Flemings boast of no great discoveries in the art of tillage. Their usages are referred to time immemorial, and they possess neither record nor tradition of the introduction of any particular article of produce, except the potato, which is believed to have been received from England. Clover, rape, and turnips, have been cultivated for several centuries in Flanders, whence they were brought into Britain. The progress of agriculture has been slow and gradual; and while other countries have been constantly adopting new modes and implements of culture, the Flemings have proceeded without any deviation from the old beaten track.

Very few books on husbandry have been published in Flanders; and were there many, they would not be read, for adherence to old-established methods, and repugnance to what is new, are characteristic of the Flemish farmer. No practice has been altered, nor has any new produce been generally introduced since the potato, except the white beet, from which sugar is made. None of the modern complicated machines have been adopted. There are no threshing machines, drills, scarifiers, or horse-hoes; and the common fan and riddle are much more frequently used than the winnowing machine. The spade is one of the most important implements in Flemish agriculture, and is used to a much greater extent than in any other country. The trenching-spade is constantly employed on all the light lands, and the blade of the Flemish hoe, a most efficient instrument, resembles and operates as a substitute for that of the spade. Indeed, the garden has evidently been the original model of the Flemish farms, and those of 40 or 50 acres must still be regarded as enlarged gardens. In comparing the cultivation of land in Flanders with that of England, we can only adduce the large gardens in the neighbourhood of London, where the common kinds of vegetables are raised for supplying the markets; where green crops are cut early for horses and cows kept in London, and where the soil is continually enriched with the manure London supplies. By the prosecution of spade husbandry, an industrious Fleming, with 15 acres of

good light land, brings up his family in decent independence, and in the course of his life accumulates sufficient means to put them in possession of a little farm of their own. There are many small proprietors who have risen slowly by the labour of their own hands; and their habitations show, by the great care and neatness observed in every particular, that an honest pride is felt in possessing this reward of industrious exertion. Incessant labour of the body, and occupation of the mind, are not regarded by the Flemish peasant with discontent, for to the one they are found to secure good health, and to the other tranquillity.

The farms in the Pays de Waes, between Ghent and Antwerp, are cultivated with astonishing method and neatness, and afford the most perfect specimens of field culture on the principles of gardening. The soil is artificial, and the result of centuries of systematic manuring, which has converted a barren sand into a rich black loamy mould. The fields, as in all parts of Flanders, are enclosed by hedges, and they are remarkably small—from half an acre to an acre; every part of them is kept perfectly free from weeds, and they are elevated in the centre, so as to have a gently inclined slope towards the extremities, where ditches carry off excessive rain, and prevent injury and reduction of the soil. Nearly similar care and preciseness are observable in the whole of W. and E. Flanders, but, while the Flemish farmers are greatly superior to the English, in minute attention to the qualities of the soil and to circumstantial particulars of cultivation, in the systematic economy of land and the judicious succession of crops, they are much inferior in amount of capital, in varied and improved implements of tillage, and especially in the choice and breeding of cattle and sheep.

Agricultural implements are of rude and clumsy construction, the only objects desired being strength and cheapness. Two kinds of ploughs are in use; the old Walloon plough, resembling the heavy turn-wrest wheel plough of Kent; and the light single-handed Belgian swing plough, which has been the model of the Hotham and other improved swing ploughs adopted in England. The harrows are of light construction, with wooden tines pointing forward at half a right angle with the frame. The *traineau*, or sledge, is an instrument peculiarly Belgian. It consists of a heavy triangular boarded frame, which is drawn by a pair of horses over the surface of the ploughed land, to smooth it, to break the clods, and to press in the seed. The efficiency of its performance is much assisted by the weight of the driver, who generally stands upon it, and keeps it level. Another instrument peculiar to the agriculture of Belgium and Holland, and used for levelling, is the *mouldebaert*, which is a large wooden, iron-edged shovel, in the form of an English tin dust-pan, with a stout handle about 8 feet in length. A pair of horses draw it by chains fixed at the middle of the sides. It takes up more than 5 cwt. of earth at a time, and, without stopping, the load is discharged in the proper place by letting go the handle, which is pulled back by a rope affixed to its end. In some districts the corn is threshed by a grooved block of hard wood, having a long handle. The *Hainaut* scythe has often been described in agricultural publications. It has a broad blade about 20 inches in length, and resembles the fagging hook employed in Surrey and Middlesex, except that it allows the workman to stand upright. It is commonly used for cutting corn; but the cradle scythe is considered a preferable instrument in the hands of a skilful mower.

The extent of farms in Flanders, and throughout Belgium, very rarely exceeds 100 acres. The number containing 50 acres is not great, but those of 30, 15, 10, and 5 acres, especially between 10 and 5, are very numerous. The extensive manufactures which formerly flourished in Belgium collected a dense population of artisans in the neighbourhood of the great towns; but when the busy scene of manufacturing industry was transferred to other countries, this population was deprived of its means of handicraft employment, and was obliged to resort to the cultivation of the soil for subsistence. Such appears to have been the chief, though possibly not the sole, origin of the still prevalent system of small farms, which are generally cultivated by the holder and his family without any other assistance. Some particulars of this class of peasant farmers are given below. Although the soil of Belgium, and especially of Flanders, is remarkable for the number of its minute divisions, it is stated by M. Vandermaelen, in his geographical description of the country, that "the prevalent opinion among the most intelligent Flemish agriculturists is in favour of large farms, as requiring, in proportion to their extent, a less establishment of buildings than the smaller ones." Indeed, most of the principal writers on agriculture have expressed a decided preference of farms containing several hundred acres, it being obvious that many very important means of facilitating the progress of agricultural improvement are obtainable only by the command of capital and the exercise of that generous spirit of enterprise which arises

from the possession of extensive knowledge and exemption from inherited prejudice. Agriculture always has been, and must be, indebted to the capitalist for the prompt and judicious introduction of new improvements in farm economy, in modes and objects of culture, in the application of the auxiliary sciences of chemistry, geology, botany, and mechanics, and for many valuable practices derived from distant and foreign parts. There is also great advantage in the acquisition of that skill in each department of agricultural business, which results from the necessary division of labour, where numerous hands are systematically employed under the intelligent management and supervision of one well-informed directing head. A large farm requires a large capital; and unless accurate accounts are kept of money paid and received, of work done, of fodder consumed, and of the distribution of the labour of men and horses, so as immediately to detect any extravagance or error, and at all times to show the profit or loss, there can be no inducement to apply capital to the cultivation of land. The most universal disadvantage of small farmers in every country is their contracted range of observation, and consequent inveterate retention of local and hereditary usages, however unfavourable to their own interests, or opposed to the facts of modern improvements. In Flanders, for instance, where the small farm and cottage system is conspicuous, no new facilities, inventions, or scientific discoveries, are ever introduced or attended to; on the contrary, every alteration, however obviously for the better, is invariably regarded with the greatest repugnance. The natural barrenness of the soil has compelled its cultivators to have recourse to indefatigable industry, and their meritorious exertions are amply rewarded by the very superior state of its present artificial fertility; but there are many important particulars in which the adoption of new and improved practices would greatly benefit the farmers and the nation. Turnips, for example, are a very extensive and necessary crop in Flanders, but from being always raised as a second crop after rye or barley, and sown, not with the drill, as they ought to be, but broadcast, and being weeded with the hand instead of the hoe, the produce is singularly small, compared with the extent of surface from which it is obtained, and the root is much inferior to that cultivated in England by the drill. Agricultural weeding in general is performed, not with the hand hoe and horse hoe, but by the hands of women and children, who crawl over the fields upon their knees. Several clumsy and awkward implements of husbandry might, with great advantage in expedition and efficiency, be replaced by modern and more scientific instruments; and were it only for humane considerations, the farmers' horses might well be released from the burden of massive wooden collars, which are five times larger and heavier than is either reasonable or useful. But such is the pertinacity with which old-established customs are adhered to by the small Flemish farmers, that they are often not only willing and content, but determined, to experience every disadvantage that belongs to the routine of comparatively ignorant ages; and this aversion to change has a great influence in retarding the beneficial effects of the efforts of the government to introduce into Belgium the superior English breeds of agricultural animals. Count du Lichtervelde, in his *Mémoire sur la Flandre Orientale*, produces a series of arguments in favour of small farms requiring only one plough and two horses, which are sufficient for about 44 acres; and he more especially insists upon the difficulty of one person supervising the labours of many, so as to secure the requisite assiduity and attention. He also observes, that the best cultivated farms in Flanders are those of about 20 acres. To these objections it may be answered, that abundant experience proves the probability of more extensive and different localities being very efficiently directed and visited by one intelligent and active proprietor; and that the 20 acre farms in Flanders are more properly extensive gardens, chiefly cultivated, as other gardens, by the spade.

Crops in Flanders.—Great attention is bestowed upon the preparation of the soil, so as to secure the most abundant crop from the smallest quantity of seed. About one third less is used in Flanders, for broadcast, than in England for drilling.

Rye is a very luxuriant, and a principal crop, as it forms an important article of consumption for bread among the working classes. The crops of wheat are uniformly fine, and free from smut and mildew, which are effectually prevented by carefully selecting the seed, by changing it every second year, and by steeping it in a solution of blue vitriol, or copper (sulphate of copper); four ounces in four gallons of water, for three bushels of grain. After thoroughly stirring, skimming off the light grains, and remaining half an hour, the grain is strained off in baskets, washed in pure water, and when dried is ready for sowing. It is steeped by some in brine, and dried by sifting lime upon it. One bushel of seed wheat produces above 20 bushels.

Barley is a crop of much importance, malt liquor being the common beverage of all classes of the population. The winter barley, or *sucrien*, is the favourite kind. It is sown in autumn, and reaped in July. Oats thrive well, with little manure, in almost every soil of Flanders. Buckwheat is raised chiefly as food for poultry and pigs; and for distillation. Peas, beans, and tares, are commonly cultivated as fodder for cattle. Clover is the glory of Flemish farming, and in no country is it found in such perfect luxuriance. Repeated ploughings, rich manuring, and a vigilant prevention of weeds, serve to produce a vigour and weight of produce which is truly surprising, and to the English farmer the wonder is much increased by knowing that such prodigious crops are raised from six pounds of seed per acre. Peas sown from Holland, about 40 bushels per acre, are invariably used as a dressing for clover. From Flanders this valuable grass was first introduced into England. It is a crop of great value, and indispensable to the Flemish farmer, who ploughs all his land, and feeds his cows and horses on green food brought to the stall. The common red species is more cultivated in Flanders than the other varieties. The liquid manure from the tank is believed to produce a strong taste, with which the cattle are disgusted. The potato crop, at the season of its full growth, also exhibits a remarkable luxuriance. The stalks exceed a yard in height, and their tops form a surface as level as the land from which they rise. The produce is often 10 tons per acre, and it constitutes one of the principal articles of food of all classes of the population, and of the farmer's live stock, especially cows and horses. This useful root was introduced into Flanders from England at the end of the sixteenth century, and it has long appeared in each rotation of the Flemish crops. Turnips and carrots are extensively cultivated for stall-fed cattle, after rye and barley. The turnips, in size and weight, are much inferior to those of Norfolk, and the carrots also yield a comparatively poor return. The cultivation of the white and yellow beet, for the extraction of sugar, is continually becoming more extensive, and several large factories have been established for the manufacture of this important article of commerce. The chicory-plant, of which the root, when properly torried, is a very good substitute for coffee, is raised in large quantities in Flanders, where establishments are formed for its preparation. The flax crop is an object of the greatest care and exertion. Its cultivation is thoroughly understood, as well as every process of its preparation for the loom; and the land which produces this plant exhibits all the neatness and precision of a carefully managed garden. Flax is a staple commodity in Flanders,—it serves to employ a great portion of the population, and it is largely exported. The town of St. Nicolas, between Ghent and Antwerp, is considered the largest and best flax-market in Europe. The finest description is raised in the neighbourhood of Courtray. The value of an acre is about 2*l.*, and the seed about 5*s.* or 6*s.* additional. Crops of flax produced from native seed are found to be superior in quantity, but inferior in quality, to those produced from the seed of Riga, which is generally procured by the Flemish farmers every year. Hemp is cultivated with great care, but not to the same extent as flax. Colza (*Brassica campestris*) and a species of poppy, the *oilite* (*Papaver somniferum*), are extensively cultivated for the oil contained in their seeds. Woad is raised for its dye of blue, weld for yellow, and madder for red. The two Flanders, and the province of Antwerp, produce a considerable quantity of madder, but the whole annual produce of the kingdom is insufficient to supply a fourth of the quantity consumed at one of the large factories of cotton and woolen; those of Ghent and Antwerp make use of madder to the value of six millions of francs per annum. Woad thrives best on gravelly and sandy soils; but madder requires land of the best description, and abundance of manure. The cultivation of tobacco was common several years ago in nearly all the provinces, but at present it is confined to Flanders; and the produce now is reduced to about one tenth of its former amount. The best tobacco is raised and prepared at Werwick, in the neighbourhood of Ypres. An acre produces about 4,000 lbs. The culture of this plant requires a great amount of labour, attention, expense, and manure. Hops are grown in small patches on almost every farm in Flanders. Pastures of grass are scarcely to be met with, except in the polders, and the vicinity of Dixmude and Furnes, where they are most luxuriant, and afford grazing for numerous cows: stall-feeding, however, is universally practised. One beast for every three acres of arable land is a common proportion, and where spade husbandry prevails, a larger number are found. Chopped turnips, carrots, and potatoes, boiled up with the meal of beans, rye, or buckwheat, constitute the usual food of cattle, and it is called *brassin*. Large quantities of good butter for home consumption and exportation are produced from the milk of cows thus fed, with the addition,

in summer, of clover and other green fodder, cut and brought to the stalls. The churns are ingeniously worked by a horse. Cheese rarely is made in Flanders, almost all the demand for it being supplied by importations from Holland. Some account of the live stock of the Flemish farmers is given under the divisions relating to horses, sown cattle, sheep, and swine.

Rotation of Crops in Flanders.—Experience has long convinced the Flemish farmers of the great advantage of frequently changing the crops on the same land; so that, in the course of time, a system of rules has been established from which they seldom venture to deviate. They have been rotation farmers for centuries; and the properties and present capabilities of every cultivated acre in Flanders are matters perfectly well known and appreciated. The order of succession of each kind of crop depends upon the nature of the soil, and upon various modifying circumstances, which, however, are so clearly understood and estimated that no confusion is known to arise. Every field is successively cropped according to principles discovered by ages of experience and careful attention to different results. It is not possible, in the present place, to present the numerous series of rotations adopted on different soils, and for different purposes: they will be found well explained in a recent work on Flemish husbandry, published by the Society for the Diffusion of Useful Knowledge.

The following is the *average produce* of the principal crops per acre, in the Waes country, the most fertile and highly cultivated part of Flanders:—Wheat, 2½ bushels; rye, 2½ bushels; oats, 4½ bushels; clover, 13 tons; potatoes, 10 tons; flax, 483 lbs. of yarn, and 6½ bushels of seed.

The land in Flanders is generally freehold, or the property of civil or religious corporations. The estates are small, and if not cultivated by the proprietor himself, which is more frequently the case, they are let on leases generally of 7, 14, or 21 years' duration. The occupier is bound to live on the premises, pay taxes, effect repairs, preserve timber, not sub-let without a written agreement, and to give certain usual accommodations to the next tenant at the end of the lease. The farm establishments are always convenient, and generally more ample, in proportion to the extent of the land, than in England and Scotland. In addition to the usual accommodations, the larger farms are commonly provided with a distillery, a crushing-mill for the preparation of oil from the colza and poppy, and sometimes a mill for grinding corn.

Peasant Farmers.—The small farms, between 5 and 10 acres, which abound in many parts of Belgium, have much resemblance to the small holdings in Ireland; but while the Irish cultivator exists in a state of miserable privation of the common conveniences of civilised life, the Belgian peasant farmer enjoys, comparatively, a great degree of comfort. His cottage is built of stone, with an upper floor for sleeping, and is kept in good repair; it has always a small cellage for the dairy, a store-room for the grain, an oven, an outhouse for potatoes, a roomy cattle-stall, a pigsty, and a loft for the poultry. The furniture is decent, the bedding amply sufficient, and an air of comfort and propriety pervades the whole establishment. The cows are supplied with straw to lie upon; the dung and its drainings are carefully collected in the tank; and a compost heap is accumulated from every possible source. The poultry are kept extremely neat, with a constant observance of the most rigid economy, industry, and regularity. No member of the family is ever seen ragged or slovenly; but all are decently clothed, though it be with the coarsest materials. The men universally work in linen canvass frocks, and both women and men wear wooden shoes. Rye bread and milk principally constitute their diet. Mashed potatoes and onions, with occasionally slices of bacon, are the usual articles for dinner. The great superiority of the Belgian over the Irish peasant farmer is owing not to any advantages of soil or climate, but to a better system of cultivation, and especially to established habits of sobriety, foresight, and prudent economy. The points of his superiority consist—1st, in his keeping as many stall-fed cattle as possible, to secure a supply of manure; 2d, in carefully collecting, and skilfully applying, manure; 3d, in adhering to an advantageous rotation of 6 or 7 crops, by which is obtained the utmost amount of produce without any fallowing. On farms of 6 acres are found no horse, plough, nor cart: the only agricultural implement, besides a spade, fork, and wheelbarrow, is a light wooden harrow, drawn by hand. The whole of the land is dug and deeply trenched with the spade, and the whole farm work is carried on without any assistance beyond that of the family. The live stock commonly consists of two cows, a calf or two, one or two pigs, a goat or two, and some poultry. All the different kinds of crops which have already been noticed are cultivated upon these small establishments with the same care and success as on the finest farms in the kingdom. The common rent of land is about 20s. an acre, and the weekly pay of a day labourer 6s. (*Mr. Nicholl's Report on Holland and Belgium, passim.*)

Horticulture.—Numerous and extensive gardens are cultivated in various parts of the kingdom for the supply of the town markets with culinary vegetables, and the common hardy fruits, which are produced in great abundance and excellence. The annual value of this kind of produce is estimated at 8,000,000 francs. Apples and cherries are especially good and plentiful, and are found in every farm-house garden in the kingdom. The culture of the vine is attended with considerable success in several elevated localities on the banks of the Meuse; and some of the wine there produced is far above mediocrity. From Belgium England obtained the cabbage, lettuce, and gooseberry.

Floriculture.—In Belgium the culture of flowers is an object of as much gratification as in Holland, and the climate is far more genial for bringing forth the beauty of these amiable ornaments of civilised life. The last classification of the Belgic population in 1836 shows that, in the whole kingdom, there were then 100 professional florists, of whom two thirds were in E. Flanders and Brabant. The tulip, carnation, and wall-flower, were brought into England from Belgium.

Manufactures.—Wool. In Belgium, is the object of an immense industry. The manufacturers of all kinds employ a quantity of foreign wool, of which the annual value exceeds 14,000,000 francs. It is imported from Saxony, Prussia, Silesia, Poland, Bohemia, Hungary, Moravia, and the southern provinces of Russia. The annual production of the indigenous wool, of pure and mixed breeds, scarcely amounts in value to 200,000 francs.

Woollen cloths form one of the most important branches of manufacturing industry, and they are greatly superior in quality to those produced in France. The dye of the black cloths, which are made in large quantities, is considered to be more permanent, deep, and beautiful, than that of the best English cloths. The casimirs of the Belgic looms are also as excellent as those of France. The chief seats of the woollen manufacture are at Verviers, Liege, Dolhain, Linburg, Modimont, Stavelot, Thuin, Ypres, and Poperinghe.

According to a report of the chamber of commerce of Verviers, in 1833, the woollen manufactures of that city and its environs employed about 120,000 persons, of 40,000 operatives. They produce annually about 100,000 pieces of cloth, worth 25,000,000 francs, and the capital employed in the purchase of raw material, manual labour, interest of machines, and buildings, &c., is estimated at 75,000,000 francs. The number of looms is double that in 1812; which, considering the introduction of mechanical improvements, implies an amount of production triple that of the time when the whole of Europe was supplied from this locality. However, the cloth manufacture underwent some reduction in 1835-36. Woollen stuffs, such as flannel, coverlets, serge, buckram, camelot, &c., are made in all the provinces of the kingdom, but principally in Antwerp and Hainaut.

Carpets.—The carpet manufactory of Messrs. Schumacher and Co. at Tournay, is the most extensive and important in Europe. It produces all kinds of what are called *Brussels* carpets, from those which adorn the sumptuous palaces of kings, to such as are used for the floor of the cottage. Constant employment is given to 1,600 workmen, who occupy from 80 to 100 looms, and produce annually about 120,000 metres of carpeting, seven eighths of which are exported. Besides the principal manufactory at Tournay, there are several others of secondary rank in the same town; in Brussels, Antwerp, Ghent, Bruges, and Courtray.

Flax and Linens.—Belgium produces a large quantity of flax. The annual value of that of Flanders amounts to nearly 40,000,000 francs. The various manipulations to which this product of the soil is submitted form one of the most ancient and important sources of the manufacturing wealth of the kingdom. The mode of culture, the order of crops, the preparation of the soil, the system of manuring, the careful cultivation of the plant, and the process of steeping, are so well understood in Belgium, that its flax is always in great demand throughout Europe. England and France buy nearly all the flax which is produced in the provinces of Hainaut, Brabant, and Namur. The two Flanders supply a very large quantity to the English market.

The linen cloths of Belgium have long been highly reputed. Their excellence consists in the goodness of their quality and the evenness of their tissue. The most esteemed are those of Ghent, St. Nicolas, Termonde, Alost, and Lockeren. The damask table linens of Courtray are universally acknowledged to be superior to those of every other similar manufactory in Europe: they are also made of great beauty at Brussels, Bruges, and Neuve Eglise. The towns of Ninove, Audenarde, Renaix, Grammont, Thieit, Roulers, Tournay, Enghein, Ath, Mechlin, and Turnhout, are renowned for their manufactures of linens, in which they carry on a considerable commerce.

A society has recently been established for the spinning

of flax by machinery, and M. Cockerill possesses already, at Liege, a large flax spinning-mill, worked by a steam-engine of 90 horse power. The only manufactory of lawn is at Saintes, in Brabant. In France, the hand-loom linens of Belgium are always in much demand, though in competition with fabrics supplied by machinery; but in Italy, Spain, and America, where they were exclusively preferred during several centuries, they have now given place to supplies from England and Germany. In 1836, there were sold in the seven markets of East Flanders 127,871 pieces of linen; a quantity which surpasses by 20,000 pieces the sales in 1834 and 1835. Valued, on an average, at 120 fr. per piece, these sales gave motion to a sum exceeding 15,000,000 francs, not including at least an equal quantity sold directly without appearing in the public market, or consumed by the producers. In the same year, there were sold in the market of Bruges 21,962 pieces of linen; at Courtray, 19,218; at Thielit, 87,860; and at Roulers, 94,078. Total, 153,118 pieces; representing a value of 15,000,000 to 20,000,000 francs. Adding the produce of Brabant and other parts of the kingdom, the whole amounts to nearly 750,000 pieces annually, worth about 100,000,000 francs, and affording occupation to more than 400,000 persons in spinning, weaving, and bleaching. The process of bleaching linen has been carried to a high degree of perfection. Bleach-works of great excellence are very numerous in the two Flanders, Brabant, and Hainault.

In the province of Antwerp is an establishment for bleaching by steam, the most important in the kingdom.

Cotton.—The cotton manufacture in Belgium represents a capital of 60,000,000 francs, in buildings and machinery; and the number of hands employed is at least 122,000. Ghent, St. Nicolas, Antwerp, Turnhout, Mechlin, and Lierre, contain the principal cotton factories of every description. They produce annually 1,500,000 pieces of calico, and 400,000 pieces of printed cottons, worth, together, nearly 84,000,000 francs. Two thirds of this produce are consumed in the kingdom. On the 1st of Jan., 1835, there were in Belgium 81 steam machines in operation, in the manufacture of cotton, 383,320 spindles, 82,175 of which were inactive; and 23,300 hand-loom, of which 6,703 were inactive. Flanders is the principal seat of the cotton manufacture. In 1835, this province contained 60 steam machines in full activity, of 900 horse power; 15,272 looms, and 280,000 spindles. The most considerable establishment in the kingdom, in this branch of industry, is that of M.M. Rosseel & Co., at Ghent.

Silk.—The production and manufacture of silk promise to become an important source of Belgic industry. Already the annual exports to France exceed the imports from that country. The breeding of the silk-worm was introduced into Belgium in 1826, and this department of business is continually increasing under the fostering care of the government. The mulberry appears to thrive in the soil of the country, and the number of young plants now cultivated exceeds two millions. In the opinion of the best judges, the Belgic silk is quite as beautiful and valuable as the choicest kind produced in the French provinces of Piedmont and Dauphiné, which, in fact, is the finest in the world. The most extensive establishments for rearing the silk-worm are at Mousin, l'Évêque, near Ath, and at Uccle, near Brussels. The quantity produced, in 1837, was 2,000 kilogrammes, and the value 10,000 francs. Antwerp, which is the principal centre of the manufacture, contains 12 establishments for the production of various kinds of silk fabrics. The factory of M. Dnysters, at Lierre, employs 50 looms, which are about to be increased to 600. Velvets, satins, gros de Naples, and other stuffs, obtained formerly from Naples, are made with a beauty of tissue and tints that cannot be surpassed. The silk manufactured at Uccle is remarkable for excellent dyed and printed fabrics.

Lace.—The manufacture of lace, though now less prosperous than formerly, has nothing to fear from foreign competition. "Brussels lace," the thread of which is made of the finest flax of the country, is superior to every other description made in Belgium or in foreign countries, and the demand for it is kept up in all parts of the world. Its peculiar qualities are delicate fineness, and a great elegance and variety of design. The patterns are all worked separately, and are stitched on. The flax employed grows near Hal, and the best at Rebecque. The finest description costs from 3,000 to 4,000 fr. a pound, and is worth its weight in gold. The spinning is performed in darkened rooms, with a beam of light admitted only upon the work, through a small aperture. The most beautiful specimens of this exquisite article are produced by the houses of M.M. Tardent-Pirlet and Duquetiaux, at Brussels. The lace of Mechlin is second in rank, with respect to richness and elegance. It is made also at Antwerp, Lierre, and Turnhout. The cities of Bruges, Menin, Ypres, Courtray, Ghent, Alost, and St. Nicolas, employ a great number of

hands in the manufacture of Valencien point. Mons contains a school for special instruction in the art of making the finer kinds of lace.

The principal manufactures of *tulle* are at Ghent, Termonde, Mechlin, Brussels, and at Bouillon, where one establishment furnishes about 200,000 mètres per month. The excellence of the Belgic embroidery on *tulle* is universally acknowledged, and the number of females employed in this art is estimated at nearly 50,000. The daily earning of each is about 60 centimes.

The manufacture of *gold and silver lace* was formerly a considerable source of wealth, but it is now much reduced by foreign competition. However, the qualities of this article still produced in Brussels are fully equal to those of the best description manufactured in Paris.

Ribbons of every species are made principally at Antwerp, Tournay, and Ypres. This branch of industry formerly employed 1,000 looms, and 12,000 persons, and produced annually about three thousand million yards of ribbon; but the manufacture, in consequence of large importations of cheaper kinds from France and Germany, has very considerably decreased.

In 1830, the manufacture of elastic stuffs in *caoutchouc* was introduced by M. Vandermaelen. More than 100 looms are employed by a company formed for the purpose, and various articles are produced, as elegant and substantial as those of France and England.

Fabrics of *hair* are produced in Brussels in great perfection.

The manufacture of *hosiery* employs about 50,000 persons. Its principal centre is in the arrondissement of Tournay, where 2,500 looms are kept in activity. About the same number are found in other parts of the kingdom. The coarser articles are most successful, and are partly exported. Finer kinds are imported chiefly from Saxony. At Arendonck, in the province of Antwerp, about 220,000 pairs of woollen hose are annually manufactured, and the most beautiful articles of knitting and netting are produced at Brussels and Tournay.

Hats of felt, or heaver, are made sufficiently good to meet the competition of foreign manufacturers, — and those of silk are of very superior quality. The latter kind are made in nearly every city in the kingdom, so that the manufacture of beaver hats has consequently much decreased. Straw hats are abundantly made in Brussels, Ghent, and Antwerp. In the province of Liege this species of industry occupies 6,000 persons, and employs a capital of 2,000,000 of francs.

Leather.—The preparation and various manufactures of leather are carried on with undiminished success. The principal tanneries are at Stavelot and Liege; there are also many at Brussels, Namur, Antwerp, Ghent, Ypres, and Tournay.

Onion is made as good in every particular as in France and England.

Paper factories exist in every province, and the manufacture of this important article is progressively improving. The produce at present is insufficient for the home supply, so that paper for hanging is imported chiefly from Paris; but the rapidly increasing manufactures of Belgium will soon enable it to possess this and every other article of use and ornament without resorting to foreign countries.

Printing, &c.—All impressions are made upon paper and with types, manufactured in the kingdom. The typographic art is, therefore, an important department of national industry. In Brussels, and several of the other large towns, printing is carried on to a great extent, and with very superior skill. In fact, the printing of Belgium is in no respect inferior to that of Paris, in beauty and neatness of execution, or correctness of text. The Belgic press is principally occupied in producing re-impressions of French works published in Paris. However, the number of original works increases every year. One printing establishment at Brussels now prints more than all the presses of the country in the time of its subjection to the French government; and this remarkable increase arises from the extensive system of reprinting the best works of France, which immediately appear in Belgium commonly at about half the original price. The injury sustained by the French authors and booksellers has induced those parties to form a combined opposition, supported by a large amount of capital, but hitherto no success appears to have attended these efforts. General complaints have been made in France, and that government has strongly remonstrated with the Belgian authorities on the injustice of this literary piracy.

Lithography has attained a high degree of excellence, and some of the productions of Brussels will bear a comparison with the finest specimens of German artists. The celebrated geographical establishment, founded at Brussels by M. Vandermaelen, possesses a good press for lithography, maps, and charts.

Bookbinding is executed in Belgium in the best Parisian style, and firmness and neatness have the additional recommendation of cheapness.

Cabinet-making is a source of employment to numerous skillful operatives. Brussels alone contains above 100, and many of their articles of furniture are exported to Germany, England, and America.

The only establishment for the manufacture of *clocks* is at Chénô, near Liège. The machinery is moved by steam. But all kinds of time-pieces are supplied chiefly from France and Switzerland; and with the view of promoting the home production of these useful instruments, the government annually awards premiums and medals for the most perfect specimens produced by native artists.

Mathematical instruments are made with great perfection, especially by MM. Themar and Sacré, of Brussels, whose reputation in this department of art has created a demand for their productions in Germany, Holland, and England.

Musical instruments, that is, pianos and wind instruments, are very skillfully manufactured at Brussels. The former are preferred to those of Germany, and the latter, which are issued from the establishment of M. Sax, who employs 100 workmen, have an European reputation for tone and elegant appearance.

Articles of gold and silver work, bronze, and jewellery, are for the most part imported from France.

Metallurgy.—The abundance of metals and combustibles in Belgium has occasioned the establishment of several extensive forges for the melting and manufacture of iron, copper, and tin. There are three principal groups of forges—1. on the banks of the Meuse, extending from its entrance into Belgium to the limits of Namur and Liège; 2. between the Meuse and the Sambre; and, 3. at Charleroy. Besides these principal groups, there are numerous forges, foundries, and tinworks, along the banks of the Hoyoux, the Ourte, and its affluents.

In 1837, there were in the kingdom 23 coke furnaces, and 66 of charcoal, each of the former yielding from 3 to 5 times the produce of one of the latter. Since that period, the number of coke furnaces has probably been at least doubled, as 26 were then in preparation, of which 6 at Liège were to be of more enormous dimensions and power than any in Europe. The annual produce of the Belgic foundries is estimated at 150,000 tons, which is half that of France, and one fourth of the produce of England. The average price of iron during the 7 years from 1830 to 1836 was 416 francs per ton, first quality,—and, second quality, 330 francs. The largest iron-works on the Continent are those of M. Cockerill, near Liège, where 16 steam-engines of 900 horse power are constantly in operation, and from 3,000 to 4,000 workmen are employed, at wages which average 3 francs per day, showing the employment of a capital of two or three millions of francs per annum. Copper, as well as iron is worked in this establishment, and not only massive materials for the engineer, and machines of the greatest power and dimensions are constructed, but various delicate and exact mechanical instruments. The enormous colossal lion which supports the triumphant pyramid on the battle-field of Waterloo was cast in the foundry of M. Cockerill. His numerous and various works extend above a mile along the banks of the Meuse, and occupy the site of the palace grounds of the prince prelate of Liège.

The royal cannon foundry at Liège is a magnificent assemblage of the requisite apparatus for manufacturing the largest pieces of artillery in iron and bronze. It consists of 2 large foundries, surrounded by 12 reverberating furnaces, 2 extensive forging factories, containing 15 fires; 5 steam-engines, &c. &c. Establishments for the construction of steam-engines are principally at Liège, Brussels, Charleroy, Tillemont, and Bruges. During the period from 1829 to 1835, the number of steam-engines constructed in the province of Liège alone was 261, of 5,400 horse power.

Naval-making is an important branch of metallurgy at Liège and Charleroy. In the latter place, about 5,500 hands are employed in this business throughout the winter. Liège is also the centre of a manufacture of *fire-arms*, which is universally renowned. About 50 factories of these articles are constantly active, and their produce is largely exported to America, Egypt, Turkey, Germany, Italy, and Spain. In the United States of America, the rifles and fowling-guns of Liège are preferred to those of Birmingham. From 26,000 to 30,000 guns are annually exported to Brazil alone. The principal kinds manufactured are,—1. single and double barrelled guns for sporting; 2. muskets for military use; 3. common guns for various purposes; 4. pistols, which, as well as the best description of guns, are made and finished with great care and skill. The number of guns of different kinds manufactured at Liège in 1836 was 266,979, and of pistols 92,400; total, 349,379. The value of these is estimated at nearly 7,000,000 francs. The produce of the gun-factories of Liège exceeds that of the whole of France, and in the number of articles it is superior to that of Birmingham.

Cutlery forms a considerable object of manufacturing industry in the province of Namur, occupying about 5,000 hands. Other establishments of this nature are in operation in Brussels, Ghent, Mons, Louvain, and Ath.

Steel implements and edge tools are made in several localities, but the main supply of the kingdom is from Germany and England. From the latter market, the annual number of clasp knives imported exceeds 40,000.

Iron and copper utensils, agricultural implements, and saddlery, are manufactured throughout the kingdom.

Carriage-building is well executed at Brussels, with respect to strength and cheapness, but elegance of design is very generally deficient.

Porcelain manufactures exist in Brabant, Hainault, Namur, and Luxembourg. At Sept Fontaines, in the last-named province, at Brussels, Andenne, and Tournay, are produced articles which, in delicacy and beauty, may vie with those of every foreign manufacture, excepting Sévres.

The different kinds of *glass*, in plate and vessels, are made in large establishments at Namur, at Liège, at Val-St.-Lambert, where about 1,000 hands are employed, and at Charleroy, where there are 44 furnaces, employing from 1,800 to 2,000 hands, and producing annually a value of nearly 5,000,000 francs. Four fifths of the produce are exported to Germany, Holland, North and South America, and other countries. Crystal is manufactured at the glass-houses of Namur and Val-St.-Lambert, and is beautifully cut and fashioned in Brussels. Casting of clasp emblems about 600 hands are employed in the province of Namur. The same district contains several factories for the preparation of *white lead*; and at Brussels, Antwerp, Ghent, Mechlin, Courtray, and some other cities, are establishments for the preparation of the various chemical products required for the useful arts and manufactures. **Candles** of tallow are manufactured chiefly in Antwerp and Hainault, and of wax at Ypres and Tournay. Lamps are made principally at Brussels and Liège, but they are now greatly superseded by the introduction of gas, which for some time has been used for lighting the streets and shops of all the large towns. Soap factories are numerous in Belgium, and increase continually. The soap of Tournay is not inferior to the finest soap of Marseilles. Alost, Ninove, Roulers, and other towns of Flanders, possess a great number of mills and presses for the preparation of all kinds of oil, which are partly exported to Germany and England.

In Belgium every circumstance apparently concurs for the successful culture of *beet*, and the extraction of sugar from its root; but, owing to some mismanagement, the labour and capital devoted to this undertaking have not invariably produced an adequate profit. However, about 50 establishments are in full activity, and their produce is highly appreciated for its superior qualities. Fifteen factories in 1836, produced above 2,800,000 kilogrammes. There is a very extensive establishment for beet sugar in the village of Waterloo. The kingdom contains about 70 refineries of sugar, foreign and indigenous, producing 25,000,000 kilogrammes per annum. Half of the whole number are in the city of Ghent, which, in 1836, exported nearly 4,000,000 kilogrammes. *Café chicorée* is prepared principally in 20 manufactories at Roulers, in W. Flanders.

Salt refineries are numerous in the provinces of Antwerp, Hainault, and East Flanders. The best are in the cities of Antwerp and Ghent.

The *breweries* in different parts of the kingdom amount to nearly 2,800, besides 150 malt kilns. Beer is the common beverage of all classes; and the best is produced in Brussels, Louvain, Diest, and Haegherde, in Brabant. Louvain alone has 40 breweries, and produces annually about 200,000 tons of white beer, *bière blanche*; a kind for which there is always a great demand.

In 1836, the whole number of distilleries for the extraction of alcohol from grain was 1,065. They abound most in the provinces of Antwerp, Hainault, and the two Flanders; and their produce, under the appellation of *cognac de vin*, or *gin*, forms an important item in the export trade of the kingdom to every quarter of the globe.

In order to encourage and facilitate improvement in manufactures and industrial pursuits, the government has instituted public exhibitions where only the products of the country and its inhabitants are admitted. The first was opened in Brussels, in 1835, when 2,727 objects were exhibited, and a distribution was made of numerous medals of gold, silver-gilt, silver, and bronze.

Patents.—A very considerable part of the revenue of Belgium is derived from a tax on patents, no one being allowed to exercise any trade or profession without a patent, the price of which depends upon the amount of profit obtained. Reports of income are required from each individual engaged in business, and the government assessors exercise inquisitorial power in assigning the citizens to classes of different degrees. The number of patents granted by the government, in 1837, for new inventions, was 71; for improvements, 21; for importations, 27.

Since the establishment of Belgium as an independent kingdom, a very rapid progress has been observable in almost every department of manufacturing and commercial industry. In proof of which it is alone sufficient to adduce the following record of the number of licences granted for the establishment of new factories, machinery, and other apparatus for carrying on each process of the industrial arts:—

Provinces.	Period.	New manufacturing Establishments.	New Steam-engines.
Antwerp	1832-36	171	
Brabant	1831-37	235	95
West Flanders	1833-36	205	15
East Flanders	1833-36	165	49
Hainault	1830-37	150	150
Liège	1830-37	250	81
Limburg	1831-37	129	
Luxemburg	1836	30	
Namur	1834-36	27	20

The mines of iron and coal are wrought with increased activity, and the great extent of commercial speculation is shown by the following official account of capital embarked by different companies from 1833 to 1838:—

Coal mines and iron works	40,540,000
General Societies	45,000,000
Glass works	8,000,000
Sugar works	8,130,000
Insurance companies	71,200,000
Roads	3,500,000
Loan Societies	43,000,000
Miscellaneous companies	26,321,000
Total	Fr. 245,691,000

Steam Power.—By a calculation, more approximative than rigorously exact, the steam-engines actually in operation in Belgium represent a force exceeding that of 20,000 horses; and the mechanical power developed by a horse being about seven times greater than that of a man, it follows that steam replaces, in Belgium, the labour of 140,000 men. In France, in 1835, there were 946 steam-engines, of 14,061 horse power.

Engines. Horse pow.

The province of Hainault possessed, in 1837, 344 of 12,447	
Liège	255 — 6,032
Brabant	45 — 472
Namur	In 1836, 31 — 378
Antwerp	9 — 127

The numbers in the other provinces are not exactly ascertained.

The commerce of Belgium at present extends its relations to numerous parts of the world, and includes every species of indigenous and foreign production. The average annual value it represents may be estimated at 360,000,000 francs; that is, 210,000,000 of imports, and 150,000,000 of exports.

The following results, deduced from the official tables of imports and exports, will serve to convey a general idea of the foreign commerce of Belgium:—

The total value of importations, in 1834, was 212,734,132 francs, and of exportations, 135,790,426 francs; in 1835, the value of importations was 212,396,446 francs, and of exportations, 160,705,447 francs. The amount of importations includes that of the merchandise remaining in bond at the close of each preceding year; namely, for 1833, 19,824,706 francs, and for 1834, 13,426,772 francs. The bonding yards are at Antwerp, Bruges, Brussels, Courtray, Ghent, Liège, Louvain, Mechlin, Mons, Nieupoort, Ostend, Ruremoud, Tournay, and Venloo.

Of the foreign merchandise imported, the value of the amount consumed in the kingdom was, in 1834, 174,855,797 francs, and in 1835, 163,890,346 francs; and of that exported to foreign countries, the value of Belgic produce was, in 1834, 118,540,917 francs, and, in 1835, 138,037,695 francs; whence it results, that the value of foreign produce consumed in Belgium exceeded that of the native produce exported 56,314,880 francs, in 1834, and 25,852,651 francs in 1835.

The external commerce of Belgium suffered greatly by the revolution in 1830, as Holland has since retained and monopolised the trade with all the colonies which belonged to the kingdom of the United Netherlands. However, it appears, from the following account of commercial shipping, that the number and tonnage of vessels which entered the great port of Antwerp in 1837 are nearly double those of 1820, the year previous to the revolution.

The articles which Belgium supplies to England are oak-bark, flax, madder, clover-seed, spelter, and sheep's wool; in return for which England sends various kinds of East and West India produce, and manufactures to the value of about a million annually, consisting principally of brass and copper manufactures, cotton fabrics and yarn, hardware, earthenware, salt, sheep's wool, worsted, woollen yarn and woollen fabrics. A large

portion of the cotton yarn, cotton cloths, and tobacco, which are exported from England to Belgium are there smuggled across the French frontier by means of large and sagacious dogs, which are carefully trained for the purpose, by being pampered in France, and half starved and ill-treated in Belgium. They are taught to avoid all public roads, and when they find themselves noticed, they slink away with their burdens, and lie concealed in the nearest covert until they can venture again on their journey. A reduction of the high rates of English import duties would be of much benefit to Belgium. On linen, furniture, and toys, it is 20 per cent.; on bobbinet, 30 per cent.; and the rates are very high on hats, paper, sewing silk, books, stationery, apples, pears, mustard seed, nuts, and the oils from linseed, rape, and hemp. The commercial and manufacturing cities of Belgium are, Brussels, Ghent, Liège, Namur, Tournay, Ypres, Mons, Louvain, Verviers, Mechlin; to which are to be added the maritime cities, which are—Antwerp, Ostend, Nieupoort, and Bruges. Some notice of the great extent of the Belgic commerce in the middle ages is given under the head of *History*; but for more particular accounts of its astonishing prosperity at that remote period, reference must be made to the articles ANTWERP, GHENT, and BRUGES.

Commercial Shipping.—Belgium communicates with the sea by Ostend, by Antwerp, by Nieupoort, by the canal of Bruges to Ostend, by the canal of Dunkirk to Furnes, by the canal of Ghent to Terneuzen, by the canal of Termonde to Hulst, by the Scheldt from Flessingue to Antwerp, by the Scheldt and the canal of Willembroek from Brussels to Antwerp, and by the canal of Louvain and the Scheldt from Louvain to Antwerp.

The principal ports are Antwerp and Ostend. The former is one of the finest in Europe, and affords reception to vessels of the largest tonnage. The situation of Antwerp, between the N. and S. countries of Europe, and the establishment of a railroad communication thence to Cologne, seem to promise to this port a future accession of great European importance.

The number of merchant vessels belonging to the ports of Belgium in 1834, not including those of the fisheries, was 137; of which the tonnage was 19,535, and the number of men composing the crews 1,063. Vessels are built at all the sea-ports, and premiums are given by government for the construction of ships for sea navigation.

Steam-boats are increasing, and it is proposed to establish them on all the principal lines of communication by water, as well within the country as to foreign ports. At present, the commercial shipping of Belgium is not more than one nineteenth of what it ought to be; for it is calculated that the kingdom requires 2,700 vessels each, on an average, of 140 tons, to export its indigenous products, and to import, by means of its own ships, the foreign produce which it annually consumes.

Among the indications of increasing commerce in Belgium, must be remarked the progressive activity of the port of Antwerp. The number of vessels, from all parts of the world, which entered there, and their tonnage, during the four years 1834-37, were as follows:—

1834	1,065 vessels	138,206 tonnage
1835	1,196	183,764
1836	1,250	176,461
1837	1,426	226,759

The number of passengers who arrived at Antwerp in 1837, by steam-packets, of 6 of which were English, was 4,000. At Ostend, in the same year, 550 vessels entered, and 2,000 passengers by the English steamers; and at Bruges, 143 vessels entered, of 18,000 tons.

Money.—The franc is the monetary unit of Belgium, and its divisions are made according to the decimal system. There are 11 different Belgic coins; namely, 2 of gold,—the piece of 40 francs, and the piece of 20 francs; 5 of silver,—pieces of 5 francs, 2 francs, 1 franc, half a franc, and a quarter of a franc; 4 of copper,—pieces of 10 centimes, of 5, of 2, and of 1 centime. The florin of Brabant is worth 1 franc 81 centimes, and it is divided into 20 sous, each sous being again divided into 12 deniers.

The *Hôtel des Monnaies* is at Brussels. The value of silver and copper coins which were thence issued, during the period 1832-37, was 16,641,668 francs. The monetary capital existing in Belgium is estimated at 200,000,000 francs. The ancient coins of the Pays Bas are still in circulation, but their number daily diminishes.

The value of the English sovereign in Belgic money is 25 francs 20 centimes; and the English shilling, 1 franc 16 centimes.

Banks and Commercial Societies.—Belgium possesses several large financial establishments, devoted to industrial and commercial operations, which render an immense service to the manufactures and commerce of the country. At Brussels an association was formed, by royal authority, on the 28th of August, 1822, with a charter for 27 years. It is entitled the *Société Générale pour favoriser l'Industrie*, and its object is to develop the

resources, and promote the prosperity, of agriculture, commerce, and manufactures. Its capital consists, 1st, of 50,000,000 florins (105,820,000 fr.), of which 20,000,000 are vested in real property, and 30,000,000 in 60,000 shares, each of 500 florins, at an interest of 5 per cent.; 2dly, of a reserved fund, formed of a third of the dividends, and which, in 1836, amounted to 20,000,000 francs. It issues notes to the amount of 40,000,000 francs, for sums of 50, 100, 500, and 1,000 francs; and its general operations consist of the discounting of commercial bills, the receiving deposits, making loans and advances, and in various ways affording accommodation to facilitate commercial transactions. The administrative body is formed of a governor, who is nominated by the king, six directors, a secretary, and a treasurer.

The *Bank of Belgium*, at Brussels, was instituted by a royal decree of the 12th of Feb., 1835, with a charter for 25 years. Its capital is 20,000,000 francs, in 20,000 shares, each of 1,000 francs. The rate of interest is 5 per cent. It operates at once as a bank of deposits, of circulation, of discount, and of accommodation to the commercial classes similar to that afforded by the society just described. A director and four administrators are nominated by the king, and the accounts are annually audited by a general assembly of the holders of ten shares.

Among the dependencies of the *Société Générale*, are the *Society of Capitalists*, with a capital of 50,000,000 francs; the *Society of Commerce*, capital 10,000,000; and the *National Society*, with a capital of 15,000,000 francs.

The Bank of Belgium has formed a *Society of United Shares*, with a capital of 40,000,000 francs. Under the same patronage was established, in 1835, the *Bank of Liege*, for 40 years: it has a fund of 4,000,000 francs, in shares, each of 1,000 francs. In 1837, a great financial society was founded, under the title of the *Commercial Bank of Antwerp*; its term is for 25 years; and its capital 25,000,000 francs, in shares, each of 1,000 francs. Numerous other institutions of this nature exist in different parts of the kingdom. The amount of capital possessed by anonymous societies authorised by the government since 1833 exceeds 300,000,000 francs. The conditions of success to these societies are that they confine their competition to such industrial operations as the manufacture of the metals and other substances of intrinsic and permanent value.

The amount of property insured against fire, in the year 1837, by 11 insurance companies of Belgium, was 1,789,832,222 francs; in addition to which, an amount, estimated at 200,000,000 francs, was insured by foreign companies.

Weights and Measures.—Belgium has adopted the weights and measures of the French metrical system; the fundamental principle of which is the measure of length. Its unity, the *mètre*, is the ten-millionth part of a quadrant of the meridional circle of the earth. The length of the *mètre* is nearly an inch less than an English yard and half a quarter; that is, 2·980992 ft. The unit of superficial measure, the *are*, is a square, of which the side is 10 *mètres*. The unit of the measure of capacity, the *litre*, is a cube, of which the side is the tenth part of a *mètre*. The *stère* is a cubic *mètre*. The unit of the measure of weight is a *centimètre* cube of distilled water; that is, a cube of which the side is a hundredth part of a *mètre*. The itinerary measures are the *decamètre*, *kilomètre*, and *myriamètre*; that is, measures containing severally, 10, 1,000, and 10,000 *mètres*. Measures of length are the *mètre*, or lineal unity, the *decimètre*, *centimètre*, and *millimètre*; which severally represent the tenth, hundredth, and thousandth parts of a *mètre*. Land is measured by the *hectare*, containing 10,000 square *mètres*; that is, the square of 100 *mètres*; and the *centiare*, which is 1 square *mètre*. For liquid and dry measure, are used the *litre*, which, as already described, is a cube of which the side is the tenth part of a *mètre*; and the *decalitre*, *hectolitre*, and *kilotitre*—decimal multiples of the *litre*, or 10, 100, and 1,000 litres. The *decalitre* is a tenth part of the *litre*. For solid measure, are used the *stère* and *decistère*; that is, a cubic *mètre* and its tenth part. For the measure of weight, are used the *gramme*, already explained; the *decagramme*, or 10 grammes; the *kilogramme*, or 1,000 grammes; and the *quintal*, or 100 kilogrammes. The *decigramme* is a tenth part of the *gramme*. It may be useful to add the correspondent values of a few of these measures with those of England, and for more elaborate explanations, a reference may be made to the *Annuaire de l'Observatoire de Bruxelles*, par M. Quetelet, 1838 and 1839.

Belgic.	English.	Belgic.	English.
Mètre	= 3·280 feet	Hectare	= 2·473 acres
Millimètre	= 0·039 inch.	Litre	= 1·760 pint
Centimètre	= 0·393 inch.	Decalitre	= 2·201 gal.
Decimètre	= 3·937 inch.	Hectolitre	= 22·009 gal.
Myriamètre	= 6·213 mil.	Gramme	= 15·438 g. tr.
Mètre carré	= 1·196 sq. y.	Kilogramme	= 2·680 lbs. t.
Are	= 0·098 rood.		= 2·205 lbs. a.

The ancient provincial measures which are still partially used, are too numerous for explanation.

Roads of the first class, paved or macadamised, and numerous others of secondary character, intersect the Belgic provinces in every direction. After England, Belgium, in fact, is the next country of Europe in which lines of road exist in the greatest number, and are kept in the best condition. They are broader and more regular than those of England, and are infinitely better managed than the roads of France: they are also capable of sustaining the greatest extremes and changes of weather, without undergoing any injury worthy of notice. The highways of the state, of the first class, have a width of 19 *mètres* 50 centimètres; those of the second class are made 13 *mètres* 60 centimètres in width, if they traverse woods and thickets, if not, 11 *mètres* 70 centimètres. Provincial roads have a width of 9 *mètres* 75 centimètres. In these dimensions, the lateral banks or ditches are not included. The whole surface occupied by the roads of Belgium is estimated at 70,000 hectares, or 210,000 English acres. Those of the first and second class are made and maintained by the state; the provincial roads are the affair of the provinces; and the smaller byways belong to the communes. It is calculated that, in Belgium, a league of road, or 3 m. English, costs in construction 150,000 francs. Besides several new state roads in course of execution, about 30 new provincial roads have been planned and undertaken; and a company has been formed for the opening of 300 m. of roads, railways, and canals, on the plain of the Campine.

Belgium is the first state in Europe in which a general system of railways has been planned and executed by the government at the public cost; and certainly it is an honourable distinction to have given the first example of such a national and systematic provision of the means of rapid communication. The undertaking was first projected in 1825, and the object proposed was to unite the principal commercial towns on one side with the sea, and on the other with the frontiers of France and Prussia. In this respect Belgium is most favourably situated for the experiment of a general system of railroads. It is compact in form, of moderate extent, is surrounded on three of its sides by active commercial nations, and on the fourth by the sea, from which it is separated only by a few hours' voyage from England. On the W. side are the two large and commodious ports of Antwerp and Ostend, and its E. frontier is distant only a few leagues from the Rhine, which affords a communication with the nations of central and S. Europe. It is therefore in possession of convenient markets for its productions, and of great facilities for an extensive transit trade. The physical nature of the country is also most favourable, being for the most part very flat, and requiring but few of those costly works of levelling, tunnelling, and embankment, which serve to increase so enormously the expense of similar undertakings in England. The government first employed skillful engineers to survey the kingdom, and to determine the main lines, with regard not only to the physical circumstances of the surface, but to the interests of the large towns and their various relations to internal and foreign trade. In May 1824, a law was passed for the prosecution of the plan proposed, and the city of Mechlin was made the centre of the system, with four principal branches extending, N. to Antwerp; E. to Louvain, Liege, Verviers, and the frontiers of Prussia; to be continued by a private company to Cologne; S. through Brussels and the province of Hainault, to the French frontier near Valenciennes; and W. by Dendermonde, Ghent, and Bruges, to Ostend. By adopting the lines that concentrate at Mechlin, a larger number of towns are passed than by taking Brussels for the central station, and the distance from Antwerp to the E. frontier is considerably less; but some regret has been expressed that Brussels, the metropolis of the kingdom, was not chosen as the centre of the system. The Belgian government merely requires that the undertaking should pay its own expenses,—that it should be neither a burden, nor a source of revenue. The expenses consist of the cost of maintenance and repairs, the payment of interest upon, and the gradual redemption of, the capital invested. For the last object, a profit of 5 per cent. per annum is expected upon the original outlay, beyond the current expenses. Besides, it may confidently be anticipated that the increase of commercial traffic throughout the kingdom will repay the outlay of the government by increasing the amount of its revenue. All the railroads established by the government of Belgium have been formed for a double line of rails; but, except in partial instances, only one line is laid down; it being intended to add the other when required. A similar plan of commencing with a single line is generally adopted in the United States of America. The cost of construction in Belgium has varied from 5,000, to 10,000, per mile, which is much below the rate of expense incurred in England and France. The Manchester and Liverpool line, and many others, cost about 40,000, per mile; the short line from London to Greenwich 20,000, a mile; and the estimated cost per mile of the lines pro-

jected from Paris to Havre varies from 15,000*l.* to 21,000*l.* In the United States of America, the expenses fluctuate between 2,000*l.* and 6,000*l.* a mile. It is worthy of remark, that the actual cost incurred in Belgium has exceeded the estimate of the engineers by only 8 per cent., while in England, the estimates, for instance of the London and Birmingham, and of the Great Western railways, have been exceeded in the cost by 100 per cent. In cheapness of fares, the Belgian railroads far surpass those of England. The length of the line between Antwerp and Brussels is 27½ miles; the fare, in a first class carriage, 2*s.* 6*d.*; while a nearly similar distance in England, from Liverpool to Manchester, is 5*s.* 6*d.* In Belgium there are four kinds of railway carriages;—the Berlin, diligence, char-à-banc, and wagon. The charge in the two first is at the rate of 1*½d.* a mile, and they answer to the English mail and coach, for which the rate of charge per mile is 2*½d.*, or nearly double. The char-à-banc, which are used by great numbers of the poorer class, are but three farthings a mile, and the wagons are only one halfpenny.

That the adoption of a system of low fares is beneficial to the managers of railways, may clearly be seen in the fact that, in Belgium, where the charges are only one half, or a third of those in England, the proportion of the population who travel is five times greater; for, according to official documents, it appears that the number of travellers on the Liverpool and Manchester line, compared with the population of the towns along its course, gives one trip to each person in a year; while a similar comparison of the travellers and population on the line between Antwerp and Brussels shows the average number of trips to each individual to be five. Since the establishment of railway communication between these two cities, and the consequent reduction of the expense of travelling to one half of the previous charges on the common road, the intercourse has become nearly ten times greater, and it appears that the difference is mainly occasioned by the poorer classes being enabled to avail themselves of this means of locomotion, both for business and recreation; an advantage of which the same classes in England are unfortunately deprived, by the amount of railroad fares being kept above their reach. The rate of charge per ton for extra luggage and merchandise on the Brussels and Antwerp line is less than 6*d.* a mile; and on the London and Birmingham line, 1*s.* 2*d.* Another point in which the Belgian railway carriages surpass those of England is, that of evenness and uniformity of motion. They move without that offensive thumping and swinging for which the English vehicles of this kind are distinguished; they are also much neater and better finished; and their velocity varies from 20 to 30 miles an hour. The beneficial effect of the government's undertaking the establishment of a general system of railways, is obvious in the introduction of this important means of communication much earlier than could have been accomplished by the separate operations of private companies; and to the objection that the government may exercise a too despotic influence over public travelling, it may be replied that, from the experience afforded by the chartered railroads of England, it is not likely that the control of the state will be more absolute than that of the directors of private companies; and as a proof that the Belgic government offers no discouragement to private speculations of this nature, it may be stated that, in 1838, there had been 36 applications granted by the government for numerous branch railroads, many of which are opened, and others in active preparation.

Canals.—The length of the course of canals in Bel-

gium amounts to 460,220 metres, and that of the navigable rivers to 962,746 metres. Hence the total extent of inland navigation is 1,422,966 metres, or 884 English miles. The facilities thus afforded for the transport of heavy merchandise and agricultural produce between the principal places in the kingdom is a great advantage to the prosecution of all industrial and commercial business. The following table exhibits the name, direction, and length of each canal in Belgium.

<i>Basin of the Scheldt.</i>		Mètres.
C. of Bois le Duc to Maestricht	-	22,800

Population.—The population of Belgium, by the last census of Dec. 31, 1836, amounted to 4,242,600. It belongs to three principal races, the Germanic, which comprehends the Flemings and Germans; the Gallic, to which belong the Walloons; and the Semitic, which comprehends only the Jews. The Flemings, who speak in general a dialect of the Dutch language, form the population of the arrondissements of Brussels and Louvain, i*la* Brabant, and that of the provinces of Antwerp, the two Flanders, and the greatest portion of the province of Limburg. The Germans occupy a part of the provinces of Luxembourg and Limburg. The Walloons, who amount to about 1,300,000, speak a dialect of the ancient French, and inhabit the provinces of Liège, Namur, Hainault, the arrondissement of Nivelles, in Brabant, and a part of the province of Luxembourg. The Jews are distributed throughout the kingdom.

The French language is used in public affairs and by all the educated and wealthy classes. Among the Flemish, and German inhabitants, nearly all speak French, or at least comprehend it. The amount of population in each province, in Dec. 1836, was as follows:—

	Inhabitants.	No. of Inhab. per 100 hectares.	Inhab. of towns.	Inhab. of country.	Relation of town to country Inhab. as 1 to
Antwerp	360,180	126·8	124,257	235,923	1·90
Brabant	592,250	180·4	164,577	427,673	2·60
West Flanders	627,128	191	166,594	460,534	2·76
East Flanders	753,956	253·2	184,941	573,565	3·10
Hainault	631,823	175·4	181,623	450,994	3·79
Liège	350,715	135·4	95,425	255,290	3·09
Namur	331,305	76·9	46,901	284,404	4·16
Luxemburg	323,919	47·8	32,848	290,371	6·59
Namur	227,074	62·5	33,372	193,702	5·80
Total in the whole kingdom	4,242,600	125	981,144	3,261,456	3·22

It appears from this table that the population is very unequally distributed throughout the territory. East Flanders, the richest and best cultivated province, contains, in proportion to its extent, the greatest number of persons. The density of its population is twice as great as that of Antwerp or Liège, four times greater than that of Namur, and six times that of Luxembourg. The Pays de Waes, in the arrondissement of Termonde,

in the neighbourhood of Courtray, contains more inhabitants than are to be found in any part of Europe on the same extent of surface. It is calculated by M. Quetelet, that the number of men in Belgium capable of bearing arms is 778,381.

The following is the number of inhabitants in the chief towns of each province, taken at two points of times, separated by an interval of eight years:—

	1 Jan. 1830.	1 Jan. 1835.
Antwerp	77,199	77,162
Brussels	98,279	104,509
Bruges	42,198	44,374
Ghent	85,785	91,792
Mons	25,110	26,444
Liège	58,067	62,851
Namur	21,571	20,480
Hainault	7,393	8,805
Arlon	5,557	4,785

In 1836, the total number of births in the towns was 32,644; in the country, 111,570. The number of marriages was 31,441; divorces 15. The number of deaths, in the towns, was 25,855; and in the country, 75,379.

The number of children found abandoned by their parents (*enfants trouvés*); the number of deaf and dumb; the blind; and the proportion of paupers (*les indigents*) to the whole population, in 1836, are shown in the following columns, with regard to each province:—

	Children found.	Deaf and Dumb.	Blind.	Paupers to 100 Inhab.
Antwerp	1,918	102	385	7.9
Brabant	2,961	940	514	21.1
West Flanders	388	281	544	20.1
East Flanders	990	312	814	13.5
Hainault	1,548	33	715	21.3
Liège	210	194	405	17.2
Limburg	253	175	328	10
Luxemburg	52	12	197	0.7
Namur	607	140	219	4.4
Whole kingdom	8,207	1,900	4,117	11.8

The annual number of foundlings has continued nearly the same since 1833. Of the 1,900 deaf and dumb, 1,453 were from birth, and 407 from accident; and 960 of the blind were cases of military ophthalmia.

The following general observations express the results deduced from an examination of several statistical documents respecting the population of Belgium in 1836:—The whole male population may be considered as consisting of two parts, equal in number, namely, those under and those above the age of 23. The same is true of the females, except that the point of division is the age of 25. Of the unmarried, male and female, the number under and over the age of puberty is equal. In the country population, the two sexes are very nearly equal in number; in the towns, there is a uniform excess of females. The proportion of the married to the whole population is as 1 to 2. The proportion of unmarried to married, in an equal number of each, is comparatively greatest among males in the country. The number of widows is double that of the widowers; and this excess is much larger in the town than in the country populations. In 100 houses in the country there are 106 families. In the towns there are 466 persons to 100 families, or something above 4½ to each family; in the country, 808 persons to 100, or 8 to each family. The births to the whole population are, in the country, as 1 to 29.9; and in the towns, 1 to 27.7. The deaths to the whole population are, in the country, 1 to 44.3; and in the towns, 1 to 34.9. The total marriages to the total population are as 1 to 134.9; the number divorced, as 1 to 282.84. The proportion of the population of towns to that of the country is as 1 to 3.22. The marriages in the towns are, to those in the country, as 81 to 100, or 1 to 3; which proportion is identical with that between the two kinds of population. The average proportion of births to marriages, in the whole population, is as 4 to 6; and of deaths to births, 1 to 1.48 in the country, and 1 to 1.26 in the towns. The excess of the numbers of births to the deaths is 42,980, or 334 per cent. The greatest number of births was in March, 14,583; the least number, in August, 10,938; the greatest number of deaths was in January, 10,186; the least number, in July, 7,291. The illegitimate births are to the legitimate as 1 to 12 in East Flanders, the richest province; and 1 to 33 in Luxembourg, the poorest province in the kingdom: the general average is 1 to 21. The medium duration of life in Belgium is 31 years. The probable duration of life, immediately after birth, is—males, 24 years in the country; 21 years in the towns; females, 27 years in the country; 28 years in the towns. At the age of 5 years it is—males, 51 years in the country; 48 years in the towns; females, 51 years in the towns; 48 years in the country. At 40 years of age, 37 for both sexes, in town and country; at 60, 12 to 13; and at 80, only 4. The number of paupers (*les indigents*) constitute 14.8 per cent. or 1 in 7, of the whole population; and it is remarkable that in those provinces where industry and commercial enterprise have produced the greatest wealth and improvement, the proportion of paupers exceeds 21 per cent.; while in Luxembourg, the poorest province of the kingdom, it is only 0.7, or less than 1 per cent. The operative classes form three fourths of the whole population. The number of insane persons, of whom more than one half are paupers, are as 1 to 1,000 of the whole population; and maniacs, to the other classes of insane, as 1 to 5. Of 10 insane persons medi-

cally treated, scarcely 1 is cured. The number of deaf and dumb is as 1 to 2,133. The number of blind 1 to 1,012. On an average in 1,000 born, 843 are vaccinated; 22 have the small-pox, of which 2 die.

The government census of the population of Belgium is conducted with the most exemplary attention to systematic method. All the useful points of inquiry are included, so that the results exhibit a most valuable assemblage of scientific data, which in satisfactory completeness and precision are not surpassed by similar documents of any other country. A particular of great importance in the calculations of life insurance—the ages of the living and dying,—which in many enumerations of the inhabitants of other countries has been omitted, is ascertained with great care in the population inquiries of Belgium.

Manners and Customs.—The Belgians have been successively subjected to the influence of so many different governments—French, Austrian, Spanish, Dutch—that they consequently possess no distinctive and peculiar national character. The apathetic and persevering industry of the Dutch is blended with the vivacity and self-assurance of the French, without producing an agreeable compound. The different provinces exhibit some variety of character and manners. On the borders of Holland the people are generally similar to the Dutch, and adopt their customs, amusements, and dress; but in the southern districts they differ but little from the French in appearance, habits, costume, and language. The Belgians have always displayed a passionate fondness for social liberty,—an impatience of control that embroiled them with all their different rulers, and involved them in ruinous disasters during many successive centuries. Writers of all ages agree in describing the Belgians as the most restless, unruly, tumult-loving mortals in existence; always treating their best rulers the worst, while the bad overruled them. In the history of no other country do we find such unbounded liberty with such an invincible disposition to abuse it. The Flemish burghers no sooner emancipated themselves from the despotism of their feudal lords, than jealousy of each other's power engaged them in frequent and fatal hostilities; so that "liberty," says Mr. Hallam, in his History of the Middle Ages, "never wore a more unamiable countenance than among these burghers, who abused the power she gave them by cruelty and insolence." They confirmed every compact with ceremonious oaths, and then broke them one after another,—always complaining of encroachments upon their liberties; and this characteristic deficiency of good faith appears to have been transmitted to the present descendants of the Belgians of the middle ages. Major Gordon, in his useful Advice to Settlers in Belgium, has candidly put this failing on record, and the fact is corroborated by an able writer and admirer of the Belgians (in the *London and Westminster Review* for April 1839, p. 377.) who says that "a facility for making promises and breaking them runs through the Belgian people, in all the channels of business, wholesale or retail, of the bureau or in the workshop." The same author remarks that "this general want of veracity does not extend into the great national transactions, nor into the proceedings of diplomacy." The most obvious peculiarity by which the Belgians are distinguished is their devout observance of religious rites and ceremonies. Long and imposing processions of the priesthood in their sacerdotal dresses are frequently parading the streets of the principal towns. Every native salutes the consecrated host with the deepest reverence as it passes by, and it would be dangerous for the traveller to manifest, even by a gesture, the slightest disposition to ridicule. It is evident, indeed, in the whole conduct and customs of the Belgians, as described by writers of every party, that the higher classes are greatly influenced by bigotry, and the lower classes by superstition. In the rural districts the clergy are regarded with fanatical veneration, and they every where exercise, and endeavour to maintain, a powerful dominion over the great mass of workmen and peasants. The churches are all open at five or six o'clock every morning, when every good Catholic attends to repeat his prayers before entering upon the business or pleasure of the day, and the afternoon and evening of every Sunday are enlivened by the entertainments of tavern gardens, grounds for shooting with the cross-bow, ball-rooms, theatres, and other public places of amusement. Another remarkable and very general trait in the Belgic character is a pertinacious adherence to long-established notions, habits, and customs, with an aversion to proposed improvements, however worthy of consideration and adoption. This, however, is more especially true of the rural population,—for the middle classes of the towns are distinguished for a zealous spirit of enterprise, and extreme readiness to act upon every suggestion of advantage and additional security, in the prosecution of industrial and commercial business; and upon this important and highly intelligent portion

of the population depend the present and future elevation and prosperity of the whole kingdom. The wealthy inhabitants of the cities have very generally adopted the language, fashions, dress, manners, and amusements of the French, so that Brussels may be regarded as Paris in miniature—with much of the dullness of a mere provincial town.

Music and dancing are very favourite amusements, especially with the middle and lower classes. On every fine summer evening balls are given at the tavern gardens, which are numerous in the outskirts of every large town. The price of admission varies from 3 or 4 sous to a franc. Musical festivals are celebrated every year at Bruges, Ghent, and Antwerp, by amateur performers, who are emulated by enthusiastic ambition to win numerous prizes, which are awarded to the best performers. The musical skill exhibited on these occasions is truly astonishing; and the trial of the comparative ability of the natives of particular localities is regarded with intense excitement, which is manifested by marching the performers to the contest in stately processions, accompanied by party banners, and thousands of spectators. Music, in fact, is so commonly and carefully learnt, even by the labouring classes, that the harmony of the airs which are sung by groups of peasants while at work, is often delightful to the most cultivated musical ear. The national taste for music is strongly manifested in the numerous and singularly excellent chimes of 50 or 100 bells, called *carillons*, which are placed in the church steeples and towers of the town halls. Those in the large cities are not always played by means of a revolving barrel worked by machinery, but by keys, similar to those of an organ, though of far greater dimensions. The performer, an accomplished musician, is paid a considerable salary for amusing the citizens during an hour or two every day, with the finest musical compositions. His hands are cased with thick leather, and the physical force required is so severe as to exhaust the strength of a powerful man in a quarter of an hour. In some localities, the different chimes are so numerous as scarcely to leave an interval of silence, day or night. At a distance, the sounds float as softly as the notes of an Æolian harp, or melodious organ. The half Dutchman of the province of Antwerp loves to indulge his constitutional apathy in sedately sitting over his pitcher of beer, and watching the circles of smoke that issue from his pipe of tobacco. He is roused to extravagant mirth only once in the year, when the carollic licenses every one to commit any kind of folly for three days, under the disguise of masks and harlequin dresses. In winter, the wealthy classes are fond of driving about in ornamental sledges, constructed in very fanciful forms, and painted with the gaudiest colours. The *trekschuit*, or canal fly-boat for passengers, is also a peculiar picturesque object in the scenery of Belgium, as it glides, gorgeously painted, between vividly green banks, shaded with rows of beautiful trees. A common recreation throughout the country is the shooting with a cross-bow at a wooden bird, fixed upon the top of a lofty pole. The rustic inhabitants of the great plain of heathy sand, between Antwerp and Maastricht, are lower on the scale of civilisation than similar classes in the western and central districts of the kingdom. The necessity for ceaseless manual toil precludes all opportunity of mental culture; and leaves them rude, rough, and ignorant. Their food consists wholly of potatoes, buttermilk, and the coarsest rye bread. Of a similar character are many portions of the numerous Walloon population, inhabiting the country S. of a line drawn from Courtray in the W. to Maastricht in the E. Their language, a vulgar patois derived from the old French of the 13th century, is called by themselves *Köter Falsch*, and is not understood by the Flemings, Dutch, or French of the present age. These hardy and illiterate people have a natural propensity for war, and in former times they served, like the Swiss, in the armies of Austria, Spain and France. They are now chiefly employed in working the mines of the hilly districts in which they live. Their coarseness of character, and deficient sense of delicacy, especially of females, have often been observed by Englishmen who have had opportunities of making observations upon their habits. The disgust of travellers in Belgium has also been frequently excited by a barbarous, but common practice, of throwing domestic slops from the upper windows in the town and city streets.

In general the labouring classes in Belgium are ruder and less instructed than in Holland, but industrious and provident habits are observable in every part of the kingdom, especially in Flanders. The Flemings possess the distinctive characteristics of the Saxon race: talents for agriculture and commerce, perseverance without vivacity, and a spirit of enduring courage in war. An account of the character and condition of the small peasant farmer has already been given. The following description of the domestic economy of the superior class of Flemish farmers is condensed from the *Agrie. Survey of Mr. Batelliff*.—It is pleasing, he says, to observe his laborious industry recruited by decent

and comfortable refreshment, and his farm servants treated with kindness and respect. He does not aspire to be a gentleman, and his servants feel the benefit. They uniformly dine in a plentiful and orderly manner with the farmer and his family at the same table, which is covered with a clean cloth, and well supplied with spoons, four-pronged forks, and every other convenient article. A standing dish is soup, composed of buttermilk boiled and thickened with flour or rye bread. Potatoes, salt pork, salt fish, various vegetables, and eggs are the articles of daily consumption, with occasionally fresh meat and fresh fish, and always abundance of butter or rendered lard. All these provisions are made palatable by tolerable cooking. The potatoes are always peeled, and generally stewed in milk. A kind of kidney bean, sliced and stewed in milk, is a constant dish. No respectable farmer is without a well-cultivated garden, full of the best culinary vegetables and apples, all of which appear at his own table. He is particularly attentive to the preservation of a neat and comfortable appearance, personal and domestic. Health and cleanliness are greatly promoted by an ample supply of good linen apparel; and few, even of the labourers, are without several changes. In home work, the farmer wears a blue linen frock. His house is ornamented outside by flowering creepers, or fruit trees trained against the walls; and within, the neatness of every arrangement is highly pleasing. Each article of furniture is highly polished; the service of pewter is displayed in glittering rows, and the tiled floor is kept perfectly clean by frequent washings. The Flemish farmer seldom amuses riches, and is scarcely afflicted by poverty. Industry and frugality secure for him the enjoyment of moderate comforts, and beyond these he has no anxiety. He abstains from the excitement of spirituous liquors, though easily procured; he never exceeds his available means; punctually pays his rent, and, in case of emergency, he has always something at command beyond his necessary expenses.

Sciences and Arts.—Since the provinces of Belgium have formed an independent nation, a great spirit of emulation and desire of improvement have arisen among all classes of the population. Energy has been awakened that already have achieved much in the cause of social and intellectual advancement, and that promise to accomplish far more in the same honourable career. Not only the physical, but the intellectual resources of the country, are becoming more and more developed. It appears, from a work published in 1837, (*Dictionnaire des Hommes de Lettres, des Savans, et des Artistes de la Belgique*, par M. Van der Maelen), that there are in Belgium 1,946 persons of whom 613 are men of literature and learning, professors, &c., and 438 artists, born in the kingdom, or permanently settled, especially at Brussels, Ghent, Antwerp, and Liège. Among the most eminent artists at present are Wappers, Verbeekhoeven, De Keyser, in painting; Geefs, in sculpture; De Beriot, Servais, Vieuxtemps, and Batta, in instrumental music. Original works, and compositions of high character, are constantly contributing towards the formation of a national literature. The government sustains and encourages the progress of science, learning, the fine arts, and literary taste; pensions are given to talented young men to enable them to develop the powers of their genius in foreign countries, by studying the works of the great masters; and a national exhibition is opened every year, in which are displayed the paintings, sculptures, engravings, and designs of the best artists. It is alternately held at Brussels, Antwerp, and Ghent, so that each of these cities becomes a centre of attraction to the lovers of art every third year. The exhibition at Brussels in 1836 was formed of the contributions of more than 160 artists, nearly all natives of Belgium. The most meritorious performances are rewarded by medals of gold, silver, and bronze.

Architecture has been carried to the highest degree of perfection in the construction of the cathedrals and town halls of Belgium, which display the finest specimens of the ornamental Gothic style of the middle ages. The cathedrals of Antwerp, Ghent, and Mechlin, are magnificent Gothic structures. The open work tower of the latter is of the 12th century, and though unfinished, it is higher than the dome of St. Paul's. In England, Gothic architecture is chiefly confined to churches, but in Belgium it is shown to be equally applicable to civic edifices and private houses. Fronts richly decorated with quaint and fantastic sculptures, lofty sloping roofs, full of windows, pointed gables, castellated towers, battlements, and projecting windows combine to produce a general effect, which, from its grandeur and intricacy, delights and amuses the spectator. The town halls, or rather municipal palaces of Brussels, Louvain, Ghent, Ypres, and Bruges, are unequalled in magnitude and elaborate ornament by any similar edifices in Europe.

Belgium possesses several public libraries, containing rich collections; and the government exerts the greatest care to increase and preserve them. At Brussels, the library of Bourgogne, founded about 1550, consists exclusively of a collection of 1,500 manuscripts. The Town

Library possesses 140,000 printed volumes. The National Library, founded by the government in 1837, contains 60,000 printed volumes, and 1,000 manuscripts. At Louvain, the University Library consists of about 105,000 printed volumes, and 250 manuscripts. At Liège, the library of the university has 60,000 printed volumes, and 440 manuscripts. At Ghent, the University Library contains 51,640 printed volumes, and 556 manuscripts. The Public Library in the town-house of Antwerp contains 18,000 volumes. At Tournay, the Town Library, opened to the public in 1818, contains 27,000 printed volumes, and 85 manuscripts. The state also possesses several valuable depôts of archives. That at Liège includes the archives of the ancient principality of Liège, which are very numerous and interesting. In the dépôt of Mons are the ancient archives of the sovereign court of Hainault, and other curious antiquarian documents. That of Tournay includes the archives of the ancient provincial council, and states of Tournay. The dépôt of Ghent is very extensive and important, as containing many historical documents, such as the charters of the counts of Flanders, of the abbots of St. Bavon, &c. &c.

Learned societies devoted to general or particular objects are very numerous. The most important, as well as the most ancient, is the Academy of Sciences and Belles Lettres of Brussels, the operations of which commenced in the reign of Marie Thérèse.

Among the establishments which have taken an honourable place in the annals of science, is the Observatory of Brussels, the construction of which was projected before the revolution; but its execution and efficient operation are attributable to the present government. The precise geographical position, which it occupies is in N. lat. 50° 51' 10" N., and its long. E. from Paris 8° 7". The ground-floor is 58 mètres above the level of the North Sea. This observatory is furnished with the most excellent instruments; and, under the able direction of M. Quetelet, it is highly useful, not only in the practice and improvement of the science of astronomy, but in affording advantages for the study of other mathematical and physical sciences, as meteorology, navigation, geography, and especially dialling, and the exact notation of time. With the view of precisely determining the measure of time, a small lunette meridian has been constructed in each of the cities of Antwerp, Ostend, Bruges, Ghent, and Liège; and grand meridians are placed in the walls of the cathedrals and hôtels de ville, or other public edifices of numerous other cities. These arrangements have served to furnish an assemblage of astronomical observations in Belgium that are not known in other parts of the world. The Observatory publishes annually a scientific annuaire, similar to that of the Bureau of Longitude in Paris.

The geographical establishment of Brussels is a private institution unique in its kind. Its founder, M. Vander Maelen, to whom geographical science is much indebted, is connected with the principal scientific societies in Belgium and other countries. The edifice is beautifully placed in the centre of pleasure-grounds, and the interior contains a rich library, a museum of natural history, magnificent conservatories, replete with rare and curious plants; and a large school, in which is taught the whole process of drawing and engraving maps. Many valuable publications have issued from this institution; namely, elaborate geographical dictionaries of the Belgic provinces, a cadastral or statistical atlas of Belgium, a large map of the environs of Brussels, a geometrical plan of Brussels, a topographical chart of Belgium, &c. &c.

Public Instruction.—Belgium possesses 4 universities, devoted to the higher range of scientific and literary studies; two belonging to the state, at Ghent and Liège; the Catholic university of Louvain, founded by the clergy; and the free university of Brussels, founded by association. In the 16th century the university of Louvain was the first in Europe as a school of Catholic theology, and was attended by 6,000 students. Besides the usual faculties of law, medicine, science, philosophy, and literature, the university of Liège contains a school for teaching the useful arts, manufactures, and mining. That of Ghent gives a course of civil engineering; and the university of Louvain a course of theology. Each of the universities possesses a chemical laboratory, cabinets of physical science, of mineralogy, zoology, and comparative anatomy, a theatre of anatomy, botanic garden, and chambers for clinical practice. The number of students who attend the collegiate courses at Liège is usually about 400; at Ghent 300, and at Brussels about 320. The largest classes are those of law and medicine. About 420 students of divinity attend the Catholic university of Louvain, which is opposed to the liberal university of Brussels.

Academical Degrees.—Belgium has established a system for examining students and conferring degrees, similar to that lately adopted by the university of London. A body of examiners, composed of professors and other highly distinguished men of learning and science, holds its sessions in Brussels, and awards honourable certificates and titles to those possessed of the greatest scientific and literary knowledge and ability, without inquiring whether these requisite qualifications have been

acquired from professional teachers in the public halls of a chartered college, or from solitary perseverance in a private study. To ascertain and reward the highest merit is considered, as in reason it ought to be, sufficient for the purpose of encouraging the pursuit of useful knowledge: the questions about *where* and *how* being relatively unimportant.

There are two degrees in each department of knowledge—*candidate*, or graduate, and *doctor*, which is understood and applied simply in its original and abstract signification of a person competent to teach; that is, learned. The body of examiners consists of several separate committees or juries (*jurys d'examen*), each composed of 7 examiners and 7 supplementary members (*suppléants*). The class of moral and mental philosophy, and that of polite literature, have each a jury appropriated to examine and confer degrees, as have also those of law and medicine. The members of the examining body are apportioned for one year: 2 of each jury are nominated by the chamber of representatives, 2 by the senate, and 3 by the ministers of the government. In 1838, the four universities of the kingdom were represented in the examining body as follows:—

	Examiners.	Supplementary.	Total.
University of Liège	7	12	19
Ghent	8	10	18
Louvain	10	3	13
Brussels	5	3	8
Total	30	28	58

There are two sessions in each year. Those of 1837 conferred degrees upon 414 students, of whom 124 belonged to the university of Liège, 79 to that of Ghent, 94 to that of Louvain, 76 to that of Brussels, and 41 had prepared themselves by private study. Classical studies are discouraged throughout Belgium, with a disposition to banish them for more obviously useful acquirements.

A *military school* at Brussels annually furnishes well-instructed officers to the army; and the government has taken measures for the re-organisation of this establishment, in order to form it into a polytechnic academy. There are two *seminary schools*, one at Brussels, the other at Liège. That at Brussels belongs to the government; and although it is designated a veterinary school, its arrangements afford the means of complete instruction, not only in that department of science, but in all the different branches of agricultural knowledge, theoretical and practical; together with the chemical principles of brewing, distilling, &c. &c.

Several of the larger towns possess each an *Athenæum* or a *gymnasium*, for supplying a middle course of instruction between that of the school and the university, comprehending, however, the ancient and modern languages, history, geography, and the elements of the mathematical and physical sciences. The Athenæum at Brussels has a theatre for lecturing, capable of accommodating 1,200 persons. Each student has a furnished room, at the expense of the government; and all the lectures are gratuitous.

Besides these establishments, which are supported by the state, or by the communes, some of the provinces have *Catholic colleges*, which, as well as the university of Louvain, are under the direction of the clergy. Four of these ecclesiastical institutions are possessed by the corporation of Jesuits; namely, one at Brussels, one at Namur, one at Alost, and one at Ghent. There is also a theological seminary in the diocese of each Catholic bishop; that is, at Mechlin, Bruges, Ghent, Liège, Namur, and Tournay; and smaller schools of the same nature in each diocese; at Mechlin, Roulers, St. Nicolas, Molduc, Bonne-Espérance, Bastogne, and Floreffe. Belgium may, therefore, be considered as amply provided with the means of maintaining and propagating ecclesiastical doctrine.

Industrial and commercial schools are established at Brussels, and at Verviers, where courses of instruction are given in mathematics, mechanical science, chemistry, geography, book-keeping; in short, in every department of science and practical knowledge that is or may be subservient to the purposes of commerce and the manual arts. At Tournay, a school has been especially formed for teaching the most useful arts and trades; and in the cities of Mons and Namur, schools are opened for giving instruction in the various operations appertaining to mining. The fine arts are still an object of much emulation in Belgium, and academies of painting are very numerous attended in Brussels, Antwerp, Liège, Ghent, Louvain, and Tournay. The total average number of young men who are constantly receiving gratuitous instruction in the different academies of painting and schools of design throughout the kingdom is 8,560, and their numbers, with regard to each province, are as follows:—

Antwerp	-	1,065	W. Flanders	-	886
Brabant	-	991	Namur	-	80
Hainault	-	460	Limburg	-	30
E. Flanders	-	1,100	Liège	-	900

The Royal Academy of Fine Arts at Antwerp is the principal school of painting, and it produces every year several artists of the highest distinction. It is supported by the public, and is usually attended by at least a thousand students.

Belgium has had the rare honour of producing two different schools of painting, known by the appellation of "Flemish." The first arose under Hubert and John Van Eyck, or John of Bruges, about the year 1440. To the latter artist is attributed the discovery, or at least a remarkable improvement, of oil painting; and the remaining specimens of his skill display a most wonderful richness and brilliancy of colouring. In the days of the Van Eycks, the Flemish painters were enrolled in a guild at Bruges, and exceeded 300. The works of this early Flemish school exhibit generally a great stiffness and formality of design, and deficiency of good taste and refinement; but their representation of truth and nature, their skillful execution, and vivid colouring, with the fact of their being the earliest efforts of original art, unassisted by the relics of classic antiquity, give them a very peculiar interest. A long succession of artists, of whom the principal were Hans Memling, Quentin Matsys, Floris, De Vos, the Breughels, and Otto Vennius, extend to the commencement of the second school of painting, the ruling spirit of which were Rubens and his pupil Vanduyck. The style of Rubens resembles that of his predecessors in brilliancy and contrast of colouring, but he is no less remarkable for liberty and facility of drawing than they for confinement and difficulty. All his principal paintings exhibit the power of very superior genius, in spite of many faults, one of which is that of women without beauty or grace; and the concourse of strangers who visit the galleries, churches, and public halls, in which his works are exhibited, at Antwerp, and the other great cities of the kingdom, are a source of considerable wealth to the inhabitants.

Brussels possesses a royal establishment for lithography, and an excellent school of engraving, where designing is taught, and the different kinds of engraving on copper and wood.

Belgium is remarkable for its large and numerous schools of music, called *conservatoires*. The most important is that of Brussels, which is commonly attended by 400 pupils; and the most ancient is at Liege, with 200 pupils. The Ghent Conservatory of Music, though a very recent establishment, contains above 160 pupils. There are several others, numerously attended, at Mons, Louvain, and Namur. The Grand Harmonic Society of Brussels, which is accounted the first of the kind in existence, includes among its best performers many who were taught in the Brussels conservatory.

Schools for teaching navigation are established at Ostend, Antwerp, and Nieuport. The one at Ostend has about 60 students.

Primary instruction in Belgium has made no perceptible progress during the last nine years, that is, since the revolution by which the Belgic provinces became independent of the Dutch government, an event which, however beneficial and desirable for other national objects, has doubtless been greatly injurious to the cause of national education. The compulsory and normal system of Holland was then rejected by the Belgic authorities, who adopted, in its stead, the voluntary principle; but this has not secured either the competency of teachers or the attendance of scholars; so that general confusion and ignorance have succeeded to that order and intelligence which was steadily extending under the dominion of the Dutch. The Catholic clergy and monastic orders have made energetic and very successful exertions to possess the ground which the Belgic government left unoccupied, especially the Brotherhood of the Christian Doctrine.

Public instruction in the Belgic provinces, down to the time of their union with those of Holland in 1815, was in a very backward and depressed state. Primary education had been systematically and very successfully established in Holland since 1805, and it is due to the government of that country to acknowledge that its anxious attention was at once bestowed upon the great deficiencies and abuses of the school system of Belgium, on its union with Holland. In 1817, the Dutch normal and compulsory system first began to operate generally throughout the southern provinces of the kingdom of the Netherlands, now constituting Belgium; and during the 12 years from that time to 1829, the progress and value of primary instruction was far greater than at any period before or since. The number of children who attended the elementary schools in the winter of 1817 was 152,698, and in the winter of 1829 they amounted to 247,496, being an increase of 94,598. In 1817, the salaries paid by the government to teachers in the rural communes was 157,580 francs; in 1828 it was 498,150 francs, showing an increase of 330,570 francs, appropriated to the support and extension of the Dutch normal and compulsory system. In that period, there were 1,146 school-rooms, and 658 houses for teachers,

newly erected, or refitted; and 1,977 male and 168 female teachers received certificates of competent qualification. Well arranged schools, and able teachers, were established in almost every commune, and improvement was rapidly and universally extending. Antiquated and awkward routine was replaced by more rational and advantageous methods of teaching; uniformity was observed in the use of class-books; normal schools were opened for the instruction and training of masters; courses of lectures were given in the principal towns on the required qualifications and duties of teachers; funds were supplied in advance for the construction of school-houses; societies of masters were formed for circulating useful books and professional knowledge. Other important societies were established for the purpose of extending, in various ways, the beneficial effects of the normal system; and fines were inflicted upon any persons who presumed to teach without the requisite testimonials and certificates of competency. In short, the whole plan of proceeding fulfilled the most desirable conditions of securing the regular attendance of children, and the able and efficient performance of the duties of teachers, by the responsible superintendence of government, frequent inspection, examinations, reports, and full publicity. Notwithstanding the obvious advantages of this system, a spirit of opposition began to be generally manifested in 1828, and it appears to have been mainly attributable to ecclesiastical partisanship. The people and institutions of Holland are chiefly Protestant, while those of Belgium, with little exception, are Catholic. The Belgians are, moreover, most rigid adherents to the rights and dogmas of the church of Rome, and are remarkably subject to the influence of their spiritual pastors. They consequently never heartily concurred in the establishments of the educational system introduced by the Dutch, and eventually they charged it with being instrumental in propagating Protestant doctrines, at variance with those of the Catholic church. The refusal of several Catholic congregations to submit to the rules respecting examinations and certificates, which led to their proscription by the government; the rebellious disposition of teachers, who would not, or could not, undergo the required proof of their qualifications, and the offence often unavoidably given by the district inspectors in the execution of their functions, served at length to create an amount of opposition and perplexity that induced the government to propose, in 1829, before the revolution, a return to the principle of "freedom of teaching." Since 1830, as stated already, the adoption of that principle, whatever may be its ultimate effect, has been productive of great immediate injury to the primary schools, a large number of which have fallen back to the use of bad old methods and the employment of miserably incompetent teachers. A few primary schools receive subsidies from the present government, but most of the excellent societies which arose under the normal system for the encouragement of good teachers, the use of superior books, and the adoption of improved methods, have disappeared; and the government neither exercises any superintendence, nor makes any inspection, even of the mode of appropriating the insufficient sums which are voted by the legislature for the schools still dependent upon the national funds. A comparison of the returns for 1826, when the Dutch system was in operation, with those for 1836, when it had been discontinued six years, shows that the schools had increased to more than double the number, in consequence of no test of qualifications being required for becoming a teacher; but the proportion of scholars to the population remained exactly the same, and the instruction received may safely be considered as not half so good. The total number of schools in 1826 was 2,541, and the scholars 353,343; in 1836, the schools were 5,622, and scholars 421,303. In 100 scholars, the average number of boys is 57, and of girls 43. A comparison of the number of scholars, with the population of each province, gives the following results:—

Provinces.	1826.		1836.	
	One scholar to		One scholar to	
Antwerp	-	10-0	-	9-7
Brabant	-	11-2	-	9-4
E. Flanders	-	12-3	-	12-6
W. Flanders	-	10-0	-	13-9
Hainaut	-	9-0	-	8-6
Lige	-	14-0	-	16-2
Limburg	-	16-6	-	10-2
Luxemburg	-	8-4	-	7-1
Namur	-	8-7	-	6-6
Whole kingdom	-	10-7	-	10-7

The following ratios of scholars to inhabitants, in several other countries, are stated on the authority of M. Dupuictaux, and will afford the means of comparing the state of popular instruction in Belgium:—

Countries.	Years.	One scholar to
Holland	1835	8.3
England	1835	11.0
Ireland	1831	13.2
Scotland	1834	8.0
France	1834	13.3
Austria	1832	10.0
Switzerland	1834	9.0
Norway	1834	7.0
Denmark	1834	7.0
Prussia	1831	6.0
Saxony	1834	5.5
New England States	1834	4.0

The results of numerical documents relating to primary instruction in Belgium exhibit the following facts:—The number of scholars is far from being equal to that of the individuals requiring elementary education: with regard to which the population may be divided into four parts. The first consists of children under the age of 2 years, who form about *one eightieth* of the whole population, and whose education is merely maternal. The second consists of children between the ages of 2 and 6 years, who form about *one twelfth* part, and who ought to be for the most part committed to the guardian or asylum schools, to be prepared to receive instruction. Schools of this description are at present established only in some of the large towns, and the total number of children belonging to them does not exceed 3,000, which is scarcely a hundredth part of the requisite amount. The third part consists of children between 6 and 15, who form about *one sixth* of the whole pop., and should all receive the instruction which is afforded in primary schools, but it appears that only about one half of the total class have that advantage. The fourth and last part comprises all above the age of 15. In 1836, more than half the young men who were enlisted for the militia in the metropolitan province of Brabant were entirely unable to read. Applying the same proportion to the other provinces, it results that about 1,600,000 young men in Belgium are wholly destitute of the simplest elementary knowledge of reading. It further appears that the total mass of individuals destitute of primary instruction, consisting of adults and children above two years of age, is to the whole pop. as 51 to 100, or more than one half. The instruction given to children is far from being adequate to their wants; it is limited to reading, writing, and a very little of arithmetic. The scholars are often merely kept in charge, and learn nothing; and commonly, in the country districts, the attendance of more than one half is discontinued throughout the summer, in order that something may be earned by their services in the fields. The education of girls is more neglected than that of boys, and both sexes are generally taught together on the same benches, by male teachers. Two thirds of all the schoolmasters in the kingdom are self-appointed, and unwarranted by any certificate of competency.

Catholic Sunday schools for religious instruction are very numerously attended in the provinces of Flanders and Antwerp. The principal Sunday school in Ghent contains about 3,000 children—1,400 boys, and 1,600 girls; and the annual cost of its maintenance is defrayed by voluntary contributions to the amount of 8,500 francs. Evening schools for the working classes are established in several of the principal towns; and also some excellent institutions for instructing the deaf and dumb.

Religion.—The Roman Catholic religion is professed by nearly the whole population, which, in 1836, was 4,242,000. The Protestants do not amount to 13,000, and the Jews are about 1,100. The fullest liberty is allowed in the expression of religious opinions, and the choice of modes of worship. The incomes of the ministers of each denomination of religionists are derived from the national treasury. In 1834, they amounted to 3,427,900 francs, or 137,116*l.*; namely, 134,116*l.* to the Catholics, 2,600*l.* to the Protestants, and 400*l.* to the Jews. The Catholics are under the spiritual charge of the Archbishop of Mechlin, and of 5 bishops, namely, of Bruges, Ghent, Liege, Namur, and Tournay. The salary of the archbishop is 100,420 francs, or 4,016*l.* The salaries of the bishops vary from 2,250*l.* to 3,000*l.* From these incomes, large payments are made to vicars, canons, and ecclesiastical schools, which reduce the annual income of the archbishop to 840*l.*, and those of the bishops to about 580*l.* each. Catholic rectors of the first class receive annually from the public treasury 82*l.*, and the second class 55*l.* Of the first, there were 80 in the year 1838, and of the second 170. The number of the inferior clergy is 4,700; and their annual allowances vary from 8 to 30 guineas. The Catholic clergy is also composed of a great number of men and women belonging to endowed religious houses, and whose lives are devoted to pious contemplation, teaching, and visiting the sick. The number of convents inhabited by these classes is 333, of which 42 are for males, and 291 for females. The Protestant ministers amount only to 28; their annual allowances from the treasury vary from

16 guineas to 168*l.*: the greater number have about 84*l.* The sum of 12,000 francs has been granted by the government for the celebration of worship according to the church of England. The general consistory of the Jews is held at Brussels. The high priest receives from the public treasury 96*l.* per annum, and each of the priests 50*l.* The Béguinage, or convent of Beguin nuns, at Ghent, is of great extent, comprising streets, squares, and gates, surrounded by a wall and moat, and containing 600 of the sisterhood. The Beguins are not bound by any vow, but no sister ever quitted the order. They visit the sick and afflicted, attend the poor at the hospitals, and seek to alleviate misery as the pitying ministers of religious consolation.

Public Charities.—Belgium possesses a great number of charitable institutions, consisting of richly-endowed hospitals and almshouses, for the relief of every kind of misfortune, misery, and want, and for individuals of all ages. The annual amount of money devoted to public charities exceeds 10,500,000 francs, as follows:—

Hospitals or asylums for the poor and sick (1832)	4,246,503
Bureaux of charity (1832)	5,308,009
Institutions for foundlings (1834)	614,609
Poor-houses (1834)	421,544
Total	10,690,665

Each commune has its bureau of charity for the distribution of money, food, or clothing, permanently, to the sick poor, and occasionally to those in health. Private establishments are formed at Brussels, Verviers, and Liège, for the employment of indigent artisans. *Ateliers de Charité*, at Antwerp, Ghent, and other cities, afford work and maintenance to numerous destitute operatives. The one at Ghent constantly contains, on an average, 450 inmates. A particular account of this establishment is given in the proceedings of the Statistical Society of London, No. X.IV. Asylums for the aged poor, and hospitals for gratuitous medical treatment, are found in every town, and lying-in charities in the principal cities: they are supported partly by the communes, and by means of private endowments. The amount of donations and legacies to hospitals and bureaux of charity in the five years from 1830 to 1834, was 2,131,004 fr. There are 318 hospitals for the poor; and the average annual number of individuals maintained therein, during four years, from 1831 to 1834, was 22,880; which is 1 to 182 of the total inhabitants; and the average expense of each person was 186 francs. The annual average number of persons relieved by the bureaux of charity, in the same period, was 617,128; and the average expense of each 8.60 francs.

Numerous hospitals and asylums for lunatics are established in the principal cities of the kingdom; and in general the arrangements and the treatment, physical and moral, are very judicious and commendable. It is estimated that the total number of lunatics in the asylums of Belgium amounts to 2,000, and that this is about half the number existing in the kingdom. There are several ancient endowed institutions for the maintenance of orphans; and in Antwerp, Flanders, Brabant, and Hainault, are several foundling hospitals. During the 10 years from 1821 to 1832, the average annual number of children found abandoned was 8,849. In 1836, the number was 8,207. The annual average expense of maintaining each child is 72.40 fr.

The number of *Monts-de-piété*, or establishments for lending money upon the security of pledged property, amounted, in 1833, to 23. The following table exhibits the progress of their operations during the five years from 1832 to 1836:—

Years.	Amount lent.	Amount of Pledges redeemed.	Average Amount of each Loan.
	Fr.	Fr.	Fr.
1832	8,338,972	6,699,012	7.50
1833	7,218,172	6,726,464	6.70
1834	7,340,262	6,939,335	6.46
1835	10,092,468	7,111,213	8.46
1836	6,716,658	7,392,544	7.23

In 1831, immediately after the revolution, the amount advanced was 6,916,620 fr., and the average upon each pledge 5 fr. 90 cent.; and it is worthy of remark, that in that year, when all industrial and commercial operations were stagnant and suffering, the recourse to this means of assistance was far less than in 1835 and in 1836, when trade and manufactures were flourishing in the highest state of activity. Besides provident institutions, which exist in various localities, there are banks for savings in almost every town, which are connected with a central savings bank for the whole kingdom, established in Brussels by the general society for the encouragement of industrial pursuits. The deposits, which, in 1833, were only between 3,000,000 and 4,000,000 fr., amounted, in 1836,

to 13,707,348 fr.; of which, 10,170,385 fr. were from 8,480 private individuals, averaging each 1,200 fr.; 3,437,715 fr. were from public offices, and 79,248 fr. were from the inmates of prisons. The amount of deposits has subsequently undergone a considerable increase. In March, 1838, it was 40,000,000 fr.

Poor.—Belgium has five great workhouse establishments, for the reception, confinement, and maintenance of the poor. They are situated at la Cambré, near Brussels, for the province of Brabant; at Bruges, for the two Flanders; at Hoogstraeten, for the province of Antwerp; at Mons, for Hainault, Namur, and Luxembourg; and at Reckheim, for the provinces of Liege and Limburg; and they are not only asylums for indigent persons either sick or in health, but prisons for condemned vagabonds and beggars. It is stated by Mr. Nicholls, in his Report on the condition of the poor in Holland and Belgium, that, under the present regulations, these provincial workhouses, or *dépôts de mendicité*, are very defective institutions,—nurseries of idleness and promoters of pauperism; and that hence the necessity arose for resorting to more rigorous measures, which ended in the establishment of the poor colonies, to which all persons found beggins are sent, if able to work, and are compelled to labour for subsistence, under strict discipline and low diet. His remarks that, had the old workhouses been rendered efficient by the introduction of regulations calculated to make them tests for distinguishing between poverty and destitution—providing only for the latter,—there would have been no necessity for the poor colonies, where the test of strict discipline, hard labour, and scanty diet, is so applied as to be held in the greatest dread by the vagrant classes. All beggars are apprehended by the police. If able to work, they are sent to the penal colony; if aged or infirm, or unable to perform out-door work, they are sent to the workhouses; and although the discipline of the latter is defective, and their management in many respects faulty in principle, they serve, with the aid of the coercive colonies, to secure the repression of public mendicity. The establishment at la Cambré, near Brussels, is superior, in its internal arrangements, to the great workhouse at Amsterdam, particularly in the separate classification of the aged, the children, and adults, and also in the good arrangement and cleanliness of the sleeping-rooms. The sexes are strictly separated in all the Belgian institutions of this nature. By the penal code, a mendicant once condemned to the workhouse for public begging may be kept there during the remainder of his life; but in practice he is allowed to leave it whenever the commission of superintendence are satisfied that he is disposed and able to labour for his subsistence without resorting again to mendicancy.

The pauper colony of Belgium is near Hoogstraeten, in the N. extremity of the province of Antwerp; it was established in 1823, by a charitable society, which entered into a contract with the government at that time, to provide for 1,000 mendicants, on receiving for each 35 florins per annum, or 2l. 13s. The tract of bruyère, or poor heathy land, which the society purchased to form the colony, extends to about 1,800 acres in the communes of Merxplas and Ryckvorsel.

The cultivation of this land is carried on by the paupers, and its crops of potatoes and other vegetable produce are generally as abundant as those of the surrounding communes. The buildings are spacious and well ventilated, and the arrangements and discipline are such as to secure the general healthiness of the inmates. There is a school for elementary instruction, an infirmary, with various workshops, stores, and machinery for spinning and weaving. One ward is used in common as workshop, refectory, and dormitory. The inmates sleep in hammocks, and are clad in a very coarse uniform. They labour with the spade in the fields, or in making bricks, or at manufactures in the house, under the superintendence of an inspector. All particulars respecting the work, food, clothes, and expenses of each individual are entered daily, in books kept in the military manner. Mounted guards patrol the boundaries of the colony, to prevent the escape of deserters, and rewards are given for bringing back those who succeed in getting away, for each is compelled to remain at least one year. These rigorous measures for the suppression of mendicancy have been adopted in the absence of any acknowledgment of a right to relief, and notwithstanding that a large portion of the relief actually administered arises from endowments and voluntary contributions. No right to relief exists either in Holland or Belgium, yet in both these countries mendicancy is suppressed. The following table shows the number of pauper colonists at Hoogstraeten, during four years subsequent to the revolution in 1830, with the amount of receipts and expenses of the establishment.

	PAUPERS.	Receipts.	Expenses.
1831	465	174,770 fr.	266,573 fr.
1832	412	200,873	263,314
1833	342	153,751	234,800
1834	266	175,343	274,269

The number of inmates of all the workhouse establishments in the kingdom during the same period, and their expense, were as follows:—

	Inmates.	Expenses.
1831	2,996	427,948 fr.
1832	3,258	434,709
1833	2,647	480,455
1834	2,575	421,644

Which shows that the average cost of each inmate is 163.54 fr. per annum, or 6l. 16s. In November, 1831, there were, in all the workhouses, 1,671 voluntary inmates, and 657 by order—1,138 men, 1,018 women, 372 children; 1,502 unemployed, and 1,026 employed.

Prisons and Criminals.—In Belgium, the punishments of death, and of branding, although still written in her laws, are practically abolished. Criminals are placed in four central prisons; namely, at Ghent, for those condemned to forced labour; at Vilvorde, solely for confinement; at St. Bernard, near Antwerp, for correction; and at Alost, for military offences. There is also in the chief town of each prov. having a court of assize, and of each arrond., a prison for persons arrested, or condemned to less than 6 months' confinement, and for debtors. The number of these places in the whole kingdom is 149. A separate penitentiary for female criminals is about to be established at Namur, and a school of reform for criminals under the age of 18. Hitherto, the superintendence and instruction of female prisoners have been confided to the religious order of the Sisters of Providence. The average pop. of the four central prisons in each year, from 1831 to 1836, was as follows:—

Years.	Prisoners.	No. kept at work.
1831	3,417	2,501
1832	3,356	2,726
1833	3,185	2,587
1834	3,444	2,577
1835	3,639	2,537
1836	3,691	2,506

The average total expense of each prisoner to the state is 150 fr. per ann. They work exclusively for the equipment of the army, and for the supply of necessary clothing, &c. for prison use. The annual number of articles manufactured exceeds 1,000,000. Criminals, on their liberation, are placed under the inspection of the prison commissioners, in order to facilitate the attainment of honest occupation, and prevent a relapse into crime.

In Belgium, the amount of crime with regard to the pop., and to the criminal records of France and England, is comparatively small. M. Ducpetiaux, in a work published in 1835, entitled *Statistique comparée de la Criminalité en France, en Belgique, en Angleterre, et en Allemagne*, gives the following results of the several official returns: of England, from 1827 to 1833, taking the pop. at 13,500,000; of France, from 1825 to 1832, pop. 32,500,000; and of Belgium, from 1826 to 1832, pop. 4,000,000:—

Countries.	Annual Average.			Pop. to 1 accused.
	Total accused.	Acquitted.	Condemned.	
England	16,924	3,556	13,368	797
France	7,540	2,954	4,586	4,427
Belgium	768	142	626	5,222

In Belgium, the annual average number of persons accused and arraigned, during the period subsequent to the revolution, from 1831 to 1834, was only 620, or 1 in 6,724 of the whole pop.; and it certainly reduces highly to the honour of the moral character and governmental institutions of that kingdom, that the proportion of criminal offenders is constantly diminishing, while in England it is greatly augmenting.

The proportion of accused to the pop. varies very considerably in the different provinces, but all have experienced a diminution, as exhibited in the following table:—

Provinces.	Pop. to 1 accused.		Dimin. per cent.
	1826—1829.	1831—1834.	
Brabant	3,266	5,617	42
Limburg	5,568	6,994	40
Namur	3,976	6,369	38
Antwerp	4,229	6,138	31
Liege	4,828	5,440	11
W. Flanders	4,982	6,086	6
E. Flanders	5,410	5,784	6
Luxembourg	8,072	9,407	4
Hainault	11,546	17,111	34

With respect to the relative amount of different offences, a comparison of the returns for the period

1830-39 with those for 1831-34, shows that, with the exception of an increase of 2 in the annual average number of murders, and of 3 in that of forgeries of money, there had been a diminution in every species of criminal offence, from 9 to 47 per cent.

In general, there is in Belgium, 1 person accused of crime among 8,000 inhabitants, and 1 of misdemeanour among 170. In 100 accused of crime against the person, 20 are acquitted; and of the same number accused of crime against property, 15 are acquitted. The number of crimes against property is three times greater than that of crimes against persons.

The amount of military offences in 1837 compared with that of 1836, shows a considerable decrease of acts of insubordination and quarrelsome assaults, but a slight increase of robberies, and more than double the number of desertions. From the reports of the central prisons in 1832, it appears that in 100 individuals there confined, 61 were utterly ignorant of reading and writing, 15 could read only, but were otherwise extremely ignorant, and 24 could read and write with some degree of facility.

Government.—Belgium is governed by a constitutional monarchy—under a dynasty freely elected by the constituents of the nation. Its independence was first proclaimed, in an absolute manner, by a provisional government, on the 4th of Oct., 1830, and on the 18th of the following Nov., it was again proclaimed by the national congress. By the terms of the treaty of the 15th of Nov., 1831, Belgium forms a state perpetually neuter with regard to all other states. The Belgian constitution, decreed by the national congress on the 7th of Feb. 1831, places all governmental power in the nation, operating by means of the representative system. It establishes individual liberty, the inviolability of every man's house and property, the perfect liberty and independence of religious worship and opinions, the right of assembling and associating, the liberty of the press, the liberty of teaching, ministerial responsibility, and the independence of the judicial power. In short, the whole system of government is based upon the broadest principles of rational freedom and liberality. The entire draft of the constitution is too long for insertion in this place, but the following particulars comprise all the most essential points of this admirable document. A copy of the original, in the French language, is inserted in the *Annuaire Historique Universel*, for 1831. The order of the several subjects is as follows:—Territory and divisions. Rights of Belgians. Powers of government. Legislative chambers. Senate. King. Ministers. Judiciary powers. Provincial and communal administration. Finance. Military and police forces; and finally, various general and temporary arrangements, and provision for the future amendment of the constitution. It declares that no distinction of orders shall be observed, that Belgians are all equal in the presence of the laws, individual personal liberty is guaranteed. No one can be prosecuted, nor have his house entered, but by the authority and forms of the law. Punishment by death is abolished, and cannot be re-established. Universal toleration, liberty of public religious worship, and the liberty of publishing opinions on all subjects, are guaranteed. No state church is recognised, and no one can be compelled to conform in any way whatever to the forms and ceremonies of any ecclesiastical system, nor to observe any of the holy days which they enjoin. The state has no right to interfere in the nomination or appointment of the ministers of any religious denomination, nor to prevent the publication of their acts, except as far as it is responsible for the preservation of the liberty of the press from obvious abuse. The form of marriage, as a civil compact, is required to precede the act of religious benediction. Liberty of teaching is established. (*Vide Primary Education.*) No persons can be prevented from giving instruction; but their misdemeanours, as teachers, are cognisable by the law. The press is free, and no censorship can be established. When the author is known, and resident in Belgium, the publisher, printer, or distributor, cannot be prosecuted. Belgians have the right to assemble peaceably and unarmed; but assemblies in the open air are subject to the laws of the police. The right of associating cannot be annulled by any preventive measure. Every one can address petitions to the public authorities, signed by one or more persons. The post-office is responsible for all letters committed to it, and the contents of letters are inviolable. All power emanates from the people, and must be exercised in the manner established by the constitution.

The legislative power is exercised collectively by the king, the chamber of representatives, and the senate. Each branch possesses the power of first moving the adoption of laws; but such as relate to the state expenses and receipts must be first voted by the chamber of representatives. The interpretation of the laws, with respect to authority, belongs only to the legislature. The executive power is exercised by the king; as directed by the constitution, and the judiciary power by the courts and tribunals. All decrees (*arrêts*) and judgments are executed

in the name of the king. Questions relating exclusively to provincial and communal matters are determined by the councils of the provinces and communes.

The members of the two chambers, represent the nation, and not merely the province or subdivision of a province by which they are nominated. The sittings of the chambers are public, but each chamber can form itself into a secret committee on the demand of its president and 10 members. Members of either chamber cannot receive any pension, or hold any paid office under the government, and during the session they cannot be arrested or detained, except for any flagrant misdemeanour. The chamber of representatives is composed of deputies chosen directly by citizens who pay taxes to the amount of at least 20 florins, about 33 shillings. The number of deputies cannot exceed the proportion of 1 to 40,000 inhabitants. To become a deputy, it is necessary to be a Belgian by birth or by naturalisation; to be in possession of the civil and political rights of the kingdom; to have attained the age of 25; and to be resident in Belgium. No other condition of eligibility can be required. The representatives are elected for four years, and one half of the whole are renewed every two years. On a dissolution, the whole chamber is renewed. Each representative, except those who live in Brussels, receives 200 florins (16 guineas) each month of the session, as indemnity of expenses. The senate is composed of half as many members as the chamber of representatives, and they are elected by the same citizens for eight years. Half are renewed every four years, and the whole on a dissolution. The qualifications are the same as for the representatives, except that the age must be at least 40 years, and the amount paid in direct taxes must be at least 1,000 florins (84*l.*). The senators receive no payment, on account of indemnity of expenses. The session of the chambers must last at least 40 days. The number of representatives is 102, and of senators 51. The constitutional powers of the king are hereditary in a direct male line, natural and legitimate, in the order of primogeniture, to the perpetual exclusion of females and their descendants. In default of male issue, the king may nominate his successor, with the assent of the two chambers, and if no nomination be made, the throne is vacant. The person of the king is inviolable. His ministers alone are responsible. No act of the king is valid unless counter-signed by a minister, who thereby becomes responsible. The king nominates and dismisses his ministers at will, confers gradations of rank in the army, and appoints all persons employed in the general administration, with some exceptions, indicated by the law. He sanctions the laws, and issues the orders and decrees for their execution, without possessing any power either of suspending the laws themselves, or of dispensing with their execution. He commands the land and sea forces, declares war, negotiates treaties of peace, of alliance, and of commerce, but treaties of commerce, and others involving important consequences, are of no effect without the sanction of the chambers. The king may especially convoke or adjourn and dissolve the chambers, and he can mitigate or remit the sentences of punishment pronounced by the judges. He can also confer titles of nobility, but he has no power to attach to them any privileges whatever, all Belgians being absolutely equal in the eye of the law. The nobility enjoy only a personal title, without constituting a social order. No member of the royal family can be a minister, and no one who is not a Belgian by birth or naturalisation. Ministers have no deliberative voice in the chambers unless they are members. They can enter, however, and demand a hearing; and the chambers can demand their presence when required. They are liable to be accused by the chamber of representatives, who can bring them before the court of cassation, which alone is empowered to judge them. The king cannot withdraw a minister from responsibility, nor pardon him when condemned, without a demand for pardon from one of the chambers. There are five ministers; namely, a minister of justice, of the interior, of foreign affairs, of public works, of war, and of finance. The king is declared of age at 18 years. Before he can exercise the functions of royalty, he must take the following oath in the presence of the two legislative chambers:—"I swear to observe the constitution and the laws of the Belgian people; to maintain the independence of the nation, and the integrity of its territory." Judges receive their appointments directly from the king, and hold them for life, so that they cannot be superseded but by their own consent, or by a judgment and for reasons pronounced in open court. The trial by jury is established for all criminal and political charges, and for offences of the press. No extraordinary judicial commission, or tribunal, can be created under any denomination whatever. No taxes can be levied by the state unless ordained by a law of the legislative chambers; and all taxes, as well as the extent of the army, must be voted annually. The civil list is fixed for the duration of each reign. For that of the present king it is 2,751,323 francs, besides the appropriation of the royal edifices.

The number of citizens registered in the electoral lists in 1833 was 47,858, of whom 14,835 were in the cities, and 33,018 in the rural communes. It hence results that, in Belgium, there is one representative to 89,958 inhabitants, and to 478 electors; one senator to 79,325 inhabitants, and to 972 electors; and one elector to 85 inhabitants. To a thousand inhabitants there are 16 electors in the cities, and 11 in the country. Great Britain has one representative to 35,520 inhabitants, and France one to 70,980. Belgium, with respect to electors, is between Great Britain, which, in 1832, had 1 to 29, and France, which, in 1834, had 1 to 177 inhabitants. The national arms are the *Belgic Lion*, with the motto, *L'union fait la force*, and the national colours are red, yellow, and black, in three vertical divisions. Two decorative orders have been instituted, — the civil and military order of Leopold, and the order of the Iron Cross. The first was created in 1832 to recompense all eminent services to the country. It has four classes, consisting, in 1837, of 23 grands-cordons, 16 commanders, 109 officers, and 1,091 chevaliers, or knights. The Iron Cross was instituted in 1833, to reward the patriotism of those who were signally distinguished in the revolutionary period from Aug. 1830 to Feb. 1831.

In each province a governor is appointed, directly amenable to the Minister of the Interior, for the purpose of superintending and securing the due execution of the laws, and each administrative *arrondissement* is superintended by a commissary, under the provincial governor. The exclusive interests of each province are committed to a provincial council, elected by the citizens, who elect the national representatives. The number of councillors in each province is from 50 to 70. Each commune has also its council to manage the affairs which belong exclusively to its inhabitants. The members are elected as those of the provincial councils, in the proportion of 1, on an average, to 187 inhabitants. The total number of communal councillors in the kingdom was, in 1838, 22,285. Each commune has from 2 to 4 bailiffs, and a burgomaster who is the principal local officer for the administration of justice, and the direction of police affairs.

Judicial system. — A *tribunal de paix* in each canton, a *tribunal de première instance* in each *arrondissement*, and 3 courts of appeal, — at Brussels, Ghent, and Liege, — form 3 degrees of civil jurisdiction. Misdemeanours belonging to the correctional police are judged by a section of the *tribunal de première instance*; crimes and graver misdemeanours, political offences, and abuses of the press, are judged by a court of assizes in each province, with a jury of citizens possessing certain qualifications indicated by the law. A *Cour de Cassation*, or annulment, at Brussels, decides upon demands against judgments pronounced in the other courts and tribunals. Commercial affairs are judged by 13 tribunals of commerce, in the principal commercial towns. Military laws are administered by councils of war, and by a high court at Brussels for final decisions. According to the *Annuaire judiciaire* of 1837, the number of legal advocates in Belgium was then 791.

The Court of Cassation pronounces only upon the validity of legal forms, and refers all cases of violation or misapplication of the law to another tribunal. The courts of appeal decide upon appeals respecting the judgments rendered in the tribunals of *première instance* in civil matters, and affairs of commerce and correctional police. The tribunals of *première instance* give definitive judgments upon all civil affairs involving sums under a thousand francs; and the tribunals of *paix* determine cases extending to 50 fr., or to 100 fr. with appeal to superior courts. The tribunals of municipal police are composed of a justice of peace, a commissary of police, and of the burgomaster or bailiff of the commune. The highest degree of judicial proceedings is exercised by the courts of assize, which, in the cities of Brussels, Ghent, and Liege, are composed of a president and 4 assessors, chosen from the councillors of the courts of appeal. In the other chief provincial cities they are formed of 4 judges of *première instance*, and a councillor of the courts of appeal as president. Twelve jurymen, chosen for each case by ballot, from qualified citizens, decide upon the question of guilt, and according to their decision the court acquits or applies the punishment which the law declares. It is calculated that the business of the courts requires annually the services of 2,160 jurymen, and that the kingdom contains 26,359 citizens qualified as the law demands for the performance of that important office.

Finances. — The total revenue of Belgium for the year 1838, as shown by the *Budget Général*, amounted to 94,606,326 fr. The average sum for each inhabitant, calculating the population at 4,250,000, was therefore 22 fr. 36 c. The amount of direct imposts was 76,967,236 fr., which gives an average of 18 fr. 11 c. as the sum actually contributed to the expenses of the state by each inhabitant. In 1829, under the Dutch dynasty, the average on each person was 30 fr. 67 c.; and according to the last budget of the Dutch government, the average

in Holland is 42 fr. 32 c. In France it is 30 fr. 30 c.; and in England 69 fr. 60 c.

The Belgic revenue, as stated above, was derived from the following sources: —

Land-tax	18,261,226 fr.
Personal	8,272,000
Patents	2,833,600
Rent of Mines	115,800
Customs	9,000,000
Excise	18,970,000
Bullion	180,000
Sundry receipts	29,000
Stamp duty	8,580,000
Domains, forests, &c.	10,785,000
Tolls, post, canals	6,080,000
Capital and revenues, roads, railways, forests, &c.	9,295,000
Re-embursements	2,264,000
Total receipts	94,606,326 fr.

The total expenses of 1838 were 95,991,052 fr. 10 c., which exceeded the amount of receipts by 684,726 fr. This excess appears to have been immediately removed by an increase in the amount of receipts in the custom and excise offices.

The expenses are classed as follows: —

Interest on the public debt	9,356,000-06 fr.
Pensions	3,654,000-00
Deposit fund	613,000-00
Civil list	2,751,322-75
Senate	22,000-00
Chamber of Representatives	409,850-00
Court of Accounts	125,286-20
Minister of Justice	6,245,875-00
Foreign Affairs	721,000-00
The Interior	8,137,018-96
Public Works	7,890,815-00
The Marine	649,351-00
The War	42,078,796-35
Finance	12,645,846-78
Total expenses	96,291,052-10 fr.

The national debt consists, 1st, of 100,000,000 fr., borrowed in 1831-32, at 5 per cent., for the organisation of the army and other public services; 2d, of 50,000,000 fr., borrowed in 1836, at 4 per cent., for railways and other means of communication; 3d, of a floating debt of 25,000,000 fr., at 3½ per cent., chiefly for railways, roads, and other public works.

The pensions in 1838 were as follows: —

Civic pensions	577,000 fr.
Military	1,550,000
Ecclesiastical	720,000
To retired finance officers	913,820
To widows of persons employed on public works	6,000
Pensions of the order of Leopold	30,000
Total	3,796,820 fr.

Army. — The quota of the Belgic army is determined every year by a law. Its strength has been fixed, for several years, at 110,000 men; that is, one soldier to 37 inhab. In France, the proportion is 1 to 106; in England, 1 to 229; in Prussia, 1 to 46; and in the German States, 1 to 100. It appears, therefore, that, in Belgium, the number of soldiers to the population is three times greater than in France and Germany, six times greater than in England, and that it even exceeds the proportion in Prussia. All statistical economists are agreed that a state cannot, without injury to its interests, constantly maintain an army which exceeds by one per cent. the totality of its population. The quota of the Belgic levy of 1838, was fixed at a maximum of 12,000 men. The expenses of the war department in 1830-31, were 86,643,275 fr. In 1838, it had gradually decreased to 42,078,796 fr., or less than half; and the average expense of each man was 382-50 fr. In France, it is 738 fr.; in England, 1,404 fr.; and in Prussia, 570 fr. The following table exhibits the number of soldiers, including officers, in actual service or on furlough in 1838, in the different ranks and departments: —

Department.	On service.	On furlough.
<i>Etat-major général</i>	78	
<i>Etat-major des places</i>	162	
<i>Intendance</i>	80	
<i>Etat-major particulier</i> of artillery	98	
of engineers	99	
Infantry	33,388	47,384
Cavalry	7,768	568
Artillery	7,947	1,169
Engineers	18	400
<i>Gendarmérie</i>	237	
<i>Service de santé</i>	687	
Total	51,491	49,531

The army is furnished with 32 chaplains and curates: 5,500 subalterns and privates receive pensions, averaging each about 200 francs. A general association for the encouragement of military service in Belgium has been founded under the protection of the king; and a permanent camp is established on the Campine plain, near the frontier of Holland. It extends over a larger surface every year, and will soon become a military town, advantageously situated and well built.

A civic or national guard of the kingdom is raised for the purpose of defending the constitutional rights of the monarchy and of the people, for the maintenance of order, for upholding the laws, and preserving the territory from invasion. The whole force consists of 599,910 men, divided into 3 bands, the first of which contains 89,000.

There are 267 legions, distributed as follows:—

	Legions.	Men.
Antwerp	30	43,686
Brabant	27	52,167
W. Flanders	40	82,663
E. Flanders	28	108,206
Hainault	35	89,834
Liege	25	53,771
Limburg	24	49,798
Luxemburg	32	44,399
Namur	16	31,542
	257	599,910

The colonels and lieutenant-colonels are nominated by the king from among the majors and captains of the legions. The guard remains stationary; it is under care of the minister of the interior, and the government is empowered to call out the first van when occasion demands it.

Marine.—Belgium, on her separation from Holland, was left entirely without an armed navy. In 1838, she possessed only a small flotilla of gun boats, manned by about 600 seamen and officers. Several larger vessels were about to be constructed.

History.—In the ages immediately preceding and subsequent to the Christian era, much of the great plain which now comprises the provinces of W. and E. Flanders and Antwerp, was partially overflowed by the ocean. The soil was so marshy that an inundation or a tempest threw down whole forests, such as are still discovered below the surface. The sea and rivers had no limits, and the earth no solidity. Many of the inhabitants of this low plain lived in huts placed upon the mounds of sand, or elevated above the reach of the tides upon stakes. They had fish for food, rain water for drink, and peat for fuel. (*Pliny's Nat. Hist.* lib. 16.)

The higher S. and E. parts, forming at present the Walloon country, were covered by the immense forest of the Ardennes, which extended from the Rhine to the Scheldt, and afforded shelter to numerous tribes of the German race (*Cæs.* lib. 2. 4.), who lived by hunting, and by rudely cultivating the earth. They formed a part of the third division of Gaul, which, by the Romans was called Belgæ, Belgium, or Gallia Belgica, and were the least civilised and most courageous of all the Gallic nations. (*Cæs.* lib. 1. 1.) They had cities, surrounded by lofty stone walls and fortified gates, requiring the use of the Roman battering-rams and mining towers. Their armies contained troops of cavalry: the country produced supplies of corn, and abundant herds of cattle. The people consisted of two classes, chiefs and slaves; and Druidism from Britain was universally predominant. Flanders was occupied by the Menapii and Morini, Brabant by the Atuacii, Hainault and Namur by the Nervii (who excelled in desperate courage), and Luxemburg and Limburg by the Eburones, &c. In the great confederacy of these clans against the Romans they levied about 120,000 fighting men, 60,000 of whom were reduced by Cæsar to 500, his battle with the Nervii near Namur, and of the Atuacii he sold 83,000 for slaves, on taking the town of Tongres. (*Cæs.* lib. 6. 30.) In stature and bulk they surpassed the Romans (lib. 6. 30.) whom they fiercely encountered, and nearly destroyed Cæsar's army of the best disciplined troops in the world. The highland tribes soon became amalgamated with their Roman conquerors, adopted their manners and language, and during the long dominion of Rome in those regions, they served in her armies, and were greatly distinguished for their intrepidity; so that many of Cæsar's subsequent victories, especially that of Pharsalia, were decided by the cavalry and light infantry of Belgium. The lowland people, on the contrary, continued faithful to their ancient manners, customs, and language, and sought only to secure national independence by maritime commerce, and agricultural industry. Pliny, who speaks from personal observation, says that, in his time, their fruits were abundant and excellent.

In the 3d, 4th, and 5th centuries, the character of the Belgic population was greatly changed by successive invasions of Saxon Franks from the north, whose progress westward terminated in the establishment of the Frankish

or French empire in Gaul, and under whose dominion the ancient inhabitants of the Ardennes were either destroyed or reduced to slavery. Christianity was introduced, and monasteries were founded in the immense forests and solitudes of the higher country, which the French nobles visited only for the sake of hunting bears. The maritime lowland descendants of the Menapii, now blended with Saxons and Frisians, and known by the name of Fleming, continued to prosper in commerce and agriculture. In the time of Charlemagne, A.D. 800, the physical state of the country had become much improved. In the W. embankments were raised against the encroachments of the sea, and in the E. large tracts of forest were cleared; but the fierce and valiant warriors who formerly occupied the soil, were succeeded by an abject race of serfs, who cultivated the domains of haughty lords and imperious priests. The clergy enjoyed immense possessions: 14,000 families of vassals belonged to the single Abbey of Nivelles, and the income of the Abbey of Aine exceeded 1,300,000 dollars. The Flemings formed associations called *Gilden* (the English guilds) for protection against the despotic violence of the Franks, as well as for social assistance. These were the origin of all the ancient municipal corporations, and within a century after the time of Charlemagne, Flanders was covered with corporate towns. At the end of the 9th century, the Normans, that is, rapacious inhabitants of Denmark, Sweden, and Norway, commenced a series of piratical irruptions into Belgium, and continued to plunder and devastate the whole country during 150 years. In 1070 Flemish maritime commerce had made a great progress with Spain and England, from whence wool was largely imported. Woollen stuffs, and the herring fishery were the principal source of wealth, with corn, salt, and jewellery. The men of Flanders were so highly reputed for martial spirit that many foreign sovereigns obtained them to form their best troops. They constituted an important part of the Norman army in the conquest of England; and a Flemish princess, daughter of Baldwin, Count of Flanders, and wife of William the Conqueror, embroidered, with her own hands, the celebrated tapestry of Bayeux, which represents the whole history of that event.

The country had long been divided into provinces, belonging to different families, and governed by different laws. Hence the counties or earldoms of Flanders, Namur, and Hainault; the duchies of Brabant, Limburg, and Luxemburg; the principality of Liege; the marquise of Antwerp; and the signory of Mechlin. At the end of the 11th century, when all the states except Flanders were reduced, by the fierce quarrels of the feudal lords and prince bishops, to a cheerless waste of bondage, the fanatical phrensy of the crusades induced many of the nobles to part with lands, and to grant great privileges and political powers, in order to obtain the means of equipping armies to fight the Saracens. Their wealthy vassals, the Flemish burghers, were thus enabled to purchase independence, and a jurisdiction of their own. They consequently formed themselves into communes, elected bailiffs, directed their own affairs, and built magnificent town halls with huge bellfries, as temples and trophies of their liberties. The people, conscious of their power, gradually extorted from their rulers so many concessions, that the provinces formed, in reality, a democracy, and were only nominally subject to the monarch of France and his nobles. When the rest of Europe was subject to despotism, and involved in comparative ignorance and barbarism, the court of the counts of Flanders was the chosen residence of liberty, civilisation, and useful knowledge; and when the ships of other nations scarcely ventured beyond the sight of land, those of the Flemish merchants traversed the ocean, and Bruges and Antwerp possessed all the commerce and wealth of the north of Europe. In this state the provinces long continued, until they came under the dominion of the Duke of Burgundy, about the middle of the 15th century. Previous to this event, we find only unconnected duchies, counties, lordships, and towns, with innumerable rights, claims, and privileges, advanced and enforced now by subjects and vassals against each other or against their lords; and now by lords and vassals against the monarch, without the expression of any collective idea of Belgium as a nation. Under the Burgundian dynasty the commercial and manufacturing towns of the low country enjoyed a remarkable prosperity. The famous order of the Golden Fleece was instituted in 1430, and before the end of the 15th century the city of Ypres had 4,000 looms, and the city of Ghent 50,000 weavers. Bruges and Antwerp were the great marts of the commercial world, and contained each about 200,000 inhab. In the Flemish court of the Duke of Burgundy, named Philip the Good, about 1455, luxurious living was carried to a vicious and foolish excess. The wealthy were clad in gorgeous velvets, satins, and jewellery, and their banquets were given with almost incredible splendour.

This luxury produced depravity and crime to such an

extent, that in one year 1,400 murders were committed in Ghent, in the gambling-houses and other resorts of debauchery. The arts were cultivated with great success. Van Eyck invented the beautiful oil colours for which the Flemish school is renowned. Painting on glass, polishing diamonds, lace, tapestry, and chimes were also invented in Belgium, at this period. Most of the magnificent cathedrals and town-halls in the country were built in the 13th and 14th centuries. History, poetry, and learning were much cultivated; and the university of Louvain was the most celebrated in Europe. In 1477 Belgium passed under the dynasty of the empire of Austria; and after many years of contest between the despotic Maximilian and the democratic Flemings, the government, in 1519, descended to his grandson, Charles V., King of Spain and Emperor of Germany. In his reign the affluence of the Flemish burghers attained its highest point. The city of Ghent contained 175,000 inhabitants, of whom 100,000 were employed in weaving and other industrial arts. Bruges annually exported stuffs of English and Spanish wool to the value of 8,000,000 of florins. The Scheldt at Antwerp often contained 2,500 vessels, waiting their turn to come to the wharfs; her gates were daily entered by 500 loaded waggons; and her exchange was attended, twice a day, by 5,000 merchants, who expended 130,000 golden crowns in a single banquet given to Philip, the son of Charles V. The value of the wool annually imported from England and Spain exceeded 4,000,000 pieces of gold. This amazing prosperity experienced a rapid and fatal decline under the malignant tyranny and bigotry of Philip II., son of Charles V. The introduction of the protestant reformation had found very numerous adherents in Belgium. Lutheranism was preached with plenteous zeal by several popular fanatics, who drew around them crowds amounting sometimes to 10,000 or 15,000. Parties of iconoclasts also appeared, and demolished the ornamental property of 400 churches. Protestant persecution by the Inquisition had been commenced by Charles V.; but by Philip II. it was established in its most diabolical extravagance. He filled the country with Spanish soldiers, and commissioned the Duke of Alva to extract, without mercy, every protestant heretic in Belgium. Volumes have been written to describe the proceedings of this able soldier, but sanguinary persecutor, who boasted that in less than 6 years he had put to death 18,000 men and women by the sword, the gibbet, the rack, and the flames. Ruin and dread of death in its most hideous forms drove thousands of artisans to England, where they introduced the manufacturing skill of Bruges and Ghent. Commerce and trade in Flanders dwindled away, many of the rich merchants were reduced to beg for bread, the great cities were half deserted, and forest wolves often devoured the scattered inhabitants of desolated villages. Belgium remained under Spanish dominion until the memorable victory of Ramillies, in 1706, after which it was subject again to Austria; and having been several times conquered by, and reconquered from, the French, it was incorporated in 1795, with the French republic, and divided into departments. By this union, Belgium secured a suppression of all the feudal privileges, exemption from territorial contributions, the abolition of tithes, a more extensive division of real property, a repeal of the game laws, an admirable registry law, a cheap system of tax collection, the advancement of education in central schools and lycées, a uniform system of legislation by the creation of codes, publicity of judicial proceedings, trial by jury, and the general use of the French language. In the centre of Belgium was fought the great battle of Waterloo, in 1815. It is not necessary to add a word upon this memorable event, except to remark, that Belgium has to often been the scene on which the surrounding nations have settled their quarrels, that it has long been styled the cockpit of Europe. By the congress of Vienna, the provinces of Belgium were annexed to those of Holland, to form the kingdom of the Netherlands, which existed until the revolution in 1830, when Belgium became an independent nation. Her union with Holland was one of convenience on the part of those by whom it was negotiated, and not attributable to any congeniality of the people joined together, who differ in national character, in religion, and in language. The Belgians complained of being forced into a union which they would not have sought, and that its terms were unequal. The French revolution, which had recently transpired, excited the predisposition to insurrectionary movement, and the result was a declaration, and, finally, a general recognition, of independence. (Vide *Government, Constitution, &c.*)

Antiquities.—No part of Europe contains, within the same extent of area, so many objects, and furnishes so many associations, to interest the antiquarian, the political, ecclesiastical, or military historian, the artist, and the poet. Numerous ancient cities and towns, some of which existed long before the Christian era, still are adorned with magnificent Gothic structures of the middle

ages, that recall to the imagination the gorgeous pageantry of the days of chivalry; and on many a lone hill, and forest solitude, stand the ruins of castles, abbeys, and châteaux, whose lordly owners have been the heroes of romantic legends. In the S. and E. provinces are found lithol, tumuli, and other remains of the Celtic Druids, to whom is attributed the excavation of numerous apartments and passages in several subterranean caverns, particularly that of the hill of St. Peter, near Maestricht, which contains above 100,000 different avenues, 12 ft. in width, and from 6 to 24 in height. Numerous coins and medals of the Romans have been found on the sites of their camps and roads; and Roman masonry, containing inscriptions in honour of the Mænapian divinities, has been discovered among the relics of ancient towns, in places now overflowed by the sea. Near Charleroy, in the midst of beautiful scenery, are the ruins of the celebrated Abbey of Aîne, the cloisters of which were formed by 300 columns of the finest marble. But any attempt even to mention particular objects of curiosity would require more than allowable space. We will therefore only observe, that the site of Castles of the 15th century, in the neighbourhood of Liege, are described in Sir Walter Scott's novel of *Quentin Durward*.

It would be equally impracticable to enumerate the eminent and remarkable individuals who have received their birth, or have flourished in Belgium, throughout the course of her history. It is the land which furnished many of the ablest generals and most valiant soldiers of the emperor Charles V., who himself was born at Ghent; the land where the noble counts Egmont and Horn were beheaded by Spanish tyrants for defending social liberty; and where William Tyndale was strangled and burnt by Catholic bigotry, for translating the Gospels. It is the birthplace of Scaliger, Lipsius, and Van Helmont; of the geographers Ortelius, and Mercator; of John of Gaunt, or Ghent; of Perkin Warbeck, who was the son of a Jew of Tournay; of the painters Van Eyck, Quentin Matsys, Rubens, Vandyke, Teniers, Jordaens, Snijders, and many others who have sustained the high reputation of the Flemish school.

Authorities.—The statements of the preceding article are made chiefly upon the authority of the following works, and partly on the writer's personal observation:—*Illustration, Statistique Générale de la B.*, 1834; *Documents Statistiques de la B. (official)*, 1839; *Vander Maelen Dict. Geog. des Provinces de la B.*; *Baron d'Huart, Statistique Territoriale de la B.*, 1839; *Arnold, Belgische Zustände*, 1837; *Briavoniere, De l'Industrie en B.*, 1835; *Van Adrebeck, Agric. de la Flandre*, 1830; *Thun, Outlines of Flennus*, 1839; *Ratcliff, Agricultural Survey of Flanders*, 1839; *Nicholls, Reports on B.*, 1839; *Journal of the Statistical Soc. of Lon.*; *Article B. in Penny Cyclopædia*; *Grattan's Hist. of the Netherlands*; *Des Roches, Hist. de la B.*; *Syphorien, Voyage Historique et Pittoresque dans les Pays Bas*; *Gucciarini, Description Belge*; *Annuaire de l'Observatoire de Bruxelles*, 1839; *Durpethuuz, Education en B.*, 1839; articles in the *Annual Register* for 1830; in the *British and Foreign Quarterly Review*, April, 1839; *Murray's Hand-book of the Netherlands*, 1839; *Coglan's Guide to B.*, 1837; *Boyc's Belgian Traveller*; *Traveller's Guide through B.*, &c.

BELGRADE (an. *Singidunum*), a fortified town of the principality of Servia, on the right bank of the Danube, at the point where it is joined by the Save; lat. 44° 47' 46" N., long. 20° 39' E. Pop. 20,000. From its position, on the limits of the Austrian and Turkish empire, at the confluence of two great rivers, its great strength, and the numerous sieges it has sustained, much interest has long been attached to Belgrade. Its citadel, on a steep hill, 100 feet high, near the centre of the town, occupies a most formidable position. It has been very strongly fortified; and if it were properly repaired and garrisoned, with the fortifications on the low ground at the junction of the rivers sweeping as they do every approach by land and water, it would be all but impregnable. Latterly, however, its works have been neglected, and they are now going fast to ruin. Within the citadel are the arsenal and magazines, the principal mosque, and the palace of the pacha; the latter constructed of wood and mud. The town lies principally to the W. and S.W. of the fortress, partly along the Save, and partly on higher ground, and is surrounded by walls and palisades, generally in a ruinous state. The situation of the town is no better than that of the citadel! Many of its houses are in ruins; most of them are of the meanest possible description, "worse even than the cabins of the Irish;" and the streets are disgustingly filthy, and infested with hordes of half-starved dogs. The bazar consists of several rows of miserable wooden booths, entirely open towards the street: their assortment of goods corresponds with their appearance. Prince Miloš has

hitherto resided at Kraguevatz, but he has built here a handsome house in the upper part of the town, a Greek church, and barracks. The manufactures are inconsiderable, consisting principally of carpets, silk goods, some descriptions of hardware and cutlery, with saddlery, &c. It has a good port on the Danube, and it is admirably situated for trade, of which, in consequence, it still preserves some small share.

The Turks, under Soliman the Magnificent, took Belgrade in 1522, and held it till 1688, when it was taken by the Imperialists. Two years after, it again fell into the hands of the Turks; and though it has since been repeatedly taken by the Imperialists, they have, in most instances, soon after restored it to its Ottoman masters, of whose miserable government its present aspect and degraded condition is a striking, though, unhappily, not a rare example. It was taken, in 1807, by the Servian insurgents, who, on being obliged to abandon it, in 1812, burnt the suburbs, and partly destroyed the fortifications. The town was placed, in 1815, along with Servia, under the sovereignty of Prince Milosch; but its citadel is still occupied by a Turkish garrison, which, in 1836, amounted to only 600 half-disciplined troops. (*Murray's Handbook*; *Elliot's Travels*, i. 103, &c.)

BELIDA, an insular town of the regency of Algiers, prov. Titter, on the foot of the Atlas Mts., near the plain of Metidjah; 25 m. S. Algiers, and 10 m. N.E. Medeah; lat. 36° 18' N., long. 3° 45' E. It is surrounded by a wall 12 to 16 feet high, which has 4 gates, one at each of the cardinal points. Its streets are wider, and more agreeable than those of Algiers: the town is well supplied with water, and contains many gardens. It suffered much from the violent earthquake of 1825, since which the houses have been with only a ground-floor. Belida has some trade in grocery, spices, and other natural produce: its vicinity is fertile and picturesque. In July, 1830, the insub. invited the French to defend them against the Kabyles; but after their arrival the Bedouins compelled the citizens to take up arms against them. Next year, however, the French took and still hold Belida. — (*Rozet. Voyage*, &c., iii. 195—202.)

BELINZONA. A town of Switzerland, cant. Ticino, of which it is the cap., in a deep valley on the banks of the Ticino, 5 m. above where it falls into the Lago Maggiore, and 15 m. N. Lugano; lat. 46° 10' 35" N., long. 8° 55' 30" E.; pop. 1,600. Being situated near the S. extremity of the great road from Italy to Switzerland, by the St. Gothard pass, it is a depot for the merchandise passing between them. It has a handsome church, and a bridge over the Ticino, 714 ft. long, and 24 ft. wide.

BELITZ, a town of Prussia, prov. Brandenburg, 12 m. S. by W. Potsdam. Pop. 2,000. It is surrounded by old walls and fosses; and is the seat of a board of ecclesiastical inspection. Flax is grown extensively in its vicinity, and it has manufactures of linen.

BELLIA, a town of Naples, prov. Busilicata, cap. cant., 15 m. S. by W. Melfi. Pop. 5,000. It is situated on a hill; has a collegiate, and one other church, an hospital, and three charitable foundations.

BELLAC, a town of France, dép. Haute Vienne, cap. arrond., on the declivity of a steep hill, near the confluence of the Vincou and the Gartempe, 24 m. N.N.W. Limoges. Pop. 3,337. It has a tribunal of original jurisdiction, an agricultural society, with various manufactures, and a considerable trade in cattle, oak timber, and chestnuts.

BELLARY (*Valahari*), a distr. or collectorate of Hindostan, presid. Madras, part of the Dalaghaut ceded distr. (See BALAGHAUT.)

BELLARY, the cap. of the above collectorate, and the head-quarters of a civil catib, and a military division, 290 m. N.E. Madras; lat. 15° 5' N., long. 76° 59' E. It consists of a square fortress on an isolated rock, with a pettah or small town below it, containing the best military bazar in India. This also is the name of a ruined town of Allahabad, formerly of great extent, and having some fine Hindoo temples in its vicinity.

BELLE-FONTAINE, a village of France, dép. Vosges, 7 m. W. Remiremont. Pop. 2,650. Some cutlery is made here.

BELLEGARDE, a fortress of France, dép. Pyrénées Orientales, on the Spanish frontier, 18 m. S. Perpignan. This is a fortress of the first class, constructed in the reign of Louis XIV., to command the pass of Perthus. It was taken in 1793 by the Spaniards, and retaken the following year by the French. Bellegarde is also the name of several small towns in different parts of France.

BELLEISLE, an isl. at the N. entrance to the straits of the same name, between the country of the Esquimaux, or New Britain, and the N. end of Newfoundland. It is 21 m. in circuit, and 16 m. from the coast of Labrador. On the N.W. side it has a harbour for fishing vessels, or small craft.

BELLE-ISLE-EN-MER, an island of France, in the Atlantic, 4 m. S. of Quiberon Point, being included in the dép. Morbihan. It is almost every where surrounded

by high steep rocks. Its N.W. end is in lat. 47° 32' N., and its S. part in lat. 47° 10' N. It is about 11 m. in length, its greatest breadth being about 6 m. It is accessible only at three havens or ports, all of which are dry at low water. Of these Palais, on the E. coast, is the principal, as well as the capital. The haven here is formed by a stone pier, 200 ft. in length, and is protected by a strong citadel: it has only 5 ft. at high water, but the road is generally safe. The two other accessible points, Sauzon and Loc Maria, are also both fortified. Pop. about 6,000. It is fertile, producing excellent wheat and horses. The inhabitants are extensively engaged in the sardine fishery, and make excellent pilots.

This island was purchased in 1656 by Fouquet, intendant of finance to Louis XIV., and was exchanged in 1718 by his descendant for the comté of Glisors. In 1761 it was taken by the English, but was restored to France in 1763. (*Hugo, art. Morbihan*; *Purdy's Sailing Directions for the Bay of Biscay*, p. 8.)

BELLESME, a town of France, dép. Orne, cap. cant., on a hill which commands the environs, near the forest of the same name, 22 m. E.S.E. Alençon. Pop. 3,263. Houses well built; streets straight, neat, and well paved. The want of running water is supplied by wells. It has fabrics of coarse linens and cottons, and a considerable trade in wool and lace.

BELLEVILLE-SUR-SAONE, a town of France, dép. Rhone, cap. cant., on the Rhone, 84 m. N. Villefranche. Pop. 2,448. It has a manufacture of stuffs, called *coton broché*, and muslins.

BELLEY, a town of France, dép. Ain, cap. arrond., between two hills, within 4 m. of the Rhone, 42 m. E. Lyons; lat. 45° 45' 29" N., long. 5° 41' 19" E. Pop. 3,570. It is the seat of a bishopric; has a tribunal of first instance, a director of customs, a secondary ecclesiastical school, a public library, and a museum of antiquities. The episcopal palace, finished only a few years before the Revolution, is one of the most remarkable edifices in the department. It is very ancient. The bishopric was founded in 412. (*Hugo, art. Ain*.)

BELLINGHAM, a market to. of England, co. Northumberland, on the Tyne, 22 m. W. Morpeth, and 28 m. W. N.W. Newcastle. Pop., in 1821, 404; 1831, 464. It is supposed to occupy the site of a Roman station, and several circular intrenchments of the fortified villages of the Britons are in the neighbourhood. The entire parish belonged to the Earl of Derwentwater, and was given to Greenwich Hospital, with the other estates of that nobleman, on his attainder in 1715. The church, dedicated to St. Cuthbert, is small and old. There are places of worship for Seceders and Rom. Catholics; a free school, poorly endowed; and a book club, formed in 1809. It is a station for receiving votes at elections for members for the S. div. of the co. Markets are held on Saturdays; fairs on the first Saturday after 15th Sept., and the Wednesday before Good Friday; also "hirings" for servants on the Saturdays before 12th May and 12th Nov.

BELL-ROCK, a dangerous ledge of rocks, off the coast of Scotland, in the German Ocean, opposite to the Frith of Tay, 12 m. E. Buttonness Point. The ledge is about 850 yards in length by about 110 in breadth. At low water, some of its summits appear from 4 to 8 ft. above the level of the sea, but at high water they are always covered. Many vessels have been lost on this rock, over which the sea breaks with tremendous fury. To lessen the chance of such disasters, a magnificent lighthouse, constructed on the model of the Eddystone, was erected, on one of its points, in 1808-10. The total height of the building, including the light-room, is 115 ft. the lantern being elevated 90 ft. above the sea at high-water mark. The light is revolving, the flashes succeeding each other every two minutes. Lat. of lighthouse 56° 26' N., long. 2° 22' W. During foggy weather, bells are tolled every half minute.

BELLUNO (an. *Bellunum*), a city of Austrian Italy, cap. prov. same name, in the valley, and on the S. bank, of the Piave, at the place where it is joined by the Ordo, on the great road connecting Vienna with Venice, 48 m. of the latter; lat. 45° 7' 46" N., long. 12° 19' 51" E. Pop. 9,800. It is surrounded by an old wall; is well built; has a cathedral, designed by Palladio, and several churches and convents; a rich hospital, a gymnasium, with various other educational establishments; a valuable public library, &c. Water is conveyed into the town from a distance by a fine aqueduct. It is the seat of the provincial authorities, and has fabrics of silk, wax, leather, hats, and earthenware; with a considerable trade in timber, and large fairs in February and April. Napoleon conferred on Marshal Victor the title of Duke of Belluno.

BELMONT, a town of France, dép. Loire, cap. cant., 16 m. N.E. Roanne. Pop. 3,290.

BELMONTE, a town of Naples, prov. Calabria Citra, on a mountain not far from the Mediterranean, 14 m. W. S. W. Cosenza. Pop. 3,400. It has a castle, 4 churches, and some trade in silk. This is also the name of a small Neapolitan town, prov. Sanzio.

BELOOCHISTAN (an. *Gedrosia*, and the countries of the Ichthyophagi, Orizæ, Arabitæ, &c., *Arrian*), a country of S. Asia, lying between 24° 55' and 30° 15' N. lat., and 57° 50' and 69° 15' E. long.; having N. Afghanistan, Sistan, and the sandy desert of Caubul; E. Upper and Lower Sind; W. Persia; and S. the Indian Ocean; length, E. to W., 700 miles; breadth, on either side, 350 m., and 190 in the centre; area, 200,000 sq. m. (Eng.). Pop. has been estimated at 3 millions, but it is no doubt far beyond the mark: we incline to think that 500,000 would be nearer the truth.

Mr. Pottinger describes this country under the following divisions:—

	Ch. T.	No. of Inhab.
1. Prov. of Sarawan	- Kelat	20,000
— " Jhalawan	- Zahres	2,500
— " Mukran	- Kedge	
— " Lus	- Bela	2,000
3. — " Cutch Gundava (and Hurrund Dajel)	- Gundava (Hurrund)	
4. Kohistan	- Pabura, Sarhad.	
5. The Desert.		
6. Sind.		

We shall only notice the first four divisions; the 5th belongs properly to Caubul, and the 6th will be treated of separately.

By far the greater part of Beloochistan is mountainous, and especially its E. and W. divs., which consist of two table-lands; those of Kelat and Kohistan (*the land of mountains*), whose ranges run mostly N. and S., and communicate with each other by several other extensive ranges running E. and W. across the central prov. of Mukran. Those in the E., which separate Beloochistan from Sind, and bound Cutch Gundava W., are a lateral branch from the Hindoo-Koosh, by which the country is so intersected in various directions "as to resemble a piece of network;" it varies greatly in width; in lat. 30° being 275 in., but at Cape Monsee, where it is formed by it, it is only 10 m. across: the height of the range has not been measured; but Kelat, the most elevated point, is thought by Pottinger to be 4,000 ft., and by Bell (*Notes on Rollin's Anc. Hist.*) to be 10,000 ft. above the level of the sea. These "Brahooick mountains" terminate S. W. in a remarkable range running N. W. to about 20° N. lat., where it divides; one arm passing N. E. toward the Afghan hills, the other, the Wushatee, or Much mountains, direct W. for two degrees, bounding the desert S., and then uniting with the W. table-land, or that of Kohistan. This latter communicates N., by a long chain, with the Paropamian mountains W. of Ilurat, and after enclosing the deserts of Bampur and Bushkurd by another chain, W. with those of Kerman (Persia). A considerable range passes in a waving manner E., to meet the Brahooick mountains, varying in its distance from the sea from 25 to 100 m., and dividing Mukran into 2 parts, the coast and the interior. The height of the W. is somewhat inferior to that of the E. mountains.

Excepting those of Lus and Cutch Gundava, which prove, as already said, and that of Wud, in Jhalawan, there are but few plains of any fertility. The coast division of Mukran is covered by flat barren sands destitute of water, and, excepting date trees, of all vegetation. The desert of Bampur, a sandy waste, 155 m. long by 80 m. broad, is a continuation of the deserts which prevail in the middle of Persia and the S. W. of Afghanistan.*

Cutch Gundava, intersected by some of the W. tributaries of the Indus, is the only well-watered province. The remainder of Beloochistan suffers from want of water, excepting, perhaps, a few rice grounds in the prov. of Lus. There is not a rivulet in the N., and only a few along the coast, which, although sometimes swollen in a few minutes to torrents, by profuse rains, are for the most part of the year nearly dry. The principal stream is the Dust or Moolceedane (probably the Doodoor of the desert, and, if so, rising N. of the Wushatee mountains, and running a course of 1,000 m. before reaching the sea, in 61° 45' E. long.); the Poorally (an. *Arabitæ*), the second in size, rises in Lus, N. of Bela, and falls into the Bay of Soumaney; for 25 m. this stream is navigable for small boats. (*Pottinger*, p. 327.)

The geology of this region is nearly unknown: the rocks in the mountainous parts are grey or black; the soil is commonly stony, but consisting mostly of a black loam in the valleys; in Kohistan some of the lofty hill tracts are covered by a vegetable mould. Former volcanic action is evident in this province, which yields most of the minerals found in Beloochistan, viz., sal ammoniac, bromine, alum, nitre, rock salt, lead, iron, copper, tin, naptha, &c. (*Pottinger*, pp. 322, &c.) Gold and silver are found only in Jhalawan, 150 m. S. S. W.

* It was through the plains of Mukran and the succeeding desert of Bampur that Alexander the Great led his army into Persia. During which march so much was suffered from thirst and famine. It is not now believed that his loss of men was so great as has been represented, but the troops kept to the low hills: had they been close to the shore, they would have found fresh water on digging a foot or two below the surface.

of Kelat; antimony in vast quantity S. of Kelat, sulphur, alum, and a red aperient salt in the hills between Kelat and Cutch Gundava; white and grey marble near Nooshy on the borders of the desert; salt in efflorescence on the plains of Lus, &c.

The climate is healthy except in Mukran. In the mountainous provinces there are 4 different seasons in the year, as in Europe; the spring from the middle of February to the middle of April; the summer thenceforward to the beginning of August, the heats of which are intense only towards the latter end: the autumn lasts till the October snows; and the winter, which is very severe, for the rest of the year. In the spring there are snow, hail, and violent winds, and the weather is quite as fluctuating generally as in England. In Mukran and Lus there are 4 seasons; 2 wet, and a cold and a hot: the cold one is much milder on the coast; the hot one lasts from March to October. (*Pottinger*, pp. 319—321.) In February and March there are rains with N. W. winds for a fortnight or three weeks; but in June, July, and part of August, they prevail with all the fury of the S. W. monsoon. In Kohistan the June rains are often very partial, and a famine not unfrequently ensues from drought. Cutch Gundava enjoys a much milder climate than any other province, and is resorted to in the winter by many neighbouring chieftains.

The best timber is that of the *Zizyphus jujuba*, which is similar to teak; the palm tree grows in the W.; the tamarind, neem, peepul (*Ficus religiosa*), alao, chinar (*Pistacia orientalis*), mango, walnut, and sycamore, grow in this and other parts of the country. Fruits almost all kinds known in Europe, as apples, pears, apricots, peaches, pistachio nuts, mulberries, pomegranates, &c., with the plantain, guava, &c., are common in many districts. Mukran is famous for its dates, which are exported in large quantities: N. of Kelat the almonds are so fine that they may be blanched with a dry cloth, and melons often grow so large that a man is scarcely able to lift them. (*Pottinger*, pp. 327, 328.)

Lions and tigers are rare, but both are found on the E. border; hyenas, wolves, and jackals, prey on the whole country, and wild dogs, which hunt in packs of 20 or 30. Leopards, wild cats, foxes, &c., infest the jungles; and wild asses, antelopes, elks, red and moose deer, hares, mongooses, and mountain goats, are common; eagles, kites, magpies, are found round Kelat: water-fowl, herons, flamingoes, bustards, partridges, lapwings, snipes, &c., are natives: fish abound on the coasts; where they form the chief food of both man and beast, but not in the rivers: *Chelonæ* and *Testacæ* are also abundant; vermin and venomous animals are by no means so common as in Hindostan. (*Pottinger*, pp. 328, 329.)

Pasture being considerably more abundant than arable land, and the population consisting chiefly of wandering shepherd tribes, the number of cattle is considerable. The sheep are of the fat-tailed kind; the goats have rough and black hair: the large cattle are mostly of the black breed, or buffaloes. The horses of Cutch Gundava, and the country S. of Kelat, which are those chiefly sent to India, are large, strong, and bony, but vicious; those of Mukran and Lus are small and spiritless: there are mules and asses; but camels and mules are preferred as beasts of burden. Camel-grass and straw are the chief food of the cattle: in the S. of Mukran and Lus there are two crops of the former yearly, owing to the two wet seasons. Greyhounds and shepherds' dogs, of a ferocious kind, are both much valued: fowls and pigeons are the only domesticated birds. (*Ibid.* pp. 327, 328.)

Excepting in Cutch Gundava, which is fertile, well cultivated, and said to be capable of producing enough of grain for all the inhab. of Beloochistan, not a hundredth part of the country is cultivated: the table-lands yield only the coarser produce of Afghanistan. All the kinds of grain known in India are, however, grown; viz., rice, in the marshes on the coast (but it will not thrive in Cutch Gundava, though it be abundantly moist), wheat, barley, *Holcus spicatus* and *sorghum*, maize, sesamum, &c. The wheat and barley do not ripen so soon as in Britain; the former is sown in August and September, and reaped in June; barley sown a month later comes to maturity in about 6 months; maize, in warm and sheltered places, in 3 or 4 months. In Cutch Gundava, Lus, and a part of Mukran, wheat ripens in 6 months, barley in 5 months, and oriental grain in from 2 to 5 months. Cotton, indigo, and madder, are grown, but the indigo does not thrive: all the pulse and vegetables common with us are grown near Kelat. (*Pottinger*, pp. 324—325; *Elphinstone*, *Caubul*, p. 495.)

Manufactures are very few, and are rude; most of the articles, beyond what are absolutely necessary to the support of life, being imported from neighbouring countries, in exchange for the few natural products. Sugar is prepared near Bela, the canes being pressed in a mill, the juice boiled in flat copper pans, and the article afterwards packed in bags of palm-leaf, and

exported; the sediment is used for manure. Gum assa-fœtida is extracted from the stalk of the *Ferula assaf.*; by incisions near the root, which permit the escape of the juice; about 1 lb. is obtained from each plant. The gold and silver ores are never worked, but pass into the hands of the Hindoo traders in their rough state. At Kelat there is an armoury belonging to the khan, for swords, spears, and matchlocks; but their workmanship is very clumsy and inferior. (Pottinger, pp. 26-109.)

The principal exports are horses, and other cattle, skins, dates, grain, some rice, cotton, silk, oil, indigo, salt, borax, nitre, &c.; from Lus, grain, felt, and coarse carpets, are sent into Mukran and Arabia. From the latter country almonds and Caffre slaves are imported, the Caffres being deemed very valuable; from India, iron, tin, lead, steel, copper, indigo, beet-root, cochineal, sugar, spices, silks, gold-cloths, chinatas, and coarse woolsens, fruit, &c.; from Caudul and Khuran, steel and copper; from Seistan, white cloths, longoes, turbans, &c.; from Sind, Shikarpoor, &c., porcelain, tobacco, coffee, opium, &c. Broad cloth, Scotch plaids, and other European manufactures, are highly prized. (Pottinger, p. 295.)

The Hindoos pay for exports in silver rupces: at Kelat the currency is in Kureem Khanee rupces, one of which is equivalent to 48 copper pie; a gold sequin to 6, and 4 Zeman shigees to 5 K. R. rupces. (Ibid. 235-317.)

The people are nearly equally divided between two distinct nations, the Belooches, occupying the W., and the Brahooes inhabiting the E. division of the country. The former are desirous to be thought descendants of the Arabs, but are not physically like them, and are considered by Pottinger to have been originally Seljukés. They are tall, long-faced, but with not unpleasant features, and have generally strong, active, and athletic frames. They are subdivided into three tribes; the Haroon's, who live W. of the Great Desert, and Rinds and Mughees, in Cutch Gundava, and near the Desert of Kelat. They are brave, impetuous, insured to fatigue, freebooters, abhorring thefts, but applying wholesale plunder, often waiting and destroying whole districts, yet curiously blending an "ingenious hospitality with this predatory ferocity." Like all pastoral nations, they have no permanent residence, but live in *shirts*, or societies of four or five tents, moving about as pasture is found suitable for their flocks and herds. Their food consists of wheat and barley cakes, rice, dates, cheese, sweet and sour milk, legume soup, onions, garlic, assa-fœtida, red pepper, and occasionally flesh. All the Belooches are Mussulmans of the sect of Omar, and their customs are those of other Mohammedans, mixed with some partly derived from the ancient Jews. Polygamy is allowed, but they treat their women with respect and attention; they have often numerous slaves, and in many respects behave to them with great kindness. They are armed with a matchlock, sword, spear, dagger, and shield, which they commonly derive from foreign traders. They are good marksmen, invariably hitting a target 6 inches square, while on horseback, at full gallop; a popular sport with them is to remove and carry away on the top of a spear, while at full gallop, a stake driven deep into the ground; an operation which requires much dexterity. Games of playing, wrestling, warlike exercises, and field-sports, form the rest of their amusements. The dress of the men is a white or blue calico shirt, buttoned round the neck, and reaching below the knees; trousers of the same, puckered round the ankles; slippers; a close quilted cotton cap or turban, and scarf. The women wear long garments of red or brown cotton, reaching to the ankles, but open in front from the bosom downwards; very wide trousers of silk; and the hair either parted in separate locks in front, and then tied up together in a knot on the crown of the head, or covered by a handkerchief. The language of the Belooches is dialect of the Persian, corruptly pronounced, but from which tongue half the words are borrowed. (Pottinger, pp. 55-67, 270.; Elphinstone, p. 495.)

The Brahooes are inferior in height to the Belooches, have short thigh-bones, a round face, flat features, and often brown hair and beards. Their habits are still more unsettled than those of the Belooches, but they are not so predatory, rapacious, avaricious, revengeful, or cruel. Pottinger prefers their general character very much to that of the former, and represents them as active, industrious, laborious, quiet, hospitable, faithful, and more under the control of their chiefs. They live chiefly on animal food, of which they are very voracious, and are admitted by the Belooches to be better marksmen than themselves. They live either in tents, about 12 yards long by as many feet wide, built of sticks, and covered with coarse blankets, or in houses, which in the towns, as well as the open country, are built of tamarisk or other wooden framework, lanked with mud, or bricks of unburnt clay, and ill-finished with grass. The men are occupied in the outdoor and the women in the indoor employments, but the latter are not kept secluded, and all mix and cat-

together. Their religion is Mohammedan; their dress very similar to that of the Belooches, except that felt for caps, and garments of felt, are often worn by the men. Their language is like the Hindoo of the Punjab. (Pottinger, pp. 12-54, 70-76.)

A race called Dewahrs inhabit different parts of the country, who are probably descendants of the Cuckers, driven from Persia by the Arabs in the 38th year of the Hegira; they are below the middle height, with blunt features, and high cheek-bones; are civil and obliging, though not hospitable; being faithful and trustworthy, the guard of the palace of the khan of Kelat is entirely composed of them. Their language is pure Persian; their treatment of females better than that of any other Moslem people. (Ibid. pp. 80-271.)

Hindooes are tolerated, and monopolise most of the trade in Kelat and the neighbouring provinces, but they are not allowed to settle in Beloochistan with their wives and families. There is a large part of which is Islam of Hindoo blood and manners among the inhabitants of Cutch Gundava and Lus, where the people are indolent in their habits, and incessantly smoking. In Mukran the people are larger built and darker in colour, from intermarriages with Caffre slaves; the women in this prov. are ill-favoured, and none of them long-lived. (Ibid. pp. 11-30, 78-311.)

The government is nominally under the khan of Kelat, but chiefly in the hands of the sirdars of each individual tribe. The khan, however, can oblige each sirdar or chief to furnish him with a contingent of troops in case of need. The public revenues are perhaps about 350,000 rupces a year (35,000 £.), a large part of which is paid in produce, which the khan afterwards disposes of to the Hindoo merchants. The taxes are moderate; 1-20th of the produce is paid for lands requiring irrigation and much labour; from 1-16th to 1-10th for other lands; the respective sirdars stop a part of this, in payment of collection. Five rupces is paid for a camel-load of goods entering Kelat, and 1½ per cent. on goods sold, excepting cattle. The khan generally sits in judgment in cases of murder. This crime may sometimes be compromised with the friends of the deceased, but in the event of the murder of a foreigner, immediate execution waits upon the criminal. Adultery may be punished by the death of both, by the hand of the offended party. Burglary and night robbery are capital crimes. Petty differences are adjusted or disposed of by the sirdars, and minor offences are punished by flogging and imprisonment. (Ibid. 249-254.)

Almost all the inhabitants of Beloochistan are nearly barbarous and uncivilised: neither the Beloochees nor Brahookees are written tongues, and he is greatly honoured, and called "moallee," who can read the Koran. They are quite ignorant of all the countries in their neighbourhood, and fancy the British E. I. Company (of which they have heard from the Hindoos) to be "an old woman with plenty of money." Medicine they are totally unacquainted with; and to cure a fever they will shampoo or thump the body all over. (Ibid. pp. 26-110, &c.)

This country was quite unknown to Europeans until the time of Alexander the Great: the hills were then inhabited by a race of savages, the shore by people who subsisted as at present on fish, thence called by the Greeks *Ichthyophagi*. For nearly 10 centuries afterwards there are no records of Beloochistan. A caliph of Bagdad, in the year 92 of the Hegira, led an army through it to Sind; it was afterwards taken possession of by Masood, son of the Emp. Mahmood, and remained governed by his dynasty till 1739, when Nadir Shah having conquered it, bestowed it, with the title of beglerbeg, on an ancestor of the present khan of Kelat. Until 1758 it was tributary to the khan of Cumbul, but is now quite independent. (Ibid. pp. 263-276.)

BELP, a village of Switzerland, cant. Berne, on the Gurben, at the foot of the Belper, near the S. bank of the Aar, 5 m. S.E. Berne. Pop. 2,600.

BELPICH, a town of France, dép. Aude, cap. cant., at the confluence of the Lers and the Vixiege, 15 m. S.W. Castelnauary. Pop. 2,429.

BELPER, a market town and chapelry of England, co. Derby, par. Duffield, and hund. Appletree, 8 m. N. Derby, 54 m. S.E. Manchester, and 134 m. N.W. London. Pop. (1831) 7,890. It is situated in a valley, through which the Derwent flows. This river is crossed, at the N. end of the town, by a stone bridge of 8 arches, near which is a fine weir, for working the mills of the Messrs. Strutt. The town, though irregular, is well built. The market-place, in an elevated situation, is surrounded by handsome shops. A new church has recently been erected. Courts leet are held here at Easter and Michaelmas, when the officers of the town, comprising a constable, and other public officers, are elected and sworn. Belper is one of the places for taking votes at the election of M. P. for the S. division of the co. The living is a curacy, in the archdeaconry of Derby, diocese of Lichfield and Coventry; patron, vicar of Duffield. There are places of worship for dissenters,

and also Sunday and infant schools, and almshouses. From an inconsiderable village, this place has risen in a comparatively brief period, to be one of the most populous towns in the co. Its present (1839) pop. is estimated at about 9,000. It is much indebted to the public spirit and enlightened benevolence of the Messrs. Strutt, whose cotton works give employment to 2,000 people. The manufacture of silk and cotton hosiery in the town and neighbourhood, is also very extensive: and nails, earthenware, and other articles, are produced upon a large scale, and give employment to a great number of hands. There are also in the neighbourhood, potteries, bleaching-grounds, and coal-works. The Cromford Canal passes within 2 m. of the town; but its most important channel of communication will doubtless be the North Midland Railway, now in progress. This railway, which is intended to join Derby and Leeds, passes through Belper; and being made to connect at Derby with other railways communicating with London and the W. of England, will open an easy access to the principal markets of the empire to Belper, and the other places on its line. The surrounding scenery is very beautiful and picturesque, particularly that near the bridge. Market-day, Saturday. Fairs, 12 May and 31 Oct., for sheep, cattle, &c. &c.

BELT (GREAT AND LITTLE), two of the entrances into the Baltic, which see.

BELTUBET, a town of Ireland, co. Cavan, on the Erne, 61 m. N.W. by W. Dublin, 64 m. N. by W. Cavan. Pop. 2,026. It is a corporate town, has a good market house, and a spacious church; but it has no staple manufacture or trade, and is not increasing. There is a considerable distillery within the modern limits of the bor. It returned 2 mem. to the Irish H. of C., but was disfranchised at the Union. Its trade is injured from there being a rapid or fall in the river on its one side, and a shallow on the other. (*Municipal Boundary Reports, &c.*)

BELVEDERE, a town of Naples, prov. Calabria Citra, on a hill washed by the Mediterranean, 26 m. N.N.W. Cosenza. Pop. 5,600. It has a fort, several churches and convents, and 3 *summe-de-pèdes*, the revenues of which are appropriated to the portending of poor girls on their marriage. Its wine and raisins are in considerable repute.

BELVEZ, a town of France, dép. Dordogne, cap. cant., 14 m. S.W. Sarlat. Pop. 2,513. It has mills for extracting oil from nuts; and its fairs and markets are well frequented.

BELVOIR, an extra-parochial district of England, partly in co. Leicester, partly in that of Lincoln, in hund. Framland of the former, and soke of Grantham of the latter; 98 m. N. by W. London. Pop. (1831) 105, area, 170 aces. The inhabitants are connected with the establishment at Bolsover Castle, the splendid seat of the Duke of Rutland, which crowns the summit of an eminence overlooking the beautiful vale whence its name is derived. The site was first occupied by Robert de Todeni, standard-bearer of Wm. the Conqueror, and remained with his lineal descendants till the reign of Hen. III, when it passed, by marriage, to the Manners family, in whose possession it has since remained. The structure, which had been destroyed in the wars of the Roses, was rebuilt by the first Earl of Rutland, whose title dates 12 Hen. VIII. In the last civil war it was alternately garrisoned by the royal and parliamentary forces, and was much injured; after the Restoration it was again repaired by the first Duke of Rutland. Great improvements and additions have been made to this magnificent pile, by the present duke, under the direction of Wyatt. Whilst they were in progress a fire nearly destroyed the whole: the irreparable injury was the destruction of the fine picture gallery, in which were several of Sir J. Reynolds's paintings; and amongst others that of the Nativity. The castle is now restored to more than its former magnificence, still preserving the style of an ancient baronial residence.

BENARES, a prov. of Hindostan, formerly included in that of Allahabad, presid. of Bengal; containing the districts of Benares, Mirzapore, Ghazepore, and Junpore; chiefly between lat. 24° and 26° N., and long. 82° and 84° 30' E.; having N. Goruckpore; E. Bahar; S. the Berar ceded distr.; and W. the territ. of the rajah of Rewah, and the districts of Allahabad and Junpore. Area 8,670 sq. m. Pop. estimated at about 3,000,000. It consists, for the most part, of a cultivated flat, on both sides of the Ganges, and is, besides, well watered by the Goomty, Sone, Caramansa, &c. It chiefly produces the drier grains, as wheat and barley, legumes, flax, &c., indigo, sugar, and large quantities of opium. The latter is a government monopoly, and Bahar and Benares are the only provinces in the Bengal presid. in which it is permitted to be grown. This prov. is amongst the most flourishing in India, and increasing greatly in trade and prosperity; the total land revenues in 1829-30 amounted to 410,2704 sterling. Muslins, gauzes, brocades, and some salt of an inferior

kind, are among the manufactures. 1-10th of the pop. in the cities, and 1-20th in the rest of the prov., are Mohammedans; the judicial and other regulations of Bengal extend to this prov. Before 1775 Benares belonged to the nabob of Oude, who, in that year, ceded it to the British.

BENARES (*Varanasi Sanser., or Kasi*, the splendid), a large and celebrated city of Hindostan, presid. Bengal, cap. prov. and distr. of same name, seat of a court of circuit and appeal, and one of the 6 chief provincial cities in the presid., at the head of a judicial division. Lat. 25° 30' N., long. 83° 1' E.; on the N.W. bank of the Ganges, about 300 ft. above the level of the sea; 65 m. E. Allahabad, and 400 m. N.W. Calcutta. Pop. 630,000. (*Hamilton, 1828.*) It is the "most holy" city of the Hindoos; the ecclesiastical metropolis. In fact, of India, and is resorted to by pilgrims from all quarters, especially from the Maharatta countries, and from even Tibet and Birman. According to Bishop Heber, it "is certainly the richest, as well as probably the most populous, city in the peninsula." Its first view is extremely fine; it extends about 4 m. along the bank of the river, which is considerably elevated, and adorned with large ghauts, or landing-places, with long and handsome flights of steps. "Its buildings, which are crowded, built of stone or brick, and uniquely lofty; here and there the sculptured pyramidal tops of small pagodas; and the great mosque of Aurangzebe, with its gilded dome glittering in the sunbeam, and two minarets towering one above the other, form a grand and imposing coup-d'œil." The streets are extremely narrow, and the opposite sides approach in some parts so near each other as to be united by galleries; the only open space is the market-place, constructed by the present gov., but the city is well drained and healthy. In 1801 there were upwards of 12,400 houses, from 1 to 6 stories high, built of brick or stone, and 16,000 more of mud, with tiled roofs. The former lodge, at an average, about 15 persons on a floor; those of 6 stories often containing from 180 to 200 individuals each: they are built round a court-yard, and have small windows, many verandahs, galleries, &c.; much painting, carving, and elaborate stone-work; and are "often not unlike those represented in Canaletti's 'Views of Venice.'" The causeways are much lower than the lower floors of the houses, which have mostly arched rows in front, with little shops behind them: each street, or bazar, is devoted to a separate trade. The principal public building is the mosque, built by Aurangzebe, on the highest point, and in the centre of the city, which it completely overlooks. A Hindoo temple was destroyed to make room for it. Many other mosques, which remain, are built on equally holy spots, much to the annoyance of the Hindoo population. There are numerous Hindoo temples; an " Fakir's " houses, as they are called, adorned with idols, occur at every turn. Benares is crowded with mendicant priests; there are said to be 8,000 houses occupied by Brahmins, who live upon the alms and offerings of the pilgrims; only 1-10th of the pop. are Mohammedans; and Europeans, who are few in number, reside not in the city, but at Serail, a little way off. Turks, Persians, Armenians, Tartars, &c., are settled in Benares. Its trade is considerable in shawls, diamonds of Bundelcund, Dacca and other muslins; in silks, cottons, and fine woollens of its own manufacture, and in European articles. The Hindoo Sanserit college of this city is the chief seat of native learning in India. In 1830 it was attended by 287 pupils: an English college, established in 1832, has from 140 to 150 pupils. Numerous Christian missions have been established here, and there are private teachers of both the Mohammedan and Hindoo law. One of the greatest curiosities at Benares is an ancient observatory, built before the Mussulman conquest, by the celebrated Rajah Jee-singh. It is of stone, and contains a large square tower, in which are preserved many instruments, chiefly of stone, some of them having been evidently used for judicial astrology; a few miles to the E. there is a solid stone ruin, similar in appearance to the Buddhist temples in the W. of India, called the Saranath. The country around Benares is fertile and well cultivated, but bare of wood: fuel is, therefore, very dear, and *sutlers*, in consequence of this scarcity, are said to have been less common than in many parts of India. "This city is believed by the Hindoos to form no part of the terrestrial globe, but to rest upon the point of Siva's trident: hence, they say, no earthquake ever affects it. In 1017 it was taken by Sultan Mahmood, and from 1190 followed the fortunes of the Delhi sovereigns: since 1775 it has enjoyed tranquillity under the British, interrupted only on one occasion by a religious conflict between the Hindoos and Mussulmans, on the latter breaking down a pillar, called "Siva's walking-stick." The rajah of Benares is a pensioner on English bounty to the extent of 13,428l. annually, and without any political power. (*Hamilton's E. I. Gaz.; Ibid., Hindostan; Mod. Trav. ix. 243-208.; Reports, &c. and Appendixes.*)

BENCOOLEN, a marit. town of Sumatra (E. archi-

poles), and the principal settlement of the Dutch, as formerly of the British, on that island. It stands on the S.W. coast, in lat. 3° 49' N., long. 102° 16' E. The town, which is small and well built, is said to be unhealthy; but Fort Marlborough, originally constructed by the British in 1683, stands a little farther inland, in a healthier situation. The pop. is composed of Dutch and other Europeans, or their descendants, Ooloes, Chinese, Balle-nese, Malays, &c. The trade of Bencoolen had greatly declined previously to our parting with it in 1825. The imports consist chiefly of cloths, rice, and salt, tobacco, sugar, handkerchiefs, &c. from Batavia; opium and various fabrics from Bengal and the Coromandel coast; printed cottons, cutlery, and metallic articles, from Europe; and salted fish, roes, eggs, poultry, oil, and timber, from other parts of the island. The English endeavoured to cultivate the clove and nutmeg here, but the produce was very inferior to that of Amboyna and the Banda Islands. Bencoolen was always an unprofitable settlement to the British, the expenses of its government having uniformly exceeded its revenue. During the five years preceding its cession to the Dutch, the excess of expenditure over revenue amounted to about 85,000*l.* a year. It was ceded in 1825 to the Dutch, in part exchange for the town and fortress of Malacca and other settlements. (*Hamilton's E. I. Gaz.* i. 172; *Reports on the Affairs of the E. I. Comp.*)

BENDER, a town of European Russia, prov. Bessarabia, on the Dniester, about 58 m. from the Black Sea. Pop. 1,700. (*Schnitzler*.) It is fortified by a wall and ditch, and has a citadel on an eminence. In 1770, the Russians took this town by storm, and reduced it to ashes. They again took it in 1809, and it was finally ceded to them, with the prov. of Bessarabia, by the treaty of Bucharest in 1812. It was formerly a place of much greater consequence than at present; and is said, previously to its capture in 1770, to have had 20,000 inhabitants. In its vicinity is Varnitza, the retreat of Charles XII. after the battle of Poltava.

BENE, a town of the Sardinian States, prov. Mondovì, on a hill between the Stura and Tanaro, 16 m. N.E. Coni. Pop. 5,000. It is defended by an old castle; has a collegiate church, and an hospital.

BENEVENTO (an. *Beneventum*), a city of Italy, cap. of a small surrounding territory or deleg., within the Principato Ultra, in the kingdom of Naples, but belonging to the states of the Church, on the declivity of a hill between and near the confluence of the Calore and Sabato, 32 m. N.W. Naples; lat. 41° 7' N., long. 14° 43' E. Pop. of deleg. 23,000; of town, perhaps 16,000. It is surrounded by walls, and defended by a castle. The modern town occupies the site of the ancient one, and is almost entirely constructed out of the ruins of the latter. In fact, with the exception of Rome, hardly any Italian town can boast of so many remains of antiquity as Benevento. Of these the most perfect and by far the most worthy of notice is the arch of Trajan, now the *Porta Aurea*, erected in honour of the great emperor whose name it bears, about A. C. 114. This singularly beautiful structure is of white marble, of the composite order, and consists of a single arch. Its total height is 62 ft., the intercolumniations and friezes being covered with basso relievo representing the battles and triumphs of the Dacian war. These which are of the most exquisite workmanship, are a good deal mutilated; but otherwise this noble fabric is nearly entire. The cathedral is a clumsy edifice, in the walls of which the finest remains of antiquity are huddled together without any regard to order. The cupola of the church of St. Sophia rests on a circular colonnade of antique marble; and scarcely a wall is to be seen that is not filled with fragments of altars, tombs, columns, and other relics of the old city. Benevento is the seat of an archbishopric, and has a fine *palazzo pubblico*, a college, a seminary, a good library, a college, an orphan hospital, three other hospitals, and two *monti di pietà*. Considerable fairs are held at different periods of the year. It suffered severely from the plague in 1656, and from an earthquake in 1688.

Benevento is very ancient, its origin being ascribed to Diomed. It was first called Maleventum; but on being taken and colonised by the Romans, it was called Beneventum. In its vicinity, in 1256, was fought the great battle between Charles of Anjou and his rival Manfred, in which the latter was killed, and his army totally defeated. During the ascendancy of Napoleon, Benevento was formed into a principality, conferred on M. de Talleyrand; but, on the downfall of Napoleon, it again reverted to the pope. (*Swimburne's Two Sicilies*, i. 410. 4to ed.; *Servistori, Statistica di Stati Pontifici*, &c.)

BENGAL (PRESIDENCY OF), a very extensive territory of Asia, being by far the most important and extensive of the three presidencies into which the British dominions in the East are divided. It consists principally of territories in India, on this side the Ganges, or in Hindostan in which it extends over the whole of the large and fertile provinces of Bengal and Behar, with very considerable portions of those of Delhi, Allah-

BENGAL (PRESIDENCY OF).

abad, Oude, Gundwanah, Berar, Orissa, and Rajpootana. Beyond the Ganges, it comprises Assam, Arracan, Ye, Tavoy, and Mergul, with Malacca, Singapore, and Prince of Wales' Island; but these latter districts, or those beyond the Ganges, should rather be considered as dependencies on, than as parts of, the presidency. Its territories in and adjacent to Hindostan lie between lat. 16° 0' and 21° 15' N., and long. 74° to 95° E., having N. part of Rajpootana, the Himalaya mountains, Nepaul, Sikkin, and Bootan; to the south, Cassay, and the Birman empire; S. the Bay of Bengal, the Madras presid., and the dom. of the rajah of Berar and the Nizam; W. those of Scindia, the rajah of Bhopal, indep. Bundelcund, and Rajpootana. The distr. of Ajmeer and another detached and smaller distr. are enclosed in the last-named country. The ceded Birmanese provs., Ye, Tavoy, and Mergul, are bounded W. by the Birman empire and the ocean, and elsewhere by Siam and the Lao territories. The dom. of this presid. entirely surround those of the rajah of Rohah, and nearly so those of Oude; at one point they approach Runjeet Sing's dom., and at another come within 70 m. of the Bombay presid.; at the Himalaya, they meet Tibet, and the farthest E. boundary of their Assamese territories is not 100 m. from the frontier of China. Their total area has been estimated at 348,400 sq. m., and the total pop. at 70,000,000.

It is divided into the Upper or Western, the Central, and the Lower provinces; the former including Delhi and others W. of 80° long.; the Central, Allahabad, Behar, and others as far E. as 87° long.; and the Lower prov., Bengal, and the rest still farther E. These provs. are divided into numerous districts, which have mostly the same limits as they had under the Mohammedan government: the following is the official report of their extent, population, and land revenue. (*See Rep. on the Affairs of the E. I. Comp.*, 1831, pp. 762, 763; and *Appendix—Revenue*, par. ii. pp. 2-4.)

Division and District.	Extent of each Dist. in Eng. sq. m.	Pop. in 1822.	Land Revenue 1829-30

Table continued.

Division and District.	Extent of each Dist. in Eng. sq. m.	Pop. in 1882.	Land Revenue 1899-90
<i>Burdity.</i> Collectorates of Fitchest, Sudeban, Nugeonah, Sudeabad, Handah, Kalpee, Moosuffernugger, and Delhi, included in above district	-	-	In Sicoa Rupees. 11,614,154
<i>Ceded Districts.</i> 1. On the Nerbudda. 2. By the Rajah of Berar in 1826	29,800 55,900	-	-
<i>3. Birma Prov.</i> Assam Aracon Cachar Jynteah Te, Tump, Mergul, &c.	15,900 11,500 6,507 8,850 15,000	No returns.	After certain deductions, see Rep., p. 171.
Total	358,769	69,710,071	7,171,470.

The principal cities are Calcutta, the British cap. of India; Delhi, the Mohammedan capital; with Benares, Moorsheadabad, Dacca, Behar, Patna, Allahabad, and Agra.

The surface of this vast territory has, in different parts, every variety of elevation and aspect. But by far the larger portion consists, notwithstanding, of immense plains, including those of the Ganges and Brahmaputra. Exclusive of the Himalaya and Garrows mountains, which bound it N. and E., it has no mountains of any importance, with the exception of the Vindhyan range, S. of the Ganges.

Rivers.—No part of India is so well watered, or has so many great rivers. The Ganges flows in a S.E. direction through the whole extent of the presidency, being joined in its progress by numerous tributaries, some of them, as the Jumna, Chumbul, Gogra, Gonduck, Son, &c., of great magnitude and importance. It is also traversed in its E. parts by the Brahmaputra, which, as well as the Ganges, falls into the N. part of the Bay of Bengal, near each other. Both of them, but especially the Ganges, divide into numerous arms before reaching the sea; and their united deltas form a tract of alluvial soil of above 30,000 sq. m. in extent, and great natural fertility, but mostly overrun with jungle. There are no lakes similar to those in Tibet, or other parts of Asia; but many extensive lagoons, or *jheels*, especially in the lower prov., and above all in the districts of Dacca and Rajshyhae (See BENGAL, PROV. OF.)

Scenery.—Every kind of scenery is met with in this presidency. Kumaon, the most N. part, is a vast and tumultuous ocean of mountains, elevated in successive ridges to 7,000 ft. in height, backed by the snowy ridge of the Himalaya, and covered in great part with an uninterrupted forest of both Asiatic and European vegetation. The W. parts of Delhi trench on the Indian desert, and have an arid look, and thirsty soil; other portions of this prov. are also flat, but fertile and highly cultivated. The Doab is flat, and abounds in long grass, but is singularly deficient in timber. Allahabad is amongst the most productive provs. in Hindostan; its surface is unequal, the S. part rising progressively into a hill tract, which extends through Bandah and part of Kalpee districts. Bundelcund and the ceded distr. on the Nerbudda, form part of the high central table land of India; they abound in deep ravines, fertile valleys, and extensive forests; but are in many parts sterile, as are also some of the distr. even in the neighbourhood of the Ganges. The central prov. are undulating, often well cultivated, intersected by rivers, and adorned in many parts by groves and forests. Bahar, N. the Ganges, is flat and waste; but is very fertile on the S. side of that river; its height also increases as it advances more to the S., so that in Ramghur we find a mountainous and rocky country two thirds waste, participating in the natural features of the Gundwanah districts, joining those on the Nerbudda. Orissa, near the sea coast, is low and swampy; but its interior contains cultivated plains and dense jungles, backed W. by a mountainous forest region, which descends gradually through the Jungle Mehals and Beerbloom, into the lowlands of Bengal. The latter are inclosed, both toward the sea and the N. border, by immense belts of jungle, and have E. the noble valley of the Brahmaputra, which constitutes the prov. of Assam. From Sylhet to Aracon the interior is extremely hilly, the coast swampy, but the surface often very fertile and well cultivated: the other ceded Birma provinces have dense forests and jungles, rice-plains, and a rocky coast, preceded by low islands.

Geology and Minerals.—The Himalaya, in Kumaon, is composed of granite, gneiss, porphyry, quartz, mica, hornblende, &c.; and its lower ranges contain sandstone,

brecciated limestone, copper, and iron ore. The Vindhyan mountains betray a volcanic character throughout, and the Garrows mountains, on the opposite side of the delta of the Ganges, exhibit a similar structure. Tertiary beds are met with in Sylhet and where the Brahmaputra issues from the Assam valley, containing organic remains of crocodiles, *Tesacea*, &c. The Bhagulpore distr. is peculiarly rich in iron, and considerable mines have formerly been worked; the ore is nodular, and yields 20 to 25 per cent. metal. In the Sylhet hills there is a fine granular iron; and in Ramghur, on the banks of the Jumna, and in the Himalaya, ore is found yielding 30 to 60 per cent. Coal, in conjunction with iron, is found in considerable quantity both in Burdwan and Sylhet; that of the former distr. is preferred, and is largely consumed at Calcutta: some has recently been discovered in the Saugor distr., on the Nerbudda, which showed near the surface. The upper soil is dry, light, and sandy, in the N.W.; clayey in the Doab and its neighborhood; sandy again in Allahabad, and a shallow alluvium in the delta of Bengal. In Behar, and elsewhere, it affords efflorescences of nitre and muriate of soda, in immense quantities; the former in greater abundance than in any other part of the world. The annual export of nitre from Calcutta has, of late years, been 170,000 bags, chiefly to Great Britain, China, America, and Africa. The manufacture of salt is a gov. monopoly, within the provs. of Bengal and Bahar, and the district of Cuttack: its annual produce may be about 1,600,000. In 1837, 4,682,723 maunds were sold, realising 15,404,803 rup. The upper provs. are supplied with salt, partly from the lower ones, and partly from salt mines in the W. of India. Diamonds are found in Bundelcund, the matrix being a conglomerate bed, with quartzose pebbles; silver, and gold dust, in many rivers.

The Climate.—In so wide an extent of country is, of course, very varied; at Calcutta, the annual mean temp. was found, by three years' observations, to be 78° 20' F.; at Benares, for two years, 77° 81'; and at Saharunpore (Delhi), 73° 56': the barometer, at each of these places, for like periods, averaged respectively 29.764, 29.464, and 28.766 inches. June is the dampest, January the driest month; drought is often experienced in the upper prov., where the depression of the moistened thermometer sometimes exceeds 35°; but at Calcutta the average fall of rain in three recent years was 59.83 inches. Bengal prov. is subject to fogs from these rivers (Hohar) is free, and is temperate, producing almost every European fruit and vegetable; the upper provinces are also temperate, excepting in the hottest season, when burning winds prevail, occasionally obliging the inhab. to resort to underground habitations. In Kumaon the surface is wholly covered with snow from September to April, although, during the rest of the year, the thermom. in the sun often rises to 110° Fahr.

Vigtable Products.—Teak, saul, sissoo, lanyan, ebony, rattan, bamboos, and a large number of trees, yielding material for cartilage: oaks and pines in the hill forests; and along the coasts of the Bay of Bengal, cocoa, areca, and other palms, are met with in profusion. (See HINDOSTAN.) The lower provinces are highly favourable to the production of rice, the staple article of food, and consequently of production; the central and upper provs. to that of the drier grains; European products, and those peculiar to the tropics, being raised in alternate seasons. Grain forms a valuable export from Bengal. Indigo is cultivated from Dacca to Delhi, and occupies more than 1,000,000 statute acres; its annual produce being worth from 2 to 3 mill. sterling, half of which is expended in its production. There are 900 indigo factories in the presid., and the exports to Europe of the article amount, in some years, to 5,000,000 lbs. The culture of opium is monopolised by the government, and is carried on only in parts of Bahar and B-nares. The opium grown in these provs. is considered by the Chinese, by whom it is mostly all made use of, to be much superior in flavour to the opium of Malwah. The opium sold at the public sales in 1856-57 was 16,916 chests, worth 2,539,510. The nett revenue from it is about 1,000,000. Cotton, in every variety, is largely grown; but the imports into England do not amount to 1 per cent. of the imports of American cotton. The soil of Benares is especially adapted to the sugarcane, and sugar might, perhaps, be produced, were sufficient care taken in its manufacture, of as good quality as that of the W. India, though hitherto it has been inferior. (See next article.) Coffee, pepper, and tobacco, the latter chiefly in Bhagulpore and Bundelcund, are staple exports; the rare spices of the E. archipelago have been naturalised at Calcutta; and a multitude of trees, fruits, and other vegetables of China, Canbul, Europe, and America, are grown in different parts of the presid.

Animals.—Alligators abound in the Ganges and Brahmaputra; tigers infest the jungles; and we meet with wild elephants, rhinoceroses, leopards, wolves, bears, jackals, a great variety of birds, a profusion of fish, and

different species of serpents, both innocent and noxious. (*See HINDOOS.*) Silk is procured from both the native and the Chinese or annular worm; the mulberry and castor oil plants being cultivated for the purpose. The produce is, perhaps, inferior to that of Italy, though the best Indian silk fetches a very high price: the silk districts lie chiefly between 22° and 26° lat., and 86° and 90° long.

Races of Men.—A number of widely differing tribes inhabit the territ. under this presid.: Hindoos, differing in physical and mental qualities in almost every prov., the hill-people in Bhauagpore, and Gonds in Gundwana, of which tracts they are believed to be the aborigines; Maharras, Moguls, Saks, Rajpoots, especially in Delhi, Bundelcund, and Oude; Cooshes, Khynas, Garrows, Coos-yabs, Mughs, &c., ultra Gaugetic nations, all apparently of a different family from the Hindoos; with quite different usages and religion.

The Government is vested in the gov.-general of India, at Calcutta, and five councillors; three of whom are appointed by the comp., the fourth also by the comp., but not of their body, and subject to the approbation of the sovereign; the fifth, the commander-in-chief with precedence after the gov.-general. Though in case of vacancy

he never succeeds to the government, the senior civil member always doing so. There is a lieutenant-governor at Agra, with authority over the upper prov., subject to the control of the central gov. of India (*see AGRA*); and Prince of Wales's Island has a separate governor.

Public Revenues.—149,782 sq. m. of territory, under the Bengal presid., embracing the whole provinces of Bengal, Bahar, Benares, and Bengalese Orissa (excepting Cuttack), are assessed under what is called the *perpetual* settlement at a permanent revenue of 3,347,000. (*See BENGAL PROV.*) The upper or W. prov. and the ceded distr. on the Nerbudda, with an area of 96,310 sq. m., are assessed on the village system (*see BOMBAY PRESID.*); and the ryotwarry system (*see MADRAS PRESID.*) prevails in some of the central provs. and in Cuttack. The taxation, on account of land, averaged, in 1827, 1s. 10d. per head; a portion of the public revenue is besides derived from taxes on houses, professions, salt, sales, and licences, opium and tobacco; tributes from protected and other states; customs, excise, post-office, stamps, judicial fees, &c.; fines; sayar and abakare duties, pilotage fees, &c. The revenue and expenditure of the presid., in the undermentioned years, was—

The Bengal debt bearing interest is about 32,000,000. 18,000,000 of which are at 5 per cent.; the civil debt not bearing interest amounts to 8,000,000. The Bank of Bengal was established 1809, and has a capital of 7½ mill. rup.; the Union Bank has a capital of 8 mill. rup.; and there is a bank at Agra with a capital of 2 mill. rup., chiefly supported by European officers. A new bank, called the Bank of India, is being formed at Calcutta, and savings' banks are about to be established. There is little gold in circulation, and the highest silver coins are rupees. These formerly varied a little, but the company's rupee, worth about 2s., is now the only one that is coined. The gold mohar is equal to 16 rupees. Cowries are fast disappearing.

Weights, Measures, &c.—The chief weights in use are the seer (2 lbs.), the factory maund (74 lbs. 10 oz.), and the basar maund (82 lbs. 2 oz.); the measure of length, the pica (1½ millo square), the bega varying from about 2 to 2½ to the English acre.

Justice.—The supreme court of justice is the sadder dewanny, and musamit adawlut, in Calcutta. Its functionaries—administering, under its first title, justice in civil, and under the second, in criminal cases—are a chief justice and three puisne judges, who have lately been personally vested with all the powers of the court; the concurrence of one colleague only being necessary in sentences of death. The only appeal from these judges is to the queen in council. The courts next in rank are the six prov. courts of appeal, viz. Calcutta, Moorshehabad, Dacca, Patna, Benares, and Bareilly, for suits above the value of 5,000 rup., the decisions of which are final, except in cases of special appeal. There are 49 zillah courts, with power to try suits to the amount of 20,000 rup., and decide appeals from decisions of registrars, sadder ameems, moonsiffs, and other native judges. Native judges have been, during the last year,

established in zillah and city courts, and native assessors now sit on the bench with European judges.

Police.—There are about 15 or 20 police stations in each distr., with 20 or 30 well armed men at each, at whose head is an officer, who holds inquests, &c.; in addition to these each village has its watchman, and all together form a body of 164,000 men; besides which there are a mounted and river police, both conducted by natives. The police force is now much more efficient than formerly.

Crime.—Crimes are more numerous and aggravated in the W. and ceded districts than in the lower provs.: in the central provinces they exist to a middle extent, between the two extremes. Crime is now greatly on the decrease; in one year the total decrease of offences in the lower and western provinces was 14,211, and under a mild and equitable system murders decreased 876 in two years. Dacoity, an atrocious system of gang robbery (*see BANGAL PROV.*), did not, in 1850, exceed 1-7th part of its amount 30 years previously.

Military Force.—The total military force in this presid. consists of 96,897 men, 13,284 of whom are Europeans, including 2 regiments of British cavalry and 8 of infantry. The Bengal, of all our native Indian armies, contains the greatest number of men of high caste. The yearly costs of the army is 3,450,000.

Pilot Service.—There is a pilot service at the mouths of the Ganges, consisting of 12 schoomers of 200 tons each, which put a European pilot and leadman on board each ship as it appears in sight. The cost of this service, including buoy vessels, light houses, &c., is 183,866. a year.

Religions, &c.—The Hindoo and Mohammedan are the prevailing religions. In the prov. Bengal, the Mohammedans constitute about 1-7th of the pop., but their distribution is remarkable, as in the W. of that prov.

(and in Bahar) they are to the former but as 1 to 4, while they equal their numbers in the E., although more distant from the original seat of Mohammedan power. The Mussulmans live mostly in the cities and towns, where they sometimes even outnumber the Hindoos. The Gonds have a rude idolatry peculiar to themselves; Buddhism is confined to Aracan and the Birmeese provs. In 1830 there were upwards of 10,000 native Christians, attending the different Protestant churches stationed in the presid. The church establishment consists of the Lord Bishop of Calcutta (to whom the other bishops in India are subordinate), an archdeacon, and 37 chaplains: the total annual expenditure on this account in 1835 was 52,800*l*. There is also a small public establishment of the Scotch kirk. The Roman Catholic estab. receives the countenance and support of gov.; its members are subordinate to a vicar apostolic at Agra, with direct authority from the pope, and a legate at Calcutta, under the authority of the R. C. bishop of Madras. Christianity is said to be increasing; and it is affirmed that, in 1832, 50,000 children attended the Protestant schools in Bengal only.

Education, &c.—Education and the study of the English language are also rapidly spreading. Seminaries and private schools, receiving the aid of government, have been established in many places, and superior colleges planted or revived in the principal cities. In 1830 the Bengal gov. spent 44,830*l*. in forwarding these objects.

Charitable Institutions.—Public dispensaries have been established in Agra, Delhi, and Cawnpore; and those in Moorshadabad, Dacca, Patna, and Chittagong districts have been revived or remodelled.

History.—In 1707 Calcutta, which had previously been subordinate to Madras, was made a separate presid.; and in 1726 a charter was granted to the comp. enabling them to establish a penal court there, as well as at the other presid. In 1760, by a treaty with Meer Cossim, the subahdar of Bengal, the revenues of Burdwan, Midnapore, and Chittagong, were assigned to the E. I. Comp., and in 1765, an imperial grant from Shah Allum to the English to receive the revenues of the dewanny of Bengal, Bahar, and Orissa, gave them the virtual sovereignty of those provinces, which they actually assumed in 1772. In 1773 a governor-general was appointed to reside in Bengal, to which presid. the two others were made subordinate, and a supreme court of judicature established, with judges appointed by the crown; in 1775 the comp. became possessed of Benares and its territory. In 1793, under the administration of Lord Cornwallis, the Perpetual Settlement was introduced into Bengal, Bahar, &c.; prov. courts of appeal were at the same time established in Calcutta, Patna, Moorshadabad, and Dacca, with the courts of sudder dewanny, and nizamat adawlut: in 1798 the English took possession of Allahabad; in 1801 the subahdar of Oude relinquished Rohilcund, Goruckpoor, and the Doab, to the British; and in 1802, the nabob of Furruckabad ceded his territory on receipt of a pension. In 1805, the empire of Delhi finally fell before the British arms. Kumaun was obtained from Nepal in 1815; Saugor, and the territories on the Nerbudda were ceded in 1818; in 1824, Singapore and Malacca, the latter ceded by the Dutch, were acquired; and in 1826, large distr. in Gundwana were ceded by the rajah of Berar; Aracan, Martaban, Ye, Tavoy, and Mergui, were ceded also in 1826 by the Birmeese, as well as all dominion over Assam; and finally, within the last few months, British officers have been sent from Calcutta to take upon themselves the government of the most easterly parts of the last named prov. The governors-general of India, since 1758, have been as follows:—

1758 Col. R. Clive.	1793 Sir J. Shore (Lord
1760 J. L. Holwell, Esq.	Teignmouth).
1760 H. Vansittart, Esq.	1798 Marq. Wellesley.
1764 J. Spencer, Esq.	1805 Marq. Cornwallis.
1765 Lord Clive.	1805 Sir G. Barlow.
1767 Harry Verelst, Esq.	1807 Earl of Minto.
1769 J. Cartier, Esq.	1813 Marquis of Hastings.
1772 War. Hastings, Esq.	1823 Lord Amherst.
1785 Sir J. Macpherson.	1828 Lord W. Bentinck.
1786 Marq. Cornwallis.	1835 Lord Auckland.

(*Hamilton's Hindostan, and Gazetteer; Reports on the Affairs of the E. I. Comp.* 1830—1832: *Bengal Almanac*, 1838.)

BENGAL, one of the largest and most important provinces of Hindostan, the principal seat of the British power in India, between 21° and 27° N. lat., and, for the most part, between 80° and 93° E. long.; it has N. Nepal, Sikkin, and Bootan; E. Assam, Jynteah, Cachar, and the Khyen districts of Birman; S. the Bay of Bengal, and parts of Orissa and Aracan; and W. Bahar: area 82,700 sq. m., pop. (1822) 94,887,000. Bengal is protected on the N. by a thick jungle of *angeah* grass, sometimes 30 feet high, and by tall forest-trees, covering a belt of lowland country from 10 to 20 m. broad, backed

by the Himalaya ranges; E. by the Garrows mountains, and their prolongations; the sea coast on the S. is fenced by shallows, and is difficult of access; and on the W. frontier, which is most exposed, the country is not favourable to an invading force, being in parts mountainous, sterile, and thinly inhabited; and were an invading army to penetrate from the W. as far as the Ganges, that river would be a formidable obstacle to its progress eastward. Excepting towards its E. and W. frontiers, Bengal presents only a dead level, broken by occasional undulations of ground, and is every where exceedingly fertile. The two greatest rivers of India, the Ganges and Brahmaputra, flow through the prov.; and it is so intersected by their numerous arms and tributaries, that in its central and western parts, even in the dry season, few places are more than 20 miles distant from a navigable river; while, during the period of the inundation, most part of it is laid under water, the towns appearing like so many islands in the surrounding sea. Many extensive lagoons or marshes, called *jeels*, are produced by rivers altering their channels during the dry season, in consequence of obstructions formed during the inundations.

Climate.—It is less subject than any other part of India to fluctuations of the seasons; which may be divided into the cold, hot, and rainy: the natives, however, divide the year into 6 seasons, each occupying 2 months; viz., 1-2, the spring and dry season, toward the end of which the heat becomes oppressive, though reduced in the eastern by occasional showers, and in the middle districts by frequent thunderstorms: the sudden and violent squalls incident to this season send many persons dangerous on the rivers. 3-4. Early in June the rains commence almost simultaneously over the whole prov.: for the first 2 mo. they are incessant and heavy, sometimes from 3 to 5 inches falling in a day; during the succeeding 2 mo. there are intermissions of fine weather, and the increase of heat is again rapid: should the rains cease early in September, the heat becomes intense and injurious to natives as well as Europeans; but they commonly last till about the middle of October. The annual average of rain is from 70 to 80 inches. The inundation usually begins, conjointly with the wet season, in the 3d mo. of which, the Ganges reaches its highest level. Its delta is then entirely overflowed, and the whole region exhibits a singular scene; the ears of rice floating on the surface, and the habitations of the peasantry insulated amidst the waste of waters, while they are seen passing from place to place in boats, with their families and movable property, lest a sudden rise of the river should sweep the latter away in their absence. About the middle of autumn the rivers begin to subside, and the land is completely drained previously to the setting in of winter, when heavy fogs and dews prevail in the lower, and frosts in the upper, districts. Although within the range of the tropical winds, the mountain chains and the rivers materially influence their currents and effects. In the central distr. the winds blow mostly N. and S., following the course of the Ganges.

Geology and Minerals.—Granite, whinstone, and other primary rocks are met with in the beds of the Dummodah and the Jungle Mohals distr.; whinstone and hornblende in the Rajmahal hills (Biangulpore); micaceous limestone and some tertiary deposits in Silhet and below the Garrows hills; coal and iron are found both in Silhet and Burdwan. Soil, generally, clay, with a considerable proportion of siliceous material, and fertilised by various salts and by decayed animal and vegetable substances. Bengal is not generally rich in minerals or mineral springs. Fresh water is not obtained at Calcutta at a depth of 140 feet; but nitre there and elsewhere effloresces on the surface in large quantities.

Vegetable products.—The bamboo, date-palm, areca, in the central parts, cocoa in the S. and basia in the pools and in the hilly tracts, grow wild in profusion, as well as the plantain, mango, orange, lemon, and many other fruits. The peasants have generally orchards, and entertain a superstitious veneration for the trees planted by their ancestors. Different kinds of grain, indigo, cotton, sugar-cane, and tobacco, are objects of culture; the hills in the N.E. yield red jarool wood and betel, and thick jungles spread themselves over great part of the country.

Animals.—Tigers infest the jungles; and these, with elephants, buffaloes, gyaals, wild deer, and boars, jackals, apes of many kinds, &c., are natives of Bengal: pariah dogs and adjutants swarm in the towns, where they perform the function of scavengers; the *Fulur bengalensis*, and other kinds of vultures, kites, crows, &c., and various birds, abound. Crocodiles and gavials in the larger rivers; the cobra-de-capello, and other formidable serpents, turtles, frogs, lizards, &c.; plenty of fish, and swarms of musquitos, are every where met with.

Bengal is distributed into three divisions; viz., those of its three principal cities, Calcutta, Moorshadabad, and Dacca, which have subordinate to them the following districts or collectorates:—

- | | | |
|---|--|---|
| 1. Burdwan,
Jungle Mahals,
Jessore,
Nudda,
Hoogly,
24 Pergunnahs,
Calcutta City
and Suburbs. | 2. Purneah,
Dinajepore,
Rungpore,
Rajshahye,
Beerbhoom,
Moornhedabad. | 3. Dacca Jelalporo,
Tipperah,
Chittagong,
Backergunge,
Sylihet,
Mymensing,
Dacca. |
|---|--|---|

The chief cities, besides those already mentioned, are Burdwan, Hoogly, Chandernagore, Purneah, Rajmahal, and Dinajepore.

Agriculture, &c.—Mill (*Report on E. I. Affairs*, 1831.) supposes that one third part of this prov. is under tillage, one third jungle, and the remaining third in an intermediate state. The best and most productive lands are in the Burdwan, Nudda, 24 Pergunnahs, and Calcutta distr.; the worst and least productive in Silhet, Tipperah, and Cooch-Bahar. Rice, the principal grain in all the S. districts, yields two crops a year, one in August and one in December; and each crop may, when good, be taken at 5 quarters an acre, or 15 for 1. Farther up the Ganges, wheat and barley predominate; they are sown at the beginning of winter, and reaped in the spring. In general the supply of rice and grain is so abundant as to render Bengal the granary of India; but when a season of drought, and consequently of deficient produce, intervenes, the inhabitants, too poor and too improvident to keep a reserve stock of grain, suffer the greatest privations. Pulse of various kinds is grown, some for cattle, but not in any great quantity, as the latter are generally fed upon chaff and straw. Millet, &c., are sown sometimes for second crops; linseed, mustard, palma Christi, and sesamum largely for their oil, and maize is less grown than in most countries adapted to its culture, and chiefly on poor soils towards the W. Indigo succeeds best on newly cleared lands, and the great increase of its culture has caused large tracts of waste land to be brought into tillage. It is principally raised in the Dacca Jelalporo, Jessore, Mymensing, and Burdwan districts; and though it be true that a good deal of tyranny has often been exercised by the planters over those under them (see *Evid. of Rammohun Roy, in Report for 1832*, pp. 364—368, and *Rep. for 1831*, pp. 232, 233.), and that disputes respecting boundaries, limits of culture, &c., have often led to disturbance and bloodshed; still the people are uniformly best clothed and fed where indigo is grown. Its culture and preparation is mostly in the hands of European capitalists; the natives, even when they have the intelligence, being generally without the means of carrying it on upon any thing like an extensive scale. The sugar-cane grows luxuriantly in many parts of the prov., and especially in the Rungpore, Beerbhoom, and Burdwan districts; its growth and manufacture, as well as that of tobacco, being mostly carried on by the natives, are both, consequently, in a very rude state; but there is little doubt that were European capital and skill applied to this department, sugar might be rendered one of the staples of India. The mulberry (*Morus indica*) ceases suddenly where it meets the poppy; the culture of which is restricted to the border of Behar. Silk, an important product, is obtained from five different varieties of worms, including the Italian; about 1,000,000 lbs. are annually exported, mostly for Europe, at an average price of about 13s. per pound. Both silk and sugar have evidently been known in Bengal from the earliest times: the Sanscrit has names for every object and occupation connected with the former, and the original name of this prov., *Gour*, appears to be directly derived from *gur*, which signifies sugar in both ancient and modern Indian tongues. The cotton of Bengal is not generally much sought after; a great deal of a coarse kind is produced, which is used for home consumption; a better sort is produced in the E., but that which is made into the finest manufactures is brought from the Doab. The Dacca muslin is made from a fine cotton cultivated on the banks of the Magna, that is, of the river formed by the junction of the Ganges and Brahmaputra. Sun-hemp and coffee have both been tried, but with little success; potatoes are well suited to the soil; but most other esculent vegetables introduced from Europe have become tasteless and insipid. Husbandry is in a very low state. Farms are generally small, varying from 2 to 40 begas or bigahs (the bigah = $\frac{1}{4}$ to $\frac{1}{2}$ acre), and are burdened, as will be afterwards seen, with an oppressively high rent. It is almost unnecessary to add, that the ryots or cultivators are immersed in poverty; and are usually without the means, even if they had the inclination, of attempting any improvement. The common plough, drawn by a pair of oxen, costs less than a rupee (2s.); it is a very rude instrument; and, as it merely scratches the ground, several ploughs follow in succession to make the furrows of sufficient depth; the plough is succeeded by a kind of harrow, a heavier implement, and similar to the worse sort in use in the S. of Europe. Manures are applied only to the sugar-cane, tobacco, mulberry, and poppy. Dung (especially that of the cow) is, from superstitious

motives, almost exclusively used for fuel. The rotation of crops and the use of fallows are unknown, and the land is generally in an impoverished and exhausted state. Much grain is lost by birds, and the irruptions of wild animals or cattle, in consequence of bad enclosures, as well as from suffering the crop to get over-ripe before it be cut down. Grain is trodden out by oxen; stacking corn, or preserving it under ground, is unusual; and it is often left exposed, like rice (which, however, is not equally injured), to the weather.

Of all departments connected with agriculture, that of irrigation is best understood and practised. In the hilly districts the preservation and regular distribution of water is, in fact, essential; and there it is collected in wells and dams, the construction of which has at all times been deemed an act of singular piety and merit, whence it is distributed as occasion requires. Animal food being but little used, sufficient attention is not paid to the breeds of cattle and sheep; the profits of the former consisting chiefly in their milk and labour, and of the latter in their wool. The Bengal horse is ill-shaped, vicious, and is not used in field labour, in which oxen or buffaloes are exclusively employed: the sheep are small, lank, and thin, but, if well fed, yield tolerable mutton. The property and profit of the small farmers and cultivators is mostly in their cattle, which are grazed at a very trifling expense. Cows are usually fed near home, on waste pastures, and the waste lands of the village; buffaloes, needing more nutriment in their thriving and vegetation, do not find sufficient pasturage in populous districts. Herds of this sort of cattle are most numerous in the northern and western provinces, where, in the rainy season, they find pasturage on downs which are never submerged; and in the dry season on forest lands, which are mostly inundated during the rains; but many herds of buffaloes travel in the dry season into the vast forests which border on Bengal.

The wants of the natives being few, and necessities cheap, wages are extremely low. Housemen receive only 1 rupee per month; rascals, a shant in 16; or, if they carry also, which is usual, 1 in 8; weeding labourers are also paid in grain instead of money; rice is cleared by a wooden pestle and mortar, 5-8ths of the original quantity of clean rice being delivered in, the surplus with the chaff paying for the labour.

Perpetual Land Settlement.—Landed property in Bengal is held under what has been called the *perpetual* or *Mokururce* settlement. When the E. I. Comp. came into possession of Bengal, Behar, and Orissa, they found the land revenue collected in the most summary method by officers who had charge of districts of unequal extent, with various titles, as zemindars, talookdars, &c., and who received for their trouble a per centage on their collections. The question whether these superior officers or zemindars were originally the proprietors of the soil, and, as such, made accountable to government for the land-tax laid on it, or whether they had been at first merely collectors of the tax, which office having become hereditary in their families, gave them the appearance of being proprietors, was keenly discussed after the British acquired the sovereignty of Bengal. Specious reasonings were adduced in favour of both opinions; but it is now pretty universally allowed by those best acquainted with the subject, that the zemindars had originally been only tax-collectors; that the government, by the gradual usurpation of nearly all subordinate rights, had become the real proprietor of the soil; but that the ryots or cultivators were a sort of *quasi* proprietors, and could not be, or at all events, were not, dispossessed, provided they paid the tax imposed by government. Lord Cornwallis, however, decided otherwise, and, in 1798, the zemindars, whether cultivators or officers in actual charge of districts, were recognised as the hereditary possessors of the soil; but with a reservation of power on the part of the government to step in between the zemindar and the ryots in behalf of the rights of the latter, should they ever be infringed. The sum which the zemindar had been in the habit of paying was ascertained from the returns of a few prior years; the assessment or tax was fixed for ever at that amount, and an engagement was made that it should not be levied on him individually. Upon this basis, a system in some respects similar to that of the *metayer* system, prevalent in the S. of Europe (see FRANCE, PAPAL STATES, TUSCANY, &c.), was adopted: the cultivator pays to the zemindar a money rent (unless otherwise specified), estimated at half the produce of his land; 9-10ths of which rent or land-tax goes to the government, the other 1-10th remaining in the hands of the zemindar for his remuneration; he being, as formerly, head collector of, and responsible for, the tax. We shall not stop to inquire into the principles of this plan; but it is quite clear that, how advantageous soever in other respects, the exorbitant amount of the land-tax could hardly fail to be a source of poverty and ruin. The practice of letting lands on the metayer system is one of the worst that can be adopted (*McCulloch's Principles of Political*

Economy, p. 463.); but in European countries the tenant is never called upon to pay half the produce, unless the landlord supply him not merely with the land, but also with the stock and implements of husbandry. A claim of half the produce on account of the land only is nowhere enforced unless in India; and it is unnecessary to go farther for an explanation of the abject condition of the cultivators. Within a few years after the introduction of the perpetual settlement, the greater number of the original zemindars having fallen into arrears of rent, their estates were sold, and the purchasers having contrived, under one pretence or another, to dispossess the cultivators of the rights reserved to them by Lord Cornwallis, the latter are now become, in effect, mere *tenants at will* under irresponsible landlords.

The fixing of the assessment has, however, had the good effect of causing the cultivation of a considerable extent of waste land, and many of the zemindars are now opulent. But the ryots or cultivators, that is, the vast majority of the people, have gained little or nothing by this extension, and poverty is universal.

"The condition of the cultivators," says Rammohun Roy, "is very miserable; in short, such is the melancholy condition of the agricultural labourers, that it always gives me the greatest pain to allude to it. They have no means of accumulating capital: very often when grain is abundant, and therefore cheap, they are obliged to sell their whole produce to satisfy the demands of their landlords, and to subsist themselves by their own labour. In scarce and dear years they may be able to retain some portion of the crop to form a part of their subsistence, but by no means enough for the whole." (*Appendix*, pp. 719-721.) The total amount of the land revenue for 1820-30, was 1,958,800*l*.

Manufactures.—The want of capital, which has so injurious an influence over agriculture, is still more hostile to manufactures: it prevents the division of labour, and renders the acquisition and employment of improved tools and machines all but impossible. Manufactures have, however, been long prosecuted, and have made considerable progress here and in most parts of India. Muslins of the finest texture were formerly made at Dacca, but the manufacture is now lost, owing to the want of demand, there being no wealthy native nobility, and no native court. They were always, in fact, a mere object of curious luxury. It is commonly supposed that the manufacture was destroyed by the importation of cheaper fabrics from England; but this is an entire mistake: it was extinct before a yard of Manchester calico had been imported. The principal existing manufactures are, cotton piece-goods, and diaper, at Dacca; packthread and sail cloth, on the N. frontier; chlutzes in Calcutta; woven silks and taffetas at Moorsheadabad; union fabrics in Burdwan; and calicoes and blanketing universally. The production of salt is monopolised by the government; its average price has been about 5 rupees (11s 6d.) per maund (80 lbs.), and the E. I. Company have realised from it an average annual rev. of 22,564,900 rupees (2,269,450*l*). The increase of the revenue of Bengal is principally due, first, to the monopolies of salt and opium, and secondly, to the permanent settlement. The exchange of grain for salt, cotton and sugar; and the exchange of tobacco for betel nut, &c., constitute the chief branches of the internal trade. The foreign exports to Europe and America are indigo, silk, sugar, saltpetre, rice, lac, cotton, &c., with the produce of China, Persia, and the E. Archipelago; to China and the East, opium, grain, saltpetre, gunpowder, iron, fire-arms, cotton and silk goods; the same articles, with nails, naval and military stores, and a variety of other European goods, to the Birman empire; grain, sugar, salt, and cotton piece-goods, to the gulphs of Persia and Arabia; and home produce to the Bombay and Madras presidencies; but the trade with the latter has greatly decreased since the conquest of Mysore. The imports from Europe are metals of all sorts, wrought and unwrought, especially copper, cotton goods and yarn, woollens, silk goods, wines and ales; haberdashery, and a host of smaller articles. Bullion used formerly to be a leading article of export from Europe; but latterly large quantities have been brought from Bengal. The imports from Madras and the Comorandel coast are salt, red wood, long cloths, chintzes, &c. China supplies spices, tea, porcelain, lacquered ware, bullion, &c. (For a detailed account of the foreign trade of Bengal, see CALCUTTA.)

The Bengalese, when young, are handsome, of middling height, varying in colour from light olive to dark brown, according to rank, with an oval face, frequently aquiline noses, and universally black eyes and hair. Their constitution is weak and ill fitted to support changes of climate. Though generally healthy, they rarely attain to any great age: they marry young; and it is by no means uncommon to see women of 12 and 14 years of age with children in their arms. They are lively, inquisitive, and polite; but deficient in energy, and, speaking generally, are remarkable for duplicity, extreme bad

faith, and proneness to litigation. They are, however, less corrupt at a distance from Calcutta than in the vicinity of that capital. Domestic slavery exists very partially; the slaves are treated kindly, and more as members of the family than otherwise, not being employed in the labours of husbandry.

The Bengalese are mostly very abstemious; rice, seasoned with salt, and sometimes spice, being their chief food. The slaughter of kine, and the eating of cows' flesh, are considered by the Hindoos as sinful. They do not, however, scruple to eat different kinds of animal food, as fish, ducks, and geese; but all castes hold it an abomination to eat the common fowl. They rarely indulge in spirituous liquors; but they drink the juice of the palm, which rapidly ferments, and the intoxicating extracts of poppy and hemp; chew betel and tobacco, and smoke. In the upper parts of the prov., they live in mud hovels; in the lower distr. in huts of bamboo sticks, mats, and straw, sometimes neatly thatched. None but the opulent classes inhabit houses of brick and lime. (*Evid. of Ramm. Roy, Rep.* 1831, pp. 740, 741.) The male dress of the classes above poverty is a piece of cotton cloth around the chest, and another reaching from the loins to the ankle; the labourers have only a piece of cloth round the loins. The Mohammedans wear a turban; but the Hindoos, except men of rank, who dress like Mohammedians, are both lurches and barefooted. The female dress is generally composed of one long piece of cloth rolled round the waist, one end flowing in folds to the ankle, and the other drawn round the head and chest, and then serving for a veil: they paint their foreheads, fingers, and feet, red, and wear a profusion of rings and other ornaments. The upper classes, and especially the zemindars living in Calcutta, are gradually adopting European tastes and luxuries; and a knowledge of European arts and sciences has been diffused by means of schools in various parts, and of colleges in Calcutta and other chief cities. The Bengalese are apt and quick scholars, and the English language and literature have become familiar to many, though native learning has long been retrograde, owing, most likely, to the want of encouragement for men of literary distinction since the breaking up of the native governments. Justice is administered as in the contiguous prov. by moonshis, sudder ameens, and judges of the shikah courts, the prov. courts of Calcutta, Moorsheadabad, and Dacca; the supreme court discharging the functions of the *Sudder Dewanny Adawlat*, or supreme civil court, and *Sudder Nizamat Adawlat*, or supreme criminal court; the proceedings of the latter are governed by the Kanun and the laws of Menu. The peculiar crime of this prov. is *dacoity*, a kind of brigandage, by gangs of robbers, attended by every species of cruelty upon their victims. The Mohammedan exactions probably first gave rise to it: at all events, it was very prevalent during their ascendancy, but it is now much less frequent. Mohammedans and Hindoos are subject to their respective codes of justice: Europeans, indeed, and every one else, natives and foreigners, within the liberty of Calcutta, are exclusively amenable to the English law; but beyond those limits there is no separate provision for foreigners. In no prov. of India has the creed of Mohammed made so much progress, though at such a distance from the former seat of Moslem empire. In the E. distr. Mohammedans are nearly as numerous as Hindoos; in the central parts they constitute scarcely 1-4th of the pop., and in the W. still less. There are about 40 Jewish families in Calcutta.

In 1203 the greater part of Bengal was conquered by the Mohammedans, and governed by viceroys from Delhi till 1340, when it was erected into a separate kingdom. From 1538 to 1740 Bengal was again an appendage to the throne of Delhi: in 1755 the British acquired, from the Emperor Shah Allum, possession of Bengal, Behar, and Orissa, which has ever since been the nucleus and principal seat of our possessions in the East. The present nabob of Bengal, the descendant of the last sovereigns, deprived of all political power, receives a pension from the British gov. of 224,035*l*. a year. (*Hamilton's E. I. Gaz.*, pp. 173-216; *Ibid.*, *Descr. of Hindostan*, 1-123; *Reports on E. I. Affairs and Appendix*, 1830-1839; *Colebrook's Remarks on the Husbandry and Internal Commerce of Bengal*, 1806, an excellent work; *Mod. Trav.* vol. viii., &c.)

BENGALY (an *Hesperia* and *Berrence*), a marit. town of N. Africa, district Barca, reg. Tripoli, on the E. coast of the Gulph of Sidra (an *Syrtis Major*); lat. 32° 7' 30" N., long. 20° 2' E. Pop. 2,500. It is finely situated on the margin of an extensive and very fertile plain, but is miserably built, filthy in the extreme, and infested to an almost intolerable extent with flies. The harbour, which seems to have formerly had deep water, is filled up, so that it cannot now be entered by a vessel drawing more than 7 or 8 ft. water; and that only in moderate weather. At the entrance to the port is a castle, the residence of the bey, but worthless as a means of defence. Notwithstanding its poverty, and the indolence

of its Arab inhabitants. Bengary has some trade, principally carried on by Jews. According to a statement furnished by the French consul, the value of the exports in 1836, consisting principally of wool, oxen, and sheep, salted butter, and corn, amounted to about 12,000*l*. The trade is mostly carried on with the other Barbary states and Malta.

Such is the present abject condition of a city that occupies the site of the ancient Berenice*, which had the gardens of the Hesperides in its vicinity. It is singular, that though its walls were completely repaired under Justinian, hardly a trace of them is now to be met with. In the scarce vestige of the old city is to be found above the surface of the plain; but very extensive remains are found on digging a foot or two below the surface. Captain Beechey has given a very full account of Bengary and the surrounding country, in his voyage to N. Africa; and to it the reader is referred for further particulars.

BENGORE HEAD, a promontory of Ireland, N. coast co. Antrim, adjoining the Giant's Causeway; lat. 55° 16' 10" N., long. 6° 39' 20" W. This remarkable promontory is made up of a number of capes. Of these the most perfect and striking is Pleasant. "Its summit," to use the words of the Rev. Mr. Hamilton, "is covered with a thin grassy sod, under which lies the natural rock, having generally a uniform hard surface, somewhat cracked and shivered. At the depth of 10 or 12 ft. from the summit, this rock begins to assume a columnar tendency, and forms a range of massy pillars of basalt, which stand perpendicular to the horizon, presenting, in the sharp ice of the promontory, the appearance of a magnificent gallery of colonnade, of upwards of 60 ft. in height. This colonnade is supported on a solid base of coarse black, irregular rock, nearly 60 ft. thick, abounding in blebs or air-holes; but though comparatively irregular, it may be evidently observed to affect a peculiar figure, tending, in many places, to run into regular forms, resembling the shooting of salt and many other substances, during a hasty crystallisation.

"Under this great bed of stone stands a second range of pillars, between 40 and 50 ft. in height, less gross and more sharply defined than those of the upper story; many of them, on a close view, emulating even the neatness of the columns in the Giant's Causeway. The lower range is borne on a layer of red ochre-stone, which serves as a relief to show it to great advantage.

"These two admirable natural galleries, together with the interjacent mass of irregular rock, form a perpendicular height of 170 ft.; from the base of which, the promontory, covered with rock and grass, slopes down to the sea for the space of 200 ft. more, making, in all, a mass of near 400 ft. in height, which, in beauty and variety of colouring, in elegance and novelty of arrangement, and in the extraordinary magnitude of its objects, cannot readily be rivalled by any thing of the kind at present known." (*Letters on the Coast of Antrim*, 12mo ed. p. 91.)

BENGUELA, a country of W. Africa, the limits of which are usually considered to be the Coawra river on the N., the Cumene river on the E., the mountains behind Cape Negro on the S., and the shore from that cape to the mouth of the Coawra on the W. According to this outline, it extends from 9° to 16° N. lat., and from 12° to 17° E. long., having a mean length of 450 m., a breadth of 270 m., and an area of considerably more than 1,000,000 sq. m. (*Labat, Relat. Hist. de l'Ethiop.* (tr. i. 67; *Barbot, Voyage to Congo River*, p. 501; *Bouiditch's Map of the Coast and Interior of Congo, Angola and Benguela*, corrected from *Captain Owen's Observations*.†)

Face of the country.—Benguela appears to be mountainous throughout its whole extent; the land rising sometimes so high that, if it do not actually reach the snow-line, a very great degree of cold is experienced. (*Battel, Parchas' Pilgrims*, ii. 271; *Bouiditch's Portuguese Discoveries*, p. 62.) These mountains come down to the sea, are in general very difficult of passage, but, like other African elevations, rise in masses rather than peaks, and abound in terraces, table-lands, and valleys, to their very summits. The rivers are numerous and important, and as the direction of the mountains is from N.E. to S.W., the chief of them run a N.W. course to the Atlantic. This is the case with the large river, without a name, which falls into the ocean at Cape Negro, and with the Cobal, Coposao, Catumbela, and Cuvo. Besides these, which are very large, there are an immense number of small streams running short and almost straight courses from the W. flanks of the mountains, and the various affluents of the prin-

cipal rivers are almost innumerable; in addition to which, springs of sweet water are so abundant, that in almost every part of the country, they may be found by digging to the depth of two feet. The natural consequence of this abundant moisture in tropical countries is observed in Benguela, and nowhere is vegetation more abundant or more varied. Dense forests of cedars, palms, boobah, date-trees, tamarinds, with every other tropical tree,—and some that belong to more temperate climates, clothe the sides and tops of the mountains, intermixed with vines, bananas, ananas, and all the finest species of tropical fruit. Grain is not very abundant; but this arises from the want of skill or industry in the natives, since there is no species of corn that might not be successfully cultivated upon some part of the high or low lands. Lions, tigers, elephants, rhinoceroses, hippopotami, and other large animals, are extremely numerous; in addition to which, the zebra is very commonly met with, and, in short, every wild animal for which Africa is noted is found within the limits of Benguela. The elk (which is also a native here) is particularly prized, from its being supposed that one of its hoofs has power to cure the epilepsy, deer and antelopes, of course, are abundant. Cattle, sheep, and goats, are very numerous, but it does not seem that horses are at all plentiful. Of birds, Battel reports that peacocks are found wild in the interior as numerous as any other kind—that they are accounted sacred, and kept tame about the graves of the great chiefs. The ostrich is also found here, with all the reptiles, dangerous and harmless, for which this part of Africa is so much reputed; crocodiles being especially numerous and powerful. The mountains are known to yield copper, sulphur, petroleum, and crystals; and are supposed to possess gold and silver. Some of the rivers unquestionably bring down the former, but probably in small quantities, which the natives work into the handles of their hatchets.

The rainy season is accounted, in Benguela, to last through May and June; but it is extremely irregular, and sometimes no rain falls for the space of three years. (*Bouiditch*, vol. ii.) The coast is, by all accounts, excessively unhealthy; but the interior is salubrious, and apparently well fitted for cultivation of all kinds; every degree of temperature seems to be experienced at different elevations, and it probably is not exposed to the uncertainty of rain which exists on the coast. Battel, who resided in different parts of the interior for a considerable time, never, amongst all his miseries, complains of the climate.

It is not to be supposed that Benguela, through all its great extent, comprises but one kingdom; the much larger portion is inhabited by petty tribes of independent and very savage barbarians, whose habits and manners do not differ from those of other negroes, with the exception of one—the Gagas, or Gigas, a wandering herd of robbers, which appear to approximate nearer to perfect barbarism than any other, even of the African races. They are of no tribe nor nation, destroy all their own children, and keep up their strength and numbers by stealing those of 12 or 13 years of age from the countries which they overrun. They are bold and skilful soldiers, but ruthless cannibals, without the slightest idea of art or industry, so that wherever they encamp, they destroy all around, and then depart, to inflict the same desolation on some other district. They appear frequently to cause a famine, where such a calamity would otherwise seem to be impossible, verifying the animated description of the locust:—"Before them is a garden, behind them a barren desert." Battel, who was their prisoner for more than two years, has left a full and curious account of these savages, which carries the impress of truth on every line. Benguela was formerly subject to Angola, at least nominally, and was accounted one of the 17 provinces of that kingdom. The Portuguese have long had settlements on the coast and the interior, but their power does not seem to extend far beyond their fort. See *Angola*. (*Battel's Parchas*, ii. 274—277; *Barbot*, p. 501; *Merolla*, pp. 64—68; *Labat*, i. 70; *Bouiditch*, pp. 26—64; *Capt. Owen's Nar. of Voy.* ii. 271—275.)

BENGUELA VELHA (*Old Benguela*), the native capital of the country above described, lat. 10° 45' S., long. 15° 5' E. It is well situated on the coast, between the rivers Cuve and Lonja, in a very fruitful champagne country, and about 3 m. to the S. is a convenient harbour, called by the sailors Men's Bay, from the number of domestic fowl which are collected about it. There are no accounts preserved of the pop. or other statistics of Old Benguela; its trade, if it ever had any, having long since been transferred to

BENGUELA (ST. FILIPPE DE), the Portuguese capital of the same country, lat. 12° 12' S., long. 15° E., about 100 m. S. of the old town. Pop. about 3,000, the greater portion being free blacks or slaves; it is a wretched place, built of half-baked bricks and so

* This name was given to it under the Ptolemies, being that of the goddess of Ptolemy Philadelphus.

† Bouiditch's map was constructed from the Portuguese survey of the coast and interior, in 1790, and is by far the best existing of this part of Africa. Captain Owen's survey of the coast was performed in 1825. According to the coast of Cape Negro, the most S. and W. point of Benguela, lies in 16° 5' S. lat., 13° 22' E. long.; according to the last in 16° 40' 7" S., 11° 53' 3' E.

slightly that no tenements are ever repaired, but as soon as they begin to decay, others are built by their sides. It stands on an open bay, and is watered by a tolerable stream, formed by the junction of two small rivers. Its site is a marsh, full of stagnant pools, and so extremely unhealthy, that the Portuguese affirm none of their countrywomen could endure it three months. It was lately nearly destroyed by an invasion of elephants, a number of them having entered it in search of water during the dry season; and danger always threatens the inhabitants from the alligators and hippopotami in the river. To compensate these evils, it was, if it be not still, a good *slaving* station, the exports formerly averaging 20,000 a year. This traffic is said to have diminished of late years; but such does not really appear to be the case. (See *Burton on the Slave Trade*, p. 30.)

BENICARLO, a marit. town of Spain, in Valencia, on the Mediterranean, 25 m. S. Tortosa. Pop. 5,500. It is defended by walls, a ditch, and an old castle. Streets narrow and dirty, and the houses mean. The surrounding territory is very fruitful, particularly in wine. Large quantities of which, of a dark red colour, considerable strength and flavour, are shipped from this town, whence it is sent to the ports of Cetta. It is thence conveyed by the canal of Languedoc, to Bordeaux, where it is employed to give body and colour to the clarets, especially to those exported to the English markets. (*Milano; Henderson on Wines*, p. 194. &c.)

BENIN, a country of Africa, near the E. extremity of the Gulf of Guinea, between 4° and 9° N. lat., and 4° and 8° E. long. It has S. the Gulf, W. Dahomey, N.W. Yarraba, and N.E. and E. the lower Niger, which separates it from the states of Nyffe, Jacoba, Funda, and Calabar. It has something of a triangular form, is about 340 m. in length by 300 m. in extreme width, and contains probably not less than 50,000 sq. m. (*Adams' Remarks on Coast from E. Palmas to N. Congo*, pp. 109-128; *Clapperton's Second Exped.* pp. 1-37; *Lander's Travels*, pp. 632-694.) On the coast, the country is level, but it rises gradually, till, in the central parts, the continuation of the Korg mountains attains an elevation of 2,500 ft. It is well watered, for the delta of the Niger comprises more than 140 m. that is, more than 7-10ths, of the whole sea-board. The W. branch of this delta is the stream which has always been called the river of Benin; the farthest E. is the main limb, formerly called the Nun; but demonstrated by Lander to be the Niger. (See NIGER.) Besides these, there are several other streams upon the coast, nor can there be any doubt but that the mountains give forth many affluents to the great river in the interior. (*Smith's Voyage to Guinea*, p. 227; *Lander*, p. 467, *et seq.*; *Adams*, pp. 109, 115, &c.) Under the influence of abundant irrigation, and a tropical sun, the productions of the earth are very numerous. They do not, however, differ from those of other parts of the same coast, except that wood is rather more abundant. (*Adams*, p. 111.) The hippopotamus is more common than in other countries of Guinea (*Lander*, p. 639.), in proportion to the more magnificent scale of the hydrography; but in other respects, the animals of Benin are also described in those of Guinea generally; and the same remark will apply to the habits and customs of the natives: the same arts, with the exception of gold working, for gold is not found in Benin (*Adams*, p. 170.); the same government; the same religion (Fetichism); the same festivals, marked by the same disgusting cruelties, are observed here as in Ashantee (see ASHANTEE), with one additional aggravation, namely, the annual sacrifice of human victims to the power of the sea (*Adams*, p. 115.) Benin is well peopled; the capital contains 15,000 inhab., and the town of Warre 5,000. (*Adams*, li. 123.) Clapperton also found the N. frontier, on the Akinga river, very populous, as did the E. frontier, upon the bank of the Niger. Previous to the nominal abolition of the slave-trade, this country was the great theatre of that traffic; and it is now (1839) carried on to a greater extent than ever. An annual fair is held at Poumy, on the coast, at which not fewer than 20,000 slaves are sold, of whom it is alleged 16,000 are brought from the single district of Heebe or Eboe, a port of Benin, on the right bank of the Niger. Some few of these are sold to native masters, as the kings of New and Old Calabar, but the vast majority are disposed of to foreign traders, and are shipped principally for Brazil and Cuba. (*Adams*, p. 129; *Burton*, *passim*, &c.) A more harmless trade, and to a considerable extent, is carried on in salt, palm oil, and blue coral.

BENIN, a large town of Africa, cap. of the above kingdom; lat. 6° 15' N., long. 5° 53' E. Pop. 15,000. It stands on the right bank of a large stream, hitherto called the river of Benin, but now known to be one of the numerous mouths of the Niger; it is built without any order, the houses being detached from each other, and consequently occupying a great deal of ground. They are large, constructed of clay, and neatly thatched with reeds, straw, or leaves. There is an almost con-

tinual market for cattle, sheep, goats, pigs, poultry, yams, cotton, ivory, and European wares; it was also formerly the great emporium for slaves; but the river not being navigable for large ships higher than 40 m. below Benin, this traffic is now carried on nearer the coast, and chiefly at Brass, the outlet of the main branch of the Niger. For a negro town, Benin is extremely clean, and it has a system of municipal government resembling in many respects that of more civilised communities: every district is under the control of a *street king*, whose office is not much unlike that of our aldermen, and who are sometimes powerful enough to hold the monarch at defiance. Calao, or Agaton, is the port of Benin; it lies about 40 m. down the river, or rather on a large creek which the former gives out from its bank, and is accessible to craft of the burden of 60 tons. It is said to be larger and more populous than Benin itself. The surrounding country is well wooded, fertile; but low, flat, swampy, and very unhealthy. It was here that Belzoni died of dysentery in 1823, on his road to Houssa and Timbuctoo. (*Smith's Voyage to Guinea*, p. 224, &c.; *Adams' Remarks on the Country from Cape Palmas*, p. 111, &c.; *Nowell's Annales des Voyages*, xxi. 149; *Smith's Mag.* pp. 94, 462.)

BENIN (BIGHT OF). The coast of Benin is so called. It is a considerable indentation of the Gulf of Guinea, extending from the Akinga to the Niger. It is an iron-bound coast, offering no entrance to vessels, except at the mouths of rivers, and scarcely there, if the vessels be of much burden. (*Adams*, p. 227.)

BENIN, (RIVER OF), called also the FORMOSA, falls into the Gulf of Guinea, about 180 m. below Benin, in lat. 6° 40' N., long. 5° E. It is a deltoid branch of the Niger, commencing at Kirroo, about 100 m. above Benin, and its whole course, inclusive of windings, may be about 210 m. (See NIGER.)

BENISUEFF, a town of Egypt, cap. prov. same name, on the W. bank of the Nile, 64 m. S. Cairo. Pop. 5,000. This is a pretty well built, important town, being the entrepot for all the produce of the fertile valley of Fayoum, which is brought here for shipment to Calao. It had, in 1835, a large cotton-mill at work, which gave employment to several hundreds of poor people; with large barracks for cavalry, &c. It is well supplied with provisions of all sorts; and quarries of alabaster have recently been discovered in its vicinity. (*Scott's Egypt and Candia*, p. 265.)

BENNECKENSTEIN, a town of Prussia, prov. Saxony, reg. Erfurth, on the Rappode, at the foot of the Harz, in an *enclave* situated in the duchy of Brunswick, 13 m. N.W. Nordhausen. Pop. 2,700. It has an iron-foundry, a nail-work, a brewery, and a manufactory of baskets.

BEN NEVIS, a mountain of Scotland, in Dumfriesshire, the highest of the British mountains. It lies immediately to the E. of Fort William, being separated from the Grampians by the desolate tract called the Moor of Rannoch. It rises 4,370 ft. above the level of the sea; being 43 ft. higher than Ben Macduh, the next highest mountain in Scotland, and 759 ft. higher than Snowdon, the most elevated of the Welsh mountains. Its circumference at the base is supposed to exceed 24 m. Its outline all round is well defined. Its N. front consists of two grand ascents or terraces: the level top of the lowest of which, at an elevation of about 1,700 ft. contains a wild *tarn* or mountain lake. The outer acclivities of this, the lower part of the mountain, are very steep, though covered with a short grassy sward, intermixed with heath; but at the lake, this general vegetable clothing ceases. The surface of the upper and higher part of the mountain, where not absolutely precipitous, is strewn with angular fragments of stone, of various sizes, wedged together, and forming a singularly rugged coating, among which we look in vain for any symptom of vegetable life. On the N.E. side, a broad, terrific, and tremendous precipice, commencing at the summit, reaches down to a depth of not less than 1,600 ft. The furrows and chasms in the black beetling rocks of this precipice are constantly filled with snow, and the brow of the mountain is also encircled with an icy diadem. From the summit, the view is remarkably grand and sublime: it commands most of the W. islands, from the Pass of Jura to Cuicullin, in Skye; and on the E., the view extends to Schiehallion Cairngorm and Ben Macduh. (*Anderson's Highlands*, p. 266. &c.)

Ben being a term used in the Gaelic to signify a high summit, is applied to several of the Scotch mountains, as Ben Lomond, on the E. side of Loch Lomond, 3,195 ft. above the level of the sea, and the best known of all the Highland mountains; Ben Macduh, on the confines of Banff, Inverness, and Aberdeen, 4,327 ft. above the sea, being, as already stated, only 43 ft. lower than Ben Nevis; Ben Sawers, Ben Glac, Ben Wyvis, &c. (See SCOTLAND.)

BENOIT (ST.), a town of the Isle de Bourbon, on the E. coast of the island, at the mouth of the Maroulins. The products of the district are shipped in

small vessels at the creek, or bay, for St. Denis, the cap. of the island.

BENSHEIM, a town of the grand duchy of Hesse Darmstadt, 15 m. S. Darmstadt. Pop. 4,000. It has a church, a college, and an hospital.

BERAR (Dowry Rajas or), a territ. of India, in the Deccan, under British protection, comprising Nagpoor, part of Berar prov., and a considerable portion of Gundwanah; between lat. $17^{\circ} 48'$ and $22^{\circ} 43'$ N., long. $78^{\circ} 30'$ to $80^{\circ} 4'$ E.: having N. the ceded distr. on the Nerbudda; E. parts of the Bengal and Madras presid., and S. and W. the nizam's dom.: greatest length, N. to S., 330 m.; breadth, 300 m.; area, 56,723 sq. m. (*Capt. Sutherland*). Pop. early in the present century, about 2,600,000, exclusive of some of the wilder districts. In the N. its boundary is a high table-land; its S.W. limit is for the most part identical with the course of the Wurda; the other chief rivers are, the Pain-Gunga, its tributary the Khaban, and the Mahanuddy. The land is fertile in dry grains; peas, vetches, flax, sugar, betel, and tobacco, are also raised. The Nagpoor wheat is reckoned the most nutritious in India; it comes to perfection in three months, and with maize, which is sown after it as a second crop, forms the chief subsistence of the inhab. A large proportion of the land has been brought into cultivation since the British have had the superintendence of this country; the capital of the cultivators generally has increased, and irrigation and the state of the wells are better attended to. Additional bullocks are now used in agriculture, but no improvement has taken place in the implements of husbandry: the plough is a crooked instrument, of the coarsest wood, with a little bit of iron at the end of it, costing but 3 or 4 rupees, and sufficient only for scratching the ground. Sugar, betel, and tobacco are largely manured, but not with cow dung, which is used by the Hindoos for the floors of houses, and for fuel, though plenty of wood suitable for the latter purpose is scattered over the country. Indigo grows wild, but is not cultivated to any extent, and opens very little. A great portion of the country belongs to zemindars, who pay nothing but a quit-rent to government, and are in other respects independent of any superior authority: but these are less numerous in the central districts, which, a few years since, were placed under the immediate superintendence of the rajah. In the more civilised parts the revenue is collected under the village settlement; the chief farmer of the village being the *potail*, responsible for the payment of the ryot under him; receiving their rents, advancing them money when necessary, and receiving for his own remuneration 1-6th part of the whole sum collected. Cows, or agreements between the government and the *potail*, or between the *potail* and the ryot, that only so much shall be collected from the land in a certain term (generally 5 or 7 years), are very common, and were introduced by the Maharattas when they conquered this territory, in order to promote cultivation, which at that time had been greatly neglected: the system is said to be advantageous, and if the assessment were moderate, and the term of agreement extended, and the conditions abided by, it perhaps would be as good a system as the principle on which it is bottomed will admit of.

The office of *potail* is usually considered hereditary, but is dependent on the pleasure of the government. The revenue is about 46 or 47 lacs, and the civil expenditure 7 or 8 lacs rupees a year. The ascending ranks of judicial authorities are the *potail*, the native pergunnah collector, the subahdar of the district, and the rajah himself, who holds all the subahdar jurisdiction round the capital. The *punchayet*, a body of five judges, two of whom are chosen by each of the contending parties, and the fifth by the *potail*, decides most civil suits, and its decision is final. This system is said to work well, except near Nagpoor, where corruption is common. It is always, however, resorted to; for, when the rajah decides, he exacts $\frac{1}{2}$ of the sum in dispute as a fine from the loser, and another $\frac{1}{4}$ as a compensation for the decision, from the winner. There are no statute laws; succession to property is commonly determined by the Hindoo code, and there are a few men of learning in the cap. versed in this; but where one of these is not called in, most matters are determined by the *punchayet*. Education is not much countenanced either by the government or the people at large; it is mostly confined to the children of the Brahmins and mercantile classes, and amongst these extends little beyond reading, writing, and accounts. All other classes are very illiterate, and it is rare that a cultivator can write his own name. There are no schools for Mohammedans only; they forming but a very small part of the pop. Domestic slavery is not very prevalent, and is more common in the cap. than elsewhere; it chiefly occurs from persons pressed by poverty disposing of their children, who are treated more as members of the families of their owners than otherwise: none are exclusively employed as agricultural slaves, nor are any attached to the soil. The public roads are few; there are no canals; communication is

very trifling generally, and in bad weather there is none at all. The trade of Berar with other provs. is very insignificant, and from all these causes the knowledge of the state of this country is, of necessity, very imperfect. Commerce is said to be promoted in a most singular manner, that is, by a belief amongst the lower tribes, that suicide is acceptable to their divinities, and they accordingly immolate themselves at fairs, &c., to which merchants and other classes resort to witness the spectacle! In 1830, 816 European, and 4,000 native troops, formed the military establishment.

After the fall of the Mogul empire, the Maharattas overran this country, and under the second Maharatta rajah, Jenjee, who lived about the middle of last century, it is said to have been in a more flourishing condition than at any other period. The rajah of Nagpoor, however, at the beginning of the present century, having become hostile to the British, was deprived of the prov. of Cuttack, which had previously belonged to him, and some territories adjoining Hyderabad, which were given to the nizam. In 1817 the rajah was again in arms against the English, who then took upon themselves the administration of his territory. This continued for 84 years, during which time much improvement to the general satisfaction of the people was effected. The annual revenue had risen from 37 to 47 lacs of rupees, when the centre parts were delivered up to the young rajah Bajee Rao Boodlah, on his majority in 1826, at which time he ceded to us a territory on both banks of the Nerbudda, and those parts of Gundwanah now belonging to the Bengal presid., together with an annual tribute of 8 lacs; the whole of our acquisition by this treaty being estimated at 30 lacs rup. a year. In 1829 the rajah was put in possession of the rest of his prov., with an agreement that instead of a force of 3,000 horse and 2,000 foot, he should, for the future, maintain a standing army of 1,000 horse only. (*Hamilton's E. I. Gaz.* 1. 217—221.; *Reports on the Affairs of the E. I. Comp., Extract of Mr. J. J. Munro, pp. 140—150.; Appendix vi. 153.*)

BERA T, a town of Turkey in Egypt, in the N. part of Albania, on the Tuberathi (an. *Apus*), 28 m. N.E. Aulona; lat. $40^{\circ} 48'$ N., long. $19^{\circ} 52'$ E. Pop. 8,000? It consists of an acropolis or citadel, on the summit of a pretty high hill, and of a lower town. The former, which was repaired and strengthened by Ali Pacha, is very extensive, and contains within it the palace of the vizier, several Greek churches, and about 250 houses. Being commanded by the neighbouring heights, and without either springs or cisterns (*Pouqueville*). It could oppose no effectual resistance to an invading army properly supplied with artillery, or strong enough effectually to blockade it. The lower town, at the foot of the acropolis, is intersected by the river, over which there is a good bridge of 8 arches. It has numerous mosques, and a large and handsome bazar. Merchants import British and other foreign goods through the port of Aulona. Scanderbeg failed in an attempt to take this town, which has always been regarded as an important post, and the key, in fact, of this part of the country. (*Pouqueville, Voyage de la Grèce*, l. 201. ed. 1820; *Hughes' Albanus*, ll. 335.)

BERAUN, a walled town of Bohemia, cap. circ. same name, on the Beran, 2,200 m. W.S.W. Prag. Pop. 2,200. It has fabrics of earthenware and fire-arms; and in its vicinity are quarries of marble and coal mines. In the vicinity of this town, the Austrians, in 1746, gained a signal victory over the Prussians.

BERBERA, a sea-port town of Africa, in the country of the Somalis, on the Sea of Ab-el-Mandeb, at the bottom of a narrow and deep bay; lat. $10^{\circ} 24'$ N., long. $45^{\circ} 8'$ E. It is rather an encampment than a town, the inhab. dwelling mostly in tents or huts constructed of a few sticks, and covered with skins. It has few permanent residents; but from September to April, during which period a great annual fair is held, there is a large concourse of visitors, sometimes to the amount of 7,000 or 10,000. The Somalis bring with them, from the interior, ghee or butter, coffee, sheep, various descriptions of guns, myrrh, ostrich feathers, gold dust, hides, slaves of both sexes, &c., which they exchange for iron, and cotton, cloth, rice, dhourrah, &c., brought from the Arabian ports of Mocho, Hodeda, Makulash, &c. The trade is almost wholly in the hands of Baiban merchants, who are said to realise large profits. (*Willstedt's Arabia*, ll. 360. &c.)

BERBICE. See GUIANA.

BERDITCHIEF, a town of Russia in Europe, gov. Volhynia, on its S.E. confines, 25 m. S. S. Jitomir. Pop. 9,000? It is dirty and ill built, and is principally inhabited by Jews. It is, however, the centre of a considerable trade. Its fair, called *Chowfric/friskalia*, is much frequented. In 1832 there were brought to it Russian merchandise of the value of 3,108,756 roubles; foreign and colonial do. 1,518,195 r.; Asiatic do., 347,000 r.;

• *Pouqueville* says that the lower town has 6,000 inhab., and the upper 250 houses.

with horses of the value of 710,000 r., and cattle, 150,000 r. (*Schneider, La Russie*, &c., p. 508.)

BEREZINA, a river of Russia in Europe: it rises in the district of Dissa, gov. Minsk, which it traverses from N. to S.: after receiving various affluents, and being joined by a canal with the Dun, it falls into the Dnieper a little below Kitchitza. This river has become celebrated from the difficulties and disasters attending the passage over it of the army under Napoleon, when retreating from Moscow in 1812. The above river must not be confounded with another and smaller river of the same name, which also rises in the gov. Minsk, and which, having divided, during a part of its course, the govts. of Grodno and Wilna, falls into the Niemen, at Nikolaief.

BERGAMO, a town of Austrian Italy, cap. prov. and distr. same name, on some low hills between the Serio and the Brembo, 29 m. N.E. Milan; lat. $45^{\circ} 41' 51''$ N., long. $9^{\circ} 40' 26''$ E. Pop. 30,500. It is surrounded by walls, and has an old castle; but these are now useless as means of defence. It is well built; has a massive cathedral, 14 churches, 12 monasteries, 10 nunneries, a large hospital, a *mont-de-piété*, an orphan asylum, and other charitable institutions, a lyceum, and a *seminario*; the Carrarese school, founded by Count Carrara, where gratuitous instruction is given in music, painting, and architecture; a public library, with 60,000 vols., 2 theatres, &c. There are here extensive establishments for the spinning and weaving of silk, great quantities of which are produced in the vicinity, with woollen and cotton fabrics, iron-foundries, &c. A great fair is annually held on the 22d of August, and 14 following days, in a large quadrangular building, called the *fierra*, containing 540 booths or shops. All the products of Lombardy are exposed to sale at this fair; but silk is the staple article, and next to it are iron, wine, &c. It has also a considerable trade in grindstones, quarried in the neighbourhood. The value of the goods disposed of at the fair is said sometimes to amount to 1,200,000*l.* It has also other, but less considerable, fairs, and cattle-markets. It is the seat of a bishopric, of the provincial assembly, and of a judicial tribunal.

Bergamo is very ancient, having existed under the Romans. In 1428, the inhab. placed themselves under the protection of the republic of Venice, of which it continued to form an integral part till the subversion of the latter in 1796, when it was given of about 7 years after the battle of Agnadello, in 1509, when it was taken by Louis XII. During the French ascendancy, it was the cap. of the dep. of Serio.

Bergamo has given birth to some very eminent men. Among others, to Bernardo Tasso, the father of Torquato (a colossal statue has been erected in the *Piazza Grandi*, in honour of the latter); Tiraboschi, the author of the learned, elaborate, and invaluable work on the history of Italian literature (*Storia della Letteratura Italiana*); the Abbé Serassi, author of the *Linga Tasso*, &c. The Bergamasque dialect is peculiar, and one of the most corrupted forms of the language spoken in Italy. (*Oesterreich. Encyc.*; *Rampoldi, Corografia Italiana*, &c.)

BERGEDORF, a town of the distr. or ter. of Hamburg, at the confluence of the Itlle with a canal that joins the Elbe, 9 m. S.E. Hamburg. Pop. 2,000.

BERGEN, a town and sea-port of Norway, cap. of the diocese of S. Bergenshuus, at the bottom of a deep bay, 365 m. W. N. W. Christiania; lat. $60^{\circ} 24'$ N., long. $5^{\circ} 20'$ E. Pop. in 1835, 22,539. It is built on a promontory, and surrounded on every side by water, except N.E., where it is enclosed by mountains considerably above 2,000 ft. in height; and is protected, besides, by lofty walls, and several forts, mounting in all about 100 guns. The harbour is safe and commodious, and the water deep; but the bay all round is so beset with rocks as to render its navigation dangerous without a pilot. Bergen is generally well built, though some of its streets are narrow and crooked; viewed from the sea, it appears remarkably picturesque, being built amphitheatrically round the harbour. It contains a cathedral and 4 other churches, 3 hospitals, a prison, a house of correction, 6 establishments for the poor, a national museum, 5 public libraries, a naval academy, a superior college, established by Bishop Pontoppidan in 1750, and various schools. It is the seat of a tribunal of secondary jurisdiction, the residence of the high sheriff and bishop of the diocese: one of the three public treasuries of the kingdom, and a division of the National Bank, are established at Bergen. It has a governor, and a garrison of 300 men; and a squadron of the navy is stationed here. There are manufactories of tobacco and porcelain, many distilleries, and some rope-yards.

The fishery is the principal business carried on here; but both the internal and foreign trade are considerable. The imports from the N. provinces consist of cod-fish, roes, fish-oil, tallow, skins, feathers, &c., which are brought by fleets of 50 to 80 small vessels, twice a year during the summer; and which take back in return the other necessities

and some of the luxuries of life. The articles brought from the other parts of Norway are less important: they consist chiefly of iron manufactures, glass, tiles, millstones, &c. and fir timber; but the planks and deals of Bergen are not equal in quality to those of Christiania. The foreign trade is chiefly with the Baltic, Denmark, Sweden, Holland, Hamburg, England, France, and the Mediterranean. The imports from Hamburg far exceed the exports thence from Bergen, and consist of fabrics and colonial goods of every description. England supplies her manufactures and colonial products; but the trade with this country has much decreased. France sends thither salt, wine, and brandy; and receives most of the salted fish roes. The dried cod, or stockfish, a staple commodity of the place, is sent to most Catholic countries. We subjoin a statement of the quantities of the principal articles imported into, and exported from, Bergen, in 1834.

Imports.		Exports.	
Brandy	15,152 gals.	Bones	295,960 lbs.
Corn	37,510 qrs.	Stockfish	19,421,508
Flour	274,579 lbs.	Salted cod	5,592,967
Harleed meal	102,481	Herrings	174,798 bns.
Cotton cloth	51,436	Oil	7,344
Woolen do.	38,751	Oil	17,259
Coffee	267,454	Lolsters	368,097 no.
Flax	137,431	Horns	15,619 lbs.
Hemp	1,333,298	Iron	17,259
Molasses	364,935	Rock moss	66,595
Sugar	497,057	Skins, various	44,609
Soap	140,266	Wool	24,176 lb.
Tobacco	594,967	Anchovies	3,254 lbs.
Wine	27,442 gals.		

During the same year, 1,032 vessels entered, and 985 cleared out of the port: of those entering it, 539 were Norwegian, 184 Danish, and 71 British. The inhab. are industrious, and several of the mercantile houses are believed to be wealthy. The modern town was founded by one of the kings of Norway in the 11th century. In the 13th, traders from the Hanse towns began to settle; and, in the succeeding centuries, acquired an almost sovereign supremacy in Bergen, until checked by an act of the Danish government in 1560. The principal part of the trade is now in the hands of natives. (*Board of Trade Papers*, part v.; *Dict. of Commerce*; and *Penny Cyc.*)

BERGEN, a town of the Prussian States, cap. island of Rugen, 15 m. N.E. Stralsund. Pop. 3,000. It stands almost in the centre of the island; has a court of justice, a castle, and a convent of noble ladies.

BERGEN-OP-ZOOM, a strongly fortified town of the king. of Holland, prov. Brabant, 23 m. W.S.W. Breda, near the left bank of the E. Schelde, with which it communicates by a canal; lat. $51^{\circ} 29' 44''$ N., long. $4^{\circ} 17' 23''$ E. Pop. 6,000. Besides its fortifications, which are exceedingly strong, it is surrounded by marshes that render its access to it very difficult. It has a grammar-school, and a school of design and architecture, with numerous fabrics of earthenware. Its anchovies, taken in the river, are in considerable demand.

This was one of the first towns occupied by the States General. In 1622 it stood a memorable siege by the Spaniards, who were compelled to retire, after losing 10,000 men. In 1747 it was taken by the French by stratagem. In 1814 it was nearly taken by the British by a *coup de main*; but they were finally repulsed with considerable loss.

BERGERAC, a town of France, dép. Dordogne, cap. arrond., in an extensive and fertile plain, on the Dordogne, 27 m. S.S.W. Périgueux. Pop. 9,985. It is neat, well laid out, generally well built, and thriving. It has a magnificent bridge of five arches over the Dordogne, a theatre, and some fine promenades. The fortifications by which it was once surrounded were demolished by order of Louis XIII., in 1621. It has a court of original jurisdiction, a college, and a secondary ecclesiastical school. Excellent paper is made here; and there are manufactures of different sorts of iron and copper goods, serges, hosiery, hats, and earthenware, with tanneries, distilleries, iron-foundries, &c. It maintains an intercourse with Bordeaux and Libourne, and is the principal entrepôt for the trade of the dep. Bergerac suffered much from the religious wars, and still more from the revocation of the edict of Nantes. (*Hugo, art. Dordogne*, &c.)

BERGUES, a town of France, dép. du Nord, cap. cant., at the foot of a hill, on the Colme, 5 m. S.S.E. Dunkirk. Pop. 5,598. It was strongly fortified by Vauban, and has the means of laying the adjoining plain under water. Though old, it is pretty well built. In one of its squares are two high towers, the remains of two ancient churches destroyed during the revolution. It has a communal college, an hospital, and a small public library. It has distilleries, refineries of salt and sugar, with potteries, and fabrics of soap and tobacco. Owing to its favourable situation on the canals of Bergues and Hondscote, it is the entrepôt of

the corn, cheese, and lace, produced in the adjoining country. (*Illego art. Nord, Diction. Géographique.*)

BERKELEY, a bor. and par. of England, co. Gloucester, hund. Berkeley. Area of par. 14,680 acres. Pop. par., in 1821, 3,620; in 1831, 3,959; pop. of the town only, 501; houses, 195. The town is situated amidst rich pasture lands, in the vale of Berkeley, on the Avon (which joins the Severn $\frac{1}{2}$ m. below), 101 m. W. by N. London. It consists mostly of 4 streets, diverging from the market-place; houses but indifferent. The church is a large handsome building, in the pointed style, with a modern tower at some distance from it. There is also a chapel of ease at Stone; 4 dissenting chapels in the town, and 2 in the tithing. There is a free grammar-school, endowed with about 40*l.* a year, in which 26 boys are educated. The town-hall (a handsome structure built in 1828) is now used as a chapel by the Independents; the market-house is beneath it. The market is held on Tuesday, and two annual fairs on May 14, and Dec. 1.; there are also cattle-markets on the first Tuesday in Sept. and in Nov. The Gloucester and Berkeley Canal (navigable for vessels of 600 tons) has its entrance $\frac{2}{3}$ m. from Berkeley, but the place can only be considered as a large agricultural village. The corporation exists by prescription only; there are no charters, nor has it now any duties to perform.

Berkeley Castle on an eminence S.E. of the town, is amongst the most perfect specimens of its kind remaining in the kingdom, being in complete repair and occupied; it is an irregular pile, with a keep and many castellated buildings, enclosing a spacious court. There is a fine baronial hall, a chapel, and a dungeon chamber 24 ft. deep. The other apartments are numerous and gloomy: in one of these Edw. II. is supposed to have been murdered, in 1297; this castle is nearly surrounded by a fine terrace. The date of its foundation is uncertain, but it was granted, in 1150, by Henry II. to Robert Fitzharding, and in the last civil war it was garrisoned for the king, and for a time avowed the surrounding district; it was subsequently surrendered to the parliamentary army, after a nine days' siege. (*Loxbrook's Hist. of Gloucestershire; Atkins's Ditto; Smythe's Hist. of the Berkeleys; Parl. Reports.*)

BERKHAMSTEAD (GREAT), a par. and town of England, co. Hertford, hund. Dacorum, 26 m. N.W. London. Area of par. 4,260 acres. Pop. of par., 1821, 2,310; 1831, 2,363; houses at the latter date, 477. The town is in a deep vale, on the S.W. side of the Bullion and the Grand Junction Canal, which here run in a line together, parallel with the high road, which passes through the town. It forms the principal street, about $\frac{1}{2}$ m. in length; a smaller street branches from the church in the middle of the town, towards the old castle. Houses irregular brick buildings, but many of them very respectable. The church is a Gothic cruciform structure, with a tower, and several small chantries, and curious monuments. There is a free school, established in the reign of Henry VIII.; an annuity of 1*l.* revenue, 624*l.*, but it has long been unavailable to the town. All Souls college has the patronage. Another school, founded in 1727, has an ann. revenue of 279*l.*: in it 20 boys and 10 girls are clothed and educated. The castle, on an eminence E. of the town, enclosed a space of 11 acres, and was very strong; it originated in the Saxon period; was strengthened in the reign of Wm. I., and rebuilt in that of Hen. II., who, at one time held his court in it, and conferred many privileges on the town. Cowper the poet was born here, his father being rector of the parish.

BERKS. or **BERKSHIRE**, an inland co. of England, having N. Oxford and Bucks, from which it is separated by the Thames, E. Surrey, S. Hampshire, and W. Wiltshire, and a part of Gloucestershire. It is very irregularly shaped, and contains 481,280 acres, of which about 260,000 are tillage land, 72,000 meadow and dairy land, and 30,000 waste, consisting of part of Bagshot Heath, &c. It is a very beautiful co.; has every variety of soil and surface; and is well stocked with timber, particularly oak and beech. Exclusive of the Thames, it is watered by the Kennet, Loddon, Ock, and other rivers. It is about equally divided between tillage and stock and dairy husbandry. The Berkshire breed of pigs is much celebrated. Agriculture in a rather backward state; 4 or 5 horses are generally yoked to the plough; and from the want of proper covenants in leases, land is often left in a bad and exhausted state at their termination. Property much divided; a third part of the co. is supposed to be occupied by proprietors. Farms of all sizes, under 1,200 or 1,400 acres; but few above 500 acres, or under 50*l.* a year. Average rent of land, 16*l.* 10*s.* an acre. Windsor Castle, the ancient and only significant residence of the English sovereigns, is in this co. This was formerly one of the principal seats of the woollen manufacture; but it has entirely disappeared, and the manufactures now carried on are but of trifling importance. Principal towns, Reading, Windsor, and Abingdon. Berkshire is divided into 20 hundreds, and 151 pars. In 1831, it had 28,103 inhab. houses, 31,081 families, and 145,389

persons. It returns 9 mem. to the H. of C.; viz., 3 for the co., 2 each for the bors. of Reading and Windsor, and 1 each for Abingdon and Wallingford. Co. constituency in 1837-38, 6,758. Sum expended on the poor in 1836, 64,644*l.* Annual value of real property in 1816, 719,890*l.* Profits of trades and professions in do., 229,704*l.*

BERLEBURG, a town of the Prussian States, prov. Westphalia, cap. circ. Wittgenstein, 27 m. S.S.E. Arnsberg. Pop. 2,200. It is the residence of the prince of Wittgenstein. Berleberg has a castle, a haras, or *dépot de chevaux*, and some forges.

BERLICHINGEN, a village of Wirtemberg, on the Jaxt, 9 m. W.N.W. Kunselsau. Pop. 1,400. It has a castle, a Catholic church, and a synagogue.

BERLINCHEN, a town of the Prussian States, prov. Brandenburg, on a small lake, 82 m. N.N.E. Frankfort on the Oder. Pop. 2,200. It has an hospital, distilleries, and fabrics of linen.

BERLIN, the capital of the Prussian States, and the ordinary residence of the monarch, on the Spree, 127 ft. above the level of the sea, in the middle mark of Brandenburg; lat. 52° 31' 45" N., long. 13° 22' 45" E. Streets broad and straight, some of them being ornamented with rows of trees; squares regular and spacious; houses all of brick, and mostly stuccoed over; public buildings and monuments numerous and magnificent; so that, notwithstanding its sameness, and the want of bustle and liveliness, Berlin is one of the finest cities of Europe. It was founded about the middle of the 12th century. In 1688 the population was about 18,000; in 1775 it had increased to 135,500; in 1816 it was 182,387; and at the close of 1838 it amounted to 290,797; viz. —

	Males.	Females.	Total.
Civil	135,073	136,895	271,968
Military	15,081	3,748	18,829
Totals	150,154	140,643	290,797

The births in 1838 were 10,045, the marriages 2,929, and the deaths 8,554. The number of families in Berlin at the present moment is not exactly known; but in 1831 they amounted to 50,243. In 1838 the city contained 7,614 front and 6,606 back houses, or 14,220 in all; giving an average pop. of 20-21 individuals to every house. In Edinburgh, where the pop. to a house is greater than in any other large town in Great Britain, each house has, at an average, about 16 inhab., so that, in this respect, it is inferior to Berlin. This density of pop. arises in both cities from the same cause; that is, from the appropriation of different stories (Edinburgh, *flats*) and parts of the house to the accommodation of particular families. Some of the houses in Berlin have 50, 70, 80, and 100 inhab. The back houses are built round court-yards, one of which is attached to almost all the principal houses, and do not front the streets. The city is surrounded by ramparts; but they serve only for purposes of police and revenue, and are quite useless as a means of defence.

Berlin owes much to the taste and munificence of its sovereigns. The quarter called the new town (Neustadt) was built by the great elector, Frederick William (1640-1688), who also planned the *Unter der Linden* street, and otherwise greatly enlarged and beautified the city. The succeeding monarchs, especially Frederick I., Frederick the Great, and the reigning monarch, have added many new streets, squares, and suburbs, and have embellished the city with many splendid buildings and monuments. Among the principal of these are the royal palace, imposing by its vast magnitude; the museum, a noble building, begun in 1823, and finished in 1829, containing a large collection of vases and a sculpture and picture gallery; the opera house; the theatre royal; the royal library, a heavy building, but which contains one of the largest and finest collections of books and manuscripts

in the world; the Joachimsthal, one of the royal gymnasia; the royal academy; the arsenal, erected in 1695, and esteemed the finest building in Berlin; the university buildings; the old palace, formerly belonging to the Knights of St. John, now the residence of Prince Charles; the Brandenburg gate, one of the most colossal structures of the kind in Europe, and a principal ornament of the city, erected in 1790, after the Propylæum at Athens, but on a much larger scale—it is surmounted by a statue of Victory, in a chariot drawn by 4 horses, carried away by the French, in 1807, and brought back in triumph in 1814; the monument to the brave men who fell in the campaigns of 1813, 1814, 1815, immediately outside the Halle gate; the royal guard-house, with statues of Scharnhorst and Bulow; the monument in honour of Marshal Blücher, and a host of others; but, strange to say, Berlin cannot as yet boast of a monument in honour of Frederick the Great. The churches, of which there are 37, are inferior; the principal are the cathedral; St. Mary's, with a steeple 292 ft. in height; the church of St. Nicholas, consecrated in 1223; the church of the garrison; and the church of St. Hedewig. The Spree, which intersects the city, and insulates one of its quarters, is crossed by above 40 bridges, principally of stone, but partly also of iron. Some of them are handsome structures. The "Long Bridge," of stone, has a fine equestrian statue of the "Great Elector." The *Unter der Linden* street is the finest in Berlin, and one of the finest in Europe. "It is $\frac{3}{4}$ m. in length, from the Brandenburg gate to the royal palace; the five noble avenues in the centre being composed of chestnuts, linden, aspen, acacia, and plantain, whose varied foliage contrasts beautifully with the numerous elegant palaces and public buildings that line each side of the street. It is the corso of Berlin; for here the fashionable and the wealthy exhibit themselves and their equipages: here are the palaces of the Queen of Holland, Prince William of Prussia; the seminaries of the artillery and engineers, the Academy of the Fine Arts, the opera house, the arsenal, and the king's palace. In short, in whatever direction we turn our eyes, whether to the Brandenburg gate or the museum, majestic structures seem vying in magnificence with each other, intermingled with the statues of Prussian heroes, presenting altogether one of the finest architectural vistas of any city in Europe. (*Germany and the Germans*, i. 58.) Frederick Street is above $\frac{1}{2}$ m. in length, and there are some other fine streets: the Schloss Platz, or square of the palace, the Gens-d'armes-market, Wilhelm Platz, the most fashionable square in the city, the square of *La Belle Alliance*, &c., are all well built, and most of them highly ornamented; but, unluckily, they are not planted inside, and, consequently, notwithstanding the fineness of the buildings, have not half the effect they would have were they properly laid out.

Besides its military and judicial establishments, Berlin has to boast of many celebrated literary institutions. The university established in 1810, enjoys a high degree of reputation, and is attended by nearly 1,800 students. There are also 6 royal gymnasia or high schools, with many inferior academies and schools; among others one (*Gewerbe Institut*), in which young artisans of promise receive gratuitous instruction in drawing, modelling, &c. The military seminary has about 335 pupils. The hospitals and other charitable institutions are numerous and well conducted. The orphan asylum supports about 400 children in the house,

exclusive of about 700 boarded out of doors. Manufactures, important and valuable. They include woollens, silk stuffs, and ribands, cottons, porcelain, cast-iron goods, paper, coaches, and light carriages, jewellery, watches, and clocks, hats, snuff, and tobacco, refined sugar, &c. The cast-iron goods, manufactured at the foundry outside the Oranienburg gate, comprise all sorts of articles, from colossal pillars and statues, down to the minute furniture of a lady's toilet. In delicacy of impression they are unequalled by those made in any other country. The casts in relief of some of the finest pictures are particularly admired. The porcelain, for which Berlin has long been famous, is the produce of a royal manufactory, which, as was to be expected, annually costs the government a considerable sum. There were in Berlin, in 1838, 29 steam-engines—of which one only was employed in the spinning of wool, and not one in the spinning of cotton. There are 10 cotton spinning establishments in the city, but they are all moved by water-power. Printing is carried on to a great extent. Subjoined is a classified account of some of the principal trades carried on at Berlin, and of the number of individuals employed in each in 1838:—

Trades.	Masters or Parties working for their own account.	Labourers and Apprentices.
Pastery-gingerbread bakers and confectioners	105	
Butchers	669	528
Tanners, curriers, cordwain and parchment-makers	79	806
Shoe-makers	2,056	2,416
Glovers	91	118
Harness-makers and saddlers	183	245
Tailors	2,119	2,781
Lace-makers	307	
Hat-makers	57	123

Owing to the flatness of the ground on which it is built, the drainage of Berlin is very imperfect; and, instead of running off, the water in the streets, in wet weather, stops and stagnates on the surface. The Spree, too, being more like a great canal than a river, conveys so slowly away the filth that is poured into it, that in hot weather the odours are alike unpleasant and unwholesome. But the greatest annoyance in summer arises from the heat of the sun, which, being reflected by the arid sandy soil, becomes very oppressive. The streets used to be badly provided with *trottoirs*, but this is no longer the case; the change in this respect has been a very advantageous one, for the streets being mostly paved with small sharp stones, were very unpleasant, and (to a stranger at least) even painful to walk upon. There are numerous hackney coaches and other street carriages, placed under judicious regulations, and as superior to those of London as can be well imagined. The principal streets are lighted with gas, and the houses are all heated by stoves. The rent of shops and houses varies so very greatly, that no general average can be given.

A traveller visiting Berlin in search of amusement, and without introductions, will, perhaps, exhaust the *sights* in a fortnight, and may then find it dull. But a stranger, provided with good introductions, will meet in society with many of the ablest men of Germany, most of whom government has attracted to the capital by bestowing upon them official situations or chairs in the university. Berlin is in fact the centre of intelligence, the Athens, as it were, of the N. of Germany. There are but few people in Berlin who would be called rich in England, but large numbers have revenues of from 2,000 to 3,000 rixdollars a year. It is not the habit among the middle classes to ask strangers to dine at their houses, but to take them to clubs. All classes are extremely well informed. In 1825 there were in the town 416 authors; and their number has not certainly declined in the interval. The theatre, dedicated to the regular

drama, is generally well attended. There is attached to it a subscription room for balls and concerts, which are frequently attended by the royal family. With the exception of Vienna, and probably Munich, there is no city where music is more universally patronised, or where the opera is better performed or more heartily appreciated, than in Berlin. "Here," says Mr. Strang, "it is not fashion, but a passion for the art, that prompts the crowd of admiring listeners to congregate in the opera-house — listeners, whose judicious applause is at once illustrative of their taste for, and knowledge of, good music." The fashionable dinner-hour is 3 or 4.

The *condittoris* are much frequented by the upper classes. They resemble our confectioners' shops; but are far more spacious, and fitted up with greater attention to comfort and elegance. Besides refreshments of all sorts, they are well supplied with domestic and foreign newspapers, literary and scientific journals, &c. Tea and coffee constitute the favourite beverage of the higher classes; and the latter, when they can afford it, is popular with all ranks. Chicory and roasted acorns are not unfrequently used as substitutes for coffee. The gin palaces of Berlin are nowise inferior, if they be not superior, to those of London, and are quite as much, or rather more frequented. Dram-drinking is, in fact, very prevalent, not only in Berlin, but throughout all the N. of Germany. The custom of smoking prevails among all classes; and the consumption of tobacco is immense. Prostitutes are licensed, and are but few in number.

Berlin is the seat of an extensive commerce, and the centre of the pecuniary transactions of the monarchy. The Royal Bank, the Association for Maritime Commerce, &c., have their principal offices in it. The Spree, which is navigable for flat-bottomed boats or barges, drawing 9 ft. water, is connected by canals and otherwise with the Elbe on the one hand, and the Oder on the other; and exclusive of the facilities for commerce that are thus afforded, newly constructed lines of road lead from the city to most quarters. The town revenues amount to from 600,000 to 700,000 rixdollars a year, of which about 100,000 rixd. (14,500*l.*) are expended upon the relief of the poor. The country round Berlin is uninteresting, sandy, and miserably poor; so that most part of the provisions and fuel (timber) required for the use of the city have to be brought from a distance. The annual consumption, at an average of the population, is estimated for each individual, at 100 to 110 lbs. butchers' meat, (*ex game, poultry, and fish*); 88 to 90 lbs. wheat; and about 180 lbs. rye.

The police is strict, and sometimes carries interference to what would be reckoned in England an unwarrantable extent. But the public tranquillity is seldom interrupted; outrages of all sorts are rare; and the persons and property of natives and strangers are better protected than in most large towns.

Owing to circumstances already alluded to, Berlin is but indifferently healthy, particularly in summer. The deaths in 1838 were: —

Of old age	555
Suicide	69

BERMEO, a sea-port town of Spain, on its N. coast, prov. Biscay, on a rather shallow bay, 16 m. N.E. Bilbao. Pop. 4,250. The inhab. are principally dependent on the fishery, which they carry on to a considerable extent. This town gave birth to the only distinguished epic poet whom Spain has to boast, Don Alonzo d'Erédia, the author of the *Araucana*, born here in 1528.

BERMUDAS (THE), or SOMER'S ISLANDS, a group of islands in the N. Atlantic Ocean, belonging to Great Britain, said to be above 350 in number; in about lat. 32° 30' N., and long. 64° 30' W.; 600 m. E. from S. Carolina: they are estimated to contain about 20 sq. m., or from 12,000 to 13,000 acres. White pop. in 1837, 4,033; coloured and free blacks, 4,422. When viewed from the sea, their elevation is trifling, the highest land scarce attaining to a height of 500 ft. Their general aspect is similar to the West Indian islands, except that they remind the voyager (from their proximity, and the sea flowing between them,) of the lake scenery of European climates.

St. George's Island, and St. David's, with others of minor importance, form several bays; and the harbour of St. George's is large enough to contain the whole British navy, but is difficult of ingress and egress, in consequence of the smallness of its entrance. The principal island (or main land, as it is called) is about 20 m. in length, but it rarely exceeds $\frac{1}{4}$ m. in width. In the centre of this island, and on the N. side of a beautiful bay, is the town of Hamilton, now the seat of government. The only places that are fortified are Ireland Island, and St. George's, whose forts have lately been built, which render the islands almost impregnable. At the former of these is the naval dock-yard, off which there is good anchorage and moorings laid down for 15 or 20 ships of war, though the breakwater is extensive enough to contain a large fleet of the line. There are 2 other mooring places for king's ships, viz. Murray's Anchorage, near the ferry, and Five Fathoms' Hole, off the mouth of St. George's harbour. With the exception of two or three small detachments, the chief military force is stationed at St. George's, and consists of 1 regt. of the line, and companies of artillery and engineers. The legislature is composed of 8 members of council, and 36 of the assembly, each parish returning 4 of the latter, who are elected every seven years, or whenever a new sovereign ascends the throne.

There are 10 established churches, and 7 chapels, erected since the emancipation of the slaves in 1834. Many schools have been established by the archdeacon, for the education of coloured children, as well as poor whites; and there are many who receive instruction from the young ladies of each parish, at Sunday schools, held at the parish churches, which are supplied with books by the Society for Promoting Christian Knowledge. In the most populous parts of the islands friendly societies have been formed by the labouring people, to provide for those of their sable brethren who have been prevented by illness, or who, at the time of emancipation, were too old to maintain themselves. The police has hitherto been very deficient, but lately a colonial law has passed to provide for police magistrates and constables, whose exertions have already wrought a beneficial change in the lower orders.

The principal articles exported from the Bermudas (the produce and manufacture of the islands) are—arrow-root, potatoes, onions, and palmetto and straw-hat manufactures. They possess about 100 sail of vessels, of from 100 to 150 tons burden, generally employed in conveying salt-fish and dry provisions from Halifax and Newfoundland to the West Indies for the consumption of the negroes; and carrying away rum and sugar, which they find a market for in some of the North American provinces. An inconsiderable whale-fishery, carried on in Bermuda employs about 12 whale-boats and their crews three months in the year: the number of whales seldom exceeds 20 in the season, yielding about 1,000 barrels of oil. This fishery, being carried on very near the land, is capable of considerable extension by the employment of additional capital. The reefs that surround the islands abound in fish of great variety; none is, however, cured for exportation. The islands abound in poultry of the best kind. Beef and mutton may generally be procured, but the only meat that is plentiful is veal. The ordinary fruits and roots of intertropical climates are generally to be had in Bermuda; but peaches, oranges, grapes, melons, and figs, are abundant. The mails from England are received monthly, *via* Halifax, whence they are conveyed by hired mail-boats. The winter generally commences about November, and lasts till April, during which time the islands are subject to strong N.W. gales, which often damask ships crossing this lat.; and scarcely a winter passes without eighteen or twenty vessels being driven in by stress of weather, or forced on the rocks that run out many miles to the N. and N.W. The total value of the imports in 1837 amounted to 97,811*l.*; exports, 25,271*l.*: ships inwards, 122, tons, 11,651; outwards, 126, tons, 11,001.

The revenue in 1837 was 17,273*l.*, and the expenditure 19,374*l.* The legislatures of these islands, and Antigua were the only colonial legislative bodies that abolished slavery without the intervention of apprenticeship. The proportion of the 20,000,000*l.* voted by parliament for compensation was 50,564*l.*, for 4,203 slaves, valued at 27*l.* 4*s.* 11*d.* each.

BERN (CANTON OF), the largest and the second in rank in the Swiss Confederation, in the W. part of Switzerland, between lat. 46° 19' and 47° 30' N., long. 6° 50' and 8° 28' E., having N.W. France; N. and N.E. the cant. of Basle, Solothurn, and Aargau; E. Lucerne, Unterwalden, and Uri; S. the Valais; S.W. Vaud; and W. Fribourg and Neuchâtel: length N.W. to S.E., 42 m.; greatest breadth at its S. part 62 m.: area, 2,562 sq. m. Pop. (1837) 400,000, three-fourths of whom are Protestants, the rest Catholics. Most part of this cant. is mountainous, especially the S., which is intersected by the Bernese Alps, to which belong the Finsteraarhorn, Monch, Jungfrau, Schreckhorn, &c., some of the highest summits in Switzerland: in the N. the ranges belong to the Jura, and are considerably lower. The region between these two mountain systems contains the valley of the Aar, the Emmenthal and other fertile valleys, but in no part presents any thing like an extensive plain: S. of the lakes of Thun and Brienz, begins what is called the Bernese Oberland, a mountainous region, including the four celebrated valleys of the Simmen, Lauterbrunnen, Grindelwald, and Hasli. The chief rivers are the Aar and its tributaries, Birse, and Doubs: the lakes those of Thun, Brienz, and Biemne; between the two former of these is the small but highly cultivated plain of Interlachen. The climate varies with the elevation, and is, besides, remarkably subject to sudden changes of temperature: even in the Interlachen, where it is the mildest, after a warm day, very severe frosts often occur at night. Rains and fogs are frequent; but the canton, as a whole, is generally healthy. It is divided into 28 prefectures, under 4 principal divisions; viz. the Oberland, country of Bern, Emmenthal, and the old bishopric of Basle, united to Bern by the allies in 1815. Iron ore is found in great abundance in the Jura mountains; gold dust is met with in the sands of the Aar and the Emmon, and crystals in the Grimsel rocks; and there are many mineral springs, some used as baths, and much frequented. The soil is in great part stony and barren, and the arable land occupies but a small proportion of the whole surface, and, though well cultivated, the produce of corn is insufficient for the supply of the inhab., and large quantities are imported. There are in parts plantations of fruit-trees: white mulberry, chestnut, peach, fig, &c., and a few vines are raised on the shores of Lakes Thun and Biemne, but not to any considerable extent: in the Lauterbrunnen, wheat is treated as an exotic, cultivated in small beds, and trained on sticks. Cattle of a superior breed form the chief wealth of the canton, and breeding, grazing, and dairying are the principal branches of industry. In 1830, the live stock was 158,230 head of black cattle, 107,380 do. sheep, 55,870 goats, 26,880 horses, and 55,210 swine. The pastures in the Oberland and Emmenthal are excellent, and produce the finest cattle; the latter valley has also a strong and active breed of horses, exported to France for draught and heavy-armed cavalry. The cheese made in this cant. is, next to that of Fribourg, the best in Switzerland; the average produce is estimated at 50,000 cwt. a year: a great deal is sent from the Emmenthal into Germany and Italy. The houses in the Oberland are generally of wood, but in the Jura, and round Bern, of stone: the Bernese are, for the most part, well lodged. The estate of a father is every where divided into equal shares among his children, without respect to sex or seniority, except in the Emmenthal, where, by a peculiar law, landed property descends to the youngest son. Hence, in the greater part of the canton, land is very much subdivided, and the holders in very depreciable circumstances: there are but very few estates that reach to 100 acres, unless they belong to village or town communities, but the possessions of the latter are frequently sufficiently large not only to defray the annual expenses of the community, including the relief of the poor, but sometimes to yield a surplus revenue, after all outgoings are deducted, which is divided amongst the citizens. Each commune is obliged to support its own poor, who do not become chargeable upon other communes or upon the state; they generally receive out-door relief, but if subsequently prosperous, are bound to return what they have received. Manufactures and trade are of little importance; linen and woollen cloths are made in the Emmenthal; paper, around Bern; watches, jewellery, and fire-arms are made in Bern, Porrentruy, &c.; thread and printed calico, near Biemne; silk, especially for umbrellas, and leather, in the bishopric of Basle. There is also an extensive manufactory of agricultural implements at Hofwyl. The exports consist chiefly of cattle, cheese, &c.; iron from the Jura, and a few manufactured goods: the imports are corn,

salt, colonial produce, and articles of luxury. The revenue, in 1866, amounted to 2,608,268 Swiss francs, and the expenditure to 2,183,862 do., leaving a surplus of 424,902 do.

The government is entrusted to a grand and an executive council; the former consists of 240 members, 200 of whom are chosen by the people in the primitive assemblies of the 27 prefectures, and 40 by the Grand Council itself; and is presided over by the landammann, who is the first magistrate of the cant: it meets once a month, if necessary, but determines on nothing without the co-operation of the Executive Council, which consists of 16 members, chosen from among the former. From the latter the Council of State is selected, whenever Bern has the directorial power of the Confederacy. Members of the Grand Council must be 25 years old, and have landed property to the value, at least, of 5,000 Swiss fr., excepting professors of the university, advocates, and physicians, of whom such qualification is not required.

The salary of the landammann is 4,000 Swiss fr.; that of a memb. of the Executive Council 3,000 fr. a year; memb. of the Grand Council are allowed 2 fr. a day during the time they are assembled. Every male from 16 to 50 years of age is liable to serve in the army. The contingent of troops furnished to the Confederacy is 5,158 men, and of money 104,080 Swiss fr. a year. There is a judicial tribunal in each distr., and a court of appeal in Bern; the latter consisting of 10 memb., with a president; and besides these, a *matrimonial tribunal* in every parish. Savings' banks are general, and education well attended to. In 1831 there were no fewer than 700 country schools, in which 65,000 children were instructed; and since then education has made a considerable progress. In 1834, a university, a gymnasium or preparatory school for the university, and a normal school for the instruction of schoolmasters, were established. The university has faculties of theology, jurisprudence, medicine, and philosophy, each having 3 ordinary, and from 2 to 6 extraordinary professors; the salary of the former is from 2,400 to 3,000 Swiss francs, and of the latter from 1,800 to 1,400 do. There is also a veterinary school, and some distinguished private educational establishments, especially that of M. Von Fellenberg, at Hofwyl. Dr. Bowring reports (1836) that when he visited the prison in Bern, which contained 320 convicts, 315 could read; and those unable to write, most of whom were strangers, did not amount to 50. Except about 50,000 individuals of French extraction, in the ancient bishopric of Basle, the inhab. are of German stock; and German is the prevalent language. The German part of the pop. are generally much superior in their physical appearance to the French portion, especially those in the Oberland. The Bernese are brave, hospitable, public-spirited, and really good-tempered, notwithstanding they are subject to violent fits of passion, which sometimes occasion the effusion of blood. Catholics are less industrious than the Protestants. This cant. entered the Swiss Confederation in 1533: at first its territory was very limited, but afterwards, by conquest and purchase, it acquired nearly the whole of the now existing cant. of Vaud and Aargau, which, in addition to its present extent, it held till 1798, when it was taken by the French. In 1815, in the annual session of Vienna, the Congress of Vienna added to its dom. the town of Blenné with its territory, and the greater part of the ancient bishopric of Basle, otherwise entitled the bailiages of the Jura. (See *Helvetic Almanac, Lutz's Switzerland; Dr. Bowring's Report, &c.*)

BERN, a town of Switzerland, cap. of the above cant., and, alternately with Zurich and Lucerne, of the Swiss Confederation, on the Aar, 52 m. S. of Basle, and 60 m. S. W. Zurich; lat. 46° 37' 16" N., long. 7° 25' E. Pop. 30,560. It stands 1,708 feet above the level of the sea, on a hill, and is seated on the W. is surrounded on all sides by the Aar. A stone bridge, 260 feet long, is erected over the river, and three gates lead to the interior of the town. The fortifications, by which it was formerly surrounded, were demolished in 1835. It is the finest town in Switzerland, and one of the finest of its size in Europe. Three principal streets extend in a parallel line from E. to W., and are intersected by a number of lateral streets. The houses are massive structures of freestone. Piazzas run along the houses on both sides the principal streets, which are also adorned with handsome fountains. Principal public edifices:—The cathedral, a fine Gothic structure, founded in 1421, and finished in 1502, 160 feet long, and 80 feet broad; the steeple, though unfinished, is 190 feet high. It has some fine glass paintings, and various trophies and monuments. The church of the Holy Ghost, founded in 1723, is also a fine structure, as well as the Mint, built in 1790; the general *burgerspital* (hospital of the citizens), built from 1730 to 1740; another magnificent hospital, called the *Insel* (island), founded in 1718, occupying one whole street, and affording a splendid prospect from the Aar; the state-house of the avoyer, previously to 1831 the residence of, and now partly occupied by,

the French embassy; the house of correction, the largest building of the kind in Switzerland, and one of the best contrived in Europe, finished in 1833, at an expense of 1,300,000 Swiss fr.; the corn magazine, a large and massive edifice, having on the floor an extensive open hall, with 43 pillars, in which the corn-market is held twice a week; the *Hôtel de Musique*, in which a theatre is established for the winter season, is also worth notice.

Bern has also an arsenal and a large town-hall, both old edifices. The charitable institutions are—two large hospitals; two orphan houses, one for boys and another for girls; a fund for the support of poor students; a lunatic asylum, situated about 2 m. from Bern; and an asylum for old poor persons. The university, gymnasium, &c., noticed in the preceding article, are situated in the town. There are also a Swiss economical and a Swiss historical society; with societies of natural history, medicine, and arts; a botanic garden; a public library, with valuable MSS. relating to Swiss history, and a collection of Roman, Greek, Gothic, and Swiss medals, Roman antiquities, and portraits of the Bernese avoyers, &c. There is also a museum of natural history, with bas-reliefs of the Bernese Oberland, of the cantons of Vaud and Valais, and of St. Gothard; and many private scientific collections well worth notice. The trade of the town is of little importance. Three newspapers are published. Two fairs are annually held; one after Easter, and another in November. Some woollen cloth, and stockings are manufactured, and there are tanneries, breweries, &c. About 2 m. from Bern there is a gunpowder mill, the powder made in it being formerly reckoned the best in Europe. The corporate property of the citizens is large, amounting, it is said, to 30 millions of Swiss fr.; and the revenue, besides defraying the municipal expenditure, supplies every citizen, gratis, with fuel, and leaves, over and above all this, a surplus sum, which is annually distributed among the citizens.

House-keeping in Bern is less cheap than in Zurich, but not so dear as in Geneva. The price of a pound of meat is 3½d. sturl.; bread 1½d. to 1½d. wh. 4d. to 8d. a bottle; cheese 4d. to 8d. per lb. The inhab. are serious and reserved, and proud of the ancient glory of their city. The aristocracy live secluded from the other classes. Bern is the birth-place of Haller; it has not, however, to boast of so many distinguished men as Zurich, Basle, and Geneva. The town has bears for its arms; and some of these animals are maintained in a place called *Bärengraben* (bear's ditch), on funds appropriated to that special purpose.

Bern was founded in 1191, by the Duke Berthold V. of Zähringen. Its history is the same as that of the canton. The environs are beautiful, affording the most splendid views of the Alps on one hand, and the Jura on the other. There are many fine public walks; amongst which are the *Plattform*, a terrace near the cathedral, 180 feet above the Aar; and the *Engi*, a magnificent walk, affording a fine prospect over the river, the city, and the lower mountains, to the high-Alps. Hofwyl (which see) is about 4 m. from Bern. There are also several mineral baths in the vicinity, such as Blumenstein and Gurnigel.

Mr. Inglis speaks very favourably of the advantages of Bern as a place of residence. "It is," says he, "greatly superior to Basle, Lucerne, or Geneva. It is a pleasant thing to walk in wide airy streets, and at the same time to have the advantage of shade, if required. Where there are arcades one may always choose to be in the centre and quiet—bustle under the arcades—quiet in the bustle of the streets; and in the *agréments* of a city, Bern has decidedly the advantage of its rivals. It possesses all those public establishments which make a place agreeable as a residence. It has excellent libraries, excellent academies, delightful promenades, convenient and well ordered baths; a theatre; concert-houses; and during winter; clever lecturers upon most of the sciences; eloquent and pious clergymen of almost every denomination; and to this list may be added abundance of shops, where all that contributes either to comfort or luxury may be found." (See *Description of Bern*, by Wagner; *History of Bern*, by Stapfer, late Minister of the Helvetic Republic; *Inglis's Switzerland*.)

BERNARD (GREAT ST.), the name given to a famous pass of the Pennine Alps, leading over the mountains from Martigny to Aosta. In its highest part it attains to an elevation of above 8,000 ft., being almost impassable in winter, and very dangerous in spring, from the avalanches. Very near the summit of the pass, and on the edge of a small lake; is the famous hospice founded in 962, by St. Bernard, and occupied by brethren of the order of St. Augustine, whose especial duty it is to assist and relieve travellers crossing the mountain. In searching for travellers who have lost their way, or been buried in the snow, they avail themselves of the assistance of a peculiar breed of dogs of extraordinary size and sagacity. The brethren have faithfully discharged the arduous duties imposed on them, and have rescued hundreds of travellers from a premature death. The

BERNAU.

hospice is a massive stone building; it possesses some, but not much, independent property, and is principally dependent on collections made in the Swiss cantons and other states, and on donations from the richer class of travellers. In 1800, when the road was not nearly so good as it has since been made, Napoleon led an army of 30,000 men, with its artillery and cavalry, into Italy by this pass. The hospice contains a monument, erected by order of Napoleon. (In honour of Dessaix, who fell at the battle of Marengo. *See* *Broceton's Passes of the Alps; Murray's Handbook*, &c.)

BERNAU, a town of the Prussian States, prov. Brandenburg, on the Pnko, 15 m. N.E. Berlin. Pop. 3,000. It is in part fortified, and has fabrics of silk, velvet, calicoes, linen, &c., with numerous and celebrated breweries. In the church and town-house are tents, bows, arrows, &c., taken from the Hussites.

BERNAY, a town of France, dép. Eure, cap. arrond., on the Charente-inf., 26 m. W.N.W. Évreux. Pop. (town & cant.) 5,062. This is a thriving town, and has latterly been a good deal improved. It has a court of primary jurisdiction, a commercial tribunal, a communal college, and a theatre; with manufactures of woollen goods, linens, cotton yarn, paper, wax, &c., and bleach-fields and tanneries. The arrond. of Bernay was estimated by M. Dupin, in 1827, to have 8,714 manufacturing work-people, the yearly value of whose produce amounted to 5,551,152 fr.; and if this estimate was nearly accurate when framed, both these sums must now be considerably greater. The greatest of the French fairs for horses is held here on the Wednesday of the fifth week of Lent. It is said to be attended by from 40,000 to 50,000 jockeys, amateurs, and other individuals, some of them from great distances. There is an immense show of Normandy horses. (*Itug*, art. *Eure*.)

BERNBURG, a town of Germany, cap. duchy Anhalt Bernburg, on the Saale, by which it is intersected, 23 m. S. Magdeburg. Pop. 6,000. It consists of three parts; two on the left, and the other on a hill on the right, bank of the river, which is here crossed by a bridge. The first two parts are surrounded by walls; the other, on the Mount town, has a castle on its summit, and is open. Bernburg is well built, well paved, and clean. It is the seat of the ducal government, and has several literary and charitable institutions, with some manufactures and trade.

BERNE, a town of France, dép. Bouches du Rhone, cap. cant., on the E. side of the lacune of the same name, 16 m. N.W. Marseilles. Pop. 1,928. It is agreeably situated, and is regularly built, but the vicinity of the lacune makes it unhealthy. It was formerly fortified, and its ramparts still exist.

BERNESTADT, a town of the Prussian States, prov. Lower Rhine, on the Moselle, 21 m. N.E. Treves. Pop. 2,000.

BERNESTADT, a town of the Prussian States, prov. Silesia, reg. Breslau, on the Wida, 21 m. E. Breslau. Pop. 3,300. It has an old castle, two churches, an hospital, and manufactures of cloth and linen.

BERTHOUD, or **BURGDOLF**, a town of Switzerland, cant. Berne, on a hill on the bank of the Emmen, 13 m. N.E. Berne. Pop. 2,000. There is a public library and a castle, in which Pestalozzi laid the foundations of his establishment. A newspaper called the *Volkfreund* ('Friend of the People') is published here. The commercial business of the place is rather important, it being the dépôt for the Emmenthal cheese.

BERTINORO, a town of the Papal States, prov. Romagna, on a mountain having the Ronco at its foot, 7 m. S.E. Forlì; lat. 44° 10' N., long. 12° 9' 15" E. Pop. 4,000. It is the seat of a bishopric; has a cathedral, and four parish churches. The wines produced in its environs have a considerable reputation.

BEHVIE, or **N.E. BEHVIE**, a royal bor. and sea-port of Scotland, co. Kincardine, on the coast-road from Dundee to Aberdeen, on the S. bank of the small river Bervie, where it joins the sea. Pop. (including Gourdon), 905. It was created a royal burgh in 1362 by David II., who, after having narrowly escaped shipwreck on the coast, and having been kindly treated by the inhabitants of this small fishing village, testified his gratitude by conferring on it the honour in question. The inhabitants have from the earliest period been employed chiefly as fishers. They engage not only in the salmon and whale fishings in the mouth of the river and on the coast, but in the herring fishery on the N. shores of Scotland. Manufactures, also, have been introduced into the burgh; namely, the duck and dowlin linen weaving, which affords employment to 112 persons. This employment is furnished by manufacturers of Montrose, Arbroath, and Aberdeen. In addition to periodical markets, there is a grain-market, which is well attended. The quantity of grain annually purchased here is about 40,000 qrs., of which nearly the whole is shipped at

BERWICK-UPON-TWEED.

367

Gourdon, a port about 1 m. S. of the town, where have lately been erected large and excellent granaries. The harbour at the mouth of the Bervie is very inferior to that at Gourdon, and admits only small vessels and boats. The staple business of this latter place, however, is fishing. Bervie joins with Montrose, Arbroath, Forfar, and Brechin, in sending a mem. to the H. of C. Registered electors in 1838, 40.

BERWICK, a marit. co. of Scotland, having N. and N.E. East Lothian and the German Ocean, and on the S.E. S., and W. part of England and the co. of Roxburgh and Mid-Lothian. Area, 282,880 acres, of which about 120,000 are arable. The N. parts of the co. are occupied by the cold, bleak, unproductive range of the Lammermoor hills; but the Merse, or level portion, lying between the Lammermoor hills and the Tweed, by which the co. is separated from England, comprising about 100,000 acres, is one of the most fertile and best cultivated districts in the empire. The farms in the Merse are large, the farmers opulent and intelligent, and the land cultivated according to the most approved principles of the modern husbandry. Wheat and turnips are here the great objects of attention; but barley and oats are also raised in considerable quantities. Steam power is employed in several thrashing-mills in this co. Few small, but no very large estates. Average rent of land in 1810 (from which, probably, it does not differ materially in 1839), 16s. 5d. an acre. The Lammermoor hills are principally depastured by sheep of the Cheviot breed. The co. is rather scantily supplied with wood, but some proprietors have made considerable plantations. Manufactures and minerals of no importance. Principal rivers, Tweed, Whiteadder, Blackadder, and Leader. Bervieshire contains 33 par.; and had in 1831, 6,159 inhab. houses, 7,385 families, and 34,048 inhab. The co. returns 1 mem. to the H. of C. Registered electors, 1838-39, 1,167; and the bor. of Lauder joins with Haddington and other bors. in returning a mem. Dunse is the co. town. Valued rent, 178,366*l.*, Scotch. Ann. val. of real prop. in 1815, 245,379*l.*

BERWICK-UPON-TWEED, a fortified town and sea-port of England, N.E. extremity of the kingdom, on the N. bank of the Tweed, and on the S. coast, 300 m. N. by W. London; lat. 55° 46' 21" N., lon. 1° 55' 41" W. Pop., in 1821, 8,723; in 1831, 8,920: houses at the latter date, 1,268. It is built on the declivity and flat summit of an elevation rising abruptly from the estuary of the river; many of its streets are narrow and irregular, but the principal one is spacious, well paved, and lighted with gas; and, on the whole, the town has a respectable appearance, and contains many well-built houses. It is connected with its suburbs, Tweedmouth and Spittal, on the S. side of the river, by a stone bridge of 15 arches, built in the reign of Charles I.; these are usually but not always inhabited, being almost wholly employed in the fisheries, or the businesses connected with them. Spittal, however, is occasionally resorted to by visitors for sea-bathing, and there are a few respectable lodging-houses for their accommodation. The pop. of these suburbs, in 1831, amounted to 4,000; and as they are now included in the parl. bor., the pop. of the latter, at the above-mentioned date, was 12,920; and it is believed to have undergone very little change in the interim. The present fortifications of Berwick were erected in the reign of Elizabeth, and are about 1½ m. in circ., forming an irregular pentagon; a battery of 22 guns commands the English side, and a 4 and 6 gun battery defends the entrance of the harbour. The ramparts form an agreeable promenade. The Tweed is navigable as far as the bridge, beyond which the tide flows about 7 m. The harbour is defended by a pier 4 m. in length, with a light-house at the head, projecting in a S.E. direction from the N. extremity of the river's mouth. But notwithstanding the protection afforded by this barrier, the water here is 18 ft. water over the bar at ordinary tides, and 26 at springs, the harbour is very indifferent: the channel is very narrow: a large portion of the harbour, particularly on the Berwick side, dries at low water, and is rocky and incapable of being deepened; and after heavy rains the *freshes* run out with great violence. The chief public structures are, the church (in the decorated Gothic style), built in the time of the Commonwealth, and, consequently, without a tower; 7 dissenting chapels; a free grammar-school; and 6 other free schools, supported by the corporation, and educating in all about 300 children. The town-hall, in the centre of the high street, with a spire and ring of bells; the under part of which (called the Exchange) is used as a market-place; over it are halls for the courts of justice and corporation meetings; and above these is the gaol: a pauper lunatic asylum; a dispensary, through which medical relief is afforded to the poor resident within 12 m.; a theatre; a public library; and assembly rooms. There are annual races in July, the course being at Lamberton, 8 m. distant. There is a good supply of water, brought from a spring 14 m. off, to several public conduits, conveyed by pipes to the more respectable

* Hugo says nothing of the theatre, nor is it mentioned by some other authorities, but it is specified in the *Dict. Géographique*.

houses. At the N.W. end of the town are infantry barracks. There is an iron foundry near the bridge, on the Tweedmouth side, which employs from 60 to 70 hands, and at which steam-engines, mill machinery, &c., are made. This is the only manufactory of any kind in the place or neighbourhood, although there are several coal mines within 2 or 3 m. of the town, on that side the river, and also available water-power. The fisheries form the principal business of the place. Those of salmon in the Tweed have long been amongst the most celebrated and productive of any in the empire. Latterly, indeed, both their produce and rental, though still very considerable, have greatly declined. The principal fisheries are within a short distance of Berwick; and the fish, excepting a small portion retained for home consumption, is all packed in ice, and shipped for the metropolis. (See *Tweed*.) Trout, whiting, &c. also abound in the Tweed.

The sea fishery of the bay consists chiefly of cod, ling, haddock, and whiting; crabs and lobsters also abound, and these last are forwarded to the London market. The imports consist chiefly of timber, staves, iron, hemp, and tallow, from Norway and the Baltic, and of groceries, &c., coastwise; the exports, of salmon, corn, wool, and other agricultural products, coals to London and a few other ports, coastwise. Ale, from the Ednam brewery, and whisky, from the distilleries of Gungahgreen and Kelsae, have also, of late years, formed part of its exports to the metropolis. There used also to be a large export of eggs, but it has been nearly annihilated in consequence of their being obtained cheaper from the Continent. One vessel belonging to the port is engaged in the Greenland fishery. The customs duties, in 1836, were 7,189*l.* 1*l.* 5*d.* There belonged to the port, in the same year, 59 vessels of 4,926 ton burden. By a treaty between Edward VI. and Mary II., of Scotland, it was made a free town, independent of both kingdoms; but, by the recent Municipal Reform Act, it is constituted an English co. for all purposes except parliamentary elections. Its present municipal limits comprise that portion of the par. on which the town stands and the suburbs of Tweedmouth and Spittal, excluding all the agricultural portions. It is divided into 3 wards, and has 18 councillors.

The revenue of the corporation is derived from town and harbour dues; rental of the fisheries, tenements, and fisheries in Berwick lands (including collieries) on the W. side of the river, and a tract called Meadows and Sints; the whole averaging 10,000*l.* a year. Their debt, in 1835, amounted to 55,411*l.* The tract last named lies near the town, and was granted to the corporation by James I. It is divided in 3 portions: the first is let in farms, and the rent appropriated to defray the general expenses of the corporation; the second is sub-divided in parcels of 1½ to 2½ acres, whose value varies from 1*l.* 14*s.* to 9*l.*; there are 984 of these, called meadows; and the third is parted in farms of about 40 acres each, the rents of which are each divided in 11 or 22 equal parts, called stints and stints, there are 361. These meadows and stints are allotted to the burgesses for life, with remainder to their widows; and, as vacancies occur, are allotted to others at annual public meetings held for the purpose, and called "meadow and stint guilds." The first English charter of Berwick was in 30th Edw. I., by which it was made a free borough, with a market and fair: others, in 30th Edw. III. and 22d Edw. IV., confirm the laws and privileges originally enjoyed under Alexander I. of Scotland. The governing charter, previously to the Municipal Reform Act, was granted in 8d James I. The assessment of the town for lighting, paving, &c., averages about 450*l.* a year. The annual value of real property in Berwick, in 1835, was 29,666*l.*; in Tweedmouth township, 12,086*l.* 13*s.* 4*d.* Under the Poor Law Amendment Act, Berwick is the central town of a union of 20 parishes and chapelry: its own rates average 3,638*l.*, and it has 9 guardians. The town has returned 9 mem. to the H. of C. since the reign of Mary. Previously to the Reform Act, the privilege was restricted within the limits of the ancient bor., and to the free burgesses. Rateable tenements, in 1831, 458; registered electors in 1838, 735.

The first authentic notice of Berwick occurs in the early part of the 12th century, when it belonged to Scotland, and was the chief town of Lothian. During the reigns of Alex. I., David I., and Malcolm IV., it had a castle and several churches and religious establishments. It was at that period the chief sea-port of Scotland, and one of the four royal burghs. Its castle was surrendered to England in 1174, under a treaty for the ransom of Wm. the Lion; subsequently to which it was repeatedly taken and re-taken, being, from its frontier situation, almost invariably the first object of attack at every renewal of hostilities, till, on the accession of James VI. of Scotland to the English throne, its importance in this respect ceased. During the last civil war it was garrisoned by the parliamentary forces. (*Redpath's Border Hist.*; *Baines's Hist. North Durham*; *Parliamentary Reports and Papers*.)

BESSARABIA.

BERWICK (NORTH), a royal burgh, par., and seat-port of Scotland, co. Haddington, at the E. entrance to the Frith of Forth, 22 m. E. Edinburgh. It was created a burgh by James VI. Pop. of burgh and par. in 1831, 1,824. The burgh consists of two main streets, one running E. and W., the other leading N. to the harbour. It is a place of little or no trade, and has no manufactures. Its pier is good; but its harbour, which is dry at low water, is difficult of access. From its being in the neighbourhood of one of the best corn-growing districts of Scotland, grain is a considerable article of export. It is a good deal frequented in summer as a bathing-place. It joins with Haddington, Dunbar, Lauder, and Jedburgh, in sending a mem. to the H. of C. Registered electors, 1838-39, 30. About 2 m. to the E. of the burgh stands the famous castle of Tantallon, one of the strongholds of the Douglas family; and nearly opposite Tantallon is the Bass, which see.

BESANCON, a town of France, cap. dép. Doubs, on the river of that name, by which it is intersected, 47 m. E. Dijon. Lat. 47° 13' 45" N., long. 6° 2' 45" E. Pop. (town & cant.) 34,780. It is very strongly fortified, and is one of the bulwarks of France on the side of Switzerland. The works were improved by Vauban; but they have been since much extended and strengthened. Exclusive of the fortifications round the city, it has an extremely strong citadel, on an almost inaccessible rock, and outworks on some of the adjoining heights. The town is generally well built; but its streets are narrow and gloomy, "*et ses constructions ont une stérilité, une uniformité de style, qui lui donne une grande monotonie.*" The part, called the city, is almost surrounded by the Doubs; the communication with the suburb on the opposite bank, called Arches, being kept up by an old, narrow, inconvenient bridge. Principal buildings, the cathedral, hotel of the prefect, hall of the courts of justice, the royal college, erected in 1697, the arsenal, hôtel de ville, barracks, theatre, public library, containing 60,000 volumes, exclusive of manuscripts, and several fine public fountains. The hospital of St. Jacques is a vast establishment, with 500 beds, and is said to be extremely well managed. A Roman triumphal arch, though a good deal mutilated, still exists, and serves as a sort of portico to the cathedral. Besancon is the seat of an archbishopric, of a royal court for the depts. of Doubs, Jura, and Haute Saône, with tribunals of primary jurisdiction and commerce. The university, which existed previously to the revolution, has been replaced by an *académie universitaire*, or *faculté des lettres*; and it has also a royal college of the second class, with about 280 pupils; a diocesan seminary, a secondary medical school, a primary model school, two schools for the instruction of deaf and dumb, a royal academy of science and belles-lettres, a lyceum, a society of agriculture and arts, a museum of antiquities, and a free school of design and sculpture for 120 pupils. There is, adjoining to the town, a house of correction and refuge. Watch-making introduced from Switzerland about 45 years ago, is the most important branch of industry carried on here. It employs about 2,000 hands, who annually furnish above 60,000 watches. About 200 work-people are employed in the carpet manufacture, and there are besides fabrics of jewellery, hosiery, hats, hardware, including coach and carriage springs, gloves, &c. Its breweries and tanneries are both on an extensive scale. Among other articles, it annually furnishes about 600,000 bottles of Seltzer water: it is also the seat of a considerable and growing commerce.

Besancon is very ancient. It was laid waste by Attila; and has since undergone many vicissitudes. It came, along with Franche Comté, into the possession of France in 1674. (*Hugo, art. Doubs*; *Diction. du Commerce*; *Dict. Géog.*)

BESSARABIA, or EASTERN MOLDAVIA, the most south-westerly prov. of Russia in Europe, having E. the Dniester, S. the Black Sea and the Danube, W. the Pruth, and N. Gallicia. The estimates of its area differ exceedingly, Hassel giving it 891, and later authorities only 453 Germ. sq. m. It may be said to be all to some extent fertile. It is bounded by the Danube, which it is nearly surrounded, it is intersected by several considerable streams, most of which, however, are either wholly dried up, or greatly diminished during the heats of summer. The N.W. portion, contiguous to Gallicia, is hilly, or rather mountainous, and is occupied by extensive forests, but elsewhere the surface is nearly flat; soil abundantly fertile, and, with the exception of the tract along the Danube, which is marshy and encumbered with lakes, it is suitable for most agricultural purposes. "No trees, a few shrubs only, are observed near the rivers; the lakes, or stagnant waters, are covered with reeds, and in the plains between the marshes, the ox, buffalo, and bison, wander among pastures where the herbage rises to the height of their horns. In the cultivated land millet yields 100, and

barley 60 fold. The horse and the sheep exist in a wild state." (*Maize-Bread*, v. 379, Eng. trans.). But there can be no question that these returns are very greatly exaggerated. Wheat, barley, and millet, are the only species of corn that are raised; and, according to Hassel, they yield from 8 to 20 for 1; and even this, we have little doubt, is decidedly beyond the mark. According to the official accounts, 139,141 chetwerts, sown in 1829, produced a return of 651,320 chetwerts, that is, of about 5 to 1; and in 1830 the return was not so great. Hemp, flax, and tobacco, are produced in considerable quantities. The breeding of cattle is the principal business of the inhabitants; and they are largely exported with hides, tallow, &c. With the exception of tanneries, distilleries, and tallow and soap-works, there are either no manufacturing establishments in the country, or none worth notice. Large quantities of salt are produced from the lakes contiguous to Akerman (which see). A good deal of inferior wine is made. Education is at the very lowest ebb; there being in 1830 only 838 pupils at all the seminaries in the prov. (*Schnitzler, La Russie, &c.; Russian Official Returns.*)

BESSE, a town of France, dép. Puy de Dôme, cap. cant., 20 m. S.W. Clermont. Pop. 2,027. It is built of basalt, in the middle of a volcanic country; and the environs offer several natural curiosities. It has some trade in cattle and cheese.

BESSINES, a town of France, dép. Haute Vienne, cap. cant., on the Gartempe, 10 m. E. Bellac. Pop. 2,713.

BETHLEHEM, (*Hei-el-Lehm, House of Bread*), a famous town of Palestine, 6 m. S. Jerusalem: lat. 31° 44' N., long. 35° 15' E. Pop. from 3,000 to 4,000, of whom by far the greater part are Catholic, Greek, and Armenian Christians. A splendid church, erected by the empress Helena, stands over a grotto or cave, said to be the birth-place of Christ. Connected with the church are convents for the three sects of Christians noticed above, of which that belonging to the Latins is a fine building; but more resembling, externally, a fortress than a religious establishment. Some remains of an old aqueduct, formerly 16 or 18 m. in length, exist on the W. side of the town; but the chief buildings consist of almost innumerable chapels, and other memorials of holy persons, and of the events for which the place and neighbourhood are celebrated in sacred history. The houses of the inhab. are mean in the extreme.

The country round Bethlehem is extremely fruitful, yielding figs, grapes, olives, and sesamum in great abundance; but here, as in other parts of this neglected land, cultivation is wanting. There is no deficiency of water; three extensive reservoirs, called the pools of Solomon (*Eccles. ii. 6.*), and a copious fountain, said to be the "scaled fountain" of the same prince (*Sol. Song. iv. 12.*), lie on the S., on the N. W. is a large cistern of rain water, said to be the "well by the gate," whence David's military men drew water, while the place was in the hands of the Philistines (*2 Sam. xxiii. 16.*); and the whole neighbourhood abounds in springs and rills.

The tract between Bethlehem and Jerusalem is the valley of Ephraim (*Grand's Valley*, Josh. xv. 8.), the scene of many combats between the Jews and Philistines (*2 Sam. v. 18. et. al.*). Here are shown many pretended relics of the scriptural age; as the house of Simeon, the tomb of Rachel, the village of Rama, the cave of En-gaddi, the well in which was seen the star of the Messiah, and many others. The original name of Bethlehem was Ephrath (*Gen. xxxv. 19.*); a term which, like its present designation, referred to the fertility of its soil. It was never very considerable in respect of size (*Micah, v. 2.*), but seems to have been always regarded as important; and being the scene of the pastoral tale of Ruth, and the birth-place of David and Jesus Christ, it has acquired a celebrity hardly surpassed even by that of Jerusalem. It was fortified by Rehoboam (*2 Chron. xi. 6.*), and, in a subsequent age, the emperor Hadrrian is said to have built a temple here to Adonis. Of this, however, no vestige remains. The present inhab. enjoy a considerable share of liberty: they are bold and hardy, and successfully resist every attempt at oppression by their governors. They are consequently stigmatised, by the Turks, as of a rebellious spirit. There was formerly another Bethlehem, more to the N., belonging to the tribe of Zabulon, Josh. xvi. 15. (*Masandrell, 116-123.; Volney, ii. 270, 271.; Robinson, i. 189-186.; Arab. Fada, Tab. Syr. 186.*)

BETPUNE, a town of France, dép. Puy de Calais, cap. arrond., on a rock, at the foot of which is the Brethe, 18 m. N.N.W. Arras. Pop. (town & cant.) 4,495. It is well fortified, by works partly constructed by Vauban. Its plan is that of an irregular triangle; the citadel, which is isolated, occupying one of the angles. It has a tribunal of primary jurisdiction, a communal college, two hospitals, manufactures of linen and cloth, breweries, and a considerable trade in linen, cheese, and rape oil, the canal of the Lave, which unites with the Lys, facilitating its trade. It was taken by the allies in 1710; but was restored to France by the treaty of Utrecht. (*Hugo, art. Puy de Calais.*)

BETLIS, or BILIS, a town of Turkish Armenia, 18 m. W. from the W. extremity of Lake Van, and about 130 m. E. by N. Diarbekr; in probably about lat. 36° 35' N., long. 42° 50' E.* It stands in a wide ravine, open to the E., but closed by high mountains to the W.; the houses being dispersed over the steep banks of a stream which runs through it, and on several of the neighbouring hills; it is, therefore, most irregular. The houses are built of red stone, and are generally of two stories, with grated windows to the streets, the latter being paved with round stones. The houses being much scattered and intermingled with gardens, the town covers a large extent of ground: it is not enclosed by a wall, and this is hardly necessary; each house being, in fact, a pretty strong fortress. It is said to contain 1,500 houses, of which 500 belong to Armenians; and if so, its pop. may amount to about 9,000. It contains 4 caravanseras, 3 large and 12 small mosques, 3 baths, 8 Armenian churches, and 1 Nestorian. The most remarkable object in the town is the old castle, in its centre, on a rock 30 ft. in height, and built up with thick walls to an elevation of 100 ft. There are a considerable number of butchers, bakers, gunsmiths, and silversmiths; but the principal manufacture consists of coarse cotton cloth, and tobacco. The territory produces fruits and vegetables in perfection. The army of the Turkish sultan, Solymán the Magnificent, sustained a signal defeat by the Persians, near Betlis, in 1554. (These particulars have been derived from Colonel Shiel's paper in the *Journal of the Geographical Society*, viii. 72.; see also *Kinnaird's Persia*, p. 330., &c.)

BEUTHEN, a town of the Prussian States, prov. Silesia, reg. Oppeln, cap. circ. 35 m. N.E. Ratibor. Pop. 3,300. It has 3 Catholic churches, 3 convents, with fabrics of coarse cloth, pottery, zinc, and calamine, and breweries. There is another town of the same name in Silesia, reg. Liegnitz, on the Oder, 12 m. W. by N. Glogau. Pop. 2,600. It has fabrics of cloth, earthenware, and straw hats, and some boat building. Its environs are very fertile.

BEVEREN, a town of Belgium, prov. E. Flanders, 6 m. W. Antwerp. Pop. 6,650, com. in ludd. It stands on the road from Antwerp to Ghent, is well built, and has a fine church, with a lofty spire. About 2,000 women are employed in the lace manufacture, and there are several breweries, tanneries, &c.

BEVERLEY, a par. bor. and market town of England, E. riding co. York, of which it is the cap., near the Humber river, to which it is united by a canal, 157 m. N. London, 28 m. E. S. E. York, and 9 m. N. W. Hull. Pop. of par. bor., that is, of the old bor. and liberties, 1821, 7,503; 1831, 8,302. It is believed to owe its origin to an ancient monastery, which, after having been sacked by the Danes in 867, was restored by Athelstan, who granted the place several privileges, and made the monastery a sanctuary for criminals. It is a well built, handsome town; in fact, "very few towns in England can compare with Beverley in cleanliness and general neatness of appearance. It deserves to be represented as most respectable and substantial." (*Zensory Report*.) The great glory of Beverley is the minster, or collegiate church of St. John, which, in size and beauty of architecture, is far superior to many cathedrals. This splendid structure, which has been erected at different periods, what are called the decorated and perpendicular English styles, is 334 ft. from E. to W., the length of the great cross aisle is 167 ft., and the two towers at the W. end are each 200 ft. in height. The W. front is said by Mr. Rickman to be the finest of its kind in England. Near the altar is the seat of refuge, with an inscription assuring criminals of their safety while there, and a tablet with effigies of St. John of Beverley and Athelstan. The parishes of St. John and St. Martin have the minister, as a church common to both. It is kept in excellent repair by the rent of estates appropriated to that purpose by Queen Elizabeth and Sir Michael Warton. St. Mary's church is also a magnificent structure in the old Norman style; and lands producing above 800*l.* a year have been left for its support. The churches of St. Martin and St. Nicholas are in ruins. The Primitive and Wesleyan Methodists, Independents, Baptists, and Society of Friends, have chapels here. The sessions-house, and house of correction for the E. riding, are situated in the immediate vicinity of the town. The latter, which is a very large establishment, and constructed on the most approved principles, cost above 40,000*l.* Here also is the Register-office for the E. riding. The endowed schools are, a grammar-school, of great antiquity, to which is attached 2 fellowships, 6 scholarships, and 3 exhibitions to St. John's, Cambridge; a Blue-coat School, founded in 1709; Graves's School, founded in 1804; and schools on the systems of Lancaster and Bell. There are also several almshouses, an hospital, dispensary, mechanics' institute, public reading-rooms, a savings' bank, a theatre, open occasionally, and assembly-rooms. Races are held

*There is a great discrepancy in the statements as to the latitude and longitude.

near the town every June. The corporation of "the town and liberties of Beverley," consisting of a mayor, recorder, 12 aldermen, 13 capital burgesses, and freemen, who hold by birth, apprenticeship, purchase, or gift, enjoys several valuable privileges; the principal are, exemption from tolls throughout England, from sitting on juries without the borough, and from the jurisdiction of the sheriffs of York; the burgesses have also the right of pasture for 18 head of cattle each, on a common of about 1,200 acres. The corporation holds a criminal court, with power of life and death, which however is never exercised; a court of session, called the Provost's Court, for all pleas to any amount, except those for landed property; and a court of requests for debts under 5*l*. The public business is transacted in the Hallgarth or Guildhall, where the quarter sessions for the riding are held. The elective franchise, granted by Edw. I. was not exercised till the beginning of Eliz., since which time the borough has continued to return 2 members to the H. of C., the right of election, previously to the Reform Act, being vested in the freemen, whether resident or not. The electoral boundaries comprise the parishes of St. Mary, St. Martin, and St. Nicholas, and the part of St. John's within the liberties. Constituency, in 1837-38, 1,062. The election for the members of the E. riding is held here. The town is situated in a fertile country, and has an extensive retail trade; tanning is also extensively carried on. Near the town is a large factory for paints, cement, and Paris white, which last is made from the cliff-stone raised at Queen's Gate, and found to be peculiarly adapted to the purpose: there are also factories for patent wrought-iron wheels, and for fancy ironwork and agricultural implements of all descriptions. A brisk corn trade is carried on. Markets for general purposes on Saturdays, and for cattle on alternate Wednesdays, held in an enclosed area of four acres, ornamented by a stately cross resting on eight columns. There are here eight great cattle fairs, at which private banking-houses, a branch of the Hull Banking Co. and a savings' bank, have been opened here. Fisher, bishop of Rochester, who suffered martyrdom under Henry VIII., was a native of the town. (*Allen's Hist. of Yorks.; England's Yorks.; Secular Papers.*)

BEWDLEY, an ancient market town, bor., and chapelry of England, co. Worcester, 14 m. N.N.W. Worcester, 19 m. S.W. Birmingham, 108 m. N.W. London. Pop. 1831, 2,908. It is locally in the hund. of Dodingtree, but has separate jurisdiction. It is built on the descent of a hill, on the W. bank of the Severn, over which there is a fine stone bridge. The more ancient part of the town was built at some distance from the river. It had formerly 4 gates, 2 of which were standing in 1811, but they have been since pulled down: the principal street is well built and paved. The town-hall is a fine modern building, erected on 3 arches, with handsome iron gates leading to the market-place. The church is a neat stone edifice, with a tower. A charter was granted by Edward IV., but the governing charter was given by James I., and confirmed by Anne. The corporation hold a court of session annually, and a court of record for all pleas, and for the recovery of debts not exceeding 100*l*. The lord of the manor holds an annual court, at which constables and other officers are appointed. At the reign of Henry VI., Bewdley enjoyed many privileges; among them that of being a sanctuary for persons who had shed blood. This town has sent 1 member to the H. of C. since 3 James I., who, previously to the Reform Act, was returned by the corporation, a self-elected body. The new boundary act defines the limits of the bor. to be the par. of Ribbesford, and the hamlets of Wribbenhall, Hoarstone, Blackstone, Netherton, and Lower Milton, with Lickhill, having a pop. of from 7,000 to 8,000, and about 800 qualifying tenements. Registered electors, in 1837-38, 400. There are several well-endowed charities. The manufacture of woollen caps, called Dutch caps, formerly flourished here, but has many years since disappeared. The principal trades and manufactures now existing are in salt, ironware, malt, tanning and currying leather, and making combs; besides which there are some rope-works and a brass-foundry. There is also a considerable carrying trade, connected with the Severn: near the town is a mineral spring. Market-day, Saturday. Fairs, 23d April, 24th July, and 11th Dec., for cattle, pedlary, &c. (*Boundary Report, &c.*)

BEZ, a town of Switzerland, cant. Vaud, cap. circ., in the fertile plain of the Rhone, on the Avençon, 26 m. S.E. Lausanne. Pop. 2,040. It is chiefly celebrated for the salt springs and salt mines in its vicinity.

BEYROUT, or BEIROUT (an. *Berytus*, *Beyroun*), a sea-port town of Syria, on the S. side of an extensive bay open to the N., 48 m. S.S.W. Tripoli, 19 m. N.N.W. Sidon, and about 3 m. E. from Cape Beyrut, the latter being in lat. 33° 49' 45" N., long. 35° 27' 54" E. Pop. 12,000 or 15,000. There are here no public buildings of any beauty or importance, nor are many remains of antiquity to be met with; for though the modern town occupies the site of the ancient one, the latter was long since de-

stroyed by repeated earthquakes, and the recent buildings are erected over the ruins of those which they have superseded. Along the shore, however, and in part under the water, are some mosaic pavements, fragments of columns, and (W. of the town) a thick wall, supposed to be of the time of Herod the Great. The bazars are large and well frequented; but there seems to be a deficiency of private shops, and the streets are, in general, narrow and crooked. A plentiful supply of water from a tolerably large river (*Nahr-Beyroun*), and a great number of wells, modify, in some degree, the heat of the atmosphere, and render the town much cleaner than the generality of those in the E. The walls (of a soft sandstone) are about 3 m. in circ., and the suburbs are perhaps equal in extent to the town itself. The neighbourhood is very fertile, producing all kinds of fruit; but the chief article of cultivation is the mulberry tree, an extensive and important manufacture being carried on here of silk goods, especially of sashes. Beyrut had formerly a small port, formed by a strong mole, but its present mole or jetty is of very inferior dimensions, and is scarcely sufficient to shelter boats. There is, however, good anchorage 4 m. from the town, in six or seven fathoms; and large ships may anchor a little farther out in 10 or 11 fathoms. After centuries of neglect, it seems to be again rising into some importance as a place of trade. Its exports are—galls, madder, gums, silk (raw and wrought), wine, and oil. The imports are—muslins, cottons, tin, cardware, cloths, and West India produce: there are about 12 European establishments in the place, and previously to 1832 the only English consul in Syria was resident here.

Berytus was a very ancient town of the Phœnicians, deriving its name, according to Stephen of Byzantium (art. *Berytus*), from the number of its wells, the prefix *beer* signifying a well in the language of the country. Under the Romans it rose to great eminence, notwithstanding it had been entirely destroyed in the wars of Alexander's successors about 80 years before the Roman conquest of Syria. Augustus planted in its colony, gave it his daughter's name, with the addition of the epithet Felix (*Berytus Colonia Julia Felix*), (*Plin. v. 20*). A school of law, established here in the beginning of the third century (probably by Alexander Severus), continued for 300 years, or till the town was overwhelmed by an earthquake in 551, to be the most celebrated institution of the kind in the empire (*Gibbon*, cap. 17.). But the town again revived; and, under the Saracens, attained to considerable importance. It was frequently captured and recaptured during the crusades, at which period the mole, forming its port, was destroyed. In the 17th century it was, for a short while, the capital of the famous Druso Emir, Fakr-ed-Din, and latterly it fell into the hands of Djézzar, pasha of Acre, who built its present walls, cut a canal from the river to the town, erected several fountains, and otherwise improved and beautified the place. At present it is the capital of a small pashalic, the pasha being a French renegade, formerly a colonel in Napoleon's army. The Phœnician deity Baal-Becrith (Lord of Wells) is said to have been named from, or to have given name to, this place, which is also famous in Christian legend as the scene of St. George's victory over the dragon. (*Mansueti*, 50-51.; *Idem*, ii. 156-159.; *Robinson*, ii. 1-6, 35.; *Adelon*, ii. 4-12, 36-41.)

BEZIERES, a city of France, dcp. Hérault, cap. arrond., agreeably situated on a fertile hill, in a rich country, at the junction of the *Canal du Midi* with the Orb, 33 m. S.W. Montpellier: lat. 43° 20' 31" N., long. 3° 13' E. Pop. (town ex. com.) 14,710. At a distance the city has a fine appearance, but on entering the illusion vanishes. The houses are mean, and the streets narrow, crooked, and filthy. Its citadel has been demolished; but it is still surrounded by old walls, flanked with towers, round which is a newly-planted promenade. The cathedral, a Gothic building, has a noble interior, and its sharp towers and castellated walls give it at a distance the appearance of a superb Gothic mansion. The view from its terrace is extensive and delightful. One of the churches that existed previously to the revolution is now the corn-market, and the ancient episcopal palace is the seat of the courts and government offices. Its convents have all been abolished. Beziers has tribunals of primary jurisdiction and commerce, a communal college, an agricultural society, a public library with 5,000 volumes, and a theatre, it produces silk, stockings, dimities, pashment, eddigris, starch, gloves, glass, and highly-esteemed sweet-meats; but it is principally distinguished by its distilleries, which are extensive, and produce brandy, little, if at all, inferior to that of Cognac. Its situation makes it the centre of a considerable trade.

Beziers is very ancient; and the remains of an amphitheatre, and of cisterns and other Roman works, may still be recognised. In 1209, during the first crusade against the Albigenses, Beziers having afforded protection to numbers of the fugitives, was besieged by the Catholic army, who, having carried it by assault, committed, at the instigation of the pope's legate, an indiscriminate mas-

sacred of those found within its walls, whether heretics or not! It also suffered severely during the religious wars of the 16th century.

Barbeyrac, the learned translator and annotator of Grotius and Puffendorf; and Riquet, the engineer of the *Canal du Midi*, were both natives of Besiers. (*Hugo, art. Herault; Dictionnaire Géographique, &c.*)

BHADRINATH (*Vadarnatha*), a small to. in N. Hindostan, prov. Kumaon, in a valley of the Himalaya, 80 m. N. Almora, and 10,284 ft. above the level of the sea; lat. $30^{\circ} 43' N.$, long. $79^{\circ} 30' E.$ It is remarkable only for a temple much venerated by the Hindoos; said to possess 700 villages, in different parts of Gurwal and Kumaon, and visited annually by 50,000 pilgrims, from all parts of India. It has warm, sulphureous, and cold springs. (*Hamilton's E. I. Gaz.* i. 224.)

BIHAMO, or **BANMO**, one of the chief towns in the Birman emp., cap. of a Shan principality, and chief seat of the Chinese trade with Birmah; on an elevated bank of the Irrawadi, 170 m. N.N.E. Ava, and 20 m. W. the Chinese border; lat. $24^{\circ} 10' N.$, long. $96^{\circ} 45' E.$ Next to Ava and Hangoon it is the largest place in the empire, and contains 2,000 houses, inhabited mostly by Chinese; is surrounded by numerous well-peopled villages, and defended by a wooden stockade. The houses in Bhamo and its district are better than those in most parts of the Birman dominions; those of the Chinese are built of brick, and those of the natives, of reeds, thatched with grass, and separately railed in: there is a good bazar. The trade in woollens, cottons, and silks, is wholly in the hands of the Chinese, who mostly arrive here in caravans in December and January, but 500 of them live constantly in the town, as well as many other foreigners.

The Shans, Singphos, and others, purchase salt, *gnapee* (dried fish), and rice, in large quantities, especially salt, which fetches a very high price. All payments are made in silver; and, were it not for a prohibition of the export of bullion from the Birman empire, it might answer the purpose of some European merchants to settle here. The people appear opulent; have adopted in great part the Chinese costume; and wear more ornaments than in any town in Birmah. The revenue of the district, which is of no great extent, is said to amount to 3 lacs of rupees a year. Old Bhamo, the original Shan town, is situated 2 days' journey up the Tapan, the nearest tributary of the Irrawadi. (*Crawford's Embassy; Asiatic Journal, Calcutta*, No. lxxv. April, 1837.)

BIHATGON, a city of N. Hindostan (*Nepaul*), said formerly to contain 42,000 houses; once the seat of an indep. chief, and, though much decayed, still the favourite residence of the Nepalese Brahmins; 8 m. E.S.E. Catmandoo; lat. $27^{\circ} 40' N.$, long. $85^{\circ} 8' E.$ The palace and other buildings have a striking appearance, owing to the excellent quality of the bricks and tiles.

BIHATNER, a to. of Hindostan, prov. Rajpootana, the mod. cap. of the Bhatly country, and the most E. town in the presid. Bengal, 195 m. W.S.W. Delhi; lat. $29^{\circ} 36' N.$, long. $74^{\circ} 12' E.$ It was taken and destroyed by Timour, in 1398, and again taken by the rajah of Biemore in 1807, who retained possession of it for several years.

BHAUGULPORE, or **BOGLIPOOR**, a distr. of Hindostan, principally in prov. Bahar, but the E. portion (Rajmahal) in Bengal, between lat. $23^{\circ} 4'$ and $25^{\circ} 49' N.$, and long. $86^{\circ} 15'$ and $87^{\circ} 31' E.$, having N. Tirhoot and Furruckh distr.; E. the latter and Moorsheadabad; S. that of Beerbhoom; and W. Bahar and Manghur; length, N.W. to S.E., 133 m.; breadth 80 m.; area, 8,225 sq. m. Pop. 2,020,000. It comprises a territory on both sides the Ganges, is divided into 22 thannahs, and Bhaugulpore. S. of the Ganges it is hilly, and its hills are connected with the Vindhyan chain; they are in two separate clusters, one in the E., the other in the W., and connected by a third lateral range: the E. hills approach nearer than any other to the Ganges. Besides this river, which runs through Bhaugulpore for 60 m., the chief rivers are the Gogree and Gandahl. To the S. of the Ganges the streams are mere hill torrents, which, though wide, are usually fordable. The *jhels*, or marshes, are neither large nor numerous. In the dry season their beds are often partly overgrown with the wild rose, a sign of the fertility of the soil, which is, however, not universal, much of Bhaugulpore, even in the plains, being stony and bare. The climate is warmer than in Furruckh, the hills hotter than the plains. E. and W. winds are the most prevalent: night frosts with the latter often occur to the S. of the Ganges; but, for a warm climate, the W. part is remarkably healthy, and fevers are common only in the E. Vegetation very similar to that about Calcutta. There are a few wild elephants on the E. hills, but the most remarkable quadruped is the Hanuman ape, which abounds in immense numbers. Sometimes of people inhabit the E. hills, differing greatly from the rest of the population, and thought to be descendants of the aborigines. In person they resemble the other tribes of the Vindhyan inhabitants; their faces are oval, but not lozenge-shaped, as in the

Chinese; eyes similar to those of Europeans; noses obtuse, seldom arched, but not flat; lips full, but not like the negro's. They call themselves *Malcr*, and number about 56,000; divided into two sections, called the N. and S. mountaineers, who differ materially in many of their manners and customs, and do not intermarry. They are good-natured, but not hospitable; less civilised, but in quite as comfortable a condition as the inhabitants of the low country; their houses are neater, and the ornaments of their women more numerous and valuable. Their chiefs were formerly much addicted to predatory descents, but have been pensioned by the government to refrain from them. Such is the fondness of this people for ardent liquors, that they generally spend all they receive in drink at Bhaugulpore. They respect Brahmins, although of a different religion: their own duties have neither images nor temples. Another rude tribe, called *Maiyas*, of about 100 families, live on the W. hills, and subsist by felling and selling timber. The land in the E. parts of this district is more fertile than that in the W.: rice, wheat, garden produce, at Munger; legumes, *ricinus*, cotton, and sugar-cane, are the chief objects of culture; about 3,000 sq. m. are under tillage. The high rice-lands are manured, and dried husbandry practised; and some of the implements of agriculture are a decided improvement upon those of Bengal. The farms are small, and sometimes cultivated by several farmers clubbing together: most of the zemindars cultivate their own estates, employing their poorer relatives in the operative duties. 234,000 begas were once purchased by government, to afford a land settlement to veteran and invalid soldiers; but the plan was not found to answer, and has been given up. The total land-revenue, in 1822-30, was 45,794. Cottons, mixed cloth (silk and cotton), sugar, fire-arms, and metallic and domestic articles, are the principal manufactures; but trade is impeded by bad roads, and the want of a few bridges. The Mohammedans form about a sixth part of the population.

Portions of the four ancient countries of Augga, Gaur, Mithila, and Magadha, are comprised in this district, which contains many Buddhic, Brahminical, and Mohammedan antiquities. In the 12th century, W. Bhaugulpore was seized by the Moslems, and the E. by the Bengalees, and down to the time of British supremacy both were in a state of constant anarchy. Cossin Ali, untamed chief of his district in this district, but after his works were destroyed, in 1763, the British dominion was soon quietly established. (*Martin's Hist. of E. India*, ii. 1-290; *Hamilton's E. I. Gaz.* i. 251-256; *Rep. on E. I. Affairs*, 1832.)

BHAUGULPORE (*the abode of refugees*), cap. of the above distr., seat of a gov. resident and court of circuit; beautifully situated, 2 m. S. of the Ganges; 110 m. N.W. Moorsheadabad; 240 m. N.W. Calcutta: lat. $25^{\circ} 13' N.$, long. $86^{\circ} 58' E.$ Pop. about 30,000, chiefly Mohammedans. It covers a great extent of ground, but is meanly built, consisting of scattered market-places, badly supplied, and inconveniently placed on declivities. Its greatest ornaments are the European and Moslem places of worship; the latter are of brick, and amongst the handsomest in the prov., although small and some of them ruinous: the monument of Hoseyn Khan, a square building with five neat domes, is worth notice. There are a gaol and hospital, a Mohammedan Arabic college, with about 40 pupils, and an English school, with (1829-30) 134 scholars, chiefly belonging to the mountain tribes. The Roman Catholics, of whom there are about 50 individuals, partly descendants of the Portuguese and partly native Hindoos, have a small church. A monument to the memory of Mr. Cleveland, by the council of Bengal and the inhab. of Bhaugulpore, has been erected about 1 m. from the town. A little to the N.W. are two remarkable round towers, respecting which no tradition exists, but they continue to be visited by the Jain sect. Bhaugulpore is embosomed in groves of palmrya, tamarind, and mango; its vicinity abounds with swelling hills, and is extremely fertile, well cultivated, and healthy, though said to be infested with serpents. (*Hamilton's E. I. Gaz.* i. 206; *Mod. Trav.* ix. 170-173.)

BHOOG, a city of Hindostan, prov. Cutch, of which it is the mod. cap.; built about six centuries ago, in a plain S.W. of a hill called Bhoogan, 60 m. N.E. the Indian Ocean; lat. $23^{\circ} 15' N.$, long. $69^{\circ} 59' E.$ Pop. (1818) about 30,000, which, owing to bad and oppressive government, is much less than its amount at the beginning of the present century. From the N. the city has an imposing appearance; its white buildings, mosques, and pagodas, being intermixed with plantations of date-trees; but the interior has a very different appearance. It is surrounded by a high, thick, and well built stone wall, flanked with round and square towers, mounted with artillery. Streets narrow and dirty, and turning at sharp angles; houses generally within strong walled enclosures, provided with loopholes, and each forming in itself a complete fort. The palace is a well-built castle, adorned with several cupolas, and domes covered with

enamel in the Chinese style; temples numerous, many of them large, and presenting a multitude of elaborate decorations. Every where are seen memorials of *rautes* and other immolations: the mausoleum of Row Lacks, grandfather of the present ruler, and of a lady who ascended his funeral pile, is the most remarkable, and would be considered a beautiful ornament in any European city. Some others are in Moorish architecture, worked up with stucco to resemble marble. The hill Bhoojan is surmounted by extensive but ill built fortifications, which are no protection to the town; they enclose a temple dedicated to the *Nag*, or cobra de-capello. This fort was taken by escalade by the British, in 1819. W. of the city, and close to the walls, there is a large tank or pool containing an elevated terrace, formerly a place of recreation for the chiefs; but the buildings are now in ruins. Bhooj is celebrated for its gold and silver works. (*Trans. Bombay Lit. Soc.* ii. 217; *Mod. Trav.* x. 172-175.)

BHOPAL, a state of Hindostan, tributary to the British, prov. Malwa and Gundwanah; between lat. 22° 30' and 23° 40' N., and long. 76° 40' and 79° E., having N. and W. Scindia's dom.; E. and S. those of the presid. of Bengal and the Nerbudda river, which forms its entire S. boundary: length, E. to W., 145 m., greatest breadth 80 m.; area, 6,779 sq. m. (*Sutherland*). The country is full of jungles, and uneven; the chief range of the Vindhyan mountains intersects its S. portion; but the soil is generally fertile, especially in the valleys, and watered by numerous streams. The ruling people are Patans, established here by Aurungebe early in the 18th century, and of course Mohammedans. In 1812, the vizier Mahomed made a vigorous defence against Scindia, the rajah of Berar, and the Pindarries; but on his death, in 1816, the British interfered to protect his dom., and the Marquis of Hastings conferred on his successor, Nusseer Mahomed, in 1817, a considerable part of the present territory in reward for his hearty co-operation with the British. It was then calculated that in five years the revenue of the rajah would increase to nearly 30 lacs a year. Bhopal continues in a tranquil, and evidently prosperous condition.

BHOPAL, the cap. of the above state, placed on the boundary between Malwa and Gundwanah, lat. 23° 17' N., long. 77° 30' E.; 110 m. E. Oojein; 310 m. S.W. Allahabad. It is surrounded by a stone wall, but is in a dilapidated state, as well as its suburb, and a Hindoo fortress at its S.W. extremity. There are two considerable tanks immediately adjoining it, from which two rivers take their rise.

BHURTPORE, a small territory of Hindostan, prov. Agra, including the small pergunnah Tanna; shape somewhat triangular, having N.E. the British dom.; S.E. those of Scindia; and W. the rajpoot state of Macherry: area, 1,946 sq. m. (*Sutherland*). It is inhabited by Jauts, who migrated from the banks of the Indus, and settled here about 1700, and who have assumed to themselves the title of the military caste, and their chief that of rajah. The soil of Bhurtpore is light, but well watered and cultivated: cotton, corn, and sugar, are the chief agricultural products. Wood is very scarce and dear; the houses are all of red sandstone, and the villages in good condition and repair. Wells are numerous, and constructed by building the masonry first, which is afterwards undermined and sunk. The peacock is an object of veneration. The chief towns are Bhurtpore and Deeg. Large quantities of salt are produced from brine springs at Comber. In 1768 this territory was at its greatest extent; stretching along the course of the Jumna river, from near Delhi to Etawah; but the greater portion was soon after conquered by Nudjiff Khan. In 1826, having been usurped from its rightful sovereign, the British interfered and took the capital, since which it has been under their protection.

BHURTPORE, the cap. of the above territory, and seat of its rajah, 81 m. N.W. Agra; lat. 27° 17' N., long. 77° 23' E. It is about 8 m. in circumference, and was formerly surrounded by a mud wall 60 feet thick, flanked by many bastions, and defended by a strong fort; but these fortifications have been mostly blown up and demolished. This city was built with part of the spoil pillaged by the Jauts from the baggage of Aurungebe's army during his last march to the Deccan, and became afterwards a celebrated mark for military stores. It resisted with great vigour the forces of Lord Lake, who took, in 1803, 3,100 women under its walls; but it at last capitulated to him. In 1838 it was stormed and taken by Lord Combermere from the usurper Doorjun SAI, when the present rajah Bulwunt Sing, was established in its possession. (*Hamilton's E. I. Gaz.* i. 232-234; *Heber's Narrative*, ii. 357-360.)

BIAGGIO (ST.), a town of Naples, prov. Calabria Ultra, 3 m. W. Nicastro. Pop. 3,000. Its situation is insalubrious, and it suffered severely from an earthquake in 1788. Its territory produces good wine, and has some mineral springs.

BIALYSTOCK, a prov. of Russia in Europe, for-

merly belonging to Poland, having the government of Grodno on the E., and being surrounded on all the other sides by the modern kingdom of Poland. Area, 3,436 sq. m. Pop. variously estimated, but probably about 260,000. Surface flat, with some slight undulations; soil generally sandy, but not infertile. It is bounded on the S. by the W. Bug, a navigable affluent of the Vistula, which is its principal channel of communication. Forests extensive and valuable, but much dilapidated, through want of proper regulations as to their management. Agriculture is almost the only employment; and considerable quantities of corn (especially rye and wheat), with linseed, hops, and timber, are sent to Danzig and Elbing. The nobles are very numerous, being estimated to amount to 9,000 families, or nearly 50,000 individuals; but the great bulk of them are steeped in poverty, many being compelled to cultivate their little patches of land with their own hands, or hire themselves to others. Manufacturing industry is all but unknown, and only the most common and indispensable trades are carried on. (*Schnitzler, La Russie*, &c. p. 557.)

BIALYSTOK, a town of Russia in Europe, cap. prov. same name; lat. 53° 7' 35" N., long. 23° 18' E. Pop. 8,218. It is a handsome town; houses of brick, with the gables to the streets, which are straight and well paved. The castle of Count Branicki, grand hetman of the crown, called the Versailles of Poland, is the distinguishing feature of the town. (*Schnitzler, La Russie*, &c., p. 558.)

BIANA, a to. of Hindostan, prov. Agra, territ. Bhurtpore, 50 m. W.S.W. Agra, lat. 25° 57' N., long. 77° 8' E. It stands at the foot of a hill, the ridge of which is covered with the remains of buildings, including a fort and a high pillar, conspicuous at a great distance. The town is large, contains many stone houses, and a good bazar. It preceded Agra as the cap. of the prov., and is often mentioned in the memoirs of the Emp. Baber.

BIBERACH, a town of Württemberg, circ. Danube, cap. bailiwick, in a fertile valley, on the Illers, 22 m. S.S.W. Ulm. Pop. 4,600. It is encircled by walls flanked with towers, and has a town-house, 4 churches, one of which is common to Catholics and Protestants; a college, 3 schools, a well endowed hospital, &c. Some branches of the linen and woollen manufactures are carried on, and there are numerous tanneries and breweries, and a bell-foundry. The mineral waters of Jodensbad are at a short distance from the town. It is the birth-place of Wieland; and in 1796 the French, under Moreau, defeated the Austrians in its vicinity.

BICANER, or BICKANER, a territ. of Hindostan, prov. Rajpootana, divis. Marwar, chiefly between lat. 27° and 29° N.; having N. the Bhatty country; S. the Jondpore and Seypore dom.; E. Hurrana and the Shehawutty country, and W. Jesselmere and the great desert, of which it forms a part: area, 18,000 sq. m. (*Sutherland*). The surface is elevated, but flat, sandy, and destitute of water where not irrigated by wells, which are from 100 to 200 ft. deep. The crops are very precarious, and greatly dependent on the periodical rains: rain-water is carefully preserved in cisterns. *Bajwarah* and other Indian pulse are almost the only articles grown, other necessaries being supplied from the contiguous prov. Coarse and fine rice are imported from Lahore; wheat from Jeypoor; salt from Comber; spices, copper, and coarse cloth from Jesselmere. The other imports are sugar, opium, and indigo: horses and bullocks of an inferior breed are nearly the sole exports. Bikanere and Chooro are the chief towns. In 1818 the rajah was admitted under British protection, without a subsidiary allowance.

BICANER, the cap. of the above dom., and residence of its rajah, in the Indian desert; 240 m. W.S.W. Delhi, and 145 m. N.W. Ajmeer; lat. 27° 57' N., long. 73° 22' E. It is fortified by a strong wall strengthened with many round towers, and contrasted impressively with the desolation around it, which is as frigid as that of the wildest tract of Arabia, except on its N. side, where there is a wooded valley. Most of the dwellings in the town are mere mud huts painted red; there are some lofty white houses and temples; and at one corner a citadel about ½ m. sq., encompassed by a wall 80 ft. high, and a good dry ditch, a confused assemblage of towers and battlements, overtopped by crowded houses. Its best security is in the scarcity of water in the country around. (*Hamilton's E. I. Gaz.* i. 237, 238; *Elphinstone's Account of Coash*, 15-20.)

BICESTER, a par. and town of England, co. Oxford, hund. Ploughley, 62 m. N.W. by N. London. Area of par., 2,820 acres. Pop. of par. in 1821, 2,544; 1831, 2,868. The town is well built on a small stream, that joins the Charwell at Islip. The church, built in 1400, on the site of an older one, contains many ancient monuments, and has a lofty tower. There is a charity school, where 30 boys are clothed and educated; and another for the instruction of 60 girls. The weekly market is held on Friday, and annual fairs on Easter Friday, 1st Friday in June, Aug. 8., Friday after old Michaelmas, and 2 fol-

lowing Fridays, and the 1st Friday in Dec.; they are for cattle, and both fairs and market are well attended. Its proximity to the Oxford Canal gives it some business, but no particular manufactures are carried on, except that of bone lace by a few of the females, and the brewing of ale, noted for its excellence. The par. is divided into 3 townships, King's End, and Market End. In the latter the town is situated.

BIDACHE, a town of France, dép. Basses Pyrénées, cap. cant., on the Bidouze, 18m. E. Bayonne. Pop. 2,722.

BIDEFORD, a sea-port, bor., and par. of England, co. Devon, hund. Shebbear, on the Torridge, about 1½ m. above where it unites with the estuary of the Taw; 180 m. W. by S. London. Pop. in 1821, 4,063; in 1831, 4,846; houses at last census, 997. The greater part of the town stands on an acclivity on the W. of the river, and is connected with its E. division by a stone bridge of 24 arches, built in the 14th century. It consists chiefly of 2 spacious streets, paved, and partially lighted; the houses, though improved, are, for the most part, but indifferent examples of timber framing, filled up with bricks. Besides the church (in the earlier Gothic style), the Baptists, Independents, and Wesleyans, have each a chapel. There is a neat town-hall, and another hall, with a school, is attached, belonging to the trustees of the Bridge estate. Being a place of frequent resort from the neighbouring watering-town of Appledore, it has public assembly-rooms. The river is faced by a fine quay, 1,200 ft. in length, broad and convenient. It has an ancient endowed grammar-school, a national school for 300 children, and a school supported by the dissenters. An endowed hospital maintains 7 aged poor. Ropes, sails, and a considerable quantity of common earthenware, are manufactured; it has also a small lace manufactory, and several docks, in which the smaller class of vessels are built: in the vicinity are several tan-yards. The port is within Barnstaple bar (see **BARNSTAPLE**), and is accessible for vessels of 200 tons as far as the bridge; about 2½ m. above which the Torrington Canal unites with the river. Ships of larger size unload at Appledore. Its principal imports consist of timber, from the Baltic and from Canada; coals, from Bristol and Wales; and groceries and other colonial produce, from Bristol and other ports. Its chief exports are silk, cordage, and articles of general supply, for the New-foundland fisheries; oak bark, to Ireland; earthenware, to Wales; and corn and flour, to Bristol. It had, on the 1st of January 1836, 115 registered vessels, of the burden of 9,509 tons, manned by 545 seamen, mostly employed in the coasting trade; and about 160 licensed boats, employed in the coast fishery. The port comprises those of Clovelly and Hartland in its jurisdiction. The market days are—Tuesday for corn; Saturday for general provisions. There are 3 fairs; Feb. 14., July 18., Nov. 13.

Its municipal affairs are managed by a mayor, 3 aldermen, and 12 councillors. Previously to the municipal act (5 & 6 W. 4. c. 76.), it was governed by a charter of 16 James I., confirming and extending a previous one (16 Elizabeth). The corporation revenue does not exceed 50*l.* a year, derived from tenements in the bor.: the quay dues belong to the lord of the manor, and are regulated by an act passed in 1828. The living is a rectory in private patronage. Bideford is styled a bor. in the Saxon records. It sent members to the H. of C. during the reigns of Edward I. and II., but grudging the expense which this occasioned, it got relieved from the obligation, and has not since been represented! In 1671 it obtained a market and fair. The expeditions under Raleigh and Grenville, to Carolina, appear to have originated its foreign commerce. Silk weaving was introduced in 1660, and in 1685 many French refugees settled in it, and increased its trade. At the close of this century its Newfoundland trade had become extensive; and for the first half of the 18th century its imports of tobacco were only exceeded by those of London. Dr. Shebbear, of pamphleteering notoriety, was a native of Bideford.

BIDSCHOW, or **BICZOW**, a town of Bohemia, cap. circ., on the Ciská, 16m. W. Konigratz. Pop. 4,000. **BIELSK**, town of Russia in Europe, gov. Toula, on the Oka, 56 m. S.W. Toula. Pop. 7,000. This, which is an ancient town, is, after Toula, the most important in the government. The inhab. carry on a considerable commerce.

BIELEFELD, a thriving town of Prussian Westphalia, cap. circ., 38 m. E. Munster. Pop. 5,800. It has excellent bleaching grounds and extensive manufactures of thread and linen. It is defended by a rampart and ditch; and, besides Catholic and Protestant churches, has a synagogue, and an orphan asylum. It is celebrated for its tobacco pipes made of carbonated magnesia, and known in commerce by the name of *écume de mer*, or *mercurshausen*.

BIELGOROD, a town of European Russia, gov. Koursk, cap. district, on the Doutz, 80 m. S. Koursk. Pop. nearly 8,000. It consists of an old and new town

and three suburbs. Houses mostly of wood. Its name *White town* is derived from a chalk-hill in the neighbourhood. (*Schnitzler, La Russie, &c.* p. 300.)

BIELITZ, a town of the Austrian States, in Moravia, on the Riala, 16 m. E.N.E. Teschen. Pop. 6,000. It is well built, and is the seat of a Protestant consistory, which has under its jurisdiction Moravia and Austrian Silesia.

BIELLA, a town of the Sardinian States, div. Turin, cap. prov. and mand., on the Cervo, partly on the summit and partly on the declivity of a mountain, 12 m. N. E. Ivrea. Pop. 7,700. It is the seat of a bishopric; has 4 parish churches, 2 hospitals, and a college; and produces linens, silks, and paper.

BIELO OZERO, or **WHITE LAKE**, a lake of Russia in Europe, gov. Novgorod, about 240 m. E. Petersburg. It is of an elliptical shape, its greatest length being nearly 30, and its greatest breadth 20 m. Its bottom consists of a whitish clay, which, during tempestuous weather, communicates its colour to the water; whence, doubtless, its name is derived. It receives numerous small rivers; its surplus waters are carried off by the Chexna, an affluent of the Wolga. It is deep, and generally limpid, and is well stocked with fish.

BIELOZERSK, a town of Russia in Europe, gov. Novgorod, S. side of the above lake. It is fortified, and has some trade.

BIELSK, a town of European Russia, prov. Białystok, 70 m. S.S.W. Grodno. Pop. 2,000. It is well built, paved, has a handsome custom-house, and gave its name to the palatinate of Bielsk, of which it was the cap. till 1795. This is one of the towns from which Jews are excluded.

BIENNE, or **BIEL**, a town of Switzerland, cant. Berne, in a fertile little plain at the E. foot of the Jura, near the lake of Biénne, and on the road from Basle to Berne, 16 m. W. of the latter. The Suze flows through the town. Pop. 2,150; houses, 304. It has a good gymnasium, with 6 professors. The public library, which was plundered in the revolution, contains at present only 2,500 volumes. Biénne is very ancient; previously to 1798, it was a free and independent city; but in that year it was united to France, and, in 1815, to the cant. of Berne.

The lake of Biénne extends along the Jura chain; being about 10 m. in length by 3 in breadth. It is not pre-eminent for beauty of scenery, and owes its celebrity principally to its having within it the *Isle de St. Pierre*, the retreat of Rousseau.

BIGGAR, a burgh of barony, Scotland, co. Lanark, 27 m. S.W. Edinburgh. Pop. in 1835, 1,454. The barony of Biggar has for centuries been the property of the Flemings, formerly Earls of Wigton, to which family the greater part of it still belongs. It consists chiefly of one wide and spacious street. The chief employment of the inhab. is cotton weaving for the Glasgow market. This species of business afforded work, in 1835, to 210 persons. The burgh also contains 28 shoemakers, 26 masons, 20 tailors, 20 carters, 16 spirit-dealers, of whom 5 are innkeepers, 4 surgeons, &c. The quantity of excisable articles sold in 1835 was 2,608 gallons of British spirits, 80 gallons of brandy, 136 gallons of ginger-wine, 88 doz. of foreign wine, 2,528 lbs. of tea, and 1,876 lbs. of tobacco and snuff. The par. church is a venerable Gothic edifice, built in 1560. There are also 2 dissenting chapels, a savings' bank, and 3 public subscription libraries.

BIGLESWADE, a par. and town of England, co. Bedford, hund. Biggleswade, 41 m. N.W. London. Area of par., 4,220 acres; pop. of do., in 1821, 2,778; 1831, 3,226. The town is situated on the great North road, by the Ivel, over which there is a stone bridge. Houses chiefly brick, and have a neat, modern appearance. The church is a Gothic building, founded in 1230, and extensively repaired in 1832. There are 2 free schools, one for 12, the other for 8 boys: a charity, producing 300*l.* a year, supports them, and is applied also in various other specified modes. The river is navigable to the town, by which means it is supplied with coals, timber, corn, &c. The weekly market, on Wednesday, is one of the largest in England for corn. There are 2 annual fairs; Feb. 14., Saturday in Easter week; Whit-Monday, Aug. 2., and Nov. 8. There is a small manufacture of thread lace, employing some females, and a steam flour-mill; but the chief support of the place are its markets and fairs, and the travellers who resort to it. A petty sessions for the three neighbouring hundreds is held in the town. It has several good inns.

BIJANAGUR (*Vijayanagara*, the city of triumph), ANNAGOONDY (Canarese), or ALPATNA, an anc. and celeb. city of Hindostan, prov. Bejaour, occupying both banks of the Toombudra; that part of it on the S.E. bank only being properly called Bijanagur, and belonging to the British dom., presid. Madras; 17 m. S.E. Bejaour, 27 m. N.W. Bellary; lat. 15° 14' N., long. 76° 37' E. It was formerly the metropolis of a kingdom, which, in 1515, comprised the two Carnatics, above and

below the Ghauts, and is said to have then been 24 m. in circ.; this portion of the conjoined cities is now about 8 m. in circ., nearly uninhabited, and in ruins; these however, are all of granite, and far excel in extent and grandeur those of any other Hindoo city. Bijanagar has a most remarkable site. "It is built," says Hamilton, "in a plain, enclosed by and encumbered with stupendous masses of granite, which, in some places, swell up from the surface to the form and magnitude of hills, and in others present detached blocks of various forms, piled over one another in all sorts of fantastical combinations; occasionally surrounding little isolated valleys, and elsewhere obstructing all passage except through the narrow winding defiles which separate the fragments. The communications from street to street, and in some cases the streets also, follow the mazes of these chasms, and in one quarter the principal thoroughfare is under a naturally covered passage formed by the rocks; the ancient battlements, turrets, and gateways are still in a high state of preservation: the main streets paved with immense flags of granite, are intersected at intervals by aqueducts; and tanks and wells are excavated in the rock. Temples, choultrys (hotels), and many other edifices, public and private, of the purest style of Hindoo architecture and great dimensions, are seen perched on the most conspicuous eminences of the naked rock, or ranged in long lines on the plain. . . . There is a continued succession of paved streets, now nearly uninhabited, for three miles, from the Toombuddra ferry to Humpa, at the W. extremity; and the appearance of the ruins about Camlapoor, on the S.W., indicate that they also were once included within the city boundaries. . . . The walls, pillars, arches, and even the flat roofs and beams of all these structures are composed of granite. . . . Some blocks are from 12 to 15 feet broad, and thick in proportion; and though of unequal bulk and various shapes, are universally well cut, fitted to each other with the greatest nicety, and display at this day an exterior lustre surpassing that of most buildings of 20 years' standing." The Toombuddra is about one third of a mile broad, but at the upper part of the city contracts greatly, and here there was once a stone bridge: its bed is clogged by detached granite rocks, which rise above its surface, and are generally surmounted by some religious edifice. It forms the N. and E. boundary of the city, which is enclosed S. and E. partly by its natural barriers, partly by strong stone walls. The chief edifices are—the temple of Wittoba (an incarnation of Vishnu), nearly in the centre of the city, which consists of one central and four subordinate buildings, surrounded by several smaller pagodas and numerous cells, and occupying an area 400 feet long by 20 wide; this temple contains a chariot cut entirely out of white, on which the image of the god is exposed on holidays; the temple of Mahadeva, at Humpa, with a pyramidal portico of 10 stories, and 160 feet high, well endowed, and attended by many Brahmins, faces a fine street 90 feet wide, lined with handsome stone buildings decorated with sculptures, running nearly parallel to the Toombuddra, from which it is separated by rows of trees, and leading to another temple, where there is an image of the bull Nundy, 12 feet high, carved out of the solid rock. Between Humpa and Camlapoor the rocks are studded with pagodas, the principal of which are the great temple of Krishna, and a smaller one dedicated to Ganesa, but which contains also a colossal granite image of the former, 16 feet high by 10 feet broad. The inner city near this is the residence of the rajah, and contains the remains of four different palaces. Bijanagar has a temple of Rama, with pillars of black hornblende, and amongst a group of temples near the ferry is a gigantic figure of Hnuman, carved in bas-relief. This city was built by two brothers, between A.D. 1360 and 1363; in 1564 it was taken and completely sacked by the Mohammedans. (*Hamilton's E. A. Gaz.*, i. 229, 240.)

BIJNEE, or KHUNTAGHAUT, a territory of Hindostan, prov. Bengal, bordering on Assam, and belonging partly to British and partly to Bootan. It lies on both sides the Brahmaputra, extending S. as far as the Garrows mountains, and consists chiefly of a level country, well fitted for the production of rice, especially that portion S. of the Brahmaputra, which is the most valuable, and besides wheat, produces barley, mustard, pulse, betel, sugarcane, and mulberry-trees. The villages are generally nearer than those in Bengal, and have sugarcane and betel plantations. For a considerable distance Bijne was not known to be included in the Derang territories, but was considered to belong to Bootan; presents of elephants, &c. were, however, made yearly to both the Deb. rajah and the British government, and a kind of dependence on either or both of them, acknowledged by the Bijne rajah. In 1785 the payment in elephants was commuted by the British government into a tribute of 2,000 rupees: the Bootan tribute consists chiefly of dried fish. Half the rents of the rajah are paid in coarse cotton cloth woven by females. His affairs generally are very ill managed; his country plundered by needy re-

tailors; its trade ruined by exactions and monopolies; and some years since he was so poor as to be obliged once in three years to raise loans by absolute begging. The people are divided into two sections, the Bhakat, or worshippers of Krishna, and the Gorum, who eat pork and other meats, and drink liquors. The British gov. claim the right of investiture to the seminary.

BIJNEE, a town of Hindostan, cap. of the above rajahship, 23 m. N. Goalpara; lat. 26° 29', long. 90° 47' E. It contains a fort defended by a brick wall, the residence of the rajah, some small brick temples, and about 100 thatched huts. It appears at present to belong to Bootan. (*Hamilton's E. A. Gaz.*, i. 241—243.)

BILBAO, a sea-port town of Spain, the ancient cap. of Biscay, in a fine plain, on the Nervion or Ibaizabal, about 10 m. above its confluence with the sea at Portugaite; lat. 43° 15' 47" N., long. 2° 45' W. Pop. 18,000. It is said to be healthy, notwithstanding the climate is remarkable for humidity. Houses lofty, uniform, and well-built, with projecting roofs, that afford shelter from the sun and rain. Streets well paved and level; several of them may be washed at pleasure with water conveyed by an aqueduct from a mountain a league distant. Bowles describes it as a paragon of cleanliness; but its pre-eminence in this respect is questioned by Mr. Inglis. No wheeled carriages are allowed to pass along the streets, but all goods are carried in panniers on mules, or in sledges, which have a contrivance by which they constantly moulder their path with water. There is a fine promenade by the river's side, over which a suspension-bridge is thrown in lieu of the old wooden one that formerly existed. There is also a stone bridge of 3 arches, and a handsome cemetery, formed by the corporation, at an expense of 30,000*l*. Convents and monasteries are here very conspicuous. They are immense piles, of little architectural beauty, having strong gratings to all the windows. Some of them are very rich; and a man must take about 30,000 reals (300*l*.) into the convent on admission. The *abatijos*, or slaughter houses, in the Tuscan style, in the centre of the town, are well contrived, well ventilated, and copiously supplied with fresh water. The corporation is extremely rich. On the occasion of the visit of Ferdinand VII. no less than 2,000,000 of reals (20,000*l*.) were expended in feasts, decorations, and bull-fights. Their funds arise from octrois, or tolls, upon the various necessities imported by sea or land, and the monopoly of the supply of beef, which is farmed to the butchers. They maintain an elementary school for teaching reading, writings, and Latin, by an impost of 4 reals per ton on foreign vessels entering the port. The Consular, or Tribunal of Commerce, supports schools of drawing, architecture, mathematics, and the French and English languages, for the children of the town and neighbourhood. There is an hospital calculated to accommodate 250 patients; it has a ward for the reception of strangers or persons above the lower class, who may wish for good advice at a moderate expense, without troubling their relations or friends. These pay half-a-dollar a day, and have the comforts of a private house, and the best hospital attendance. The manufactures consist of various descriptions of hardware, and of leather, paper, hats, tobacco, and earthenware. There are several docks for building merchant vessels; two large rope manufactories, &c. Bilbao is the principal port for the N. of Spain. The exports principally consist of iron and steel, wool, fish, fruits, chestnuts, &c., and sometimes large quantities of corn from the interior; but the trade of the port has declined ever since Saxon wools began to be preferred to those of Spain in foreign markets. The clearances are not now above half their former number. Some houses have still considerable returns from the fish trade, and one or two from the exportation of iron; but this also has fallen off, from the greater cheapness of Swedish iron. The imports consist principally of cotton and woollen fabrics, colonial products, &c. Large vessels usually stop at Portugaite, near the mouth of the river, or at Olaviaga, about 4 m. below the town. Spring tides rise about 13 ft.; and by taking advantage of them, vessels of considerable burden occasionally reach the town.

There are no public amusements, excepting occasional bull fights. Two attempts to establish a theatre have failed; partly, as Mr. Inglis supposes, through the agency of the priests. One or two houses are said to realise from 2,000*l*. to 3,000*l*. a year; but Mr. Inglis thinks no one exceeds 300*l*. Beef costs about 10 quarts (3*d*.) per lb.; mutton, 3*d*., and the best bread, 1*d*. Labourers earn from 10*d*. to 1*s*. a day; masons, carpenters, &c., from 2*d*. to 2*s*. Good wine is 3*d*. a bottle. The markets are well supplied with vegetables and fruit, particularly the *tomato*, or love apple, a principal ingredient in Spanish cookery. There is plenty of game, among which the small birds called *chimbo*s are great dainties. The cuttle fish, and a particular kind of eels, are also highly esteemed. Circles of from 6 to 10 families agree to meet together every evening during the winter, at the house of one of the party, changing the rendezvous

every week. They take chocolate before leaving home, and sup on their return. Cards, dancing, and music fill up the evening's amusements. They eat together only at the end of the season, when all the money won at cards is spent upon a dinner in the country, of which the members of the circle partake.

Bilbao was founded under a charter granted by a lord of Biscay, in 1290; from whom, and succeeding sovereigns, it obtained several privileges. The Conestado de Burgos was transferred thither at the end of the 15th century; and its decisions in matters of commerce were referred to throughout Spain, and regarded as of the highest authority out of it. It has been alternately occupied by the different victorious parties in the late and present civil war. (*Diccionario Geográfico Histórico por la Real Academia de Madrid*, 1802, i. 178.; *México Diccionario Geográfico*, ii. 118., and Supplement; *Bowles, Introducción a la Geografía de la España*, 1778; *Insula, Spain* 1820, i. 18—39.)

BILEDULGERID, the name given to an extensive territory of Africa, embracing the country lying between the S. declivity of Atlas and the Sahara, or Great Desert; and between Fezzan on the E., and Cape Non, on the Atlantic, on the W. It mostly consists of vast deserts, differing but little from the Great Desert, with which it insensibly intermingles. In parts, however, where there is water, extensive plantations of the date palm, which here flourishes in great luxuriance, are met with. It is said by some, that its real name, *Blad-el-Jerid*, means country of the date-palm; while others, among whom is Shaw, interpret *Blad-Jerid* as meaning dry or parched country. (*Shaw's Travels*, p. 4, 4to. ed.)

BILLERICAY, a chapelry and town of England, co. Essex, hund. Barnstable, par. Great Burstead, 24 m. E.N.E. London. Its pop. is returned with that of the parish, which was, in 1821, 1,461; 1831, 1,977; houses, 387; area, 4,420 acres. The town is on an eminence overlooking a rich vale, and commanding extensive views. Silk braid and laces are the only manufactures, and these are declining. There is a weekly market, Tuesd., and fairs Aug. 2, and Oct. 9., for cattle. The parish church is about 2 m. from Billericay, but there is an episcopal chapel in the centre of the town, and three dissenting chapels; there is also an endowed school for 10 poor children. The ann. val. of prop. of the par. in 1815 was 7,169*l*. Its average poor-rates, 1,081*l*. Billericay is the central town of a poor union of 26 par. About 1 m. from the church are some earth-works, called Blunt's Walls, where Roman remains have been dug up.

BILLITON, a rocky sterile island of the Eastern Archipelago (1st div.), between Sumatra and Borneo. It is of a circular form, about 50 m. in length and 45 in breadth. The pop. is very scanty, not being supposed to exceed 2,000 or 3,000; from one, which in tropical countries is usually scarce, is found here in great abundance, and the metal produced from it is said to be of excellent quality. The produce of rice is not sufficient even for the consumption of the pop. The Dutch maintain a garrison in the island, and some cruisers on the surrounding seas, to check the piracy in which the natives are prone to indulge. The interior has not been explored. It is, however, believed to contain mines of tin.

BILLOM, a town of France, dép. Puy de Dôme, cap. cant., on a hill, 14 m. E.S.E. Clermont. Pop. 4,467. This is one of the most ancient towns in Auvergne. The walls, by which it was formerly surrounded, have disappeared, and its manufactures and commerce have also declined. A university, founded here in 1458, continued to flourish till 1585, at which epoch it was made over to the Jesuits, by whom it was administered till the suppression of their order, when it also ceased to exist. At present the town has a departmental college. During the period of the League, Billom was a principal focus of the disorders that agitated Auvergne. Storms are very frequent in this district; and, in consequence of the prevalence of rainy weather, the town has sometimes been called *l'égoût de la Basse Auvergne*. (*Hugo*, art. *Puy de Dôme*.)

BILSA, a town of Hindostan, prov. Malwa, belonging to Scindia, on the E. side of the Betwa, near its confluence with the Russ, 32 m. N.E. Bhopal. It is surrounded by a stone wall, and had, in 1820, 5,000 houses. The contiguous country is celebrated for the excellence of its tobacco.

BILSEN, a town of Belgium, prov. Limburg, cap. cant., on the Demer, 7 m. W. Maestricht. Pop. 2,700. It produces earthenware and cutlery.

BILSTON, a market town and chapelry of England, co. Stafford N. div., hund. Sealdon, par. Wolverhampton, 24 m. S.E. Wolverhampton, 11 m. N.W. Birmingham, and 107 m. N.W. London. Pop. (1831) 14,492; houses, 2,988. It stands on rising ground, and is very irregularly built. The principal streets contain some substantial and handsome houses, and, within the last few years, its appearance has been much improved; though, from the number of forges, collieries, and such like works, it has

a sombre aspect. The principal buildings are—the episcopal chapel, a neat edifice, rebuilt in 1825; St. Mary's chapel, a fine structure, built in the Gothic style of architecture, in 1830; and the Rom. Cath. chapel, a handsome structure in the same style, erected in 1833. The gov. of the town is vested in 2 constables, appointed annually at the court leet held by the lord of the manor. Under the Reform Act, Bilston forms part of the borough of Wolverhampton, with which it is intimately connected; but for all parol purposes, it is independent. Fifty sessions are held on Tuesday in each week; and a court of requests, for the recovery of debts not exceeding 5*l*. is held every second month, alternately with Willenhall. The living is a curacy, within the jurisdiction of the dean of Wolverhampton; the patronage is in the inhab. at large; every householder, whether male or female, being entitled to vote at the election of the minister. There are places of worship for Independents, Baptists, Primitive and Wesleyan Methodists, and Roman Catholics. There is a blue-coat school, founded and endowed by Humphrey Perry, Esq., of Stafford, for clothing and educating 60 boys; since extended to the admission of two or three more, by additional small bequests; 2 schools under the British or national system; and an "Orphan Cholera School," erected and endowed in 1833, for the instruction of 450 orphans, left destitute by the cholera, which prevailed in the previous year. This disease raged here with such desolating effect, as nearly to clear several entire streets of their inhabitants, and to oblige many large manufactories to stop working, from the number of hands that fell victims to its violence. There were, between Aug. 4, and Sep. 23., as many as 3,568 cases, of which 742, or about 1-20th of the pop., proved fatal.

Bilston, which, down to a comparatively recent period, was but an inconsiderable place, is wholly indebted for its growth and importance to the iron trade carried on in it and its immediate vicinity. Its advantages in this respect are not surpassed by those of any other place. Round the town are all but inexhaustible mines of coal and ironstone, the main bed of coal being 30 ft. thick, with strata of ironstone both above and below; and large supplies of the finest sand used in the casting of metals, are also found in the vicinity. Bilston has the further advantage of being connected, by numerous canals and river navigation, with London, Liverpool, Bristol, Hull, &c. The importance of these improved means of communication may be judged of from the fact that, previously to the opening of the first canal in 1772, there was only one blast furnace for smelting iron at Pilsdon! Their subsequent increase has been quite extraordinary; and there are now great numbers of furnaces, forges, rolling and slitting mills, &c., which, with the coal trade, furnish employment to a large population. The manufacture of japanned and enamelled goods is very extensively carried on in the town, of which it may be said to be the staple trade. In the neighbourhood is a remarkable quarry, the stones in which lie upon each other in 12 distinct layers, increasing in thickness from the surface, the lowest being about 3 ft. thick. This stone is used for various purposes, and is formed into grindstones, whetstones, millstones, and cisterns. At Bradley, a small adjoining village (in the W. div. of Cuttlestone hund.), a fire rises from a stratum of coal about 4 ft. thick and 30 ft. deep, which has been burning for above half a century, and has reduced several acres of land to a calx or cinder, used in the making of roads. This place formerly belonged to the portionists or prebendaries of Wolverhampton, and in their charter was called Billestone. It was a royal demesne at the time of the Conquest; and in the reign of Edward III., under the name of "Billestone," was certified to be free of toll. In 1824, an act of parliament was obtained for a market, now held on the Monday and Saturday of each week, independently of the toll-free markets, or fairs for cattle, which are held on Whit-Monday, and the Monday next before Michaelmas-day.

BINCHE, a town of Belgium, prov. Hainault, cap. cant., on the Haine, 9 m. E.S.E. Mons. Pop. 4,500. It produces earthenware and cutlery, and has tanneries, glass-works, and tile-works, with a considerable trade in lace, paper, and marble and coal procured in the vicinity.

BINDRABUND, a town of Hindostan, prov. Agra, on the Jumna, 35 m. N.W. W. Agra. The place is famous in the history of Krishna, to whom many temples are dedicated. The principal pagoda is one of the most elaborate and massive works of Brahminical architecture. There are also numerous sacred pools, where pilgrims perform ablution.

BINGEN, a town of the grand duchy of Hesse Darmstadt, prov. Rhine, cap. cant., at the confluence of the Nahe with the Rhine, 14 m. W. Meutz. Pop. 4,300. It has some manufactures, and a considerable trade in corn and wine. Near it is the Bingerloch, a rapid in the Rhine, which is dangerous when the water is low; and on the removal of which large sums have been at different times expended. Bingen is very ancient, having existed under the Romans.

BINGLEY, a market-t. of England, W. R. co. York, 178 m. N. W. by N. London, 82 m. W. by S. York, near the Aire. Pop. in 1821, 6,176; 1831, 8,037. It consists chiefly of one long street, tolerably built, and well supplied with water. All Saints Church is a neat edifice, in the later English style: the Baptists, Independents, and Methodists have places of worship. A free grammar-school was endowed by Henry VIII.; there is also a national school and some almshouses. The worsted, cotton, and paper manufactures are carried on, and there is some trade in malt, which is conveyed to other parts, chiefly by the Leeds and Liverpool canal, that passes by the town. Public meetings are held in a new court-house; petty sessions weekly; markets on Tuesday; fairs on 25 Jan., and 25, 26, 27 Aug. A branch of the Yorkshire District Banking Company is established here. (*Allen and Bigland's Histories of Yorkshire*.)

BINTANG, an isl. of the E. Archipelago, lying off the S.E. extremity of Malacca; lat. 1° N., long. 104° 30' E.; length 35 m.; breadth about half as much; chief town Khio, formerly a place of considerable trade.

BIORNEBORG, a sea-port town of Russia in Europe, prov. Finland, gov. Åbo-Biörneborg, near the mouth of the Kouno, on the Gulph of Bothnia, 72 m. N. Åbo; lat. 61° 30' N., long. 21° 40' E. Pop. 4,567. It was founded in 1558, and is pretty well built. None but small vessels can come up to the town, those of larger burden anchoring at a considerable distance down the river. It has some trade in ship-building, and exports thence, timber, and tar, fish, &c. (*Schützler, La Russie*, &c., p. 622; *Dict. Géographique*, &c.)

BIR, or **BEER** (an. *Birkha*), a town of Asiatic Turkey, on the declivity of a steep hill, on the E. bank of the Euphrates, 75 m. N.E. Aleppo, and 38 m. W.S.W. Orfa; lat. 36° 54' N., long. 38° 7' 15" E. Pop. 4,000. It is surrounded on the land side by a well-built wall. Within the town, on a steep rock, is the citadel or castle, now in a state of dilapidation. It has several mosques, a public bath, and a caravanserai. The rocks on which the town is built consist of chalk; and the houses being also formed of this material, its whiteness, during sun-shine, powerfully affects the eyes, which are also injured by the dust that is blown about. Bir is the point at which travellers and caravans between Aleppo, on the one side, and Orfa, Diarbekr, &c. on the other, usually cross the Euphrates, which they do in boats of a peculiar description. It is also the nearest point on the Euphrates to Iskenderoun, and has latterly acquired considerable celebrity from its being the point at which Colonel Chesney has proposed to begin and terminate the navigation of the Euphrates by steam. (*See EUPHRATES*.)

BIRIOUTCH, a town of European Russia, gov. Voronezh, cap. distr., on the Sosna; lat. 50° 40' N., long. 38° 31' 15" E. Pop. 5,600. It is surrounded by a rampart and ditch; has 7 churches, and 4 fairs each year.

BIRMAIL, or **THE BIRMAN EMPIRE**, an extensive country of India beyond the Ganges, formerly the most powerful state of that peninsula, and considerably larger than at present; extending between the lat. of 5° and 27° N., upwards of 1,000 m. in length, and nearly 600 m. in breadth. At present it comprises the territory between lat. 15° 45' and 27° 22' 30" N., and long. 92° 43' and 90° E.; having W. the British prov. of Aracan, Chittagong, and Cassay; N. Upper Assam and Tibet; E. the Chinese prov. of Yun-nan, Laos, the country of the indep. Shans, and that part of the prov. of Martaban belonging to the British (which, together with those of Tavoy, Mergui, Aracan, Assam, &c., was taken from the Birmane in the war of 1824-5), and S. the Indian Ocean; length, N. to S., 710 m. (Engl.), greatest

breadth, E. to W., 370 m. Area, about 200,000 sq. m. Pop. perhaps about 4,000,000.* (See foot of previous column.) *Mountains*.—Birmah is enclosed E. and W. by two principal offsets from the Himalaya chain: in the N. and central parts of the country there are also many subordinate mountain ranges, running mostly parallel to the former, and like them decreasing gradually in height toward the S. From lat. 16° (Cape Negrais) to 23° N., the Anopetomoo, or Yoomadong mountains constitute the W. boundary. At the latter point of lat. this range is 200 m. in breadth, and from 2,000 to 5,000 ft. in height: in lat. 21° the elevation is considerably greater, but thenceforward it rapidly declines, and the breadth becomes so much less that, in 17° lat., it scarcely exceeds 20 m.; this chain terminates in a rocky promontory, bounding S.E. the Bay of Bengal. On the E. border a succession of ranges, inhabited by wild and half-subjected tribes, but little known to Europeans, stretch from the Gulph of Martaban to the Chinese frontier. *Zingyet-Thowng*, the highest point of the southernmost of these ranges, is no more than 3,000 ft. above the level of the sea; but between lat. 18° and 22° N., they rise much higher, and in the N. attain a very considerable elevation, the Phungun mountain in about 27° 15' N. and 97° 15' E., being 12,474 ft. high, and covered with perpetual snow. W. of the vale of Kubo, the Muring range now bounds the Birmane and Munneepoor territories; and E. of these, four hill-ranges extend in parallel lines, for a long distance S., enclosing three extensive valleys of the Khyendwe, Moo, and Irrawadi rivers. Ranges running E. and W. are uninfrequent, but there is one in 20° N. lat., about 50 m. S.E. of Ava; and a small range, the Galladzet hills, in about 18° 30' N., bounding N. the great plain of Pegu.

Plains, &c. — That of Pegu is the principal, and consists chiefly of the delta of the Irrawadi. It is a perfect flat, of most fertile alluvial soil, annually overflowed by its rivers, producing an abundance of rice, and constituting the granary of the empire. The valley of Hsikong, in the N., is an extensive plain, 50 m. long, and varying from 15 to 45 m. in breadth; bounded on all sides by hills, and which probably, like that of Munneepoor, at one period formed the bed of an alpine lake. (*Asiat. Journ.*) Excepting these, there are few plains of any size; but numerous valleys, of the highest fertility and beauty, as Kubo, Bharno, and those of the larger rivers: these are chiefly in the S. and central parts of the country; in the N. they are mostly rocky desiles, or narrow steppes.

Rivers. — The principal are the Irrawadi (*Erinate*), with its affluents, the Ningthee, Moo, and Lung-tchuen; and the Than-lweng, and Si-tang. The Irrawadi, an Asiatic river of the first class, rises in Tibet, and runs generally S. through the whole length of the Birman empire, falling, after a course of 600 m., into the sea, by a great number of mouths in the kingdom of Pegu. (*See IRRAWADI*.) The Than-lweng, or Sauluen, is also a river of the first class, and rises in Tibet, beyond the sources of the Irrawadi: it descends in a nearly uniform S. direction in almost all its course, bounding the Birman empire E., and falls into the sea between Martaban and Moulmein.

The Si-tang rises from the Lake of Guanngue, in lat. 20° 20' N., runs S., and disgorges itself, after a course of about 200 m., by a large mouth, but nearly useless as an harbour, or for navigation, because blocked up by an island and many dangerous shoals, with no more than a fathom water during the eflux of the tides, and not available for any vessels drawing 6 ft. water. This river communicates by cross branches with both the Irrawadi and Than-lweng. The Ningthee rises in the Patkoi chain, on the borders of Assam; and running in a S.W. direction, constitutes for some distance the boundary between Birmah and the Munneepoor territory, and falls into the Irrawadi, opposite Yandabo, in 21° 40' N. lat., under the name of the Khyen-dwen. It is navigable for the largest class of boats as far as Kingma, in 22° 40' N. lat.; almost all the streams which fall into it on the E. side are auriferous. The Aracan river for the greatest part of its course flows through the country of the half-subjected Khyens; and the Kuladyne, its chief tributary, is considered one of the boundaries between the Birmane territory and the British prov. of Chittagong.

Lakes are very numerous in the prov. of Pegu: in the distr. of Bassein as many as 127 have been enumerated. The largest lake, however, is that of Kandangyee, or the Great Royal Lake, 26 m. N. Ava, which is 30 m. long, 8 or 9 m. broad, and traversed by the Moo river, a tributary of the Irrawadi. There are other smaller lakes in its neighbourhood, but none of any importance.

Coast and Harbours. — There are 240 m. of sea-coast from the mouth of the Than lweng to Cape Negrais, with three good harbours: viz., those of Bassein, Rangoon, and Martaban: that of Rangoon is the best, but

* Some estimates differ widely from this; but this is of the highest authority, being that of Mr. Crawford.

	Sq. Miles.	Chief Towns.	Inhabitants.
The provinces under the actual dominion of the king of Ava are—			
1. Ava (Miamma Pyee)	53,466	Ava Amaraapura Sa-kaing Monchoho Yendabo Pegu Rangoon Froine (Pri) Bassein	354,000
2. Pegu (Fa-jain Pyee) Bassan, Sarawadi, &c.	22,540		40,000

is infested by a worm, which destroys all wood except ebony and tamarind.

Minerals.—The N. provinces are the richest in valuable minerals. Besides fine marble, which might be advantageously imported into England, as dead weight, serpentine, and nephrite, and amber mines are worked by the Chinese. Amber is found in immense quantities in the valley of Hukong; gold to the value of 100,000*l.*, and silver to that of 120,000*l.* per annum; all the varieties of the sapphire, with spinelle rubies, are found in great abundance at about five days' journey E.S.E. from the capital, and are important articles of export; besides, a few emeralds and sapphires, though of an inferior quality; iron, copper, tin, lead, antimony, arsenic, vitriol, sulphur, nitre, &c., are found. Petroleum is obtained in large quantities on the Irrawadi, above Prome. The wells, about 2 m. from the river, produce each a daily average of 150 gallons, which sells on the spot for about 1*l.* 8*d.* per cwt. The gross annual produce is about 60,000,000 lbs., and might be greatly increased. It is used for lights, paying boats, &c.; and is said to have the valuable property of securing wood from the attacks of insects. Coal is said to have been met with in various spots. A monopoly exists of gold, silver, and precious stones. (*Crawford's Journ.* pp. 441, 442; *Pemberton*, pp. 13, 134–142; *Malcom's Travels*, i. 169.)

The Climate is generally healthy, especially in the hilly tracts; but even in the plain of Rangoon, &c., it is infinitely more so than in Aracan or the valley of the Brahmaputra, a fact proved by the Peguans being amongst the most active, healthy, and vigorous inhabitants of the empire. The extremes of heat and cold are seldom experienced, except before the periodical rains. In Pegu, as high as Prome, there are but two seasons in the year, the rainy and the dry; the former lasting from the end of April to the end of Oct., and the cold season immediately succeeding, the rains are heavier in this than in any other part of India. In Birman Proper, or from Prome to lat. 26° or 27° N., there are three seasons; a cold, lasting from Nov. to Feb.; a hot, from March to June; and rain falling during the remaining months. Heavy mists occur in Nov. and Dec., but no snow falls; and only a little hail in April or the beginning of May. Earthquakes are not unfrequent, and in Pegu, violent rains, with thunder and lightning, &c., often usher in and conclude the wet season. The transitions of the seasons are extremely sudden; the greatest heats are in March and April: the trees shed their leaves in May, but only to be immediately clothed with new ones. In June, July, and August, the inundations from the mountains raise the river at Ava to 32 ft. above its lowest level (Feb.); but all the waters are drained off again by Oct. (*Sangermano's Descr.* pp. 164, 165; *Pemberton's (Capt.) Report*, &c. pp. 154, 155; *Dictionnaire Géog. Univers.* ii. 127.)

Vegetable Products.—Sixteen thousand different species of plants, natives of the Birman dominions, were collected by Dr. Wallich when he visited the empire in 1826; amongst them were the teak, saul, 7 kinds of oak, 2 kinds of walnut, 3 species of willow, a rose; the almost unique *Amerkasia nobilis*, near Martaban, a magnificent species of *Leguminosa*, 20 ft. high, handfuls of whose fine deep scarlet flowers are offered by the natives before the images of Boodh; the *Hibiscus Lindleyi*; many new genera of Orchideæ, Scitamineæ, Liliaceæ, &c. &c. (See Wallich's *Plantæ Rarioræ*, &c.) The teak-tree abounds in forests along the hills skirting the Irrawadi, and in the N. provinces, both on hills and in valleys; in lat. 23° 30' it approaches closely to the banks of the river, though it does not grow in Pegu within the influence of the tide. The most convenient and accessible forest in the country is that of Sarawadi, which furnishes nearly the whole of what is exported to foreign countries. The teak of Ava is said to be less durable than that of the coast of Malabar, but it has been ascertained by experiment to be stronger than the last, and therefore fitter for machinery, gun carriages, &c. In the vale of Kubo the saul and varnish-tree are most plentiful; bamboo grows to the circumference of 24 in. in the jungles, which contain whatever other underwoods are prevalent in India. The *minosa catechu*, sugar-cane, indigo, and cotton-plant, are common; and the tea-plant, of a genuine character, besides inferior sorts, flourishes on the heights of the N. and E. provinces. Every month produces some fresh fruit; the banana, cocoa, palm, pine-apple, guava, jambo, mango, &c., are abundant, but citron, pomegranates, and oranges, are the only fruit shared in common with Europe. Pulse of all kinds, wheat, maize, millet, rice, &c., and many pot-herbs, are usual articles of culture. Firs, &c., are rare, but junipers, rhododendron, and other European plants, grow on the upper region of Mount Phuyen and other considerable heights in the N.

Animals.—Elephants of three different varieties, the single-horned rhinoceros, wild boar, tiger, leopard, &c., inhabit the jungles; buffaloes, porcupines, civet and wild cats, and great numbers of apes, deer, and antelope, are found. Occasionally a white elephant is met with, which

is much prized, and one is always kept as part of the royal establishment at Ava, where he is treated with great care and attention. There are no jackals, or foxes, but dogs are numerous. There are no asses, except a few at the capital, obtained from the Chinese caravan; and, consequently, there are no mules. Game is not so abundant as in Hindostan: there is a small species of hare, but very inferior, and found only in the high lands. Snipes, quails, pigeons, our common fowl in the wild state, three species of peafowl, with one species of pheasant, are found; parrots, and other birds of rich plumage, are found; the gyal, in the Irrawadi, chameleon, many lizards and formidable serpents, as the *cobra-de-capello*, *cobra ceras*, &c.; tortoises, the mango fish, sable, and many others; scorpions, spiders, and centipedes, leeches, which abound in dangerous numbers in the marshes, mosquitoes, and a very voracious ant, destructive to house furniture, are among the animals. (*Crawford*, pp. 454–457.)

People.—Several distinct tribes inhabit the Birman territories; viz., 1. the *Mramma* (Birmans), between 19° and 24° N. lat.; 2. *Talaia* (Peguans), between the Than-lweng river and the Galladzet to the S. and E. hills; 3. *Shans*, with more affinity to the Siamese than other races, and spreading over the E. and N. provinces; 4. *Gassaycers*, chiefly in the capital; 5. *Khyens*, a rude people scattered among the other population, but living in the mildest parts of the country; 6. the *Ys*, probably a Chinese tribe who have adopted Birman customs, residing between the latter and the Irrawadi; 7. *Karyens*, inhabiting an extensive hilly tract between the Than-lweng and Sitang, good cultivators, but unsubdued, and bearing great enmity to the Birman: the *Lababings*, Taong-ai, &c.; the *Khamd*, *Singphos*, and other Tibetan or Tartar tribes in the N. Mr. Crawford estimates the Karaens and Khyens in Bassein prov. at 45,000, and the whole of the wild tribes at 80,000. Most of these nations, though differing in language, manners, &c., are of the physical type common to all those situated between India and China. They differ from the natives of both these regions in certain particulars, and are said by Crawford to resemble more the Malays. The Birman are short and stout, but well proportioned; with coarse black hair, and an olive complexion: the women are fairer than the men, who have more beard generally than the Siamese; the physiognomy of both sexes is open, cheerful, and not unpleasing, and very few of them are in any way deformed. They are robust, active, inquisitive, not deficient in courage, and form a total contrast to their neighbours of Bengal in habits and disposition. They are said to be lively, and impatient; much addicted to theft and lying, deceitful, servile, and proud; but at the same time courteous, benevolent, and religious—though it be difficult to imagine religion linked with thieving and lying. The foreigners settled here consist of about 16,000 Siamese slaves; 1,000 Anamese, descendants of some who were formerly in a state of slavery; about 3,000 Chinese, chiefly from Yunnan, settled in the towns of working the mines; many Hindus from Bengal, Mohammedans, and a few Europeans. Though fond of repose, when an inducement to exertion offers, the Birman exhibit not only great strength, but courage and perseverance, and often accomplish what we should think scarcely possible. But the mildness of the climate, the fertility of the soil, and the badness of the government, render these valuable qualities of little avail. In countries like Birman, the customary standard of competence is easily attained. The poorest classes obtain the necessities which they require with comparatively little labour; and those who should go further, and attempt to make a display, or to improve their lands and houses, would expose themselves to extortion, and perhaps to personal danger. Sloth is, in consequence, the solace of the poor, and the principal enjoyment of the rich. (*Crawford*, pp. 371, 372, 465–470, &c.; *Malcom*, i. 220, &c.)

Occupations.—*Agriculture.*—Excepting near the towns, most of the land is waste and unappropriated, unless occasionally by wandering tribes, who raise crops with little labour on the virgin soil. The cultivated lands are assigned, with their inhabitants, by the sovereign, in large districts, to his various favourites, who are not unaptly called their "esters," and who grind their cultivators by the most oppressive exactions. The farms generally consist of only a few acres each; and agriculture, except, perhaps, among the Karyens, is in its rudest and most imperfect state. Rice is the chief article of produce, and forms the main food of the people: it is mostly grown in the S., where, although the plough is seldom used, and the soil only trodden by cattle, a single crop is said to yield 80 or 60 fold. In the N. provinces a plough, similar to that of India, is used, and the soil is afterwards pulverised by means of a wooden cylinder, and a rough harrow dragged over it: 2 or 3 crops a year are here obtained, but they are not so productive as the single crop of the lower provinces. Pulse of various kinds, Indian millet, and maize, are grown in the N. prov., the latter yield-

ing (but such statements are almost always exaggerated) 100 fold. Good wheat is grown in the neighbourhood of the capital, but it is little used for bread; and we have been assured by Mr. Crawford, that all the wheat produced in the empire would not feed 50 families! *Secamum* is universally cultivated for its oil and oil-cake, which is given to the cattle. Cotton (*gossypium herbaceum*, Wallich) of a firm and silky texture, but of short staple, is grown in every part of the empire and of its dependences; but principally in the upper provinces. Indigo is also generally grown, and is naturally of good quality; but the culture and manufacture of the plant are both so very rude, as to render the produce wholly unfit for exportation. The potato and pot-herbs of Europe are quite unknown; but yams, and a species of sweet potato, are, as well as tobacco, very general articles of culture in the N. There are no melons, cucumbers, or egg-plants; but the banana, tamarind, &c., are extensively grown; and in some tracts the number of fruit-trees forms the basis of taxation. The sugar-cane is cultivated, and the stalk eaten when ripe, the manufacture of sugar, except a very small quantity, being unknown. An inferior kind of tea, with a large leaf, is grown on the hills, and eaten by the natives with garlic and onions, which are also produced there. Capsicum, next to salt, forms the chief condiment; from the highest to the lowest, all season their rice with this plant, and its consumption is "incredibly great;" betel-nut is raised for home consumption; and the piper betel is cultivated largely, and of excellent quality. In addition to rice, pumpkins and pulse, *gnapee** and oil, compose the main food of the peasantry. Animal food being prohibited by the Buddhistical religion, is not generally eaten, excepting poultry or fish which have died a natural death, lizards, serpents, iguanas, &c., by the lower classes; or game, &c., by some individuals privately. Many of the hill tribes do not, however, regard the injunction, and kill bullocks and other cattle for food, or to sacrifice to their deities: many others also, by one means or other, evade the law of not spilling the blood of animals, or openly break it. The common beverage of the people is water; but spirits, though prohibited, are imported or distilled from rice, and toddy is made from the juice of the palmyra, date, or cocoa-tree.

Cows, buffaloes, goats, and a very few sheep, are kept; but neither for their flesh or milk. Oxen are used only for draught, and prevail chiefly in the upper country, the buffalo being more common in the lower. The Birman horse is not more than 13 hands high, but strong, active, esteemed in the country, and used only for the saddle. The elephant is domesticated and used for carriage; the camel is altogether unknown. Hogs are plentiful, but commonly used only as scavengers.

Arts and Manufactures are in the most backward state. Ploughing, cleaning cotton, spinning, weaving, and dyeing, are operations mostly performed by women or captive Casays: the loom used is like that of Bengal. Silk and cotton goods are woven, the former chiefly in the capital and the large towns in its vicinity, but are very inferior to those of India and China. The Khyens, however, though considerably less civilised than the Birmanese, surpass them greatly in the manufacture of silk, and produce some superior crimson scarfs, embroidered with gold, and narrow shawls. The Khyen looms can only make fabrics 1 cubit, while those of the Birmanese produce some 2 cubits in width. Printing on cotton, &c., is unknown; but dyeing with indigo, turmeric, &c., is practised; and the colours of the Birmanese fabrics are much admired for their brilliancy: alum is the only mordant used. No fine linen is manufactured; and British goods of all qualities are commonly imported, and sold cheaper than any produced by the natives. Some coarse earthenware is made; the large Pegu jars are well known, and somewhat celebrated, but seem no longer to be manufactured: all the porcelain used is imported from China. The Birmanese cast bells, and execute slaggees, &c. in gold and silver respectably; but otherwise they do not work well in metals. Some rude cutlery and matchlocks are made at Ava, &c.; but their swords are chiefly bought from the Shans, and old muskets from the English: the latter fetch from 37s. to 50s. each, while new Birman muskets are only considered worth 25s. Lacquered ware for trays, betel boxes, &c., is amongst their best manufactures. Their gunpowder is very bad. Their paper is of three sorts, one of which is made of bamboo fibres, covered over with a mixture of charcoal and rice-water, and written on with a piece of statite, as we do on a slate. Nearly all their manufactures are domestic. Excepting carpenters, smiths, masons, carvers, and gliders, who work for the palace, temples, and priests, there are but few public artisans, and these reside only in the larger cities. The Birmanese war-boats are very well built, and adapted for their pur-

pose: they consist of the trunk of a long teak-tree, expanded by heat so as to admit two rowers abreast; the gunwale is raised a foot above the side, and elaborately carved and gilded, as well as the prow, which is much raised: each boat holds from 20 to 100 men, and in velocity they very far transcend our swiftest men-of-war boats. The common trading boats are mere canoes, decked with split bamboo, and partly covered in with mats, with one bamboo for a mast and another for a yard.

Houses, Temples, &c.—The ordinary houses consist wholly of bamboos and matting, badly thatched with leaves or grass, very soon built or removed, and in the lower situations raised 3 or 4 ft. from the ground on wooden posts; those of the priests are of a superior kind, and somewhat similar to those of the Chinese, or those of the Shans in the N. provinces, having a long roof rounded at the ends, matting walls, and being divided into several compartments. The ordinary beds of the people consist of merely a small mat laid on the ground. The temples are of different styles in different provinces; at Pagan, in Birman Proper, they are heavy, broad, and surmounted by a small spire; the Pegu pyramids are adorned with many figures of griffins, eagles, crocodiles, &c. They are all much gilt and decorated, and often contain very solid masonry: many are, however, in ruins, since most of them are built and endowed by wealthy individuals, and it is deemed more meritorious to build a new, than to repair an old one.

Commerce.—In the lower provinces the traffic is almost wholly by water conveyance; in other parts goods and passengers travel by carts or waggons drawn by oxen, or on the backs of these animals: the upper districts send to the lower petroleum, nitre, paper, lacquered wares, silks and cottons, cutlery and metal ware, palm-sugar, onions, tamarinds, &c. and receive from Rangoon, Tongbo, and Bassein, which are the chief trading places, rice, salt, pickled and dried fish, and foreign commodities. The Shans export cottons, silks, ivory, bees' wax, stick-lac, varnish, lacquered wares, swords, and metals, to Ava, and take back salt, dried fish, &c. The red Karyens traffic in slaves with the Siamese, which may, it is said, be put an end to by the British authorities, our possessions in Martaban intervening between the two territories. The principal foreign trade is with China, and its chief seat the town of Bhamo, whither the Chinese caravans come and meet the Birman and Mohammedan merchants; and from Dec. to April this town "presents a most animated scene of active industry, and a greater variety of tribes than is, perhaps, found at any other fair in Asia." The principal articles of import from China are silk (to the amount of about 27,000 bundles, worth 81,000*l.* a year), copper, carpets, fur jackets, ornament, quicksilver, vermilion, verdigris, drugs, tea, fresh and dried fruits, dogs, birds, &c. The tea, of a coarse quality, is sold at about 6*d.* per lb. The exports to China are chiefly raw cotton, averaging 14,000,000 lbs., and worth 228,000*l.* a year; feathers, ivory, wax, edible birds' nests from the Mengy archipelago, rhinoceros' and deer's horns, sapphires, and some British manufactures; chiefly broad cloths and carpets. The total value of the trade with China is variously estimated at from 400,000*l.* to 700,000*l.*, of which, as already seen, silk and cotton amount, in ordinary years, to about 309,000*l.* The principal foreign trade of the Birmanese by sea is carried on from Rangoon, with Calcutta, Chittagoug, Dacca, &c. By far the most important article of export in this way is teak timber, of which about 7,500 full-grown trees used to be annually shipped, principally for Calcutta. Among the secondary articles of export are cotton, of a superior quality, formerly used in the manufacture of the muslins of Dacca; with gold and silver, catechu, stick-lac, ivory, glue, &c. The imports by sea are British cotton goods, which have nearly superseded those of India, araca and cocoa-nuts, tobacco, iron (wrought and unwrought), copper, lead, quicksilver, borax, nitre, gunpowder, fire-arms, opium, sugar, arrack, rum, English glass and earthenware, steel, &c. (For further information as to the trade of the Birmanese, see *Crawford's Journal*, ii. 189–199; *Malcolm*, i. 265; and the art. RANGOON in this work.)

Measures, Weights, &c.—The chief measure of capacity for rice is the *Bakel* = 584 lbs. avoird., = *of length*, the finger-breadth, hand-breadth, span, cubit 19 spans, or 19.1 Eng. inches, bamboo = 28 cubits (144 yds.), taing = 7,000 cubits (2 m. 1 fur., nearly);—the chief *weights*, the tical (nearly $\frac{1}{2}$ oz. avoird.), viss = 100 ticals, or 3 catties (2 lb. 2 oz.).

Money.—There is no coined money, excepting some of very base quality, and of lead, struck at Amarapura and Rangoon; gold and silver ingots, of a tical weight, and various degrees of purity, form the rest of the currency. Gold is valued at about 17 times the worth of silver, a tical of which latter, nearly pure, is worth 2*s.* 8*d.* (*Trant*.)

Revenue and Taxation.—One tenth part of the products of the cultivator, which is often taken in kind,

* *Gnapee* is made of prawns, shrimps, or any cheap fish, pounded into a consistent mass, and frequently allowed to become partially putrid. It is known in commerce by the name of *Betelching*. (*Malcom*, i. 265.)

and 10 per cent. on all imports, &c. (12½ per cent. is exacted at Rangoon, 2½ per cent. of which go to the underlings of the government), 5 per cent. on exports and on the petroleum collected; the monopoly of marble, amber, the precious metals, and gems above a certain size, of wrecks, and the property of certain foreigners dying in the country, all belong to the king. The fiscal system is "replete with uncertainty, rapacity, and violence;" there is no direct land-tax, but parties are assessed in proportion to their supposed means, or rather inversely, as to their ability to pay, since it is often according to the number of persons in a family; in other places, it is as the number of fruit-trees; or a house-tax is resorted to. The revenue derived from the Kareyns, by a personal or poll-tax, is 3,000 rupees a year. These, together with imposts on salt, fisheries, &c., and duties from the Chinese workers of the mines, are the chief sources of the royal wealth. Most of the provinces are considered the property of the royal family or principal court favourites; the king, as he grasps at more money, assesses each of his viceroys in a certain sum; these assess their subordinate district governors for a larger sum, and these again force still more out of the unhappy peasantry, who generally are made to pay double the sum originally demanded by the king. The gold and silver that thus reaches the royal treasury is never, except on urgent occasions, disbursed again; the only channels of its expenditure are in presents to favourites, gilding temples (for which most of the gold in the country is used), and making ornaments. The obligation to make presents to obtain favour or justice prevails universally, and from the top to the bottom of the social scale, there is one uniform system of extortion and rapacity, which has so completely crushed the spirit of the people, that, although few are in beggary, all fear to be rich, lest they should be marked out and impoverished by the harpies of the state. (*Crawford's Journ.* pp. 415—432.)

The Government is an hereditary and absolute despotism, the sovereign being "lord of the land and lord over his subjects, who style him 'golden,'" speak of informing the "golden ear," throwing themselves at the "golden feet," &c. They approach him with their hands joined above their heads, and even make obeisance to the palace walls, before which all must dismount and take off their shoes. The sovereign is assisted by 4 wongcees, or chief public ministers; 4 atween-woons, or private counsellors; 4 woon-docks, ministers of the interior; 4 state secretaries; 4 reporters; 4 officers, to regulate ceremonies; 9 to read petitions, &c. Their several ranks are determined by their dresses, coronets, and number of gold chains; the monarch himself only being privileged to wear 24. The whole nation is divided into the royal family, nobles, and commonalty, and none dare assume the dress of a superior grade. The Birmanes have no farther distinctions of caste, as in India, nor any hereditary distinctions; although, in other respects, a kind of feudal system prevails; and the king can command the appearance of his nobles in the field, with their quota of vassals. (*Hamilton's Gaz.* pp. 48—50; *Sangermano*, p. 58; *Wilson's Docum.*, Append. p. 38; *Crawford*, p. 491; *Trant*, p. 267.)

Armed Force.—The Birmanes are not, as a nation, a military people, but would make good soldiers under able officers. There is no regular system of conscription; every man is liable to serve, but no large force is ever disposable; and it is believed that the whole levies raised to oppose the English in the last war (when the government was in such alarm that 150 teals, nearly 200, bounty was given to each man), did not amount to more than 50,000 men. (*Capt. Low's Hist.* &c.) Excepting a small body of Cassay horse, and one of artillery, all are infantry, and armed with long spears, two-handed swords, and muskets, and the jungle a kind of carbine, carrying large balls, which, as they are good marksmen, is a formidable weapon; except in close combat. They are adepts at raising stockades, which they do wherever they take up a position; but these are not generally defended with much vigour. The war-boats, which have each a nine-pounder, or small piece of ordnance at the prow, constitute the best portion of the armed force.

Jurisprudence.—Each large city has its judicial tribunal, and townships (*myo*) have each a governor, called *myo-ss-gi*, who is assisted by inferior police officers, placed over the several wards; from the decisions of the *myo-ss-gi*, there is appeal to the provincial governors, and from the latter to a higher law officer in the capital. The code of laws (which may be found at length in Sangermano's "Description of the Birman Empire") is derived from the "Institutes of Menu," and contains many salutary regulations; but through a most corrupt administration, the aims of justice are frequently perverted, and the greatest tyranny is exercised. The slavery of a debtor, or his children, in discharge of a debt, is common; and females, in such a case, may be used as concubines. Trial by ordeal often takes place, and in criminal cases the punishments are marked by

the greatest cruelty. The Birmanes seem to have taxed their ingenuity to invent terrific and revolting modes of death. These they bear with an intrepidity or indifference common to all Asiatics; but owing to the extreme corruption of the Birmanes officers, there are very few offences that may not be explained, or their punishment materially alleviated, by a pecuniary sacrifice. (*Crawford*, pp. 413. 491. &c.; *Sangermano*, pp. 65—70; *Wilson's Docum.*, Append. p. 44.)

Religion is Buddhism, believed to have been introduced by Gaudma, the chief deity himself, in the 6th century B.C. This faith is universal here—except among foreigners; individuals who have been converted to Christianity; a few Zodi, believed by Sangermano to be Jews; and some hill tribes, as the Khyens, Kareyns, and Cassays, in the lowest stage of idolatry. Those who are curious in religious creeds may find that of Hooch at full length in translation of Sangermano. The priests, called Rihahans, are much respected; they are bred up like monks to their calling from an early age, and observe celibacy; but may at any time renounce their vows and marry. They are voluntarily maintained by the population, and suffered to engage in manual labour; their chief occupation being the instruction of youth. All foreigners are allowed the fullest exercise of their religion; and may build places of worship any where, and have their public festivals and processions without molestation. But, though thus tolerant to strangers, they are most intolerant to their own people. No Birman dare join any of these religions, under the severest penalties; and the most rigorous measures are adopted for suppressing all religious innovations. It is a curious fact, that the inhab. of the conquered Birmanes provinces in our possession seem to be now more attached to their religion than ever. A notion that it was in danger, seems to have awakened new zeal in its favour. (*Malcom*, i. 320.)

Education is so far diffused that almost every male Birman can read and write, and this is the case with many of the females. The Khyens have no knowledge of books or reading, &c., and hold medicine in contempt: the Birmanes themselves are grossly ignorant of physic; blood-letting is unknown, and whether for fever or rheumatism, they shampoo the patient, treading him till he is in a profuse perspiration; any one may practise this profession. Diseases of the digestive organs, and of the skin, cholera, leprosy, &c., are the most frequent; inflammations are not generally acute, and wounds of a very severe character are said to heal with singular rapidity.

The Birmanes are possessed of some knowledge of the heavenly bodies, and the signs of their zodiac are the same as ours: their year consists of 354 days, the errors in which computation they partially rectify every third year. They have 12 months, of 29 and 30 days alternately, and 7 days in the week, named from the planets, in the same order as ours. There are 70 hours between sunrise and sun-set, calculated at the capital by the successive filling of cups by dropping water; but as the length of the days changes, these cups must, of course, be also continually changed. Their common era begins from the year A.D. 638, making our year 1839 the Birman year 1201. (*Sangermano*, p. 162; *Trant*, p. 267. *Hamilton's E. I. Gaz.* p. 51.)

Language.—There are two languages spoken by the bulk of the people; viz. the *Birman* by the *Birman*s, and the *Peguian* or *Mou* by the *Peguans*; exclusive of many rude dialects. Besides these, there is the *Pali*, or sacred language, which has a distinct written character. In the common *Birman*, the letters are formed of circles and segments of circles, probably derived from the *Pali* alphabet, but differing wholly from the *Dreanagari*. The signs of the language are not very intelligible. There is no inflection of any part of speech. Relation, number, mode, and time, are all indicated by prefixing or affixing certain articles. The words follow each other in their natural order, an arrangement indispensably necessary to a dialect so inartificial. (*Crawford's Journ.* p. 387.)

Dress.—That of the men is a covering from the loins reaching half way down the leg; over this a frock with wide sleeves, tied all the way to the knee; on the head, a square handkerchief of English or Madras manufacture, or a turban of English book muslin. The women wear a somewhat similar dress, but shorter than that of the men; and the petticoat being open in front, permits the thigh to be seen at every step: they wear no head-dress. The hair of both sexes is worn long, and tied in a knot on the top of the head: the men pluck out their beard; but the practice of blackening the teeth is not followed as it was formerly, and still is, by some neighbouring nations: sandals, but neither boots, shoes, nor stockings, are worn. The dress of the peasantry, Khyen tribes, &c., is mostly black; yellow is a sacred colour, and only used by the priests and upper classes; a quilted jacket is sometimes worn; and in the N.E. the Chinese costume is adopted. The court dress of the nobility is handsome,

consisting of a long robe of flowered satin or velvet, reaching to the ankles, with an open collar and loose sleeves; velvet caps with gold circlets, many ornaments, &c.

Habits, Customs, &c.—Chewing betel is common, and smoking universal, even with children. The Birmese eat twice a day; viz., early in the morning, and in the evening: their food is served up on trays, in red lacquered plates, and small cups: spoons are used, but not so much as fingers: knives and forks are unknown. The people are very superstitious, consult the stars, believe in fortunate or evil times, wear talismans, practise alchemy, &c. If any member of their small communities of 4 or 5 houses chance to die, the Khyens believe the evil spirit has taken possession of the place, break up their settlement, and remove to another spot; and, when an earthquake happens, shout and beat their houses, to expel the fiend.

Slavery, and especially the selling of women, is general: polygamy is allowed; marriage, although a mere civil contract, is universally respected; and the sovereign himself has no right to seize for his harem a married woman. Divorces are exceedingly common: females are allowed as much liberty, usually, as men: they are engaged in all sorts of drudgery and confidential occupation, yet infidelity among those who are married is rare, though chastity among the others is a virtue little practised or appreciated. To avoid, it is pretended, the seizure of their females, who have naturally some beauty, the Khyens have long adopted the custom of tattooing their countenances: a tattooing of their bodies in all kinds of figures also prevails amongst the Birmese. Corpses are either burned or buried; persons of rank are publicly laid out in state; and amongst all classes visits of condolence and presents are received by the survivors of deceased persons, and musicians attend to play before the body till the funeral, which is conducted with as much magnificence as the friends can afford. The funerals of priests are public festivals, and many accidents are caused by timber, and other heavy bodies that are fired up in the air on those occasions, falling on the crowd that has collected: the Khyens also treat deaths as matters of public rejoicing. Many *barbaric* customs prevail amongst the Birmese; such as the privilege that every one has to throw water over any others, of whatever rank, during the last three days of the year, which produces much sport; the privilege that friends of new married people have to come into the house on the wedding night and break every thing they can find, for which reason weddings are often kept secret, &c.

Amusements, Taste, &c.—Boxing, cockfighting, football, throwing a quoit of bamboo, a few games of chance, chess, and dancing, are among the chief recreations. The Birmese are good mimics, and very fond of acting; their drama is by far the best among the Indo-Chinese nations. Their music (several specimens of which are given in Mr. Trant's *Two Years in Ava*) possesses decided melody; they are much attached to it, and usually sing at their work. Their principal instruments are, a drum of bamboo or cane, covered with skin, a kind of hurdy-gurdy, oboe, lute, &c.; in their dances they exhibit many contortions of the body. They have several epic and religious poems, besides some other literary productions.

History.—The earliest records go back to the year a. c. 543. The first kings are said to have come from Bahar, and fixed the seat of government at Promé, where it continued for 336 years. In A. D. 107 it was removed to Pagan (Paghah Mow) where it remained for 12 centuries, and where are still to be seen extensive ruins, including many temples, and some relics of Hindoo worship. In 1322, the court was removed to Sakking; in 1364, to Ava; in 1752, Alompra transferred it to his native place, Monchobo; one of his sons carried it back to Ava; another to Amarapura: from 1822 to 1837, Ava again became the capital, when the revolution that placed the Prince of Sarawadi on the throne, restored that honour to Monchobo.

In the 18th century the Birmese became the most powerful nation of the E. peninsula of Asia. Ava had been governed by the King of Pegu for some time previous to 1783, when Alompra, the founder of the present dynasty, expelled the Peguans from Ava and Promé, and in 1756 effected the conquest of Pegu. The Shan country was conquered by his son in 1768; Cassay in 1774; Aracan in 1783; in 1790, the Tenasserim provinces taken from the Siamese; and Assam conquered in 1823. Emboldened by these successes, the court of Ava entertained designs on the neighbouring British territories; our frontiers were subject to continual irruptions, and our ambassadors to all kinds of contempt and insolence; until, after a hostile invasion of Cachar, a state with which we were allied, and renewed outrages on our possessions in Chittagong, Sir A. Campbell was sent with an army up the Irrawadi. After a variety of engagements, in which the British were always successful, a treaty was concluded Feb. 24, 1826, at Yandabo, 50 m. from the capital, by

BIRMINGHAM.

which the provinces of Aracan, Yé, Tavoy, Mergui, and part of Martaban, were ceded to the British, together with 5,000,000 rupees to defray the expenses of the war; and the King of Ava ceased to have dominion over Assam, Jyntea, Cachar, and Cassay. In April 1837 the Prince of Sarawadi, brother to the former king, seized the throne; put to death or otherwise disposed of the courtiers who had been opposed to him; and removed the seat of government from Ava to Monchobo.

It is worthy of remark that, in our late invasion, the country people displayed no vigorous opposition or enmity towards the British troops; indeed, so far from it, when they found that their property was respected, and themselves treated with humanity and kindness, they flocked back to their deserted habitations; freely supplied the soldiers with provisions; expressed their wishes for the success of our arms, and our permanent occupation of the country; and, in some instances, openly declared in our favour.

The contrast between the present and former state of the Birmese provinces occupied by the British, is most creditable to our government. An unexceptionable witness, Mr. Malcom, the American missionary, says that "coin is being introduced, instead of masses of lead and silver; manufactures are improving; implements of improved construction are used; justice is better administered; life is secure; property is sacred; religion is free; taxes, though heavy, are more equitably imposed; and courts of justice are pure, generally. Formerly, men were deterred from gathering round them comforts superior to their neighbours, or building better houses, for fear of exactions: now, being secure in their earnings, the newly-built houses are much improved in size, materials, and workmanship. Every where, in British Birmah, people praise British justice." (l. 74.) It is to be hoped that this striking change may lead the Birmese to reflect on the gross defects of their institutions, and thus pave the way for their improvement. (*Crawford's Embassy to Ava*, the best work by far that has hitherto appeared on the country; *Malcom's Travels*; *Pemberton's Report on the E. Frontier*; *Sangermano's Desc. of the Birman Emp.*; *Wilson's (II. H.) Documents, &c.*; *Trant, Symes, Foley, Hanway, Richardson, &c.*, in *Calc. Asiatic Journal, Asiatic Researches, &c. &c.*)

BIRMINGHAM, the principal hardware manufacturing town of England, co. Warwick, at the W. extremity of the co., and nearly in the centre of the kingd., 18 m. N. W. Coventry; 56 N. W. Oxford; 69 S. W. Manchester; 102 N. W. London; lat 52° 30' N., long. 1° 18' W. Including the immediately contiguous townships of Aston and Edgbaston, it extends over an area of 18,780 acres, and had in 1801 a pop. of 73,670, and in 1831 of 146,986; viz., 71,756 males, and 75,230 females. At present (1839) the pop. is probably not under 190,000. Birmingham stands on the side of a hill by the river Rea. The principal thoroughfare of the older portion, in a low and damp situation, exhibits some curious specimens of ancient domestic architecture. The more modern part, placed on higher ground, contains some magnificent and costly buildings, a great number of spacious and well laid out streets, with houses, principally of brick, though many of the more recently erected have stone fronts. Among the public buildings may be specified the theatre, reckoned one of the most commodious and superb for its size in the kingd.; the Society of Arts; the market-hall, 365 ft. long by 108 wide, lately erected; the town-hall, a noble building, modelled on the temple of Jupiter Stator at Rome, built of brick, faced with Anglesea marble, 166 ft. long, 104 ft. broad, and 83 ft. in height, having a grand saloon, capable of accommodating 9,000 persons, and containing one of the finest extant organs. The churches and chapels are particularly handsome; that of St. Philip, on the summit of the highest eminence in the town, is justly admired for its architectural beauty: the new church of St. George, endowed and mostly built at the cost of Lord Calthorpe, is also especially worthy of notice. The barracks, erected in 1793, at the N. E. extremity of the town, cost 13,000*l.* The free school, erected from the design of Sir Edward Barry at a cost of

40,000*l.*, on the site of the ancient building, is one of the most perfect structures of its kind in Europe, and a principal ornament of the town. The Blue-coat school, founded in 1724, and enlarged in 1794; the News room, on Barnet's Hill; the buildings connected with the railway station, covering and enclosing 10 acres of ground; with some very superior hotels and assembly-rooms, may also be specified. A bronze statue of Nelson, by Westmacott, stands nearly opposite the market-hall; and a handsome bridge has been erected across the Rea, at Deritend. It was only very recently that Birmingham became an incorporation, or possessed any chartered privileges: in fact, in 1676 it was not even a market-town. Its ancient government was by two constables, a headborough, a high and low bailiff, with other inferior officers chosen annually at the court leet of the lord of the manor. The duty of the high bailiff was to inspect weights and measures, and the markets; that of the low bailiff, to summon juries, and to choose all the other officers. It should, however, be observed, that the terms high and low had no reference to the duties performed by these functionaries. The duties of the two high tasters were, to examine the quality of the beer, and its admensurement; and of the two low tasters, or meat conners, to inspect the meat exposed for sale, and to cause that to be destroyed which was unfit for use. Under its recent charter of incorporation, Birmingham is divided into 16 wards, and is governed by a mayor, a recorder, 16 aldermen, and 48 common councilmen. It has also, since the passing of the Reform Act, sent two members to the H. of C., a privilege which it did not previously enjoy; and had, in 1837-38, a parl. constit., of householders of 10*l.* and upwards, of 5,555. The boundaries of the parl. bor. include the parishes of Birmingham and Edgbaston, and the hamlets of Deritend and Bordesley and Duddeston cum Nechills. The pop. of the parl. bor. in 1831 was 142,251. The charter constitutes the corporate body a court of record for the borough, to be held on Wednesday for the recovery of debts, under 20*l.* There is a board of officers, under a local act, for the administration of relief to the poor. A well organised body of police is about to be established. With the exception of those just built, the streets are all paved, thoroughly drained, and lighted with gas; and a company has been formed for supplying the town with water. Prior to 1715, Birmingham formed only one parish, and for all civil purposes is still so considered. In that year, however, a portion of the parish of St. Martin was formed into that of St. Philip; and in 1829 two other parishes were formed; viz., St. George and St. Thomas. There are four district, and other churches; several chapels of ease, and places of worship for Protestant dissenters, Roman Catholics, Swedenborgians, Scotch Presbyterians, and Jews. The living of St. Martin's parish is a rectory, charged in K. B. 19*l.* 3*s.* 6*d.*; that of St. Philip is a rectory, not in charge; to which is joined the prebend of Lawley, including the dignities of canon, residentiary, and treasurer, in the cathedral of Lichfield, and is in the gift of the bishop; that of St. George is a rectory, in the gift of a private individual. The remainder are curacies, either in the gift of the bishop of Lichfield, or of peculiar trustees. There are numerous charitable institutions, both medical and educational. The General Hospital and General Dispensary are supported by voluntary contributions, legacies, and other donations. The former is supposed to receive more extensive patronage than any institution of a like nature in Britain;

and annually alleviates the affliction of a vast number of patients. The cost of erecting the General Hospital—one of the finest buildings in the town—was upwards of 10,000*l.* It was begun in 1776, and completed in 1778; but in 1791 it was enlarged by the addition of wings. The General Dispensary, instituted for the medical assistance of poor, sick, and midwifery patients, at their own houses, was established in 1794. Besides these benevolent establishments, there is an institution for the relief of bodily deformity, an infirmary for diseases of the eye, a Magdalen asylum, several sets of alms-houses, founded by W. Lench in the reign of Henry VIII.; and gratuitous musical festivals are held at Christmas in the town-hall, for the benefit of distressed housekeepers. A history of the schools of Birmingham would fill a volume. The 20th report of the charity commissioners contains 114 closely printed folio pages, solely upon the charities of this town. The free grammar-school was founded in 1552, "for the education, institution, and instruction of boys and youths in grammar," and endowed with the revenues of the ancient guild of the Holy Cross. Many inferior schools in the town derive their funds from this establishment. Since 1676, a sum, more or less, has been set apart from it to furnish exhibitions at Oxford or Cambridge; and since 1796, the number has been ten, at 35*l.* each. It is reckoned, that by the year 1840 its revenues will amount to 9,000*l.* a year. In the Blue-coat school, (founded in the early part of last century, and supported by voluntary contributions, rents of lands, premises, and funded stock,) nearly 200 children are taught writing, reading, sewing, and other useful arts. The other principal schools are, the Protestant Dissenters' Girls' Charity-school, the Royal Lancasterian, the Female Lancasterian, and Madras school, on the principles of Dr. Bell's system. There are also national, infant, and Sunday schools; a school for deaf and dumb; a royal medical school; a school of medicine and surgery; a college for the education of young men, established by the Independents; a philosophical institution; an atheneum, for the diffusion of literature and science; a society of arts, and a mechanics' institute. According to a return made to the select committee on education, in 1838, there appears to be in Birmingham 634 schools, and 29,149 scholars; of which 97 schools and 2,166 scholars are stated to be of a superior description. There are 2 public libraries. The Old Library, a neat structure, has about 600 subscribers, and the collection of books, amounting to upwards of 20,000 vols., is as good as any of the kind in the kingdom. The New Library is a smaller building, containing about 5,000 vols.

Manufactures.—As a place of manufacture Birmingham has long held an important position, and has never been surpassed in the production of articles of ingenuity and utility: most articles in gold, silver, iron, copper, brass, steel, mixed metals, and glass, are produced here, from the most trifling trinket to the most ponderous and powerful machine. Of the early history of its manufactures we know nothing certain. It is supposed, and with great probability, to have been the place where the arms with which the early inhabitants defended their shores from the invaders under Julius Cæsar were manufactured: a supposition favoured by the fact of moulds for spear, arrow, and axe heads having been found either in the neighbourhood, or at no great distance from it, added to the proof afforded by the enormous mountains of calx or cinder which borders on the parish of Aston, and with regard to which Hutton (*Hist. Birmingham*) remarks, "From an attentive survey the observer would suppose so prodigious a heap could not accumulate in a hundred generations; however, it shows no perceptible addition in the age of man." So far back as the 12th century it was noted for the tanning of leather; but this

trinket trade is astonishingly great; and the transactions are often immense. In articles of comparative insignificance. This is evinced by the fact of one manufacturer having received an order for the eyes of dolls to the extent of no less than 500*l*.

The manufacturing district, of which Birmingham is the centre, embraces a considerable tract to the N.W. of the town, embracing the southern part of Staffordshire, with the extreme northern border of Worcestershire and a detached part of Salop. Within this district are the populous towns of Dudley, Wolverhampton, Bilston, Walsall, Wednesbury, and Stourbridge. Independently of the production of the crude material, in which most of these towns are extensively engaged, different branches of the hardware manufacture are carried on in them, as the nail and japan ware trade, bridles, and stirrup plating, coach and harness ornament making, and saddler's ironmongery. The japan ware is mostly confined to Bilston and Wolverhampton, as is the lock trade to the latter, and the saddlers' ironmongery to Walsall, Wolverhampton, and Wednesbury. But all these departments are carried on in Birmingham, though not to so great an extent as in these separate places. The mode of conducting business in Birmingham has undergone a considerable change from what it formerly was. There are now but few large capitalists. With the exception of the Soho works, and a few other large manufactories, the business is conducted on a small scale in innumerable divisions. The greater number of the manufacturers have only very limited capitals; and many of them are merely agents, or middle men, possessing a capital of not more than 500*l*. or 600*l*. The system generally acted upon is as follows:—The workmen, each in their particular line, undertake to execute the orders received by the merchants and agents settled in the town; which they accomplish by the following means: A building, containing a great number of rooms of different sizes, is furnished with a steam-engine. These rooms or shops being all supplied with shafts, lathes, benches, and such other necessary conveniences as are requisite for the work to be done; and when an order is given to one of these workmen to execute, he hires such one or more of these rooms as the occasion requires, and stipulates for a certain amount of steam power, and continues the occupant of this apartment till the order be finished. (*Porter, on the Progress of the Nation.*) In 1786 there was only 1 steam-engine at work, which was of 25 horse-power, and was used for grinding flour. In 1803 there were 10 engines, producing 370 horse-power, of which 260 horse-power was used in manufactures. In 1823, the number of engines was 66, the horse-power 1,222, of which 1,000 horse-power was used in manufactures. In 1835 the number of engines was 169, and the horse-power 2,700, of which 275 was used in grinding flour, 1,770 in working metals, 279 in pumping water, 87 in glass grinding, 97 in working wood, 44 in paper-making, 37 in grinding clay, 61 in grinding colours, and 80 in sundry other occupations. (From a return compiled by Mr. W. Hawkes, *Phil. Inst. Report*, 1836.) Women are extensively employed in polishing the goods in the glass toy branch, and in all parts of the manufactures of the town. Boys are principally engaged by the workmen and undertakers, as apprentices; and receive a progressive amount of wages, varying from 3*s*. to 10*s*. per week, according to their ages and occupations; they get their food at home, and in some instances work in the houses of their parents. Some of the small manufacturers have accumulated large fortunes. The condition of the work-people is, on the whole, decidedly favourable. It is impossible to give an average of the wages paid in different trades, they are so very various; for instance, in the making of buttons, a great number of hands are employed,—as, the piercer, the cutter, the stamper, the glider, and the burnisher,—who all receive different wages; and so also in the other departments. For work, which 20 or 30 years ago from 2*s*. to 3*s*. a week wages were paid, not more than 12*s*. to 14*s*. are now received; but as the workman executes more work, and as provisions are now much lower than during the war, he is probably better off. In 1833, wages, owing to the stagnation of trade, were as low as they have been known to be. Formerly, the average rate of wages, in common trades, was 30*s*. at present (1838) they may amount to 25*s*. a week. An average of 76 individuals employed in the various occupations gives 23*s*. 6*d*. per week. In 1833, the trade of Birmingham was perhaps at its lowest ebb; and in 1824-25 at its greatest height of prosperity. During the latter, a manufacturer stated his profits, upon a capital of 10,000*l*., to have been 5,000*l*. per annum; while, in 1833, the capital used did not for some time return the expenses of its employ; but since then it has very materially increased. The number of families chiefly employed in agriculture, including the gardeners employed in cultivating the numerous plots of ground laid out in the neighbourhood, was, in 1821, 607; 1831, 1,032. Families chiefly employed in trade, manufacture, and handicraft, 1821, 22,761; 1831, 25,064. Like all manufacturing towns, Birmingham has suffered more

or less at different times from pauperism, according to the fluctuations of trade. The amount that have been paid in poor-rates were, in 1776, 5,805*l*. Medium average, for 1783-4-5, 11,385*l*.; 1803, 14,680*l*.; 1831, 55,435*l*.; 1834, 59,512*l*.; 1837, 39,658*l*. Friendly societies have existed for some time in this town. In the years ending 1813-14-15, the total number of members was 13,433; at present there are upwards of 400 societies, and 40,000 members. In 1827, a savings' bank was opened, and in 1829 it had deposits with 2,499 depositors, and the sum invested 43,881*l*. For the year ending 1833, the number of depositors in the Warwickshire savings' banks was 6,580; of whom 3,545 had deposits in that of Birmingham. In 1833, the number of depositors in the Birmingham savings' bank had increased to 7,446, and the sum invested to 134,896*l*. The following analysis shows the proportionate increase of the population:—In 1700, there were 194 baptisms, and 169 burials; 1760, b. 849, bu. 1,140, marriages 259; 1800, b. 1,976, bu. 1,251, ma. 557; 1821, b. 2,998, bu. 1,775, ma. 1,193; 1830, b. 4,472, bu. 2,138, ma. 1,871. In 1821, the number of males was 61,028; 1831, 71,766;—females, 1821, 55,694; 1831, 75,230. The number of persons who died above the age of 95, between 1820 and 1830, was 48; of whom eleven were 99, six 100, four 101, two 102, four 103, two 104, one 105, and one 114.—This town is of great antiquity; it is known, indeed, to have been of importance before the invasion of the Romans. In *Domesday-book*, in which occurs the first authentic notice of the place, it is spelt Bermenheham. Its history, previously to the Norman conquest, is extremely obscure. Indeed, until the time of Charles I., little is recorded of it, and that little of scarcely any interest. In the reign of that monarch it took the side of the parliament, and warmly defended the cause it espoused. In 1655 or 1666, the plague committed frightful ravages. In 1791, high church and tory politics seem to have been very prevalent; and a riot having arisen out of a festival in commemoration of the French revolution, much property was destroyed, including the houses and libraries of the celebrated, but then obnoxious, Dr. Priestley, and of Mr. Hutton the historian. The loss on this occasion, amounting to 60,000*l*., was made good to the sufferers by act of parl. The sentiments of its inhabitants have, however, undergone a great revolution in the interval, and from one extreme they appear to have gone to the other. Of late years, they have stood prominently forward as the advocates of ultra-liberal opinions, and have identified themselves as the great supporters of those dangerous and easily abused institutions, called political unions. The great increase of the town is to be dated from the time of Charles II., when building leases became common, and houses were erected to meet the demand of the increasing population. There are many lines of canal, all tending to bring prosperity to the town and increase to its manufactures and population. The old canal communicates by the Severn with Shrewsbury and Gloucester, and by the Trent with Gainsboro', Hull, and London, and by a junction with the line running through the potteries of Staffordshire, with Manchester and Liverpool. By the new Birmingham canal a communication has been opened by Tanworth, Atherston, Nuneaton, and Coventry, with Oxford, and hence by the Thames to London. But the grand means of conveyance is the railway from London, with a continuation to Manchester and Liverpool. By means of this railway the journey from London to Glasgow may be accomplished in about 36 hours, and in 6 or 10 hours less to Dublin. The markets are held on Mondays, Thursdays, and Saturdays, and the fairs on the Thursday in Whitsun-week, and on the Thursday next before Michaelmas-day, for cattle, sheep, horses, and hardware generally. The air of Birmingham is salubrious (notwithstanding the number of furnaces and forges which abound), owing to the dry and sandy nature of the soil. The deaths, in proportion to the number of the inhabitants, are fewer than in London, Liverpool, or Manchester. The most celebrated seats in the vicinity are Hagley, 72 miles distant; Enville, 18; and the Leasowes, 6; this latter was the creation of Shenstone, and displays eminent taste and genius. Hagley, the seat of Lord Lyttelton, has been apostrophised by Thomson, Pope, and other poets. Enville, the seat of the Earl of Stamford, is a very beautiful place, and the seat of various other villas and retreats in the neighbourhood, belonging to wealthy manufacturers, some of which are extremely recherché. (*Hutton's Hist. Birmingham*; *Shaw's Hist. of Staffordshire*; and *Private Inform.*)

BIRNBAUM, a town of the Prussian States, reg. Posen, cap. circle, on the Wartha, 45 m. W.N.W. Posen. Pop. 2,500. It has a castle; Catholic and Lutheran churches, a synagogue, an orphan hospital, with tanneries, linen fabrics, &c. The circle is in parts very fertile, but in many places it is covered with lakes and marshes.

BIRK, a town of Ireland, now called Parsons Town, which see.

BISACCIA, a town of Naples, prov. Principi Ultra, on a hill, 12 m. N.E. St. Angelo de' Lombardi. Pop. 5,000.

It has several churches and an hospital; and is supposed to occupy the site of the ancient *Homula*, mentioned by Livy (lib. x. cap. 17.). The bishopric, of which Biscaccia was formerly the seat, has been united to that of St. Angelo do' Lombardi.

BISCARI, a town of Sicily, prov. Syracuse, m. N. W. Modica. Pop. 2,447, having declined 253 between 1798 and 1831. It is of modern date, having been founded in the 16th century.

BISCAY, a district in the N. of Spain, comprising Biscay Proper, Guipuzcoa, and Alava, the three Basque provinces, called by the Spaniards *Pais Vasco*, and being part of the Roman provs. of Vasconia and Cantabria. These provs. extend from 10° 46' to 30° 20' W. long., and from 42° 25' to 43° 27' N. lat., having E. France and Navarre; W. and S. Burgos, and other parts of Old Castile; and on the N. the Bay of Biscay. Their mean length is about 60 m., and their breadth about 50 m. Area estimated at 2,953 sq. m.; but their limits have varied considerably at different periods. The country may be considered as a prolongation of the declivity of the Pyrenees to the boundaries of Castile. It is broken into highly picturesque glens and valleys interspersed with some fertile plains. The district has marble of various colours, lime and sandstone, a profusion of iron ore, and some copper and gypsum of good quality, as well as salt-mine, and saline and sulphurous cold and hot springs.

The following is an account of the area of each prov., and of its pop. in 1803, and (according to Miñano) in 1826:—

Provinces.	Area.	Pop.	
		1803.	1826.
Biscay Proper (Guipuzcoa) - - -	1,964 sq. m.	111,433	139,001
Alava - - - - -	680	108,589	126,789
	1,079	67,523	84,139
Total - - - - -	2,953	287,555	349,929

1. Biscay Proper, or the lordship of Biscay, has on the N. the ocean; on the E. Guipuzcoa; on the S. Alava and Old Castile; and on the W. also Old Castile. Under the new division of Spain, made by the Cortes in 1822, it forms part of the province of Bilbao. The city and towns of Orduña, which are insulated by Alava and Old Castile, belong to it. Bilbao is the seat of government; and there are also Durango, Guernica, Balmaseda, and a few other small towns. Some of the mountains look as if they consisted of a congeries of hills heaped on each other. Gorgeva is of this description: it has, on its summit, a considerable extent of level land. Principal rivers, Nerva, Ansa or Ibaizabal, Cadagua, Mundaca, and Lequeitio. The coast is abrupt, and deeply indented by bays formed by the mouths of the rivers, and by a number of small harbours. The iron mines, which are frequent, and produce some of the best metal in Europe, particularly that at Somorrostro, the ore of which yields above a third part of iron. According to Antillon, the annual produce of this mine used to be 800,000 quintals. Climate humid, but not insalubrious. Houses good, and conveniently built; the upper parts, which were anciently of wood, are now of stone. There are many very ancient châteaux, mostly flanked with strong towers, that belong to the heads of families. With the exception of the towns named above, and a few others, the inhab. live dispersed in *caserios* of five or six houses each, with lands attached, which are mostly cultivated by the owners, in whose families they have remained for centuries, it being reckoned discreditable to part with the paternal property. Where land is hired, the rent, which is paid in money, usually amounts to about a third part of the value of the produce. The soil is mostly a stiff clay, and would produce little but pasturage or wood, were it not for the patient industry of the inhabitants, who break it up with a curiously shaped implement called a *ayaga*; but in lighter soils, where wheat only is grown, they use a strong plough. As arable land is scarce, they break up patches on the slopes of the mountains, where the ground, not being deep enough for the growth of large trees, is covered with thick shrubs. These they grub up and burn, and spreading out the ashes, get fertile crops of wheat the first three years; barley, or rye, the fourth; flax, the fifth; and good pasturage till the ground be again overgrown by brambles. They do not, however, notwithstanding their industry, reap grain enough for their consumption, but supply the deficiency by importations from Alava. Next to agriculture, the chief employment of the peasantry is in the making of charcoal for the iron foundries, from the wood cut in the forests, with which the sides of the mountains are covered. These contain plantations of excellent white oak, and in the glens and valleys are numerous groves of grafted chestnuts, which furnish a considerable article of export. The grapes are not good: there is a great pro-

fusion of apples, with pears, cherries, figs, &c. Cattle small and hardy; sheep difficult to raise from their getting entangled in the brambles; the wild boar is occasionally seen, as are wolves and bears; though both are very rare, especially the last. Fish abundant and excellent.

The staple business of Biscay Proper, and the other two provs., is the manufacture of iron, which is made into a great variety of tools and implements; but owing to the suspension of work in the royal armaments, the loss of the American colonies, and the introduction of foreign iron, as well as the long wars of which this country has been the theatre, this important branch of industry has greatly fallen off. The Spanish Academy of History say that, in 1802, when their account of Biscay was compiled, there were 180 iron works, producing annually 80,000 quintals of iron, of 155 lbs. each, which, when Miñano wrote (1826), were reduced to 117 works, yielding only 45,000 quintals. Copper boilers were also made at Balmaseda, and factories for cordage and rigging, made of hemp brought from Aragon and Navarre, were established in various parts; and tanneries at Balmaseda, and Bilbao; but these, also, are much fallen off. The other manufactures are those of coarse porcelain, table and other household linen, fine and coarse hats, braziers, carpentry and joiners' and cabinet work, straw and rush chairs, tallow candles, &c. The people near the coast occupy themselves a good deal in fishing, and the exports of dried fish are sometimes very considerable. (See *Diccionario por la Real Academia*, li. 487; *Miñano*, x. 41—44.)

2. Guipuzcoa has the seignory of Biscay on the W.; Alava on the S.; Navarre and the Bidasoa, which separates it from France, on the E.; and the Bay of Biscay on the N. Since 1822 it has been called the prov. of St. Sebastian. The country is rough and mountainous. The highest mountain on the frontiers of Alava rises 1,800 ft. above the sea, and contains some salt mine, and saline springs. The prov. is watered by the Deva, Urola, Orla, &c., and the Bidasoa, which all run N. into the Bay of Biscay. The coast is rocky, and the ports insecure, with bars at their entrances, except Pasajes, which has deep water, and is spacious and well fortified. At Mondragon, on the Deva, is a celebrated iron mine; the ore yields no less than 40 per cent. of metal. At Vergara is a college, where the young nobility are educated, and other useful institutions. On the N. of this, at Placencia, is a royal manufactory of fire-arms.

Guipuzcoa yields to no part of Spain in the magnificence of its ecclesiastical and other buildings. The roads are well paved, and kept in good repair; the inns commodious, and well conducted. Climate soft and temperate; but, like the other provs., it is subject to heavy rains and violent storms, both in summer and winter. The prov. produces most kinds of grain and other necessaries, but not in nearly sufficient quantities for the support of its inhab. Fruits and other natural products nearly the same as in Biscay. The fish, including salmon, are excellent; and tunny, rays, and sardines, are supplied to the neighbouring provs. The grapes, though indifferent, furnish the light wine called *chacoli*. A good deal of cider is also produced. The growth of timber in the woods and plantations is not equal to the consumption of the iron works. Agriculture nearly the same as in Biscay.

Iron may be had in any quantity. According to Antillon (*Geographie Physique*, p. 85.), 100,000 quintals used to be annually wrought up into hinges, nails, horse-shoes, boilers, kitchen utensils, arms, anchors, working tools, &c. They make, also, fishing tackle, rigging, tanned leather, coarse cloths of goats' hair, coarse linen and sail-cloth. Ship-building has lost its activity, but some vessels are fitted out for the cod and whale fisheries.

Guipuzcoa imports what grain it wants from Alava; wine, from Navarre and Rioja; soap, oil, flax, &c., from Castile and Andalusia; woollens, cottons, cloths, silks, jewellery, and articles of fashion, from England, Holland, and France. It exports little native produce, but iron, hardware, and fruits; but wool, and sometimes corn, are brought from the interior to its ports for shipment. Formerly, it had a considerable coasting trade to the shores of the Mediterranean, and a large share of the whale fishery and the cod fishery at Newfoundland. The famous Caracas Company originated here. Its commerce has fallen off since 1809. Being a frontier prov., it admits the royal troops to garrison its strong posts. (*Diccionario por la Academia*, l. 321; *Miñano*, lv.; *Antillon*, p. 85.)

3. Alava has the seignory of Biscay and Guipuzcoa on the N.; Navarre on the E.; and Old Castile, from which it is divided by the Ebro, on the S. and W. It now forms a principal part of the prov. of Vitoria, the name of its chief town. The other towns are Salvatierra, Aequilana, and Gamboa. It is surrounded and intersected by mountains, similar to those in the other Basque provs.,

and affording the same products of iron, black and red marble, gypsum, &c. They are covered with oaks, wild apple trees, thorns, box, yews, limes, hollies, &c. The crops of grain exceed the demand of the inhab. Climate cold and damp, with long winters, frequent and heavy rains, snow, frosts, fog, and mists; but it is healthy, and the inhab. strong and long-lived. Agriculture is the chief pursuit. In some parts they plough with oxen, as in Navarre; and in others, use the *laza*, as in Biscay and Guipuzcoa, weeding the ground repeatedly till it looks like a garden. The iron-works are greatly reduced in consequence of the destruction of the forests which supplied them with fuel, and of the weight of the duties paid on iron taken into Castile. The manufactories of hats, shoes, boxes, &c., are also in a state of decay; but a good many hands are occupied in the manufacture of table linen and coarse cloths. They also make a good deal of salt. (*Diccionario por la Academia*, i. 13.; *Althano*, i. 54.; *Antillon*, p. 92.; *Journal of the British Legion by a Staff Officer*, p. 155.)

The Basques have a peculiar language, which is undoubtedly of great antiquity. Léluse, in his *Grammaire Basque*, endeavours to trace it to the Hebrew, as a dialect of the Phenician, brought to Carthage, and thence to Spain; and attempts by its means to interpret the speech of Hanno in Plautus! From the supposed prevalence of Basque names of mountains, plains, forests, rivers, and towns in every part of Spain and Portugal, it has been concluded that the Basques once pervaded the whole peninsula. They have no alphabet of their own, but learned men write the language with Roman letters. Its chief characteristics are its similarity to the Hungarian and Turkish, in its inversion of the order of its particles, and its unparalleled variety of verbal inflections. Their only books are the New Testament, printed at Rochelle in 1571, some devotional tracts, catechisms, national poetry, dictionaries, and vocabularies. They count by twenties up to a hundred, and seem originally to have had but three days in their week, there not being ancient names for more. Few natives, except the gentry, know any language other than the Basque. It is also spoken with some variation, in part of Navarre, as well as by the French Basques (*Lecture, Grammaire Basque*, p. 2, 3, 14, 26, 28, 219.; *W. Humboldt, Prüfung der Untersuchungen über die Urbewohner Hispaniens*, &c.)

The government of these provinces has, from the earliest times, a republican form. The people choose the members of the *ayuntamientos*, or municipal corporations, who, again, elect the deputies to the provincial assemblies, which meet every two years in Biscay, once a year in Guipuzcoa, and twice a year in Alava, to provide for the interior administration of their respective provinces, to vote the supplies, and to determine the appropriation of the money granted. Each assembly chooses a magistrate, in whose hands the executive power is placed when the *juntas* are not sitting, and who treats on equal terms with the *corregidores*, or ambassadors, appointed by the king of Spain to reside in each prov., but who must not, on any account, be natives of these provinces, nor exercise any authority in them. The people choose, also, the tax-collector, and pay their civil officers moderate salaries for their services. Their taxes are light, and levied according to a valuation, which is frequently modified. Their ancient privileges, or *fueros*, order that they shall not be taxed by the Spanish government, except in a small sum, paid by Guipuzcoa and Alava, continuing at about 5400. sterling, the amount paid in the 14th century. But Biscay is free from this, and pays a larger sum every four or five years under the name of *donativo* or gift. They have no monopolies nor custom-houses, every article being imported duty free. They are also free from the conscription and impressment to which every other part of Spain is subject; but, in case of foreign invasion, they are bound to defend their frontiers without the king's troops. Another of their important privileges is that of being exempted from torture, or threat of torture, direct or indirect, on any pretence whatever, within Biscay or out of it. (*Fuero St. Ley*, xii.) On the other hand, they have always been prohibited from trading directly with the Spanish colonies, and are shut out from a free trade with the rest of Spain, by heavy duties and a line of custom-houses all along the Ebro; and are also obliged to resort to the court of chancery at Valladolid, for the decision of their lawsuits. Their financial system seems to have been well managed, since the price of the Alava 3 per cent. debt, before the breaking out of the present civil war, was 93; and in Biscay and Guipuzcoa, the extra taxes imposed during the French invasion were being refunded to the contributors. Foreigners, not of the Catholic religion, cannot establish themselves in any line of business in the Biscay provinces. (*Diccionario Geográfico por la Real Academia de la Historia*, Madrid, 1802, ii. 438, 510.; *El Puerto Privilegiado*, &c. de Fuzcaya, Medina del Campo, 1575.; *Spain past and present*, *Monthly Chronicle*, November, 1838, p. 440.)

The Biscayans being devoted to agriculture, navigation,

and commerce, and having little inequality of condition, possess those virtues that are seldom found united with ease and riches acquired without toil. They are honourable, brave, cheerful, and courteous, without being mean. They are also docile, when well treated; but, if roused by ill usage, are stubborn and inflexible. In general, they retain the dress, customs, and simplicity of manners, as well as the institutions of the 13th century; and pride themselves on their independence, and the antiquity of their lineage. The women, who are robust, assist the men in their severest labours. Not only the in-door, but the out-door, work of the house is done by female servants; and even *señoras*, delicately brought up, may be seen in their walks climbing the rocks with no other protection than a parasol. (*Diccionario por la Real Academia*, ii. 484.; *Althano*, i. 326.)

They are very fond of dancing, and assemble every Sunday afternoon to enjoy that amusement. Some of their dances are of a grave, majestic, and ceremonious character; others, gay and lively. They also delight in bull-fights, and play much at a game with a ball, called *pelota*, for which public sites are every where appropriated. At their weddings they discharge guns and pistols, on entering and quitting the church. Some villages distribute bread and cheese, wine and walnuts, at their funerals; some beg money for masses for the soul of the deceased. They are sober, but are fond of good living. They dress with a blue cap, red sash, and *alpargates*, or hempen sandals, tied on with blue or red ribband, and in wet weather, *espadillos*, or brogues of hide. The women dress as in Castile; the married wear a thin muslin handkerchief, tied on the head, like the Irish; the girls wear their hair braided down their backs. There are theatres at Bilbao and Vittoria, where plays and operas are performed; and the upper classes follow the fashions of France and the rest of Europe. (*Diccionario por la Real Academia de la Historia*, i. 326.; *Boules*, p. 306.; *Humboldt's Campaign in Navarre and the Basque Provinces*, p. 72.)

Little is known of the early history of the Basques before the time of the Romans, or during the ascendancy of the Goths and Saracens; by all of whom the country was partially over-run. The Spanish Academy of History says, there is no reason to suppose that any family ever had that absolute sovereignty over it that has been supposed, but that its rulers were subject to the Spanish kings of Asturias, Navarre, and Castile, like the rest of the principal seigns of the kingdom, with the exception of that difference which arose from the great power of the family of Haro, who held the lordship for many years. In 1332, the deputies of the three provinces offered the dignity to Alphonso XI., king of Castile, who accepted the lordship; but before the grant was executed, the most formal reserves were made of their franchises and privileges, and the king was obliged to sign a treaty, one of the articles of which was, that the Castilian monarch should never possess any village, fortress, or house, on the Basque territory. Their country has been the scene of frequent and long-continued wars with foreign nations, and is now the principal theatre of a destructive civil conflict. Though republican in all their institutions, they are much attached to the Spanish dominion. (*Diccionario por la Academia*, ii. 488—508.; *Monthly Chronicle*, art. *Spain past and present*, Nov. 1838.)

BISCEGLIA, a sea-port town of Naples, prov. Terra di Bari, on a rocky promontory, on the Adriatic, 12 m. E.S.E. Barletta; lat. 41° 14' 34" N., long. 16° 31' E. Pop. 10,000. It is surrounded by lofty stone walls, and is ill built: it is the seat of a bishopric, has a cathedral, 2 collegiate and some other churches, convents for both sexes, a public school, an hospital, a *moneda-piété*, and a fine theatre. Its ports admit only small vessels, and it has little trade. It has numerous reservoirs and cisterns cut in the solid rock, and arched over, for the collection and preservation of the rain water, the place being entirely destitute of springs. It is supposed by some to be the *Natolium* of the Penteringian tables, but other critics contend that its ancient name was *Figlitie*. Swinburne says that it is destitute of any remains of antiquity. (*Swinburne's Two Sicilies*, i. 188. 4to. ed.; *Cramer*, Naples, p. 53.; *Diet. Géographique*, &c.)

BISCHOFSEBURG, a village of the Prussian States prov. E. Prussia, on the Dümmer, 15 m. S.S.W. Rossel. Pop. 2,000.

BISCHOFSTEIN, or BISCHSTEIN, a town of the Prussian States, prov. E. Prussia, reg. Königsberg, on a marshy lake, 47 m. S. by E. Königsberg. Pop. 2,200. It has 2 Catholic churches, a high school, fabrics of cloth and stockings, with distilleries, breweries, &c.

BISCHWEILLER, a town of France, dep. Bas Rhin, cap. cant., on the Moder, 15 m. N. Strasburg. Pop. 5,854. It was once fortified; but the works were destroyed by the Imperialists in 1706. It manufactures coarse woollen and linen cloths, woollen gloves, pottery, tiles, and bricks, and has woollen mills, madder mills, tanneries, &c.

BISHOP'S CASTLE, a town of Naples, prov. Salerno, 10 m. N.W. Civita-di-Stabia, cap. cant., in a valley, 10 m. N.W. Civita-di-Stabia. Pop. 2,000. It has several churches, a dyework for cloth, and fairs on May 16 and 17.

BISHOPS-AUCKLAND, a market-town and township of England, co. Durham, N.W. div. Darlington ward, par. St. Andrew Auckland, 10 m. S.W. Durham. Area of township, 2,570 acres. Pop. 2,859, of which the town may have about 2,000. The latter, which is well built, stands on an eminence, having the Wear on the N., and the Gaunless on the S.E. The par. church is about 1 m. distant; but there is a chapel of ease in the town, and the Methodists, Independents, Quakers, &c. have also chapels. There is here a grammar-school founded by James I., and farther endowed by several prelates; a school on the Madras system for 200 boys, and a school for girls, both founded by Bishop Barrington, &c. The town owes its importance, and, perhaps, existence, to its having at its N.E. end the magnificent castle or episcopal palace of the Bishop of Durham. The building is of great extent, has a fine chapel built by Bishop Cosin, and some good pictures. The park includes about 800 acres.

BISHOP'S CASTLE, a par. bor., and town of England, co. Salop, hund. Parslow, 144 m. N.W. by W. London. Area, 6,000 acres. Pop. of par., 1821, 1,870; 1831, 2,007; of which the town had 1,729. It stands on the slope of a hill, near a small branch of the Clare. There are some good houses, in detached situations; but the greater part of the town is irregularly, and meanly built, of unhewn stone. The church (originally a fine structure of the Norman period) was partly destroyed in the last civil war, and subsequently restored. There are several dissenting places of worship, and a free school, educating 50 boys and girls. The town-hall, built in 1750, contains prisons for criminals and debtors: both this and the market-house are good brick buildings. A weekly market is held on Friday, and annual fairs, Feb. 12, Friday before Good Friday, Friday after May 1, June 5, Sept. 9, and Nov. 13. That in May is a pleasure, and that in July a wool fair; the rest are for cattle. Both the fairs and markets are much resorted to by the Welsh, who are the chief supporters of the town. The ann. value of the real prop. in 1815 was 8,242. A charter of the 26th of Elizabeth conferred on the corporation the privilege of returning 2 mem. to the H. of C., which it exercised till the passing of the Reform Act, when it was disfranchised. Its local limits were extensive, having a circ. of 15 m. Its name is derived from an ancient castle of the bishops of Hereford, which has been long demolished: the site of it, however, may still be traced.

BISHOP'S STORTFORD, a par. and town of England, co. Hertford, hund. Branhlin, on the Stort, 26 m. N.N.E. London. Area, 3,480 acres. Pop. of par., 1821, 3,358; 1831, 3,958. The greater part of the town stands on the slope of a hill, on the W. side of the river, and consists of two lines of street, intersecting each other at right angles, and forming a cross. It is on the whole well built, and has several good inns. The church stands on an eminence, and has a fine tower. There is a national school for 300 children, and a public library. It has an excellent market-house (built at the intersection of the streets, in 1828, with an Ionic front), which contains a large hall, used as a corn-exchange, over which are assembly and magistrates' rooms. The weekly market is on Thursday, and three annual fairs are held on Holy Thursday; Thursday after Trinity Sunday, and 10th October. The malting and corn trades constitute the chief business of the town, for which there are convenient wharfs along the river and the canal (both of which are contiguous to it); and being in the centre of a good corn district, the trade is considerable. There is also a silk-mill, which employs many hands. The ann. value of real prop. in 1815 was 6,930. Under the Poor Law Amendment Act it is the union town for 20 pars.: its own rates average 1,231. 14. Petty sessions are held every fortnight by the co. magistrates: it is also a polling town for Hertfordshire.

BISHOP'S WALTHAM, a par. and town of England, co. Southampton, div. Portdown, hund. of Bishop's Waltham, 62 m. S.W. by W. London. Pop., in 1821, 2,126; 1831, 2,181: houses at the latter date, 438. It is situated by the Hamble (a small stream rising 1 m. from the town) in the vicinity of Waltham Forest. It has a good church, an endowed charity school for 36 boys, and a national school for 160 boys and girls. It has a weekly market on Friday, and annual fairs, on 2d Friday in May, July 30, and Friday following Old Michaelmas-day. Leather-dressing is the chief trade of the town, which is mostly disposed of at its own fairs, and those of the neighbourhood. There is also some malting business carried on. It is a polling town for the northern division of the county. The ann. value of real prop., in 1815, was 4,809. The ivy-covered ruins to a fine old castle are in the immediate vicinity. It originated in the reign of Stephen, but owed its sub-

sequently magnificence to William I. It was demolished by the parliamentary army in the last civil war.

BISHOP-WEARMOUTH. (See SUNDERLAND.)

BISIGNANO (an. *Besidia*), a town of Naples, prov. Calabria Citra, cap. cant., 18 m. N. Cosezza. Pop. 10,000. It is defended by a castle situated on the highest of the 7 hills by which it is surrounded; is the seat of a bishopric; has a fine cathedral, numerous churches, a nunnery, several convents, 2 hospitals, and a house of refuge. Large quantities of silk-worms are reared in the vicinity.

BISSAGOS, a group of small volcanic islands, on the W. coast of Africa, opposite the embouchure of the Rio Grande, between 10° and 12° N. lat., and 154° and 164° W. long. The largest is about 15 m. in length, and some of them are uninhabited. The inhab. who are described as brave and treacherous, raise some maize, but are principally dependent on their cattle, goats, and fishery.

BISZTRITZ, a free royal town of Transylvania, cap. district, in a fine valley, on the Bisztritz; lat. 47° 5' 46" N., long. 24° 32' 18" E. Pop. 6,500. It is fortified, has a gymnasium, two schools, and two hospitals, with a considerable trade in cattle.

BITCHE, a town and fortress of France, dép. Moselle, cap. cant., at the foot of the Vosges, 15 m. E.S.E. Sarguemines. Pop. 3,777. The fortress or citadel stands on an almost inaccessible rock rising from the middle of the town. The interior of the rock is vaulted and casemated; the fort mounts 80 pieces of cannon, may be garrisoned by 1,000 men, is well supplied with water, and is looked upon as next to impregnable. The town, formerly called Kaltenhausen, is built at the foot of the rock, surmounted by the citadel, near a large shallow lake or mere, where the Horne has its source. It produces different sorts of fine pottery. The glass-works of Munsthal, in the vicinity, furnish flint glass of the value of 600,000 fr. a year. (*Hydro. art. Moselle*.)

BIFETTO, a town of Naples, prov. Terra di Bari, in a very fertile plain on the Adriatic, 10 m. S.W. Bari. Pop. 5,000. It is the seat of a bishopric; has a cathedral, remarkable for its pictures and marbles, and several convents.

BITONTO (an. *Buruntum*), a town of Naples, prov. Terra di Bari, cap. cant., in a fine plain, 10 m. W.S.W. Bari; lat. 41° 13' N., long. 16° 42' E. Pop. 12,000. Swinburne says that it is a fine town, and that the inhabitants are much easier in their fortunes, and more polished and improved in their manners, than those that dwell in the cities along the coast. It is the seat of a bishopric; has a fine cathedral, 12 parish churches, convents for both sexes, an hospital, and a nunnery. The environs produce a wine called *sagarillo*, said to be excellent, and in which the town trades extensively. In 1734 the Spaniards, under the Count de Mortemar, gained, in the vicinity of this town, an important victory over the Austrians. (*Swinburne's Two Sicilies*, i. 337; *Rampoldi*, &c.)

BITRITZ, a town of Naples, prov. Terra di Bari, 7 m. S. Bari. Pop. 2,500. It has a fine collegiate church, and its territory is celebrated for its wines and almonds.

BITTBURG, a town of the Prussian States, prov. Lower Rhine, cap. circle, 18 m. N.N.W. Treves. Pop. 2,000. It has a castle, two Catholic churches, and some trade in corn and cattle.

BITTERFELD, a town of the Prussian States, prov. Saxony, reg. Mersebourg, cap. circle, 16 m. S. Dessau. Pop. 3,400. It was founded by a colony of Flemings, whose descendants are said to hold their property in common, and to be governed by peculiar laws: it has fabrics of cloth and earthenware.

BIZERTA, or **BENZART** (an. *Hippo Diarrhytus* or *Zartius*), a sea-port town of Tunis, at the bottom of a deep gulph or bay (*Sinus Hipponensis*), on a channel uniting the gulph with an internal lake or lagoon, 40 m. N.W. Tunis; lat. 37° 17' 30" N., long. 3° 50' 38" E. Pop. variously estimated at from 8,000 to 14,000. It is about 1 m. in circ., and is defended by walls, and two castles; but as the latter are commanded by a height within a short distance, it could oppose no effectual resistance to an army attacking it by land. Though it has a good appearance at a distance, it is, like most other Turkish towns, really mean and filthy. Its port, which now only admits small vessels, was formerly one of the best in the Mediterranean, and might easily be restored, in this respect, to its ancient pre-eminence. The channel on which the town is built has in parts five and six fathoms water, and it might, with no great labour, be every where deepened to that extent. The lake, or inner harbour, is of great extent, with a depth of water varying from ten to fifty fathoms, and is capable of accommodating the largest navies. The country round is also exceedingly fertile; so much so that, notwithstanding its neglected state, large quantities of corn are occasionally exported from Bizerta. There cannot therefore be a doubt that

were this town and the adjacent country in the possession of any European power, it would speedily become one of the greatest emporiums and most flourishing districts on the Mediterranean. But no improvement need be looked for so long as it is permitted to remain in the power of its present barbarous masters. (*Shaw's Travels*, p. 75.; *Modern Traveller*, xx. 265, &c.)

BLACKBURN, a market-town and parl. bor. of England, co. Lancashire, hund. and par. of Blackburn, on an affluent of the Ribble; 183 m. N.W. by N. London, 31 m. N.E. Liverpool, 21 m. N.W. by N. Manchester, 11 m. N. by W. Bolton, and 9 m. E. by St. Preston. The progress of pop. has been as follows:—

	1770.	1801.	1811.	1821.	1831.
Town	5,500	11,980	15,063	21,940	27,291
Parish	-	33,631	39,899	53,360	59,791

The town, situated on a rivulet, called in Domesday Book "Blackburne," was, with the surrounding district, a manor during the reign of William the Conqueror, who granted it to Ibert de Lacy. A castle, of which no trace exists at present, is said by Whitaker to have been a station of the Romans, and of the Saxons. Camden and Blome both notice it as a thriving market-town in their days. The eminences in the vicinity are naked, and in winter the place has a dreary aspect. It is irregularly built, owing partly to its antiquity, and partly to the intermixture of glebe and other lands, the tenures of which interfered with a better arrangement of the avenues. It is well paved and lighted, under the provisions of a late act; but is badly supplied with water. The parish church of St. Mary, originally built before the Conquest, was rebuilt on a new site in 1819, at an expense of 26,000*l.*; it is in the Gothic style, contains 2,000 sittings, of which 700 are free; and in boldness, symmetry, and correctness of design, is said to be surpassed by but few ecclesiastical structures. It sustained some injury, which was soon after repaired, from a fire in 1831. There are three other episcopal churches, viz. St. John's, built by subscription; St. Peter's, by a parl. grant; and St. Paul's, originally a dissenting chapel. Lady Huntingdon's connection. The Methodist Baptists, Independents, and Roman Catholics, have each two places of worship; the Swedenborgians and Society of Friends, one each. A free grammar-school, founded in the time of Elizabeth, and endowed with lands now producing about 120*l.* annually, educates 30 pupils; Leyland's charity school, 90 girls; and in the national school 600 children of both sexes are instructed. Altogether, upwards of 5,000 children receive the rudiments of education in public seminaries of various descriptions. The Independents' theological academy educates candidates for the ministry of that religious persuasion. The public buildings, with the exception of those applied to theological purposes, are few in number, and consist principally of a small neat theatre, and a cloth-hall. It has a dispensary and a lying-in institution, a horticultural society, and two weekly papers.

The Reform Act conferred on Blackburn the privilege of returning 2 mem. to the H. of C. The bor., which is identical with the township, comprises 3,610 acres; and had, in 1831, 4,402 houses, of which 623 were worth 10*l.* a year and upwards. Registered electors in 1837-38, 842.

The manufacture of a kind of cloth made of linen warp and cotton woof, each partly of dyed thread, giving the web a chequered appearance, and thence called Blackburn cheque, was carried on here in 1680. It was afterwards superseded by that of Blackburn greys, consisting also of linen and cotton, so called from their being printed in an unbleached state. James Hargreaves, a working carpenter, the inventor of the spinning-jenny, the first great step in that wonderful career of invention and discovery that has raised the cotton manufacture to its present unexampled state of prosperity, was a native of Blackburn. In 1767 he produced the jenny; but instead of meeting with the countenance and support due to his singular deserts, he was driven out of the town, and eventually out of the county; and it was not till about 1810 or 1812 that the people of Blackburn began largely to embark in the cotton trade, and to avail themselves of the discoveries that had originated in their town. Now, however, spinning of the coarser kind of calicoes, and their weaving by the power-loom, constitute the staple trade of the place: coarse muslins continue to be wrought by the hand-loom. In 1831, the number of spinners and weavers in the town was estimated at 15,000, and the value of the goods produced at about 2,000,000*l.* Since then the manufacture has increased at least a third, so that the value of the goods will be little short of 3,000,000*l.* The abundance of coal raised from the coal-field a few m. to the S. has largely contributed to the progress of manufactures. They have also been much facilitated by the Liverpool and Leeds Canal, which passes close to the town. Markets are held on Wednesdays and Saturdays, in an inconvenient place: fairs for cloth, in the cloth-hall, on Easter-Monday, 11th,

12th May, and 17th Oct.; and for cattle, on the alternate Wednesdays from the beginning of February to Michaelmas. The banking establishments are, branches of the Commercial Bank of England, and of the Manchester and Liverpool District Bank; a private banking-house, and a savings' bank.

"In the early stages of the cotton manufacture," says Mr. Baines, "the inhabitants, in general, were indigent, and scantily provided (and this is still the case so far as the hand-loom weavers are concerned); but decisive proofs of wealth now appear in this place on every hand; handsome new erections are continually rising up; public institutions for the improvement of the mind, and the extension of human happiness, are rapidly increasing; and this place, at one time proverbial for its rudeness and want of civilisation, may now fairly rank, in point of opulence and intelligence, with many of the principal towns in the kingdom."

The parish of Blackburn extends over 45,620 acres; it includes 23 townships and chapelrys; and had, in 1831, 63,791 inhabitants. (See *Baines's Hist. Lancashire*; *Whitaker's Hist. of Whalley*; *Parl. Reports and Returns* *Hist. &c. View of Lancashire*.)

BLACKHEATH, an elevated moory tract, in the vicinity of the British metropolis, which gives name to the hund. in which it is situated, in the lath of Sutton-at-Holme, co. Kent. The greater portion is in the parish of Greenwich, but it also extends into those of Charlton, Lewisham, and Lee, and is $\frac{1}{2}$ m. in an E. and W. direction, and about half that N. and S.; from St. Paul's to the nearest part is about 5 m. S.E. It commands many fine prospects, and has numerous elegant villas. There are two episcopal chapels, one in the parish of Lewisham and one in the liberty of Kidbrook, also two preparatory and several private schools. On the E. side is Morden College, a quadrangular structure, founded in 1708, for decayed merchants; its revenue is about 5,000*l.* a year. In the hands of seven trustees, who nominate the pensioners, and appoint the treasurer and chaplain: there are about 40 supported, each of whom receives 5*l.* a month, and has a separate apartment; but they eat at a common table: none are admissible under 50 years of age. A Roman road (Walling Street), from London to Dover, traverses the heath, nearly in the direction of the modern line: there are some large ancient tumuli on it. In the 11th century the Danes (whose fleet lay off Greenwich) were encamped on the heath some months, whence they made many excursions; in one of which Canterbury was sacked, and the archbishop carried off, and afterwards killed. Wat Tyler, and subsequently Jack Cade, took up positions with their followers on it; as did the Cornish rebels, under Lord Audley, defeated with great slaughter by Henry VII. Thither also, in former times, the lord mayor and corporation, and, occasionally, the king and his court, were wont to go, when illustrious personages were to be welcomed to the capital. (*Hasted's Kent*, &c.)

BLACK SEA (the Euxine, or *Πόντος Εὐξίνος* of the Greeks and Romans), a large internal sea lying between the S.W. provinces of Russia in Europe and Asia Minor, extending from 40° 50' to 46° 45' N. lat., and from 27° 25' to 40° 48' E. long. It is bounded on the N. and N.W. by the Russian provinces of Taurida, Kherson, and Bessarabia; on the N.E. and E. by the Caucasian countries Circassia, Mingrelia, and Imeritia; on the S.E. and S. by Armenia and Asia Minor; and on the W. by the Turkish governments of Rumelia and Bulgaria. Its extreme length from E. to W. is upwards of 700 m.; its greatest width, on the 31st meridian, 400 m.; E. from this it narrows by the projection of the Crime, and the advance of the opposite shore of Asia Minor, to 154 m.; again it widens to 265 m. between the Strait of Yenikéai and the Gulf of Samsun, but from the last point it constantly and rapidly diminishes, till its E. coast (running due N. and S.) does not exceed 60 m. in width. Its surface is estimated at about 160,000 sq. m., and its coast line, including its sinuosities, considerably exceeds 2,000 m. (*Chevalier, Voy. de la Propont. et du Pont Eux.* p. 329.; *Jones's Travels*, li. 363.; *Rennell's Comp. Geog. of W. Asia*, 277.; *Arrowsmith's Atlas*.)

The Black Sea is connected with the Sea of Azoph by the Strait of Yenikéai (an. *Bosphorus Cimmericus*, and with the Sea of Marmara, by the Channel of Constantinople (an. *Bosphorus Thracicus*). With these exceptions, it is wholly isolated. It is also much more compact in form than most other large bodies of water; giving off no great limbs, like the Baltic, Mediterranean, &c., and having very few even moderately-sized gulphs. The most important, that of Kerkint (the *Carciutius Sinus* of the ancients) lies between the N.W. shore of the Crimea and the opposite shore of S. Russia, extending as far E. as the Isthmus of Perekop. The coast of the sea is, however, by no means iron-bound; small bays and harbours innumerable occur at short distances, through all its circuit, but none of them is in the least comparable, as to size,

with the Gulph of Kirkinit, unless, indeed, the Sea of Azoph and the Sea of Marmara be reckoned gulphs of the Black Sea. The straits of the Black Sea are very remarkable; they scarcely break the continuity of the land, for at their narrowest part, that of Yenikale, is not more than 2 m. across, and that of Constantinople less than $\frac{1}{4}$ m. (*Pallas's Travels, in S. Russia, ii. 288; Chevalier, p. 44.*) The former, indeed, spreads out in low and swampy grounds into a kind of marshy bay, the greatest width of which, measured transversely, is about $\frac{1}{4}$ m. (*Pallas, ii. 300.*); but the Thracian Bosphorus flows through its whole length of about 17 m., like a magnificent river, between mountainous banks, and in no part attains a width of more than 2 m. or $\frac{1}{2}$ m. (*Jones, ii. 448.*)

The depth of water in this sea is variable, but the variations appear to be extremely regular, depending generally upon the proximity of the land; so much so, indeed, that in many places (off the mouths of the Danube in particular) the distance of the shore may be known within $\frac{1}{4}$ m. from the soundings only. (*Eton, Commerce of the Black Sea, p. 6.*) In the Strait of Yenikale, the depth, in its shallowest part, does not exceed 11 ft., nor in its deepest is it more than 22 ft.; but passing this, the sea itself is unknown, the neighbouring head of the strait, to have a general depth of 4 fathoms, deepening rapidly to 20 fathoms or more; while, in the S. parts, 48 fathoms are found at the entrance of the Thracian Bosphorus; an equal or greater depth along the W. shore, at a little distance from the land, as far as the mouths of the Danube; and in the main sea, between the Bosphorus and Sebastopol, in the Crimea, no bottom is found at 100, 120, 140, and 160 fathoms. The sea upon the S. coast, from Constantinople to Sinope (long. 35°), is tolerably deep; thence to the E. coast, it is known only that vessels of any draught may navigate its waters; and the N.E. shore, between the rivers Phasis and Kuban, may be regarded as yet unknown to Europeans. (*Poy, of the Blonde, 1820; Geog. Journal, i. 106; Eton, pp. 1-15; Admiralty Charts, sect. iv. pl. 73.*)

The Euxine is enclosed on the N.E., E., S., and S.W., by high mountains, which run down close to its margin; even on the W., the Carpathians approach its shores to within 170 m.; but towards the N.W. and N., it opens on the great European plain, which includes Russia, Poland, Prussia, N. Germany, the Netherlands, and Denmark. Not a mountain, not a hill, rises near its bed, in these directions, except the small range in the S. of the Crimea. It might be reasonably imagined, that, in consequence of such a formation, its basin would consist exclusively of the countries stretching from its N.W. and W. shores. This is, however, far from being the case. It is true that its N.E. coast, bound closely in by the Caucasus, receives only the torrents that run their short courses from the W. slopes of that mountain system, but from the S.E. and S., the supply yielded by Asia Minor is by no means niggardly, several very considerable rivers having their embouchure in its waters.

The basin of the Euxine expands, in this direction, from about 40 m. to nearly or quite 260 m. in width; but immediately N. of the Caucasian mountains, it suddenly stretches E. 350 m. to the sea receiving, through the Kuban, nearly all the water that flows from the N.E. face of the Caucasus, and by various other channels, considerably the larger part of all the drainage from the low and swampy lands W. of the Caspian. (*See CASPIAN SEA.*) On its N. coast, the Black Sea receives the waters of some of the first class European rivers from a distance of 700 m. from its shores. (*See DON, DNIESTR, DNEPR.*) The Don, indeed, falls into the Sea of Azoph; but this is, physically considered, only a part of the larger body with which it is connected. But by far the most remarkable part of the basin of the Euxine is that towards the W. It has been already stated, that the Carpathians approach, in this direction, to within a comparatively short distance of its shores; but notwithstanding this, the Danube, after breaking through the mountains at Orsova, reaches the Euxine charged with all the surplus waters of the E. and N.E. declivities of the Alps, the S. and part of the N.E. declivities of the Carpathians, the S. declivities of the Sudetes, and the N. declivities of the Balkhan; in other words, the whole water of N. Turkey, of the Austrian empire, with the exception of Bohemia and Lombardy; together with a great part of that of Bavaria and Wirtemberg. (*See DANUBE.*) These countries extend about 1,000 m. W. from the Black Sea; their surface is equal to more than $\frac{1}{11}$ th part of the whole of Europe, and their running water to almost $\frac{1}{8}$ th part. (*Lichtenstein, Cosmog. i. 328. et seq.*) When to this is added the supply from the N.E. and S., it will be evident that the basin of the Euxine is of very great extent. The much larger portion belongs to Europe, of which it drains almost $\frac{1}{3}$ d part; and the amount of water received by the sea is equal to that given from the same division of the world to the Mediterranean (*direct*) and Baltic together. It is indeed by far the largest of the European basins, nor is there any where a similar tract of country so abundantly irrigated.

There are, of course, no tides in this close sea, but from the vast quantity of water received, the currents are very marked, powerful, and regular; a little variation is caused by winds, and some trifling complexity near the mouths of rivers, but in general the direction is from all points towards the Channel of Constantinople, through which a very constant flow is kept up to the Sea of Marmara. Within this strait, however, the currents become rather more variable, being thrown from side to side by the inequalities of the coast, and the narrowness of the channel. (*Chevalier, p. 45; Jones, ii. 394, 447; Pallas, ii. 288; Geog. Jour., i. 107., &c.*) The water of the Black Sea appears to contain more salt than could have been expected, under existing circumstances. It has been observed, of the constant action of the St. Lawrence on the N. American lakes, that it has been continued long enough to make them sweet and clear, even had they originally been filled with ink! But an operation, not less powerful, has been at work fully as long upon these waters; and though the Sea of Azoph has become potable, except when a S.W. wind prevails, the Black Sea itself is said to be only about $\frac{1}{7}$ th part less salt than the Atlantic, and fully $\frac{1}{10}$ th saltier than the Baltic. (*Charidi, ii. 15; Jones, ii. 143, &c.*) This, if correct, is, in all probability, attributable to the saline nature of the sea-bed. The N. coast is almost one continued plain of salt, and the numerous lakes, with which these steppes abound, are, by the action of the summer sun, covered with a thick white crust of the same mineral, perfectly crystallised, and having the appearance, and almost the consistency, of ice. (*Pallas, ii. 466-477; Mrs. Guthrie's Tour through the Taurida, pp. 55-59., &c.*) It is very improbable that this peculiarity of soil should be continued to the very edge of the sea, and then suddenly cease; and on the other hand, if it be farther continued to any distance, it will necessarily counteract in a great degree the influence of the immense supply of fresh water. The fact is, however, that but very little is known, with any thing like certainty, of the chemical composition of the Black Sea. The Russian observations are limited to the N. shores; the few French and English travellers who have traversed its surface, have done so only partially and hurriedly: among trading navigators there has been no Jonas Hanway; and the statements of the Turks exhibit nothing but ignorance, prejudice, and misrepresentation. A scientific survey of this sea has yet to be performed, and Russia is the only power to which Europe can look for this service. Her government has already distinguished itself by similar investigations, and as she has so great an interest in the correct delineation and description of this sea, it is to be hoped that she may shortly undertake the task. Meanwhile, however, many old prejudices with respect to it are fast vanishing; and the Euxine is no longer regarded as a dark and desolate region of storms, danger, and shipwreck. That such an opinion should have ever prevailed, is not a little remarkable; but it did prevail in ancient, and in modern times till a comparatively late period. Tournefort was the first who attempted to dispel the prejudices and misrepresentations referred to; and who ventured to represent facts as he found them, and not as they had been disguised by the poets of antiquity, and by bigoted and ignorant Turkish navigators. *Qu'en venant dit il les anciens, says this learned and excellent traveller, la Mer Noire n'a rien de noir, pour ainsi dire, que le nom: les vents n'y soufflent pas avec plus de furie, et les orages n'y sont gueres plus fréquents que sur les autres mers. Il faut pardonner ces exagérations aux poëtes anciens, et surtout au chagrin d'Ovide; en effet le sable de la Mer Noire est de même couleur que celui de la Mer Blanche, et ses eaux en sont aussi claires; en un mot, si les côtes de cette mer, qui passent pour si dangereuses, paraissent sombre de loin, ce sont les bords qui les couvrent, ou le grand brouillard, qui les font paraître comme noires. Le ciel est si bas et si étroit pendant tout notre voyage, que nous ne pûmes nous empêcher de donner une espèce de démenti à Valerius Flaccus, fameux poëte Latin, qui assure que le ciel de la Mer Noire est toujours embrouillé, et qu'on n'y voit jamais de temps bien formé. (ii. 164.)*

The prevailing wind in the Euxine is from the N.E., and as it blows over a great extent of flat and swampy country, it is laden with moisture; and being confined by the high land on the E., S., and S.W., heavy fogs are occasionally produced. It may even be conceded to Dr. Clarke, that "in winter these fogs, and the falling snow, cause sometimes a darkness so great, that mariners are unable to discern objects at the distance of a cable's length from their vessels." (*Travels, i. 641.*) But this inconvenience involves scarcely any hazard, for the depth of water is always sufficient to allow of lying to without danger of drifting upon sand or rock; and with the least break in the weather, landmarks of the very best kind come into view, which may be seen at 20, and often at 60 m. distance. (*Eton, pp. 8, 9.*)

From the confined extent of the water, a short and troublesome sea is caused by any thing like a gale; but it

is not dangerous; and storms, to which the Black Sea is not more subject than other seas, are rarely of long duration. (*Eton*, p. 6.) While they last, the close pent up water being greatly agitated, accidents, of course, sometimes occur; but it would, perhaps, be rather difficult to point out any sea of limited dimensions where, under such circumstances, they do not occur. The N.W. shore is low and sandy; a sandbank, 3 m. in extent, lies near the entrance of the Channel of Constantinople; and on the coast of Crimea two rocks lie close in shore.

Lastly, there is an opening, called *Yalan Bokur* (false mouth), a little to the N. of the Channel of Constantinople, and very considerably resembling it, though easily enough distinguished when the landmarks are visible. Ignorant half-bred pilots frequently conduct their ships into this mouth; and as it runs upon a low and dangerous shore, the consequences are mostly fatal. These are the only known *real* dangers of this sea. Can it be affirmed that any piece of water of like extent has so few? (*Eton*, p. 4-9; *Jones*, ii. 347-347.) On the other hand, the Euxine is deep, and singularly free from rocks and shoals: there are but two islands in its whole area; the Isle of Serpents, off the mouth of the Danube, and Kerpe, or Carpath, on the shore of Asia Minor. The navigation is therefore of the openest kind, and even in the worst of storms there is no want of sea room. The largest ships may sail close to its high shores: the anchorage grounds are good, and hold well; and many of its ports are excellent. In fine, the Euxine may be described as a clear open sea, whose navigation is as easy as possible to skilful mariners, the bad character which it has so long undeservedly borne being wholly ascribable to the bad built of the vessels, their want of charts and compasses, and the utter incapacity of the sailors by whom, till recently, it has been navigated. From the 15th to the latter part of the 18th century, the Turks excluded every other nation from its waters. At length, the Russians fought their way to its shores, and in 1799 it was partially opened to British and other European traders. Conventions to the same effect were made with the Turkish government by Queen Elizabeth, James I., and Charles I., &c. (*Treaty of Astrakhan*, Sept. 1675.), but they were without any effect; and it is only, therefore, since the latter date, or from the beginning of the present century, that the Black Sea has become known to, and been justly appreciated by, navigators.

The climate of the Black Sea and its neighbouring countries is subject to great extremes, but at an average is lower than would be supposed from its latitude. This would seem to be ascribable principally to its want of shelter on the N.; the winds from the polar regions reaching its coast, and blowing over its surface, unmitigated except by the temperature of the plain land over which they pass. Winds from the S. are less frequent than those from the N., and have to climb the suowy heights of the Taurus before they reach the coast, they arrive there materially chilled. Even on its S. shores, the N. wind sometimes prevents travelling even in the month of May. (*Tournefort*, iii. 37.) Its N. gulphs and bays are in certain seasons frozen hard enough to open a passage for troops; and it is recorded by Strabo, (lib. vii.) that the soldiers of Mithridates engaged those of the Tauric Chersonesus (Crimea) in the winter, on a part of the Bosphorus where, in the preceding summer, a naval action had been fought. In 1065 the width of the strait was measured on the ice (*Pallas*, ii. 300.); an equal degree of cold has been experienced in several winters within the present century; and though such extreme inclemency be not very common, navigation is always suspended with every return of winter in the Sea of Azoph, and most commonly along the whole N. shore of the Euxine. On the other hand, the summers are usually hot, the thermometer in the shade frequently standing at 90°, 100°, and even 102° Fahr. It often, however, varies in the same day from 22° to 27°, both in winter and summer, and in the former the barometer partakes of the irregularity, but is subject to fewer changes in the latter. Thunder-storms are rare, but tremendous when they do occur, being frequently accompanied by destructive hailstones and water-spouts. The climate is accounted healthy, except in the autumn, when bilious fevers are prevalent. The scourge of Mohammedan countries, the plague, is more or less common all round the coast, but this is a consequence of the filth of the inhabitants, and not of the climate. (*Pallas*, ii. 376-380.; *Mrs. Guthrie*, pp. 33. 55., &c.; *Tournefort*, iii. 16., &c.)

The Euxine teems with seals, porpoises, sturgeons, dolphins, mackerel, mullet, beam, and other fish, mostly of the same kind as those caught in the Caspian and Sea of Aral (see CASPIAN SEA): there are, however, few fisheries established along its shores, though, where they do exist, they are extremely productive. (*Pallas*, ii. 81. 132. 380. 468.; *Olivier*, *Voyage dans l'Empire Ottoman*, i. 135. &c.)

There are many conflicting opinions as to whether the Euxine be or be not of permanent magnitude. It was a commonly received opinion among the ancients, that it

was formerly separated from the Mediterranean, and that the Thracian Bosphorus was burst through by a convulsion of nature, or by the deluge of Deucalion; and Aristotle even believes that this event did not long precede the time of Homer. (*Josephus*, *Antiq.* i. 3.; *Diod. Sic.* v. 3.; *Aristotle de Met.* xiv. i. 8c.; *Pliny*, vi. i. 8c.) Without supposing any great degree of physical knowledge on the part of the Greeks, it may be supposed that the inhab. of the countries bordering on the Euxine would have a vivid recollection of such a catastrophe, had it occurred, and that, consequently, it would scarcely have been an invention or hypothesis of the writers. Add to this, that geological appearances strongly confirm the supposition; and the fact, though sneered at by some, will appear not a little probable. (*Pallas*, i. 80. 83.; *Tournefort*, ii. 346-390.; *Olivier*, i. 122.; *Dureau de la Malle*, *Géol. Phys. de la Mer Noire*, pp. 195-225.) It will be observed, that, among the ancients only historians and naturalists have been cited, but it may be added, that the same revolution is dwelt upon by their poets and fabulists. (See in particular *Lucan*, vi. 5.) It was, in word, the universal belief of all ranks and orders. But this sea were ever thus confined, its surface must have been considerably higher than at present; and this also appears to be the fact, from the accumulation of salt lakes and marshes in the plain country on its N. border. It is evident, indeed, that a rise of a few hundred feet in its surface would be quite sufficient to flood the greater part of southern Russia, the whole of which, except the mountains of the Crimea, bear evident marks of having been lately under a comparatively recent periglacial *Stætic* (*Stætic*), and the whole appearance of its N. shores is that of a diminished bed. Polybius supposed the Euxine to be gradually decreasing; and he has offered reasons, in support of this opinion, formed on more solid premises than ancient writers often depend upon. (iv. 5.) In this, however, he appears to have been mistaken. The change in extent, if any ever did take place, seems to have occurred at once with the subsidence of the waters, by the opening of the Thracian Bosphorus. Since the age of Polybius no change seems to have taken place in the size of the sea; but that it has become clearer, is evident from two facts: that a bank, about 1000 feet high, called the *Σαλμα* (*Σαλμα*), formed at the mouths of the Danube, and more than 100 m. in length, has wholly disappeared; and that the Cyanean Isles, at the mouth of the Bosphorus, so celebrated in the voyage of the Argonauts, are now reduced to low and insignificant prolongations of the two opposite shores. (*Géol. Journ.* i. 105.; *Jones*, ii. 444.; *Olivier*, i. 122.) It is not, perhaps, likely that any further change should take place, except by some new convulsion. The surface is still a little, though probably but a little, higher than that of the Mediterranean, as is evident by the constant set of the current through the Channel of Constantinople, and a consequence of the narrowness of the latter, and of the rivers bringing down more water than is taken off by evaporation.

Notwithstanding the horror entertained by the Greeks, or rather the Greek poets, of this sea, its shores are famous in their true and fabulous history. Colchis, the Temple of the Sun, and scene of the Argonautic expedition, were on its E. coast; the Cimærian land of everlasting darkness was originally fixed upon its N. shore; and in more historical times, the Lydian, Persian, and Byzantine powers, and the exploits of Mithridates, illustrated its S. and S.W. borders. At an early period, many Greek colonies were planted on its shores, its commerce was also reckoned of first-rate importance. Athens drew from it her principal supplies of corn and naval stores; and it furnished the favourite slaves to the markets of Greece and Rome. Ovid died in exile somewhere on its borders, but whether on the Danube or Dniestr is disputed. From the time of Constantine till the 15th century it formed the centre of the Roman world, and during this period, a part, at least, of the Indian trade was carried on through it: the Venetians and Genoese were the conductors of this traffic. Soon after the fall of Constantinople in 1453, all but Turkish vessels were excluded from the Euxine; and it was not till after the treaty of Kalmar, in 1774, that the Russian eagle was displayed on its waters. The name of this sea, *Euxine*, is only a modernised form of the original Greek word *εὐξείν* (inhospitable), bestowed upon it for the imaginary reasons previously alluded to. It appears, however, that subsequently, the Greeks imbibed a somewhat better opinion of it, and changed its designation to *Εὐγενής* (hospitable): it was sometimes also called simply *Ἰλλυρίς* (the sea). The Turkish name is *Cava Deniz*, and the Russian *Czorno More*, both being literally translated in the term *Black Sea*.

BLACKWALL, a hamlet of England, co. Middlesex, par. Stepney, at the confluence of the Lee with the Thames, 6 m. S. of St. Paul's, being in fact a suburb of London. Here are the E. and W. India Docks, &c., for an account of which see LONDON.

BLAIN, a town of France, dép. Loire Inférieure, cap. cant., near the right bank of the Isac, 23 m. N.N.W.

Nantes. Pop. 4,553. Its castle, of which only a small part now remains, was formerly one of the strongest in Bretagne. It was partly demolished in 1629. Calvinism was early introduced into this town, a synod having been held here in 1566, at which there were reckoned above 1,200 Protestants. (*Hugo, art. Loire inférieure.*)

BLAMONT, a town of France, dép. de la Meurthe, cap. cant. on the Vesouze. Pop. 2,658. It was burnt down in 1877 and 1891. It produces yarn for hosiery, and has considerable tanneries.

BLANC (L'E), a town of France, dép. Indre, cap. arrond., on the Creuse, in a pleasant situation, 33 m. S.W.W. Chateauroux. Pop. (town & cant.) 3,847. It is divided by the river into two parts, called the high and low towns: both are ill built, particularly the former, the streets of which, besides being narrow and crooked, are also precipitous. It is the seat of a tribunal of original jurisdiction. There now remain but few traces of its ancient fortifications, which, however, were once strong enough to resist several sieges. This is a very ancient place, and was often frequented by the Roman legions. The road from La Blanc to St. Savin is still called the *Licée de César*. (*Hugo, art. Indre; Dict. Géographique.*)

BLANCO (CAPE), a celebrated cape on the W. coast of Africa; lat. 20° 46' 26" N., long. 17° 4' 10" W. This cape, which was discovered by the Portuguese in 1441, forms the extremity of a rocky ridge, called the Geb-el-reid, or White Mountain, projecting into the sea in a S. direction. Inside the cape is a spacious bay, which has on its S.E. side the bank and town of Arguin.

BLANDFORD FORUM, a par., bor., and town of England, co. Dorset, hund. Coomb's Ditch, Blandford (or N.) div., 98 m. S.W. London. Pop., 1821, 2,643; 1831, 3,109; houses 528. This neat little town is situated on a beif of the Stour, amidst one of the finest tracts of sheep pasture in the kingdom; a six-arched bridge crosses the stream, and there are two others to facilitate the communications of the town during occasional floods. The houses are uniform brick structures, arranged in regularly-formed, and well-paved and lighted streets. The church is a modern building in the Grecian style, with a tower and spire. There are also an independent chapel, a free grammar-school, and a blue-coat school, each with small endowments; almshouses supporting 10 old people; a charity producing 120*l.* a year, for apprenticing poor boys; and another, now producing 300*l.* a year, originally left for the purpose of educating 4 poor children. There is a handsome town-hall, and a neat theatre; and on a fine down, near the town, annual races are held in Aug. The weekly market is held on Saturday, and 3 annual fairs on March 7, July 10, and Nov. 12. they are for horses, cattle, and cheese. A manufacture of shirt-buttons employs many women and children of the town and neighbourhood, but it is much less extensive than formerly; lace of a very fine description (some of it selling for 30*l.* a yard) used also to be made; but the chief business of the place originates in its market and fairs, and in its being the resort of the neighbouring gentry, and others at the races, &c., which makes it a thriving and increasing town. It was incorporated by charter of 3d of James I., which also granted the manor. Under the Municipal Reform Act there are 4 aldermen and 12 councillors, and the limits of the borough are restricted to the town, where 99 of every 100 of the pop. of the parish reside. The revenue of the corporation is derived from tolls of the market and fairs, lands, and quitrents, and averages about 125*l.* a year; they hold a court twice annually. A court of record was granted by the first charter, which has long been disused. Petty sessions for the Blandford div. are held in the town, by the co. magistrates; and monthly courts of the bishop and archdeacons of the diocese. It is also a polling town for the county, and the central town of a union of 33 parishes, under the Poor Law Act; it has 3 guardians; its rates amount to 777*l.* Archibishop Wake was a native of the town; and it gives the title of marquis to the Marlborough family.

BLANKENBURG, a town of the duchy of Brunswick, cap. distr., and formerly of the principality of Blankenburg, on a rivulet of the same name, 37 m. S.S.E. Brunswick. Pop. 3,300. It is surrounded by walls, has some good buildings, including a gymnasium, a school of industry, &c. On a hill immediately adjoining the town is a large heavy-looking palace of the duke of Brunswick: it had a good collection of pictures, but the best of them have been removed. On the summit of the Regenstein, also at a short distance from the town, are the remains of a large castle, constructed by Henry the Fowler, in 915, consisting of chambers cut out of the rock. (*Murray's Handbook, &c.*)

BLANTYRE, a parish of Scotland, co. Lanark, in which manufactures have made great progress. The Blantyre Mills, in the village of Blantyre, on the Clyde, 8 m. W. Hamilton, and 8 m. S.E. Glasgow, were erected

in 1786, for the spinning of water twist. In 1791, another mill was built for male twist: both are moved by water power. The total number of workmen, in 1835, was 456; and the aggregate of spindles, 30,000. In 1813, a cotton weaving factory was established, which employs nearly 500 hands, the moving power being partly water, and partly steam. There are in the par. 128 hand-loom weavers. The dyeing of Adrianople of Turkey red on cotton yarn, has been carried on here for forty-five years. The total number of hands employed in these various works, exclusive of the hand-loom weavers, is about 1,000, of whom considerably more than a half are females. There is a school connected with the mills; average attendance in the day school, in 1835, 136; in the evening school, 56. There is also a library for the use of the workmen, a funeral society, and a society for religious purposes, all established by the workmen. (*New Statistical Account of Scotland, No. vii. § Blantyre.*)

BLAYE, a sea-port and fortified town of France, dép. Gironde, cap. arrond., on the right bank of the Gironde, 34 m. N.N.W. Bordeaux; lat. 45° 7' N., long. 0° 40' W. Pop. 3,266. It is divided into the high and low towns; the former, however, is merely the castle or citadel, built on a rock commanding the Gironde. The river is here about 24 m. wide; and for its defence Fort Pâté has been constructed on an island in its channel, about 1,000 yards from Blaye, and Fort Medoc on the opposite side of the river. All vessels inward bound are required to anchor in the port or road of Blaye, and deliver a manifest of their cargo, and many of the outward-bound ships call here to take on board provisions, and complete their cargoes. The town has also a considerable direct trade, exporting wine, brandy, corn, oil, soap, timber, apples, &c. Many of the pilots, so indispensable to ships navigating the Gironde, reside in Blaye. It has tribunals of original jurisdiction and of commerce, an agricultural society, a theatre, &c. In the centre of the town is a fine public fountain. Blaye is very ancient. In 1568 it was taken by the Protestants, and more recently by the Leaguers. The extensive marshes by which it was formerly surrounded having been drained by Henry IV., have become very fruitful of corn and other products. In 1832 the Duchess of Berry, when confined in the castle of Blaye, was brought to bed of a daughter. (*Hugo, art. Gironde; Purdy's Sailing Directions for the Bay of Biscay; Dict. Géographique, &c.*)

BLEICHERODE, a town of the Prussian Saxony prov. Saxony, reg. Erfurt, between the Bode and the Wipper, 10 m. S.W. Nordhausen. Pop. 2,000. It has some oil-mills and fabrics of serges and other descriptions of woollen cloth.

BLENHEIM, or BLINDHEIM, a small village of Bavaria, circ. Upper Danube, on the Danube, near Höchst. This village is famous as the scene of the battle of Blenheim, the scene of the great battle fought Aug. 13, 1704, between the English and Imperialists, under the Duke of Marlborough and Prince Eugene, and the French and Bavarians, under Marshals Tallard and Marsin and the Elector of Bavaria. Each army consisted of nearly 80,000 men. The English and their allies gained a complete and decisive victory. Their enemies left above 10,000 men killed and wounded on the field; a vast number more were drowned in the Danube, and above 13,000 were made prisoners; among the latter were Marshal Tallard (whose son was killed) and many other officers of distinction. All the artillery, baggage, &c. of the French and Bavarians fell into the hands of the conquerors. The loss of the latter, though severe, was not greater than might have been expected, having amounted to about 5,000 killed and 8,000 wounded.

BLENHEIM PARK, an extra-parochial district of England, co. and liberty of Oxford, 60 m. W.N.W. London. Area 2,700 acres, being the demesne attached to Blenheim House, an edifice erected in the reign of Anne, as a token of the national gratitude for the public services rendered by the first Duke of Marlborough: for which purpose 500,000*l.* was voted by parliament, and the queen added the honours of Woodstock (an ancient royal property of the crown) to the grant. It was called Blenheim from the great battle noticed above. The usual entrance to this splendid domain is from the Woodstock side, under a triumphal archway of the Corinthian order, erected by the first duchess. Fronting the palace is a fine sheet of water, partaking of the character both of a lake and river, and winding away through a deep vale; this is spanned by a magnificent bridge, and on an eminence beyond the bridge, in the midst of a fine lawn, is a fluted Corinthian pillar, 130 ft. high, surmounted by a statue of the duke in a Roman dress; on one side the pedestal is an inscription (written by Lord Bolingbroke) reciting his public services; on the others, the acts of parliament declaratory of his services, and abstracts of the entail of his estates and honours. The mansion occupies three sides of a parallelogram, the principal front being N., and the E. and W. sides forming wings for the domestic offices, stables, &c.; a terrace with

several flights of steps gives due effect to the elevations. The north, or principal front extends 348 ft. from wing to wing; it has five compartments, and is highly enriched, especially the central one, which has a Corinthian portico and fine pediment at the height of two floors; over which is an attic story. The south or garden front is of a plainer character; but its compartments correspond with the other, and a flight of steps leads to a portico, over the entablature of which is a colossal bust of Louis XIV., taken from the gateway of Tournay. The interior is magnificently finished, and contains a fine collection of sculptures, paintings, and tapestry. A well-known satirical couplet raised a prejudice against this noble pile, which prevented, for a lengthened period, a fair estimate being formed of its merits. The details have been severely criticised; and some of them may be open to censure. But whatever may be the defects of particular parts, they are lost in the *tout ensemble*. The general effect of the building is excellent; its parts seem to be admirably combined, and it has a most magnificent appearance; it is now, indeed, admitted, by general consent, to be a noble proof of the genius of its architect, Sir J. Vanbrugh, as well as an "illustrious monument of Marlborough's glory, and of Britain's gratitude." (*Brewer's Oxfordshire Gent. Mag. vol. lxxx.; Neale's Views of Seats, vol. iii.*)

BLERÉ*, a town of France, dép. Indre et Loire, cap. cant., on the Cher, 17 m. E.S.E. Tours. Pop. 2,978. The castle of Chenonceaux, once the property and residence of the celebrated Diana of Poitiers, is situated in the immediate vicinity of Bléré. Diana, having been dispossessed of the castle by her rival, Catherine de Medici, the latter surrounded it with a superb park. After many vicissitudes, it was acquired, in 1733, by M. Dupin, a gentleman distinguished by his wealth and learning, but more by the wit and beauty of his wife. Under its new masters Chenonceaux became the resort of some of the most illustrious personages of the 18th century, including, among others, Voltaire, Montesquieu, Buffon, Fontenelle, Bolingbroke, &c. Rousseau wrote several pieces for the theatre of Chenonceaux, and it was here that the *Drain de l'Atilage* first appeared. Happily, Chenonceaux escaped the revolutionary frenzy; and continues to be one of the most interesting objects in this part of France. (*Hugo, France Pittoresque, li. 101.*)

BLETCHINGLY, a par. and town of England, co. Surrey, hund. Tarnridge, 16 m. S. of London. Pop., 1821, 1,087; 1831, 1,203; houses, 208; area, 5,280 acres. The town is situated near the end of the chalk range that traverses the co. and commands extensive views. The church is a fine specimen of the earlier Gothic style: there is an endowed school for 20 boys, 11 almshouses, and several small charitable donations. There are 2 annual fairs, held June 22, and Nov. 2; the latter is for horses, pigs, and lean cattle: its ancient weekly market has been long discontinued. The inhab. are chiefly engaged in agriculture: the upper part of the par. (in which the town is situated) is a sandy and chalky soil, the lower part clay. Blethingly returned 2 mem. to the H. of C. from the 23d of Edw. I. till the passing of the Reform Act, by which it was disfranchised: the right of election was in the holders of burgage tenures, amounting to 130. A castle, built shortly after the Conquest, formerly stood on the brow of a hill at the W. end of the town. There are some vestiges in this parish of the residence of Earl Godwin, who retreated hither when his Kentish estates were inundated: the Croydon Railway passes through it, on the N. side.

BLOIS, a town of France, cap. dép. Loir et Cher, on the acclivity of a hill on the right bank of the Loire, 35 m. S.S.W. Orleans; lat. 47° 35' 20" N., long. 1° 20' 16" E. Pop. (ce cant.) 11,423. This is neither a large, a well-built, nor a handsome town; on the contrary, many of its houses are mean, and its streets narrow, crooked, and sometimes not accessible to carriages; but it is remarkable from the situation of its castle. Its antiquity, its monuments, and the historical events of which it has been the theatre. At one extremity of the town is the castle, and at the other the cathedral. The former is an immense pile, built at different epochs and in different styles of architecture. Louis XII. was born in this castle; and in it also Margaret of Anjou was married to the Duc d'Alençon, and Margaret of Valois to Henry IV. But it derives its principal interest from events of a very different character. Here, in December 1588, the Duc de Guise and his brother the Cardinal, were basely murdered by the order, and almost in the presence, of Henry III. This, also, was the scene of the imprisonment of Mary and of the death of Catherine de Medici. The last rays of glory fell on this castle in 1814, when Marie Louise held her court in it after the capitulation of Paris. It is now occupied as a barrack. The cathedral is a handsome edifice; but the finest building in the town is the hotel of the prefecture, formerly the episcopal palace. The view from its gardens is extensive and fine. In the church of St. Vincent are fine monuments to Gaston, Duc d'Orléans, and a daughter of that prince. A suburb on the

opposite side of the river is connected with the town by a handsome bridge of 11 arches, begun in 1717. The most ancient monument in the town is a superb aqueduct, ascribed to the Romans, cut in the solid rock. It is in excellent preservation; and conveys the waters of several springs, a distance of about half a mile, to a reservoir close to the town, whence they are distributed among public fountains dispersed in different parts of the city. Blois is the seat of a bishopric, a court of original jurisdiction, a departmental college, a diocesan seminary, and a secondary ecclesiastical school; a botanical garden, founded by Henry IV.; a public library, with 10,000 volumes; a royal society of agriculture; a departmental nursery, &c. It has, also, a port well frequented by the craft navigating the Loire, a theatre, an abbatoire, and a *dépot d'étalons*. It produces serges, hosiery, and gloves, cutlery and hardware, leather, &c., and has a considerable trade in wines, spirits, vinegar, fire-wood, and staves, liquorice, and other articles. Bernier, the celebrated eastern traveller, was a native of Blois. (*Hugo, art. Loir et Cher; Ingli's Switzerland, &c., p. 357., &c.*)

BLYTHER (S.), or BLYTH NOOK, a sea-port town of England, co. Northumberland, on the Blyth, 12 m. N.E. by N. Newcastle-on-Tyne, and 8 m. S.E. by E. Morpeth. Pop. in 1801, 1,268; in 1831, 1,944. It is situate on the S. side of the river, where it discharges itself into the German Ocean, and consisted till lately of a few narrow ill-laid-out streets; but modern improvements are giving it a new aspect. Its church is a chapel of ease to the parish church of Earsdon: Methodists, Presbyterians, and other dissenters have places of worship. The coal trade is carried on to a considerable extent, and iron from the Bedlington works is largely exported. The harbour is excellent for ships of small burden, affording free entrance and safe anchorage in all seasons; and the coast for some miles is peculiarly adapted for bathing. There is here a dry dock, a custom-house dependent on that of Newcastle, a light-house, and a beacon-light.

BOA VISTA, the most easterly of the Cape de Verde islands, which see.

BOBBIO, a town of the Sardinian states, div. Genoa, cap. prov. same name, on the Trebbia, 34 m. N.E. Genoa. Pop. 4,000. It is surrounded by walls, and is the seat of a bishopric, and of a tribunal of original jurisdiction. It was ceded to Sardinia, in 1743, by Austria.

BOBROV, a town of Russia in Europe, gov. Voronege, on the Bítug, 52 m. S.E. Voronege; lat. 50° 5' N., long. 40° 10' E. Pop. 5,000. It has two churches, and includes a large spare laid out in gardens. It derives its name from the number of beavers (*bobry*) formerly found in its vicinity.

BOBRUISK, or BOBRISK, a town of Russia in Europe, gov. Minsk, on the Bobruia, where it falls into the Berezina, cap. district, 90 m. S.E. Minsk. It was fortified in 1810 and 1812, and was ineffectually attacked by the French during the last of those years. It has four churches and a gymnasium.

BOCHNIA, a town of Galicia, cap. circ., near the Raba, 25 m. E. S.E. Czarow. Pop. 4,600. It has a gymnasium, and a board for the administration of mines and salt-water, or an account of the latter, which are very extensive, see WIELICZKA.

BOCHOLD, or BOCKHOLT, a town of the Prussian States, prov. Westphalia, reg. Munster, on the Ahé, 15 m. E.N.E. Clevel. Pop. 4,000. There are rich iron mines in its vicinity; and it has some trade in corn, spirits, &c., with manufactures of cotton and silk.

BOCHUM, a town of the Prussian States, prov. Westphalia, reg. Arnsberg, cap. circ., 25 m. N.E. Dusseldorf. Pop. 4,300. It has three churches and a college; and manufactures, coffee-mills, and jewellery.

BOCKING, a par. and village of England, co. Essex, hund. Hincford: area of par., 8,800 acres. Pop. 3,128. The village, almost contiguous to Brinton, and 18 m. E. by N. London, consists principally of a single street, extending along the high road from London to the E. counties. There are several corn and fulling mills on the river Bradn, and the increase (342) in the pop. during the 10 years previous to 1831, is ascribed to the increased manufacture of silk and crape. It has a free school, endowed by Dr. Gauden, bishop of Worcester, for the education of 30 boys; an almshouse, founded in the reign of Henry VI.; and some other charities. (*See BRAINTREE.*)

BODMIN, a bor. and town of England, co. Cornwall, hund. Trigg, 25 m. W by N. Plymouth. It is nearly in the centre of the county, is built on a gradual acclivity between two hills, and consists chiefly of one main street nearly a mile in length: the houses are an intermixture of low irregular ancient structures, and neatly built modern ones. The church (rebuilt about A. D. 1472) is a spacious structure in the later Gothic style, situated in the vale at the E. end, whence the town gradually ascends. The Calvinists, Wesleyans, and Bramites, have each chapels. There is an endowed grammar-school, founded by Elizabeth, and a national girls' school. The

town-hall was originally the refectory of St. Austin's Priory; each of its ends are fitted as courts of justice, and the intermediate area used as a corn-market; over the whole are grand jury and public assembly-rooms. N. of the town is the county gaol, including a sheriff's ward and a bridewell: at the W. end is the co. lunatic asylum, built in 1820. It is well supplied with water, and partially paved and flagged, but not lighted. Pop., in 1821, 2,902; in 1831, 3,375: houses at the latter period, 696. These numbers refer, however, to the old boundaries of the bor., which included but a minor portion of the parish; whereas its present par. boundaries comprise the entire parish, and also the adjoining parishes of Holland, Lanivet, and Lanhydrock, comprising in all an area of 16,300 acres, and a pop., in 1831, of 5,228. It has returned 3 mem. to the H. of C. since the 73d of Edw. I.; the right of election having been vested, previously to the Reform Act, in the corporation. In 1838 it had 332 registered electors. The market is held on Saturday; and it has several fairs. The chief manufacture is shoes, of which a considerable number are made, and sold at the different markets and fairs of the county. A railroad, commencing at Wade bridge (at the head of Padstow harbour), about 6 m. in a N.W. direction, terminates at the back of the town, by which coals and other articles are brought to it, as well as lime and sea sand, to the agricultural district through which it passes. It is governed by a mayor, 3 aldermen, and 12 councillors. It is a stannary town, and had, at an early period, the privilege of stamping tin. The summer assizes, 3 of the general quarter sessions, and the election courts for the E. division of Cornwall, are held here.

BŒOTIA, a famous region of ancient, and now of indep. Greece, prov. E. Hellas, and forming the N. part of the nomarchy of Attica and Bœotia, between lat. 38° 9' and 38° 41' N., long. 22° 53' and 23° 49' E.; shape triangular; having N. W. Phocis; N. the Opuntian Locris; N. E. the channels of Galand and Egripio; and S. Attica and the Corinthian Gulf; length E. to W. about 42 m.; greatest breadth 27 m.

Its mountains, the most celebrated of which is Zagora, (an. *Helicon*), mostly surround or divide it into two principal basins—those of the Cephissus and Thebes. Its chief rivers are the Gayrios (*Cephissus*) and the Asopo (*Asopus*). It contains three lakes; those of Topolias (*Copais*), Sazina (*Hylia*), and Parallimi; the first the largest in Greece. It is a high but well-watered region; and as many of the streams find their way, and the lakes a vent to the sea, only by means of subterraneous courses, marshes abound; and the atmosphere is damp, foggy, oppressive, and unhealthy in some places, as at Livadia, where intermittent fevers are prevalent. The fertility of Bœotia is however such, that it has always an abundant crop, though elsewhere famine should prevail. The land is well cultivated, especially with wheat, rice, madder, cotton, maize, hemp, and tobacco. Helicon is clothed in its lower parts with evergreens; above these there is a forest of pines, and its top is often capped with snow; kermes oak grows abundantly, and 6,000 oaks (258,000 lbs.) of gail-nuts are collected yearly. The lake Topolias still produces the reeds anciently so celebrated for rustic flutes, and Bœotian pipes are still in high repute. Most of the cottages in the neighbourhood are built of these reeds. Flocks of bustards inhabit the banks of Topolias; and its large cels, dried and salted, form a considerable article of trade. Many spots in Bœotia present striking scenery. It forms two eparchies, those of Thebes (*Thiva*) and Livadia, which are its two principal towns.

BOGENDORF, a village of Prussia, prov. Silesia, reg. Liegnitz 18 m. W.S.W. Sagan. Pop. 1,400. It has in its vicinity mines of the precious metals, and of copper and lead.

BOGLIPOOR. See BHADGULPORE.

BOGNOR, a marit. town and chapelry of England, co. Sussex, rape Chichester, hund. Aldwick, par. S. Bersted, 86 m. S.W. by S. London. Pop. (of the whole par.), in 1821, 1,851; in 1831, 2,190. It is situated on the coast between Selsey Bill and Worthing, and its port, which extends in a curving direction 2 or 3 m. into the sea, and make it inaccessible except to the smaller class of coasting vessels: there is a good beach and every accommodation for bathing. Previously to 1780 it was a small fishing village, and this is still the occupation of its resident population, who send their produce to the London market. In the above year Sir R. Hotham commenced building a villa and some good lodging-houses, since which this watering-place has continued to enlarge, and forms a favourite resort for those who seek retirement, rather than gaiety, in occasional change of scene. It is sheltered on the N. by the South Down hills, a range extending from Portdown to Dover. The Portsmouth and Arundel Canal passes within 3 m. There are Episcopal, Independent, and Wesleyan chapels; a school, in which 20 girls are clothed and educated; another (founded by the late Princess Charlotte) for 50 girls; a good hotel and lodging-houses, &c., for the accommodation of visitors.

The regulation of the town is placed under commissioners (by an act of parliament), who meet monthly, and levy a duty of 2s. a chaldron on coals, to defray the expenses of repairing roads, &c. Weekly markets are held, in a spacious modern market-place, on Thursday and Saturday, and an annual fair on the 5th and 6th of July.

BOGODOUKHOF, a town of Russia in Europe, gov. Kharkof, cap. distr., on the Merlo, 60 m. N.E. Poltava; lat. 50° 2' N., long. 35° 50' E. Pop. 6,800. It is surrounded by a rampart and a ditch. The inhabitants are principally employed in tanning and dressing leather, and making it up into boots and shoes; they also carry on a considerable trade in cattle, hides, &c.

BOGORODITSK, a town of Russia in Europe, gov. Tula, cap. distr., at the confluence of the Lesmol-Oupert and the Viarkova, 40 m. S.S.E. Tula. Pop. 6,000. It has a royal castle and four churches. The country round is productive of corn, hemp, flax, and honey, which form the principal objects of the trade of the town.

BOGOTA (formerly *Santa Fé de Bogota*), a city of Colombia, of which it is the cap. and the seat of the government, on an elevated plateau at the foot of Mount Chingaza, 8,615 ft. above the level of the sea; 225 m. E. the Pacific Ocean, 50 m. E. the river Magdalena, 6 m. S.E. Honda, and 34 m. N.E. Neiva; lat. 4° 37' N., long. 74° 10' W. Pop. from 30,000 to 40,000. Owing to its elevation, the city enjoys a fine and equable temperature; the climate, however, is exceedingly humid, though not unhealthy. The first appearance of the town from the N.W. is very imposing: being built on rising ground, it forms a sort of amphitheatre, and the white towers of the cathedral and the monasteries of Monserrat and Guadalupe are seen seated on lofty peaks behind it. Streets generally narrow, but regular, intersecting each other at right angles, and some having a stream of water constantly flowing down the middle: all of them are paved, and the principal ones have foot-paths. The chief street, or *Calle Mayor*, as at its extremity the *plaza mayor*, or principal square, where the market is held; it is formed by the cathedral, the palace of the president, custom-house, &c. Bogota being subject to frequent earthquakes, the houses are low, with thick walls; elegance being commonly sacrificed to solidity. Nearly half the area of the city is occupied by religious structures; there are 26 churches, besides the cathedral, 9 monasteries, and 3 nunneries; and four-sixths of the houses in Bogota are said to belong to them. The cathedral, built in 1814, and distinguished by the simplicity of its interior, was destroyed by an earthquake in 1827. Most of the other churches are more remarkable for gorgeousness and gliding than for taste; gems are lavished in profusion upon the statues. The palace of the former viceroys of New Granada, now occupied by the president of the republic, can boast no architectural beauty. The "palace of the deputies" is a large house at the corner of a street, the under story of which is, or at least was a few years ago, "let out in shops for the sale of brandy." The "palace of the senate" consists of one of the wings of the convent of the Dominicans. The mint is a large plain building. There are three sets of barracks, two *cuarteles*, and an artillery depot, where all military equipments are made, and articles of European manufacture repaired; some of the convents have hospitals attached, but they are wretchedly conducted, and very dirty. It has a university and three colleges, the principal of which belongs to the Jesuits; a school of chemistry and mineralogy; a Lancasterian school on the most liberal principles; a national academy; a public library, &c. There is a theatre, a well-constructed building, and well attended; but the performances are bad. The private houses in Bogota are constructed of sun-dried brick, whitewashed, and tiled: latterly their style has been considerably improved. Beams are now concealed by a ceiling: glass has been introduced into, and barricades removed from, the windows; the street doors are better painted, and light balconies have begun to supersede enormous and heavy galleries. In general, the houses are built with a central room, the *salon*, round which runs a gallery or a covered terrace. The furniture is simple; but European carpets and other manufactures are now in very general use. There are no chimneys, stoves only being used. In the principal streets, the ground floors are occupied by shops; these are, however, dirty and dark, and the only admission for daylight is by the door. Almost every inhabitant, not in the employ of government, in the church, or in the army, is a shop-keeper. "Seated upon his counter, smoking incessantly, and giving laconic answers to his customers, the Colombian merchant in many respects resembles those of Smyrna or Aleppo." Bogota cannot boast of ten merchants who can command 100,000 piastres, nor of five individuals living upon a revenue of that amount. The most common incomes are from 5,000 to 10,000 piastres. The city is very badly lighted; there are no common sewers; and the filth being cast into the streams that run through the streets, renders them infectious. Owing to the scantiness of the population, and the want of car-

plages, some of the streets are overgrown with grass. The markets are well and cheaply supplied with provisions; but European manufactures are said to be extravagantly dear. There are no carts or vehicles of any description, traffic being carried on exclusively by mules. The environs of Bogota are agreeable, but little frequented; the favourite promenades being the *alameda*, or public walk, at one of the entrances to the town; and the two principal streets, along which gentlemen may often be seen riding at full gallop on wretched horses, bedizened with gold, and glittering in military uniforms, "some with round hats ornamented with plumes of feathers, others with cocked ones, and a still greater number wearing *shakos* and helmets." The costume of the females is still more peculiar. Rich and poor dress alike out of doors: the mantilla is worn; a piece of blue cloth envelops the head, and covers all the features excepting the eyes, reaching to the waist; and the whole is crowned by a broad-brimmed beaver hat. The women of Bogota are generally acknowledged to be handsome; their complexions are fair and clear; their physiognomy is Spanish. They are however accused of being great *intriguantes*, and very severe strictures have been passed upon them by travellers. Visiting, evening parties, balls, masquerades, and religious processions, are their chief amusements; as bull-fights, cock-fights, the theatre, and gambling, are those of the men.

Bogota was founded by Gonzalo Ximenes de Quesada, who built 12 huts here in 1538; in 1548 it was created a city, and made the seat of a royal *audiencia*; and in 1561 advanced to the honours of a metropolitan see. It was the capital of New Granada, while a colony of Spain; a distinction which, since the war of liberation, it has changed for the greater one it at present enjoys, as the head city of a free state. (*Mod. Trav.* xxvii. 311-327; *Batbi*, 3d edit., &c.)

BOGWANGOLA, an incl. town of Hindostan, prov. Bengal, 8 m. N.E. Moorsshedabad; lat. 24° 21' N., long. 88° 22' E. It is built entirely of bamboo, mats, and thatch; but is a place of considerable trade, and from hence the cap. of the district is chiefly supplied with grain.

BOHAIN, a town of France, dép. Aisne, cap. canton, 16 m. N.N.E. St. Quentin. Pop. 3,393. It has a fabric of German clocks *a carillon*, and produces shawls, gauzes, &c.

BOHEMIA (Germ. *Böhmen*, Boh. *Czech*) (KINGDOM OF), an inland country, occupying the centre of Europe, and forming an important portion of the Austrian empire, between lat. 48° 34' and 51° 3' N., and long. 12° 5' and 16° 46' E., having N.E. Prussian Silesia, N. and N.W. Saxony, S.W. Bavaria, and S. and S.E. the archduchy of Austria and Moravia. Shape an irregular rhomboid; greatest length, E. and W. 300 m.; greatest breadth, N. to S., 170 m. The area, pop., &c. according to the *Austrian National Encyclopædia*, are as follows:—

Districts or Circles.	Extent in sq. miles (Eng.)	Pop. 1851.	Chief Towns and Pop.
Bunzlau	1,656	387,898	{ Jung-Bunzlau - 5,000 Reichenitz - 11,500

But, in 1838, the pop. had increased to 4,128,661 (*answ.* p. 234.); and in 1837 the pop. of Prague, *ex* the garrison, the inhabitants of the citadel, and the strangers in the town, amounted to 107,358. (*See* PRAGUE.)

Mountains, &c.—Bohemia is a basin, surrounded on every side by mountain-ranges, which in some parts rise to upwards of 5,000 ft. in height. From the Fichtelgebirge (pine-mountains), near the W. extremity, the chain called the Erzgebirge (ore mountains) runs N.E., forming the boundary between Bohemia and Saxony, as far as the exit of the Elbe from the first-mentioned country. The highest point of this range is the Schwarzwald, about 4,000 ft. above the sea; parallel to it is the Mittelgebirge (midland mountains), which runs as far as the bank of the Elbe. From the r. bank of the Elbe, E. and S.E., forming in part the frontier against Prussia, run a series of chains entitled successively the Lannitzer,

Iser, Riesen (giant) and Sudetengebirge, the loftiest point (of which, the *Snow-cap* is from 5,200 to 5,400 ft. in height). The S.W. border is formed by the Böhmerwald, or Bohemian forest mountains, included in the Hercynian forest of the ancients, and a branch from the Fichtelgebirge: they are wild and precipitous, and contrast remarkably with the Moravian chain in the S.E., which is of gentle ascent, varying from 2,000 to 3,000 ft. in height, and separating the affluents of the Elbe from those of the Danube. Within these boundaries, Bohemia presents an undulating surface, with an inclination for the most part towards the N.: its hills are sometimes steep, and even precipitous; but rising generally no higher than about 500 or 600 ft. above the level of the sea.

Rivers.—Bohemia forms, in fact, an elevated plateau, sloping towards the N., and drained by the Elbe, which traverses two thirds of its breadth, and receives the numerous brooks and streams that descend from its lofty barriers. The sources of this great river are in the Riesengebirge mountains, whence it descends, in a S. direction, to Pardubitz, and thence W. as far as Meinitz, where, after receiving the Moldau, it becomes navigable. In its course to the frontier of Saxony, it is joined besides by the Adler, at Königgrätz, the Iser, and the Eger; the Wattawa, Sasawa, Beraunka, and Luschnitz, fall into the Moldau before its junction with the Elbe. The Moldau is navigable from Budweis, and an iron railway between that town and Linz, on the Danube, completed in 1824, forms a connecting link of a grand water communication between the German Ocean and the Black Sea. This spirited undertaking was, until lately, the longest railroad in Europe; but it is only adapted to carriages drawn by horses, and having to pass over considerable heights, which occasion much difficulty and expense in transporting goods, the advantages it afforded were insufficient to divert the course of trade into this new channel, and it has proved an unprofitable speculation.

Minerals.—The mineral riches of Bohemia are of considerable importance and value. From the 18th to the 17th centuries, considerable quantities of gold and silver were obtained; the first is now, however, no longer met with, except occasionally in small quantities, in the beds of some of the streams; but above 20,000 marks of silver are still obtained annually from the lead mines. The latter produce about 60,000 cwts. a year of lead and litharge. Iron is found in most parts of the kingdom, but the product is but trifling, not exceeding from 15,000 to 20,000 tons a year. There are also tin mines (the only ones in the Austrian dominions), with mines of copper, zinc, cinnabar, arsenic, cobalt, &c. Coal is pretty abundant, particularly in the N. parts of the kingdom; and the produce which has increased very rapidly of late years, is now probably little under 90,000 or 100,000 tons a year. There are a great variety of mineral springs; those of Töplitz, Carlsbad, Sedlitz, &c., having a European reputation. About 800,000 bottles of water from these springs are said to be annually exported. All the salt used in Bohemia is imported. The working of the mines is superintended by two mining commissions, at Joachimsthal and Příbram. Under these are 23 inferior mining courts, and branches, the miners having their own codes of law and especial courts of justice; the whole is controlled by a department of the ministry of finance at Vienna.

Climate very healthy; but, from the elevation of the country, it is, on the whole, rather cold. In the mountainous regions, the snow, which often lies 12 ft. deep, does not disappear until April, the mildest climate is that of the valley of the Elbe. At Prague the mean temperature of the year is about 47° Fahr. The prevalent winds are westerly.

Soil, Agriculture, &c.—The soil of Bohemia consists principally of a clayey loam, but in parts sandy loams and sand predominate. In some of the mountainous circles there is a good deal of waste land; but, speaking generally, the valleys are very fertile. The first land in the circle of Silesia. Of the total area of the kingdom, amounting to 20,285 Eng. sq. m., or 1,982,000 Eng. acres, it is estimated that 11,050,673 acres are under culture or otherwise productive, being distributed as follows:—Arable lands, 5,532,509 acres; common pasture lands, 869,662 acres; woods, 3,393,216 acres; vineyards, 6,387 acres; meadows and gardens, 338,930 acres; the rest being barren mountains, water, roads, and other uncultivable lands. Here, as in all the rest of Germany, rye forms the principal crop, and next to it is oats, and then barley and wheat. The produce of each description of grain has been estimated at:—Rye, 2,129,506 qrs.; oats, 1,739,753 qrs.; barley, 877,506 qrs.; wheat, 304,158 qrs. (*Becker's Handb. d. Lexicon*, and *answ.* 236.); but we have no doubt that this estimate is below the mark; and, in fact, the estimate in the National Encyclopædia makes the product of rye 15,000,000 metzen, or about 3,250,000 qrs., and so with the other crops.

Potatoes are now very extensively cultivated, particu-

larly in the mountainous districts, where they form the greater part of the food of the people. Flax and hemp are principal objects of attention, and supply the material for the staple industry of the country. Hops, which are excellent, are raised in considerable quantities, about 12,000 cwt. being annually exported to Bavaria only.

The culture of beet-root, with a view to the manufacture of sugar, has of late years increased very rapidly; so much so that, in 1838, no fewer than 87 fabrics of beet-root sugar were in operation. The export of fruit from the circle of Leitnitz only has in some years amounted to 60,000 cwt. Some wine is made, but the quality is very inferior; and beer is the national beverage. The stock of horses, in 1831, was estimated at about 144,000; of horned cattle, at 974,000; and of sheep, at 1,350,000. Until recently, but little attention has been paid to stock husbandry; latterly, however, considerable efforts have been made to improve the breeds, and these have been very successful, particularly in the case of the sheep. The supply of cattle is inadequate for the consumption; and there is annually a large importation from Poland and Hungary.

On the whole, agriculture in Bohemia, though a good deal improved, is still in a very backward state. This, no doubt, is ascribable to a variety of causes; but principally, perhaps, to the depressed state of the peasantry, and the want of leases. Most of the land is parcelled out into immense estates; and these are cultivated, either by peasants employed by, and working on account of, the landlord, or by petty occupiers, paying a labour rent for their land. Mr. Gielg has given some curious details in reference to this subject in his *Travels in Germany, Bohemia, &c.* "Of large towns," says he, "there seems to be, in Bohemia, very few; but every vale and strath is crowded with human dwellings; village succeeding village, and hamlet treading on hamlet, with the most remarkable fecundity. On the other hand, you may strain your eyes in vain in search of those species of habitations which give to our English landscapes their peculiar charm. There is no such thing in all Bohemia—I question whether there be in all Germany—as a park; and as to detached farm-houses, they are totally unknown. The nobility inhabit what they term *schlosses*, that is to say, castles or palaces, which are invariably planted down either in the very heart of a town or large village, or at most a gun-shot removed from it. No sweeping meadows surround them with their tasteful swells, their umbrageous covers, and lordly avenues; no deer troop from glade to glade, or cluster in groups around the stem of some giant oak, their favourite haunt for ages. But up to the very hall-door, or at least to the foundations of the wall which girdles in the court-yard, perhaps twelve or twenty feet wide, the plough regularly passes. A garden, the graft generally possesses, and his taste in flowers is good; but it almost always happens that his very garden affords no privacy, and that his flowers are huddled together within some narrow space, perhaps in the very court-yard of which I have already spoken as alone dividing his mansion from the open and cultivated fields. With respect, again, to the condition of the cultivators, that is, in all respects, no different from the state of our agricultural gentlemen at home, that, even at the hazard of saying over again what has been stated a thousand times already, I must describe it at length. In the first place, then, there is no class of persons in Bohemia corresponding to our English farmer. Nobody hires land in order to make a profit out of it, at least nobody for such a purpose hires a large tract of land; but each individual cultivates his own estate, whether it be of wide or of narrow extent. Thus the graft, or prince, though he be the owner of an entire circle, is yet the only farmer within that circle. He does not let an acre of ground to a tenant; but having built up his conceited estate to an adequate number of *bouerein*-houses, he plants in each of these a *bouerein*-man, and pays him for tilling the ground. These *bouerein*-houses, again, are all clustered together into villages, so that the *bouerein* is never without an abundant society adapted to his tastes; and very happily, albeit very rudely, his days and nights appear to be spent.

"The land in Bohemia does not, however, belong exclusively to any order in the community. Many *bouerein* are owners of their farms, some of them to the extent of 100 acres and more; while almost every township has its territories, which, like the noble's estate, are cultivated for the benefit of the burgh. But in all cases it is the owner, and not the cultivator, to whom the proceeds of the harvest belong. These are, indeed, gathered in and housed for him by his representatives, who, in addition to some fixed money payments, for the most part enjoy the privilege of keeping a cow or two on the wastes belonging to the manor; but all the risk and trouble of converting his grain into money attaches to the proprietor of the soil." (II. 19.)

But though by far the larger portion of the land be cultivated in the way described, by hired labour, still it is certain that a good deal is let in Bohemia, as in all simi-

larly situated countries, not for money or a quantity of produce, but for a certain amount of labour to be performed on the estate of the lord, which amount is regulated by a law called the *Roboth-patent*. Mr. Reeve, in his instructive *Sketches of Bohemia*, has the following statement as to the relation subsisting between the lords and those occupying their estates, under this system:—

"The subjects, as they are termed, are all registered in the books of the estates; the lord collects the king's taxes, besides his own dues, and sends an annual supply of recruits to the imperial army. He has the power of expelling misdemeanants from his estate, and he exercises a certain control over his subjects; but the peasants are by no means attached to the soil; and they may always appeal to the courts of justice against their lord, with a proverbial certainty (such is the policy of the government) of gaining their cause. On the other hand, the lord represents the government to his peasants, and the peasants to the government; and whilst he is accountable to the justice of the country, he has it in his power to exercise a beneficent influence over the lower orders. He provides for their instruction; he introduces improvement and encourages trade; he increases their commercial relations; he arbitrates in their disputes; and in proportion to his fulfilment or neglect of these functions, the estate is prosperous or poor. It often happens that the nobility and gentry have acquired a purely German character, in accordance with that of the Austrian government, but very much opposed to the national spirit and national wants of the Bohemian people. All the ancient seigniorial rights which were not legalised and regulated by Joseph II., as the *Roboth* dues, &c., were abolished by that monarch. But the tradition of feudal attachment and of feudal obedience still exists amongst the people: and, although the consent of the lord is not legally required for a marriage between his peasants, it is generally asked, and considered indispensable. The possessions of some of the Bohemian nobles are immense; Prince Schwartzenberg owns one eighth of the country; and the estates once held by the great Wallenstein were so vast as to have formed the appanage of six great families after his death and attainder." (*Metropolitan Mag., April, 1837.*)

Hence the condition of estates, and of the population upon them, depends more, perhaps, in this than in any other country, on the conduct of the lords. Wherever the latter are liberal and intelligent, the estate has an improved appearance, and the inhab. are contented, industrious, and thriving. Unluckily, however, the bulk of the landlords, like the occupiers of their estates, are strongly attached to routine practices, and to those feudal privileges which, while they oppress and degrade the peasantry, impoverish the lords.

Here, as in most other countries, industry flourishes most where it has to contend with the greatest difficulties. The rich level lands of Bohemia, instead of being the best, are the worst cultivated. The occupiers of the mountainous and poorer districts display, speaking generally, not only the greatest industry, but the greatest skill, and the most improved methods of cultivation.

The forests, as already seen, are very extensive; they are mostly situated in the W. parts of the kingdom, and especially in the district of Prachin. They are estimated to yield annually above 2,000,000 cubic fathoms of wood.

Manufactures.—With the exception, perhaps, of Moravia, Bohemia has long been the most celebrated of all the Austrian states for its manufactures. At this moment it produces the finest linens and linen yarn of any country in Europe. Spinning is the universal and favourite employment of the women; and no fewer than 18,000 females are said to prosecute it as a subsidiary business! Machines for spinning have, however, been introduced; but it remains to be seen whether they will be able to undersell the yarn produced by the hand. About 55,000 hands are supposed to be employed in linen weaving; and the total annual value of the produce of this branch of industry, including that of lace, may be estimated at about 1,200,000*l.* a year. This branch of industry is said, however, to be on the decline, in consequence of the growth of the cotton manufacture. According to the *National Encyclopedia*, 20,000 individuals are employed in hand-spinning, exclusive of those employed in the factories, which are numerous: 18,000 hands are said to be employed in the subsidiary department of the trade. There are about 500 bleaching establishments in full work, and the manufacture of potash is very considerable. The woollen manufacture is very extensive: in spinning only, 55,000 hands are said to be engaged; and in weaving, from 15,000 to 16,000: the weaving of woollen stockings employs from 2,000 to 3,000 hands. The hat-makers, furriers, &c., are estimated at about 1,200; and the leather manufacturers at 4,000. There are about 100 paper-mills; and the imperial tobacco manufactory at Sedlitz supplies the whole country with that article, through the agency of above

7,000 retail shops. The manufacture of metals and minerals, and of beet-root sugar, has already been alluded to.

But of all the Bohemian manufactures none is nearly so well known in foreign countries as that of glass. Bohemian glass is not so pure as that of England or France; but the art of staining, painting, and gilding glass, is much better understood there than in this country, and articles of Bohemian manufacture are unequalled in point of lightness and richness of appearance. It is probable, however, were it not for the weight of the duties laid on glass in this country, and the troublesome regulations connected with their assessment, that we should soon become formidable rivals of the Bohemians, even in those departments in which they appear at present to have the greatest superiority.

Altogether, it is said that from 1-5th to 1-4th part of the inhab. of Bohemia are engaged in manufactures. But then it is material to observe that all the hand-spinners and weavers combine with their business that of cultivators of patches of land, and other employments. We believe, too, that the cotton trade of Bohemia, like that of the rest of Austria, is entirely the creation of prohibitions and oppressive duties on foreign stuffs and yarn; and that, were these repealed, or materially modified, the manufacture would be involved in the greatest difficulties.

Owing to the want of capital, many of the great landed proprietors are obliged to engage in manufactures. Thus, Prince Kinsky, and Counts Harrach and Bucquoy, are the greatest glass manufacturers; Prince Auersberg manufactures sulphur, vitriol, and colours; Count Urhna and Prince Windischgratz, tin plates; Count Thun, porcelain; Prince Lobkowitz, earthenware; Prince Wallenstein and others, beet-root sugar, &c. It is clear that manufactures carried on under such auspices must be more expensive and less improved than if they were carried on by individuals dependent upon them.

Races of People.—Of the 4,000,000 people in Bohemia, nearly 3,000,000 are Czeches, of Slavonic origin, and the rest Germans and Jews. The Germans, to the amount of 900,000, principally inhabit the capital and the circles of Ellbogen, Saaz, Leitmeritz, Bidschow, and Königgratz. In these circles German is the more prevalent language, though even in them Bohemian is the vernacular tongue of the lower classes, as it is that of the middle classes and even of the higher ranks in other parts. The German pop. is more industrious, intelligent, and enterprising than the Slavonic. The Jews have been settled in Bohemia from a very remote epoch. Here, as in other countries, they are mostly engaged in mercantile and pecuniary transactions; and they are also extensively engaged in the business of distilling and brewing.

Religion.—Notwithstanding Bohemia may be truly said to be the cradle of the Reformation, and the determined and long-continued stand her inhabitants made in defence of the doctrines promulgated by Huss and his followers, she is now become one of the principal strongholds of Catholicism. The spirit of the ancient Bohemians has been entirely subdued; and they have become amongst the most bigotted and superstitious adherents of a faith imposed on them by the sword of the conqueror and the rack and gibbet of the inquisitor. Nowhere, perhaps, is the miserable trumpery of relics and saints' days held in such veneration. Religion here has not been employed to enlighten the understanding or improve the morals; but to darken the one, and to pervert and debase the other. The more intelligent part of the pop., disgusted with its ceremonies, have taken refuge in scepticism; but the great bulk of the people believe what they are told, and forsake the altars of Christ to prostrate themselves before those of St. John of Nepomuck! The church hierarchy consists of an archbishop (of Prague), 3 bishops, 7 deans of chapters, with numerous canons, 11 archdeacons, 133 deacons, 1,107 parish and 508 minor cures. Though the monastic institutions were much diminished by the vigorous and salutary reforms effected by Joseph II., there are still no fewer than 75 monasteries, and 7 convents, comprising about 1,020 monks and 150 nuns; these are, however, obliged to do the duty of parish clergy, or to employ themselves in education, or in the care of the hospitals.

Joseph II. granted full toleration to all sorts of religions. The Lutherans and Calvinists together amount to from 60,000 to 70,000. The Jews, amounting to nearly 70,000, are under the grand rabbi at Prague.

Education.—If the goodness of education were to be inferred from the number of educational establishments, Bohemia would have little reason to fear a comparison with most European countries. The institutions for its promotion consist of a university at Prague; a polytechnic school; 26 gymnasiums; 3 philosophical seminaries; 20 theological seminaries; 1 military academy; 3 convents for female education; 1 Jewish college; 40 grammar schools; 2,500 Catholic, 36 Protestant, and

20 Jewish, schools; and there are also schools for music and drawing, an observatory, and numerous libraries and cabinets of natural history, arts, and sciences. The Academy of Prague, though not long established, enjoys considerable celebrity.

But there is great reason to fear that the enlightenment of the people is looked upon as a secondary and subordinate object by those who superintend education in Bohemia,—that is, by the clergy. Their primary object is to maintain the existing order of things; to educate the people in the belief that the Catholic is the only true faith; and that it is the duty of every good and well-disposed person to submit implicitly to the dictates of his spiritual and civil superiors! Such an education is better fitted to narrow and enslave, than to expand and emancipate the mind. Any thing like free inquiry, any examination into the reciprocal duties and obligations of princes and subjects, or any inquiry into the real sources of public wealth, would not be tolerated in the Bohemian academies. The pupils there are taught to believe that whatever is ordered is right! And adding to such a system of education the influence of a rigorous censorship of the press, the wonder is not that knowledge is at a low ebb in Bohemia, but that it is so far advanced as it really is.

"The march of intellect in Bohemia, though the schoolmaster be abroad, is in very slow time, and, what is worse, it is but little aided by the national pen or the national printing-press. As a proof of this, I may mention that there are only 10 printers and 10 booksellers in Prague; while for the political *quid nuncs*, there are merely published a couple of very small stupid newspapers in the German tongue, with other two, no less stupid, in the dialect of Bohemia. The literary periodicals, again, are confined to a small paper, called the *Bohemia*, in German, published thrice a week; and the *Abendunterhaltungen*, in Bohemian, printed twice a week. For the lovers of science, art, manufactures, and agriculture, a journal devoted to these matters is published twice a year; while the religious world remains quite unsatisfied with one quarterly journal. Such is the limited extent of the demand for political, literary, and religious information throughout Bohemia."—*Sirang's Germany* in 1831, ii. 206.

During the reign of Joseph II. the use of the Bohemian language was forbidden, not only in the courts of justice, but also in the colleges and higher academies. But, instead of suppressing the language of the people, this seems to have occasioned a reaction in its favour; and during the present century Bohemian literature has been a good deal attended to, and made considerable progress.

Poor.—The number of hospitals and charitable institutions in the capital and principal towns is very considerable, and in the towns the poor are carefully provided for. No regular poor-rates are, however, collected; where the foundation funds and voluntary subscriptions do not suffice, the deficiency is made up by government. But the contributions of the latter are afforded very sparingly, and begging is, after all, the great resource of the Bohemian poor, as it must be of the poor of every country where a compulsory provision is not established. It is here, in fact, universal; and all travellers are disgusted with the numbers and importunity of the mendicants.

Manners, &c.—The Bohemians are passionately fond of music and dancing, and have attained to great proficiency in both. The national airs are nearly the same with those of the Slovaks of the N.W. part of Hungary, and are generally plaintive. The waltz is the favourite dance; and two of its most fashionable varieties, the *Redowak* and the *Galoppe*, have been borrowed from the Bohemian peasants. The men are generally robust and well proportioned; and the women are (in Germany) celebrated for their beauty. The dispositions of the people are more mercurial, and their manners more gay, frank, and open, than those of their Saxon neighbours. How much soever the objects of their veneration may be changed, they are still, as in the days of Huss and Jerome of Prague, zealous defenders of what they believe to be right and proper. There is a nearly total want of a middle class—an intermediate rank between the lords and their vassals. With the exception of Prague, there are no great towns, none of those *foei* whence intelligence and civilisation are diffused over a country. But, however ignorant and prejudiced, the character of the Bohemian peasant is most respectable. In point of morals, he is quite on a level with the peasantry of the other Germanic nations. Crimes of violence are of rare occurrence. The proportion of illegitimate to legitimate births is as 1 to 8; but in the capital it is as high as 1 to 2.

Government, &c.—The nobility of Bohemia are stated to be 2,250 in number, including 14 princes, 172 counts, 80 barons, and more than 100 hereditary knights as heads of families; the total revenues of the nobility were estimated 50 years ago at 180 millions of florins, 18,000,000*l.* At the meetings of the Estates, which form 4 divisions

vis. 1st, the prelates; 2d, the nobles (*Herrn*); 3d, the knights; and, 4th, the citizens of the principal towns, nothing but the distribution of the sums ordered by the emperor to be raised, is discussed. No law, however it may affect the religious, moral, or material welfare of the state, is ever submitted to them. A small minority once made a struggle for some ameliorations of the existing system, but without success. There is, indeed, a strong feeling against the absolutism of the emperor; but the nobility are afraid lest their peculiar privileges should be affected by any change, and no efficient reform need therefore be expected at their hands. The government of the country is directed by the different sections of the ministry at Vienna; the principal of which is the imperial united chancery, under which is the *Gubernium* at Prague. The court of appeals at Prague is under the ministry of justice at Vienna; the receiver of taxes is under the finance minister at Vienna. To these central authorities the various branches in every circle are subject; the courts of justice of the circle being at the same time courts of appeal from the manor courts of the nobles, who exercise judicial authority over their estates. The city and town magistrates have their own civil and criminal courts, from which appeals lie to the court of appeals at Prague. The military have a peculiar jurisdiction, and the nobles have, as in the other provinces, a special court, called the *Landrecht*. Independent of all authorities, judicial or administrative, the police forms a branch apart, being in the towns confided to especial commissaries, and in the country to the captain of the circle, in whom the three functions, judicial, administrative, and those of police, are united. The number of civil employees in the kingdom is stated in the *Encyclopædia* to be 8,461.

Towns.—Exclusive of Prague, Bohemia contains no town of any considerable importance, or of more than 10,000 inhabs. The towns are divided into royal and aristocratic boroughs, and the former, again, into privileged and non-privileged. The towns privileged to send deputies to the diet are Prague, Pilsen, Budweis, and Kuttenberg. Both classes of royal boroughs have their own magistrates, police, &c., and their internal government in their own hands. The boroughs of the nobility are usually under the control of their lords.

History.—After innumerable mutations, Bohemia, with Hungary and Transylvania, fell, in 1525, under the dominion of Ferdinand of Austria, brother of Charles V., who had married the sister and heiress of Louis, king of Bohemia and Hungary, killed at the battle of Mohacz. Bohemia was at this epoch in the enjoyment of a comparatively free constitution, and three-fourths of the population were attached to the reformed faith. The attempts of the Austrian sovereigns to undermine the free institutions of the country, and to lay restraints on the exercise of the Protestant worship, provoked a desperate contest, which continued till 1620, when the Austrian troops totally defeated the Bohemians at the battle of Weissenberg, near Prague. The persecution which followed has seldom or never been equalled for atrocity. Many of the best and noblest Bohemian citizens lost their lives on the scaffold, and thousands upon thousands were driven into exile, and had their estates and properties confiscated. The free constitution of the kingdom was entirely annihilated; the Protestant religion all but extirpated; and such was the combined influence of massacre and exile, that in 1637 the pop. did not exceed 780,000! Subsequently the government gave every encouragement to the settlement of German colonists in the country; and in the reign of Maria Theresa and Joseph II. a new era began; and the milder and more liberal system of government which they introduced has since been followed up.

BOIS-LE-DUC, a fortified town of Holland, cap. prov. N. Brabant, in a morass, at the confluence of the Dommel and Aa, 27 m. S. by E. Utrecht. Pop. 13,500. It is about 5 m. in circ., is defended by a citadel and two forts, and in case of siege the environs are laid under water. It is a well-built handsome town, and is intersected by several canals, over which there are a great many bridges. It is the seat of a vicar-general and tribunals of original jurisdiction and commerce, and has a fine town-hall, on the model of the Stadt-house at Amsterdam; 6 churches, of which the cathedral church, or that of St. John, built in the end of the 13th and the beginning of the 14th century, is one of the finest in Holland; a grammar-school, in which Erasmus was partly educated; an academy of painting, sculpture, and architecture; 2 hospitals, an orphan asylum, a house of correction, &c. Its manufactures, which are considerable, consist of linen and thread, needles and pins, cutlery, &c., with distilleries, glass-works, &c. It is well situated for, and has a considerable trade.

Bois-le-Duc was founded, in 1184, by Godfrey III., duke of Brabant. In 1629 it was taken by the Dutch, after a lengthened siege. It was held by the French from 1794 to 1814, when it surrendered to the Prussians, by whom it was again made over to its old masters.

BOJADOR (CAPE), a celebrated promontory of the

W. coast of Africa, desert of Sahara; lat. 26° 7' 10" N., long. 14° 29' 5" W. This headland forms the W. extremity of a rocky ridge, called the Geb-el-khal, or Black Mountains. It was long the limit of navigation towards the S., and was first passed by the Portuguese in 1433.

BOJANO (an. *Bovianum*), a town of Naples, prov. Sannio, cap. canton, on the Biferno, in a deep gorge, at the foot of Mount Matese, 16 m. E.S.E. Isernia. Pop. 2,000. This town has suffered severely from earthquakes, the last calamity of this sort having occurred in 1805. It is the seat of a bishopric, and has, or had before the earthquake, a cathedral, with several churches and convents, and an hospital. During the early period of Roman history, Bovianum was a very important place. In the Social war it was one of the strongest holds of the confederates. It was taken by Sylla, and afterwards retaken by the Marsi. Under Caesar it became a military colony. Strabo says that in his time it was ruinous and deserted. (*Cramer's Ancient Italy*, li. 229.)

BOJANOWA, a town of the Prussian Silesia, prov. and reg. Posen, 9 m. N.W. Rawicz. Pop. 3,000. It is divided into the Old and New towns; most part of the houses are of wood; it has a large town-house, and fabrics of coarse cloth.

BOKHARA or UZBEKISTAN, a country of Central Asia, comprising considerable portions of the anc. *Sogdiana* or *Transoxiana*, and *Bactria*, forming the most powerful state of what is named by the moderns *Indo-Tartary*, or *Turkestan*. It lies between lat. 36° and 41° N., and long. 63° and 70° E.; having N. the desert and the khanat of Kokan; E. the mountainous regions of Hissar and Koondooz; S. Caubul; and W. the khanat of Khiva or Kharaman. Area, probably about 235,000 sq. m. Pop., according to Burnes, 1,000,000. It is divided into nine provinces, viz.:—

Provinces.	No. of tomans.	Real Levies in Tillas.	Chief City or Town.
Bokhara	-	81,000	Bokhara, 150,000 Inhab.
Karakool	-	12,500	Karakool.
Kermina	-	2	27,000
Meenkal (or valley of the Kohik)	-	7	45,000 Katta Kurgan.
Samarcand	-	5 t. and 5 other dist.	49,000 Samarcand 10,000 In.
Juzak	-	8,000	Juzak (Dizdikh).
Kurshee	-	5	32,000 Kurshee.
Sub-e-ab (or banks of the Oxus)	-	4	22,000
Balkh	-	*	Balkh 2,000 Inhab.
			277,000 = 184,6601.

Bokhara is mountainous only in the E., where its mountains are northern spurs from the Hindoo Koosh, and on its S. frontier, where they seem to belong to the Ghoor or Paropamisian range; if we except a few low-lying hills about Shuhr-Subz, Samarcand, and Bokhara. The height of the former range, in about lat. 35°, is supposed by Burnes to be at least 16,000 feet, since the mountains 150 m. E. of Kurshee are seen by him covered with snow in June. The plain region which comprises all the rest of Bokhara, is nothing but a sandy desert, with a few oases, stretching for a few miles on either side the banks of rivers; in which are planted the chief cities and towns; and which constitute the only cultivable lands, and are very densely peopled. The rivers are therefore of the highest importance: there are five, viz. the Jihon or Amoo (Oxus), Kohik or Zer-afshan, Kurshee or Karchi, Zourhab, and Balkh. The Oxus intersects the country S.E. to N.W., dividing it into two unequal portions, and varying in width from 300 to upwards of 800 yards. The course of the Zer-afshan (river of gold) is entirely within this country: it rises in the highlands E. of Samarcand, runs N. this city and Bokhara, and after a course of about 450 m., chiefly E. to W., falls into the lake Denghiz. The Kurshee rises in the same highlands as the Kohik, runs N.E. to S.W., by Shuhr-Subz and Kurshee, and is lost in the desert. The Zourhab runs from N. to S., and is similarly lost. The Balkh river rises S.W. the Hindoo Koosh, and runs N. to Balkh, where its waters are distributed all over the surrounding country by means of canals. The lake Denghiz, or "the sea," is 60 m. S.S.W. Bokhara, surrounded on all sides by sand hills; 25 m. long, and very deep: its water is salt, and it appears neither to increase nor decrease at any season of the year. There are other lakes, but of no importance.

Aspect.—The fertility of the country is said to have been anciently much greater than at present; the valley of Sogdiana has been spoken of as a paradise by both Greek and Arabian writers; but it is mostly destitute of large trees, and the banks of the Kurshee entirely so. The desert is varied only by sand hills, 15 or 20 feet high, raised by the wind; of a horse-shoe shape, the bow towards the N., and always resting on a base of hardened clay. Some

* The land rev. of Balkh, 20,000 tillas, goes to its own chief.

stunted herbage, low brushwood, and the camel-thorn, are the only signs of vegetation; and a few rats, lizards, beetles, and solitary birds, the only permanent inhabitants. S. of the Oxus, however, it is not quite so bare as elsewhere. Curtius has well described the present state of the region round Balkh, in his glowing description of anc. Bactriana. (See *Burnes*, II. 211.) Many remains of former splendour, aqueducts, temples, &c., are to be met with in various spots, as between Khooloom and Mazar; the ruins of Bykund, 20 m. W. S. W., and of Khojouban, 25 m. N. W. Bokhara, &c.

Geology and Mineralogy.—N. of the Oxus, and from the base of the mountains to Bokhara, there is a succession of ranges of limestone, oolite, and gravel, alternating with vast and hardened plains of argillaceous clay or quartzose sand; the pebbles in Minkal are sharp and angular, and look very unlike having ever been subjected to the action of water. There is more gold in the sand of the Oxus than in any other river rising in the Hindoo Koosh; but other metals are not found in any quantity in this country; silver, iron, and copper, are all imported from Russia. Sal-ammoniac is native near Jizzah, and there is a bed 5 m. in circ. of dark-coloured, imperfectly crystallised salt, near Charjoone, 500 lbs. of which sell for 3r. in Bokhara city. The water in the wells of the desert is often found brackish and unfit to drink, especially S. of the Oxus; between that river and Bokhara the water is good, and exudes through the sand.

Climate.—The climate of the elevated E. frontier is of course very different from that of the rest of the country. In the plains it is generally dry and salubrious; in the winter sometimes so cold that the Oxus is frozen over, and the snow lies for three months at Bokhara: in the desert in summer the heat exceeds 100° Fahr. The seasons are very regular; at the beginning of March the spring opens, the heat soon increases to an oppressive degree, being seldom refreshed by showers, and for four months the bed of the Kohik is dry at Bokhara, and the country suffers from drought. The summer lasts till October, when a fortnight or three weeks' rain sets in, succeeded by frosts, and these again by rains from the middle to the end of Feb. which are often very heavy, but evaporation is rapid. Violent tornadoes sometimes arise, blowing from the N. W.; but a steady wind from the N. blows across the desert in the hot season: the atmosphere is remarkably clear and cloudless at Bokhara, and meteors are frequently seen in considerable numbers at night. At Balkh the summer heat is very oppressive, and the climate unhealthy. Rheumatism is a frequent disease there; and ophthalmia and blindness are the scourges of the desert: fevers are rare, but leprosy is common.

Vegetable Products.—There is but little large timber: willow and poplar are the principal trees in the plains, and the latter is used for house-building; tamarisks and leguminous plants are the most frequent shrubs. A bastard indigo flourishes profusely on the banks of the Oxus, but neither the true plant nor the sugar-cane grow wild. Some *Boraginæ* and *Crucifera* are found universally; lilies, asphodels, and euphorbias less commonly. The *Galenia africana*, the favourite food of the camels, covers many parts of the desert; rhubarb grows in Kurseshe; but the gigantic *Ferula persica* (which produces assaetida) is the sole member of the umbelliferous family. Bokhara is celebrated for its fruits; it is believed to be the native country of the melon, which grows here to more perfection than any where else; and most of the fruits familiar to us grow there in great perfection.

Animals.—Wild animals are few: the lion is not now found, though Alexander killed one in Transoxiana. Diminutive tigers on the banks of the Oxus, wild dogs and asses, deer, and foxes, bears the Oxus, wolves, foxes, jackals, cats, martens, rats, and marmots are the chief *Mammalia*; ostriches in the S.; eagles, hawks, owls, crows, storks, pigeons, plovers, and water-fowl, are common; but there are no singing birds; and all kinds of game are scarce. Tortoises and lizards are found in the desert; but there are neither alligators, nor many snakes. The fish in the Lake Karkool are good: those of the Oxus are the same as in other Asiatic rivers; a large dog-fish is caught there often of 600 lbs. weight. There are few insects; locusts sometimes infest the neighbourhood of Balkh; the scorpion is common, but not dangerous; a kind of cucurbit insect lives on the bastard-indigo, but the dye it produces is very inferior, and the proper mode of treating it is unknown. The silkworm is abundant on the banks of the Oxus, where the mulberry is planted for it in great quantity; and the Turkmans in the summer months are nearly all occupied in the production of silk. The quality of the water, or some other cause in Bokhara city, produces the *rishku* or Guinea worm, and $\frac{1}{4}$ part of the population are said to be attacked annually with a painful disease, owing to the formation or growth of these worms beneath the skin. When observed, they are extracted by means of needles; an operation in which the Bokharese are very expert.

Races of Men.—Baron Meyendorff estimates the pop. and the different races of which it is made up, as follows:—

		Brought forward
Uzbeks	1,500,000	2,460,000
Tadjiks	550,000	Kirghiz & Kara-kalpaqs 6,000
Turkmans	200,000	Jews 4,000
Arabs	50,000	Afghans 4,000
Persians	40,000	Lezgians 2,000
Kalmucks	20,000	Bohemians 2,000
Carry over	2,460,000	Total 2,478,000

Burnes, however (1835), estimates the total pop. at no more than a million, half of whom he thinks are wandering tribes. The Uzbeks, the last race who conquered this country, say they originally came from the neighbourhood of Astrakhan, and are divided into a number of tribes, of which that of Mangout is the principal, and the khan always belongs to it. In their physical appearance they resemble a mixture of Tartar and Kalmuck, but those of the capital are scarcely to be recognised as belonging to either of these families, from their great intermixture with Persian blood. The Uzbeks are chiefly established in the principal towns, and in the valley of the Zer-afshan: they are all warriors, and the government offices are for the most part filled by them. Many are employed in trade, though they are avaricious, and much addicted to deceit. They are naturally proud, and have a great contempt for the other races, especially the Tadjiks; but are also said to be often well-disposed, and are simple, and easily subject to imposition.

Tadjiks.—The Tadjiks are regarded as the aborigines, and descendants of the ancient Sogdians. They are similar to European races in both features and complexion, the latter being much less brown than that of the Persians; their hair is black; they are active, laborious, and intelligent, but pusillanimous, and never take arms: they therefore differ in numerous particulars from the Uzbeks. They do not lead a wandering life, but are cultivators, artisans, and merchants: in the latter capacity, like the Uzbeks, they are greedy and avaricious. Most of them know how to read and write; and, excepting the clergy, they are the most civilised people of the country. Their physiognomy expresses mildness and tranquillity; but they are deceitful, and unfeeling towards their slaves.

Kalmucks.—A large portion of the Kalmucks are descendants of the hordes of Jenghiz-khan; the remainder are Torgout Kalmucks, who in 1770 abandoned the banks of the Wolga, to return to their original seat. The former are to be recognised only by their physical appearance; they have almost forgotten their original tongue, and have adopted the customs of the Uzbeks, amongst whom they live, in villages of their own.

Turkmans.—The Turkmans, or Toorkmuns, inhabit chiefly the region S. of the Oxus (which forms part of Turkestan, or Toorkistan); they belong to the great Tartar family, and differ from the Uzbeks in being exclusively a wandering tribe, having the face larger, and the figure more squat; in these particulars resembling the Kalmucks. They cultivate rice on the banks of the Amoo, but have many herds, and live much on the milk and flesh. Their horses are excellent, and have been celebrated since the time of Alexander. The Turkmans are by profession dealers in slaves; they have chiefs of their own, named begs, but all pay tribute to the khan of Bokhara.

Arabs.—The Arabs have been established here ever since the age of the caliphs. They are immediately recognised, by their swarthy complexion. Some are wandering, and others demi-nomadic tribes; a third section live in villages, some of which are near Bokhara; others are cultivators, and possess fields in the country; it is chiefly the latter who furnish the lamb-skins, in such general demand.

Persians.—The Persians are mostly slaves, who have been captured by the Turkmans; and a proportion of 8 individuals in every village of 20 houses is perhaps a fair average throughout the country. (Burnes.)

Kirghiz.—The Kirghiz are a small wandering horde, found especially N. the valley of the Zer-afshan. Some of the Afghans and Kirghiz are descendants of the hostages retained by Timour; there are some Chinese who have a similar origin. The Bohemians, or Zingees, here called Marané, are of unknown extraction, and live in different companies in every part of the country; they tell fortunes, and have all the other occupations of gipsies.

Jews, &c.—The Jews live almost entirely in Bokhara city; where there are also 300 Hindoos, who are not allowed to build temples, have idols, walk in processions, bring their families beyond the Oxus, or purchase female slaves, and are prescribed a particular dress. They come chiefly from Sindh; are very industrious and orderly, industrious and devoted to trade, in which they amass considerable wealth.

Agriculture is the principal source of the national

wealth: rice, wheat, barley, jowaree, sesamum, maize, moong, melons, and beans, are the chief objects of culture. The propensity to grow rice is strange, in a country so unfitted for it; but the fields of Shahr-Subz yield rich crops, and irrigation for the purpose is pursued to a very great extent in the Kurshee valley, and at Balkh. Meyendorff observes that the rice of the Miankal (valley of the Kohik) is not good. S. of the Oxus the wheat fields, when sown, yield crops for three successive years. When the first harvest is finished, the cattle are turned in upon the stubble fields; and next season the stalks grow up and ear; and a third but scanty crop is reaped in the same way. At Karakool, in Bokhara Proper, the return is said to be sevenfold; at Balkh the wheat ripens in a month; the crops are very good, and the stalk as high as in England. Wheat is usually sown in autumn, and reaped in July; and the fields are afterwards ploughed for peas, which are gathered in the same year. Barley is sown early in March, and reaped before wheat: it comes in the place of oats, which are not used in Bokhara. Jowaree (*Holcus saccharatus*), which, with wheat and melons, occupies most of the surface, comes to maturity in nearly the same period as barley: it grows to five feet in height, and affords but grain for the poor, and, by its leaves, good forage for the cattle. It is commonly surrounded by *tanabs* of hemp and cotton, from the seeds of which oil is extracted: a considerable quantity of cotton is grown and exported, both raw and manufactured. Trefoil is cut seven or eight times a year; madder is grown, and tobacco; the best of which is from Kurshee. Beet-root, turnips, carrots, &c., abound; the potato has not yet been introduced. Kurshee is a "sheet" of gardens and orchards, but most of the stone fruit is inferior to that of Persia. There are many kinds of grapes, and the raisins prepared from those of Bokhara are unrivalled for size and flavour, and beautifully transparent. The vines are not pruned, as in Europe. The wines have little flavour, and will not keep long. The most celebrated fruit is the melon, which is of several kinds; one is oval, with a green or yellow skin, sometimes 4 ft. in circumference, and of a most delicious flavour. Winter melons are said to surpass all the others. Cucumbers also attain great size and excellence. The iris, rose, aster, sunflower, &c., are cultivated a great deal in the gardens, which are very large and numerous. The fields are parted into *tanabs*, each of which comprises a surface of 3,600 square yards; their limits are formed by ditches for irrigation. The want of water is the great hindrance to the progress of agriculture, as, wherever there are neither rivers nor canals, the ground is uncultivated. Property in land is of five kinds: 1st, The state property, which is the most considerable. 2dly, The *kharaqi*, the right to which was formerly doubtful between the government and certain proprietors, and has been ceded to the latter, on payment of a light tax. 3dly, Fiefs, bestowed for military services. 4thly, Properties of individuals. And, 5thly, Legacies for religious purposes. The state territory, as well as other property, is let; government receiving as rent two fifths of its produce.

Cattle, &c.—Bokhara is rich in cattle; the sheep and goats claim the first notice, since the sheep yields the celebrated skins, and the goat a wool only inferior for shawls to that of Cashmere. These flocks graze on furze and dry grass, and their flesh is sweet and well-flavoured. All the sheep are of the variety with large tails, some of which yield as much as 15 lbs. tallow. The description of sheep which produces the jet black curly fleece, made into caps in Persia, and so much esteemed every where, is peculiar to Karakool, a small canton between Bokhara and the Oxus. The animal will thrive nowhere else, and has been transported to Persia and other countries without success: when removed it loses the peculiarity in its fleece, and becomes like other sheep. The annual export of skins amounts to 200,000, the best of which are sent to Constantinople. The goats yield shawl wool, and are about the common size of a dark colour; and many belong to the wandering Kirghiz tribes. The oxen are neither large nor strong, and beef is eaten only by the poor: mutton is the food for which there is the greatest market. The horses of Toorkmania are large and bony, and more remarkable for strength and bottom than symmetry or beauty. The Uzbek tribe, of Karabeer, possess the most matchless horses in the East: the breed was introduced by Tamerlane, or Timour, into the country round Samarcand and Shahr-Subz. All the traffic of Bokhara, however, is carried on by means of camels: these have a sleek coat, as fine as that of a horse, and shed their hair in summer, from which a fine waterproof cloth, of close and heavy texture, is manufactured. The Bactrian camel, with two humps, and tufts of black hair on the neck and thighs, abounds S. of the Oxus, and can carry a burden of 6 cwt.; the dromedary is common in Bokhara; the asses are large, sturdy, and much used: there are no mules.

No considerable manufacture is found in Bokhara; none employing more than four or five workmen at a

time. Cotton thread, silk stuffs of different colours, leather, excellent shagreen, good sabres, knives, and other steel articles, locks, hardware, gold and silver mountings for knives and sabres, rings, and other jewellery, articles of turnery, and fire-arms, are amongst the chief productions. Women are often employed in embroidery, and especially in divesting the cotton of its seeds, which occupies many hands. No farther use is made of hemp than to procure an intoxicating drug; sugar and confectionary are made from the manna found on the camel-thorn. The Jews and others excel in the art of dyeing, but leather is generally bad, and the cutlery, &c., inferior to that of Persia. The fine arts are still less advanced, owing to the influence of Islamism, which does not permit representations of animated objects: flowers are the principal subjects of paintings, and sculpture is confined to cutting tombstones. The modern edifices of Bokhara are destitute of merit, and the fine mosques built at Samarcand, under Timour, are looked upon as impossible to be equalled in the present day. The canals are large; which is indeed essential in a country where evaporation is so rapid; and all the villages are situated on the banks either of a river or canal, and consist generally of about a hundred houses built of earth, sometimes walled round, and intersected by public ways not so narrow as those of the towns: in their centre is commonly a public fountain, or small reservoir. There are very few towns; they are all built on rivers, and surrounded by cultivated fields: Bokhara, Samarcand, Kurshee, Karakool, and Balkh are the principal; the rest are but large villages.

Commerce.—Bokhara, though politically of such secondary importance, holds a pretty high position in the commercial world. Fruitful in the productions of the earth, where all around is desolation, it is a central mart, where the commodities of Europe, China, Persia, India, and Caubul, may be exchanged with advantage. Peter the Great of Russia wished to open a communication between the Caspian and the banks of the Oxus: he succeeded in opening roads from the S. of Asiatic Russia to the E. of the Aral Sea; and for 80 years they have been annually travelled by the caravans of Bokhara, which bring back the manufactures of Russia; while those of Britain reach the banks of the Zer-afshan by way of India.

Exports.—The exports are chiefly silk, cotton, wool, coarse chintzes, cotton-thread (which is in much request), lamb-skins, and others. The following articles were in 1819 amongst those imported at Orenburg from Bokhara:—Cotton, 16,813 pounds (599,670 lbs.); cotton-thread, 18,928 pounds (676,000 lbs.); white cotton, 20,410 pieces of 28 yds.; silks, 74,336; silks, chalcies, torquoses, lapis lazuli, dried fruits, raisins, &c. &c. The returns are paid in Dutch crowns and ducats, Spanish piastres, and Russian silver roubles. The total exports to Russia are valued at nearly \$20,000. Silk and cotton are sent in large quantities to Caubul, and even into India; and wool as well as silk, which fetches from 6 to 8 tillas (4l. to 5l. 7s.) per 256 lbs. Engl. The lamb-skins of Karakool are paid for in ready money by foreign merchants.

Imports.—The imports from India are the same as those into Caubul; a half of the 2,000 camel-loads that reach the latter country yearly from India pass on into Turkistan. Muslins, Benares brocade (about 500 pieces), white cloth from the Punjab for turbans, sugar, and shawls, which pass through to Russia, are the chief imports. Till within the last twenty years the trade in European fabrics was with Russia only, through Orenburg and Froitsha; but it is now carried on more extensively through India and Caubul. There are four great roads from Russia; viz., 1st, from Astrakhan to Bokhara, across the Caspian, and through Orgunje (Khiva), 80 days; 2dly, Orenburg to Bokhara, between the Caspian and Aral, through Orgunje, 60 days; 3dly, Froitsha, across the desert of Kizilshak, E. the Aral, 48 days; 4thly, Petropolk, through Tashkend to Bokhara, 90 days. The first is the best and safest, and is taken by the great yearly caravan, which leaves Bokhara in June; it is, however, necessary that amicable relations should subsist between Bokhara and Khiva. The less valuable merchandise goes to Froitsha, generally in August. The imports from Russia are white cloth, muslins, chintzes, and broad cloth, both of Russian and English manufacture, and the chintzes often Polish or German, imitation brocade, velvet, nankeen, gold thread, hardware, metals, cutlery, jewellery, leather, paper, Kirmis dye, refined sugar, &c. Not less than three fourths of the articles from Russia and India are of British manufacture. British chintzes, which realise sometimes 50 per cent., and broad cloth (the finest selling for 30s. per yard) are, like most other British manufactures, valued by the females of both Caubul and Bokhara greatly above those of Russia; and though we may have to yield to Russia the trade in metals, which are so readily supplied from her frontier, we shall, no doubt, supersede her in the supply of piece-goods; the demand for those of Britain has

been for some time increasing, while that for those of Russia has been proportionally diminishing. Russian muslins are said to be better than the English (though of this we are very sceptical); but all other white goods are inferior, and none now find their way S. of the Oxus. The vizier of Bokhara told Burnes, that a more extended export of white cloths, muslins, and woollens from England would effectually supplant the Russians in those branches of commerce. The transport through Caubul costs little; and if Russia navigate the Volga, Britain commands the two great thoroughfares of the Ganges and the Indus. By the trade with the Chinese territory of Cashgar and Tarkum, Bokhara derives coarse porcelain, musk, bullion, tea, silk raw and manufactured, rhubarb, and Tibet wool; in all about 80 camel-loads, but chiefly conveyed by horses. Tea is drunk at all hours of the day in Bokhara, and especially among the Turkmans; and 950 horse-loads, about 200,000 lbs., were imported from China in 1832. The Persian trade is inconsiderable; Kirman shawls, sugar, and opium, are the chief imports; the latter is re-exported to China. The merchants of Caubul bring indigo and Cashmere shawls, most of which come through their hands. From Kokan are received white cottons, silks, more durable than those of Bokhara, and a raw silk of inferior quality. The commerce with Russia is said to employ 3,000 camels; that with all other countries as many more: but it is said that none of the merchants are possessed of 40,000*l.*, from their frequent and severe losses by the pillage of the wandering tribes. The total capital vested in foreign commerce is believed to be from 500,000*l.* to 600,000*l.*

Money, Weights, &c.—The coins in use are the *tilla* (gold), worth 13*s.* 4*d.*; the *tonga* (silver) = 7*gd.*; and the *poul* (copper) = 27*gd.*. Weights the *batman* = 131*·*104 kilog. (201 lbs.); *seer* (33*g.* lbs.). The duties on European goods are very moderate, being only 2*g.* per cent.; a Christian must however pay 2*g.* and a Hindoo 10 per cent. These injunctions are derived from the Koran; but as the Koran inculcates strict protection to the merchant, and as the people are strict observers of its precepts, in no Mohammedan country is there so much safety and freedom from exaction for the trader.

The *Public Revenue* is professedly spent in the support of mosques and moolahs, but the present khan is supposed to use a considerable portion to maintain his armed force. These revenues are derived chiefly from land, which in Turkistan is valued according to the water which fertilises it: the total amount is estimated by Meyendorff at about 400,000*l.* (by Burnes, at 369,350*l.*); but half the land is enjoyed by the church. Other taxes are those on merchandise, which in the late khan's reign were not levied until the goods were sold, taxes on the farmers' produce, on gardens, orchards, and melon beds; on dried fruits, manna, and skins; customs on goods entering the capital (according to Meyendorff, about 16,000*l.* a year, which ought to be applied to the use of the schools and clergy); a capitation-tax on all the inhabitants of the country not Mohammedans, and in time of war tax on each householder. The land revenues are received by the *hakims*, or governors of districts, who pay the *employes* and troops cantoned in their prov. before forwarding the collections to the royal treasury: the administration of the finances is entirely in the hands of the khan himself and his vizier.

The *Government* is a combined monarchy and hierarchy: the khan is despotic; but does nothing without the advice and authority of the moolahs, or priests. This arises from no inability on his part to assert his power; but from the constitution of the monarchy, which is exclusively bottomed on the laws of the Koran, which are here more strictly enforced, perhaps, than in any other Mohammedan country. The order of succession to the throne formerly required only that the khan should be of the family of Jenghiz, whether by the male or female line; but that family is not now on the throne. He takes the title of *amcerool moomuneen*, or "commander of the faithful," and looks upon himself as one of the heads of the Mohammedan religion, paying, however, a respect to the sultan of Constantinople, of whom he calls himself "the bow-bearer." Every thing that the khan eats or drinks is first tasted by the vizier and his attendants, and an hour elapses to judge of their effects (poisoning being common) before they are sent him. Hence we may fairly suppose, with Sir A. Burnes, that the ruler of the Uzbeks seldom enjoys a fresh-cooked dinner. The present khan, Nussur Oollah, came to the throne in 1829, after a dispute which ended in his putting to death five of his brothers! He is about 40 years of age; and, notwithstanding his fratricide proceedings, is said to be just, liberal, and strict in religious observances, though bigoted. (Burnes.) The *koosh begge*, or vizier, has great influence, and his high office has seemed lately to have become hereditary in his family: all the local governments are at present filled by his dependants or nominees. Every town or village is ruled by moolahs, the

descendants of the first caliphs, and, excepting the khan the vizier, and priesthood, there is no other body having any weight in the country: there are no subordinate khans, nobles, or rajahs, as in Caubul or India; nothing, in short, bearing any semblance of a feudal aristocracy. The court displays no magnificence: the same system of government has existed in Bokhara from the earliest ages of Mohammedanism. The tomons, or districts, are governed by *hakims*, who are in direct communication with the khan; each is assisted by three functionaries, viz. a superintendent of police, a recorder of inquiries, and a secretary. All the chief towns have a *cad*, or judge; the smaller ones only a commissary of police: the *cad* is assisted by a mufti, and in the capital by two: the police is strict and efficient, and the roads in the interior are free from robbers.

Justice is summary and severe; guided wholly by the Koran, and often capricious and contradictory; but nowhere in Asia is there so much protection afforded to all classes. The most trivial offences are punished with death; fines, imprisonment in dungeons, and blows, are also employed. Burnes relates that, though tobacco be publicly sold, without prohibition, to be seen smoking it subjects the party to severe punishment. Meyendorff says, that a Jew, who had sold brandy to a Cossack, was imprisoned by order of the police commissary; his family fined 50 *tillas* (about 34*l.*), and himself beaten with 60 strokes of a club. This punishment is very severe, for the blows are often given on the stomach, and 75 strokes are equivalent to capital punishment. Another mode of torture consists in shutting up a criminal in a room with stinging insects, which destroy him in a day or two.

The *armed Force* consists of about 20,000 horse and 4,000 foot; levied from the different provs., but without discipline; independent of a militia of 50,000 horse, 10,000 of which are from Balkh and the countries S. of the Oxus; and which are seldom called on to serve, and when embodied receive no pay. The regulars are paid in grain, each soldier receiving 8 maunds of 25*lb.* yearly; their chiefs have assignments of land. The regular force consists wholly of Uzbeks, who, though not good soldiers, are superior, as irregular cavalry. They are armed with curved sabres, long knives, and heavy spears 20 feet in length, with a short blade: some wear a short coat of mail, a helmet of iron, or a round shield of buffalo hide; the infantry carry matchlocks, but use them very indifferently. There are no native artillerymen; the artillery consists of 41 field pieces, which lie neglected in the citadel at Bokhara. Few troops are drawn from the S. of the Oxus; the Arabs are good soldiers, but the Turkmans cannot be coerced.

Religion.—The people are all Soontie Mahomedans; their religion has great influence over all their usages; and the intolerance of their sect causes incessant hatred towards their Shiite neighbours, the Persians. Intolerance and bigotry are amongst the most prevalent national vices, and no religion other than the national one may be publicly professed, though the Jews find means to avoid the injunction. Daily public prayer is enjoined, and in the capital nothing is allowed to be sold during the hour so employed; and the police officers expel with whips persons then exposing their merchandise in the markets. There are colleges at Bokhara, but theology alone is studied, and proselytism is greatly encouraged by the government. Astrology is honoured highly, for superstition is very prevalent; magic is firmly believed in, and its origin referred to India.

Public Education.—Bokhara itself for a long period was considered a sacred as well as a holy place: Timour and his successors encouraged literature; which has, however, declined since the Uzbek conquest. Notwithstanding a great number of colleges in the capital, and schools in the country, most of the pop. know neither how to read or write. The children of the Tadjiks acquire these branches, and some knowledge of figures, to serve them as merchants, since they are very rarely members of the chief clergy: the sons of the most opulent persons generally learn only to read, write, and get the Koran by heart. Still a respect for knowledge and its professors is generally prevalent: to found schools is an act of piety, as well as to feed poor scholars; and these often come uninvited and unknown to the *menages* of the rich, and receive money. Geography, astronomy, history, and medicine are, as may be expected, in a very low state.

Habits, Usages, &c.—The diet of the people is very simple: after morning prayers, they take tea, mixed with milk, salt, and oily substances, of which mixture they are very fond. At 4 or 5 o'clock they dine, on rice, carrots, turnips, &c., with mutton, or other meat. The Uzbeks sometimes eat horseflesh, but it is expensive; cheese, milk, and fat, are much used; a sheep is killed, and the entire tail, however large or fat, is melted up with the meat, and cooked in a single boiler. Imme-

diately after dinner they take tea prepared, as in Europe; coffee is not used. They eat with their fingers, knives and forks being unknown. Drunkenness, if public, would be perhaps punished even with death.

Dress.—of the men, is one or two long robes of cotton cloth; the under longer than the upper; and a white cotton turban; or, amongst the Uzbeks, a cap of red cloth, bordered with martens' skins: here, as well as at Constantinople, the form of the head-covering indicates the distinctions of rank. They wear large white trousers, and close short drawers: the rich public functionaries are often habited in Cashmere shawls, and cloth of gold. The dress of the women differs little from that of the men; they wear the same pellisse, but the sleeves are tucked together, and tied behind; richly decorated boots; and have always a black veil over the face: the Turkman women are, however, not veiled. Both sexes often stain the nails red with henna, and the Persians use this herb to dye their beards; the women braid their hair, and blacken their eyelids and eyebrows with plumbago. The languages in use are the Persian and Turkman; the latter is spoken by the Uzbeks and wandering tribes S. of the Oxus, and is remarkable for its rudeness. The articles of luxury in use are very few; their dress and horses constitute nearly all the personal property of the people; their houses are ill built, almost destitute of furniture; they have neither plate, glass, nor clocks, and very seldom a watch. The rich have many slaves, who are brought from Orghujé, and are mostly Persians, seldom Russians or Chinese.

History.—Alexander penetrated into both Bactriana and Transoxiana, which were after his death ruled by his successors. The Arabs conquered this country at the end of the 7th, or in the early part of the 8th, and Jenghiz Khan devastated it in the 13th century: it was the native country of the next great eastern conqueror, Timour, whose successors were dispossessed, by the Uzbeks, in the beginning of the 16th century. Nadir Shah, early in the 18th century, took Bokhara; but the government soon after fell again into the hands of the Uzbeks and of the descendants of Jenghiz: that family has, however, ceased to reign since 1800. The late khan devoted himself wholly to religion, and died in 1825, leaving a kingdom that had suffered insults and encroachments on every side, from his own want of attention to temporal concerns. The present sovereign, his son, is on an amicable term with the neighbouring states of Khiva and Cabul, and the empires of China and Turkey; with the Persians the Uzbeks hold no communication; and in Kokan the influence of Russia predominates. (*Burnes's Travels in Bokhara in 1832—1834*, 3 vols. 8vo. 1835; *McGendorff's Voyage d'Orenbourg à Boukhara*, Paris, 1826.)

BOKHARA (*the treasury of sciences*), a celebrated city of Central Asia; cap. of the above *khanat*, and seat of the khan; on the left bank, and within 6 or 7 m. of the Zer-afshan, at the W. end of its valley; 115 m. W.S.W. Samarcand, and 250 m. N.W. Balkh; lat. 39° 48' N., long. 64° 26' E. Pop. (*Burnes*, 1835) 150,000, but this is probably beyond the mark. It is 8 m. in circ. of a triangular shape, and surrounded by a wall of earth, about 20 feet high, flanked by round towers and bastions, and pierced by 12 gates, with brick masonry. Bokhara is surrounded by a flat but rich country, and is quite embosomed in trees, giving it a beautiful appearance at a distance, which however vanishes on entering it. The streets are so narrow that a laden camel fills up even the largest, and in the smaller ones two persons have difficulty in passing each other: they are also extremely dirty, and always crowded with camels, horses, and asses. The houses are mostly small, and of one story; the common ones built of sun-dried bricks, on a frame-work of wood; others of a superior kind are painted and stuccoed with Saracenic or pointed arches set off with lapis lazuli and gilding; the roofs of all are flat; and they have but a bare wall without windows facing the public ways: except in one building, there is no glass whatever. About 100 ponds and fountains, constructed of squared stone, furnish the population with water: the city is also intersected by canals shaded by mulberry-trees, which bring water from the Zer-afshan; the main canal from which is opened every fifteen days. There is scarcely a garden or burying-ground within the walls; the traveller winds his way among lofty and arched bazars of brick, and sees each trade in its separate quarter of the city: here the chintz-sellers, there the shoemakers; one arcade filled with silks, another with cloth. Every where he meets with ponderous and massy buildings, colleges, mosques, and lofty minarets." The principal structure is the *Acr*, or *khan's* palace, nearly in the centre of the city, built on a natural elevation between 280 and 300 feet high, surrounded by a brick wall 70 feet high, with a lofty entrance of brick decorated by a minaret on either side. This fortress contains the residence of the sovereign, his harem, and a mosque, all encircled by a garden, together with the residence of the

visier, and his public courts of audience; stables, barracks, &c.; the gates, both of the palace and of the outer city, are shut at twilight, and a double guard mounted. There are 860 mosques, and 366 schools and colleges in Bokhara, superintended by about 300 mollahs, who undertake the charge of both religion and education; Bokhara always enjoyed the titles of holy and learned. The mosques and colleges are generally situated opposite each other, and have a striking resemblance in their architecture; that of the former is the most varied; the principal mosque covers a space 300 feet square, and has a cupola rising to one third that height, and covered with blue enamelled tiles: most of these buildings are of brick, and the courts of some paved with stone. The handsomest structure in Bokhara is a college of King Abdoolah, built in 1680, which has a lofty arched entrance, some beautiful enamel, and a white marble pavement: the largest college here was built at an expence of 40,000 roubles in specie, defrayed by Catherine II. of Russia. Attached to the great mosque is a brick tower, or minaret, 210 feet high, built by Timour, in good proportions; the materials disposed of in ingenious patterns, and the whole in good preservation. Chimneys are thrown from this tower; but, excepting on these occasions, no one ascends it but the high-priest, to call the people to prayers; and he only on Fridays, since it overlooks most of the private gardens in the city, and the most scrupulous endeavours are made to seclude the women in Bokhara from the gaze of every stranger. W. of the palace is a small square, the Segistan, surrounded with massive buildings, colleges, shops, and stalls; a third part of the city consists of shops and hotels; and the jewellery and cutlery of Europe, the tea of China, the sugar of India, the spices of Manila, the shawls of Cashmere, and every other article of use or ornament, may be purchased. Many of the merchants remain night and day in their shops, having no other habitation; the bazars are generally open every day, excepting those for slaves, gems, and other such luxuries, which are open but twice a week. There are 4,000 Jews in Bokhara, which is proportionally more than in any other eastern city, and they contend they are better treated here than elsewhere, though they are confined to a residence in three particular streets, are subject to high imposts, and not permitted to build a new synagogue. Sir A. Burnes gives a graphic description of the daily scene in Bokhara (*Travels*, i. 227—229).—"From morn to night the crowd which assembles raises the humming noise, and one is stunned at the moving mass of human beings. In the middle of the area, the fruits of the season are sold under the shade of a square piece of mat, supported by a single pole. One wonders at the never ending employment of the fruiterers, in dealing out their grapes, melons, apricots, apples, peaches, pears, and plums, to a continued succession of purchasers. It is with difficulty that a passage can be forced through the streets, and it is only done at the momentary risk of being ridden over by some one on a horse or donkey. The latter animals are exceedingly fine, and amble along at a quick pace with their riders and burdens. Carts of a light construction are also driving up and down, since the streets are not too narrow to admit of wheeled carriages. In every part of the bazar there are people making tea, which is done in large European urns, instead of teapots, and kept hot by a metal tube. The love of the Bokhara for tea is, I believe, without parallel; for they drink it at all times and places, and in half a dozen ways: with and without sugar; with and without milk; with grease; with salt, &c. The day is ushered in with guzzling and tea-drinking, and hundreds of boys and donkeys, laden with milk, hasten to the busy throng. The milk is sold in small bowls, over which the cream floats: a lad will bring 20 or 30 of these to market on shelves supported and suspended by a stick over his shoulder. Whatever number may be brought, speedily disappear among the tea-drinking population of this great city. Next to the vendors of this hot beverage, one may purchase '*rahut* i *jan*,' or 'the delight of life,' grape jelly, or syrup mixed up with chopped ice. This abundance of ice is one of the greatest luxuries in Bokhara, and it may be had till the cold weather makes it unnecessary." It seems to be as available, and used as much by all classes, as in Sicily; no one in Bokhara ever thinks of drinking water unless iced. The learned, or would-be-learned, are seen poring over the tattered pages of Toorkoe or Persian lore, at book-stalls, and at the doors of the colleges the students are often seen lounging after the labours of the day; "not, however, so gay, or so young, as the tyros of a European university, but many of them grave and mature old men, with more hypocrisy, but by no means less vice, than the youths in other quarters of the world." Each of these resident students has a fixed allowance, as well as the professors; the colleges are well endowed, and possess many of the surrounding lands, which have been purchased by pious individuals for that purpose, as well as

the whole of the bazars and baths. The baths, of which there are 18, can accommodate 270,000 people yearly, and bring an annual revenue of 1,800*l.*: some are very large. The colleges are shut for six months in the year, when the students work in the fields for a subsistence; their course of study generally lasts seven or eight years: they come from all the neighbouring countries except Persia. 'With the twilight, the busy scene in Bokhara closes, the king's drum beats, it is re-echoed by others in every part of the city, and at a certain hour no one is permitted to move out without a lantern. From these arrangements the police of the city is excellent; and large bales of cloth are left on the stalls at night with perfect safety. All is silence until morning.'

The origin of Bokhara is uncertain, but it is believed to have been at first but a collection of fishermen's huts, its site having abounded with small lakes. It is supposed to be at no great distance from the ancient *Trybactra*, but which Ptolemy places on the opposite side the Zerafshan, or river of Sogdiana; in A.D. 706 it was taken by the Arabs, and between 836 and 938 was very flourishing, and the seat of the Samanide dynasty. Jenghiz Khan burnt it in 1219, and it was not rebuilt till near the end of his life. It was threatened, but saved, by his grandson. Under Timour it flourished anew; but since the rule of the Uzbeks has rather declined, though it be still the most renowned city in Central Asia. Its priests affirm that while light descends to all other parts of the world, it ascends from the 'holy' Bokhara! (*Burnes's Travels*, ii. 229-261.; *Meyendorff's Voyage*, pp. 164-188.)

BOLBEC, a town of France, dép. Seine Inférieure, cap. cant., at the foot and on the declivity of a hill washed by the Bolbec, 18 m. E. N. E. Havre. Pop. 9,892. This is a handsome thriving town. Having been almost entirely burnt down in 1765, it was rebuilt on a regular plan. Houses partly of brick and partly of hewn stone; streets wide and well laid out, the principal being ornamented with two fountains surmounted by statues in marble. In the environs are a number of country houses. It has a chamber of commerce, and a council of prud'-hommes; and was early, and is now, very extensively engaged in the spinning and manufacture of cotton. "Bolbec," says M. Dupin, "is advantageously situated for commerce, bringing raw cotton from Havre, and wool from Fécamp and Hédeur, while she sends her products to Rouen—the great mart for all sorts of cotton goods. The manufacturers of Bolbec unite a spirit of order and economy to activity and enterprise: their establishments are on a level with the progress of industry. The workmen are not all concentrated in the town; many of them live in the adjoining country: they are in comfortable circumstances and happy." M. Dupin further states, that there were, in 1827, in the district of which Bolbec is the capital, 13,172 work-people employed in the spinning and weaving of cotton, producing goods to the annual value of above 25,000,000 fr., or 1,000,000*l.* sterling. (*Forces Productives et Commerciales de la France*.) Exclusive of cotton, it also produces various descriptions of woollen and linen goods, and has tanneries, dyeworks, &c. There is here no local tax or octroi on the goods imported into the town. (*Hugo, art. Seine Inférieure; Dict. Géographique*, &c.)

BOLGARY, or **OUSPENSKOI**, a village of Russia in Europe, gov. Kasan, near the Volga, 16 in. S. W. Spask. In its vicinity are the ruins of the ancient city of Boulghar, the capital of the Bulgarians. It was visited by Peter the Great in his expedition against the Persians in 1722, and has since been visited and described by Erdmann and others.

BOLI, a city of Asiatic Turkey, in Natolia, cap. sanjak, 85 m. N. W. Angora; lat. 40° 35' N., long. 31° 19' E. Pop. 6,000. It is situated on an eminence, at the W. extremity of a rich and fertile plain, on or near the site of the ancient city, known to the Romans by the name of *Hadrianopolis*. The ruins of a castle stand on the summit of a small hill. It is a poor place, consisting of about 1,000 houses, principally inhabited by Turks, with a few Armenians, but no Greeks. It has 12 mosques, a square or market-place, a public bath; is the residence of a pacha of two tails, and, as it lies on the direct road from Erzeroum to Constantinople, is a considerable thoroughfare for caravans. There are mineral baths within about 4 m. of the town, to which the Turks resort in great numbers. (*Kinnear's Journey in Asia Minor*, &c. p. 271.)

BOLIVIA, or **UPPER PERU**, a republican state of S. America, comprised between lat. 9° 30' and 22° 40' S., and long. 85° and 71° W., having N. and N. W. the states of North and South Peru, E. Brazil and Paraguay, S. La Plata and Chile, and W. the Pacific Ocean: extremelength, N. to S., above 1,000 m.; do. breadth, above 750 m.; the area has been estimated at 318,000 sq. m. Popping estimated the pop. at 1,200,000, but others estimate it at little more than half that amount. The *Weimar Almanac* gives the following statement, which, however, we rather incline to think, makes the population greater than it should be:—

Departments.	Area in sq. m.	Pop.	Chief Towns.	Inhab.
1. La Paz	59,856	300,000	La Paz	40,000
2. Oruro	8,490	80,000	Oruro	5,000
3. Potosí	31,400	200,000	Potosí	25,000
4. Cochabamba	55,120	250,000	Ortopesa	25,000
5. Chuquisaca	34,344	175,000	Chuquisaca	18,000
6. Santa Cruz de la Sierra	148,400	25,400	{ S. Lorenzo de la Frontera	10,000
Total	318,000	1,030,000	-	133,000

Chuquisaca is the capital city and seat of government.

Surface, Mountains, &c.—This large tract of country presents, in its various divisions, very different conditions of surface, elevation, and climate. On the W. it is traversed by lofty mountains, while on the E. it stretches out into immense plains. The Andes, which enter Bolivia at its S. extremity, give off, near lat. 24°, a lateral E. range of no great elevation, which forms the boundary for a considerable distance between Bolivia and La Plata. About lat. 20° the Andes divide into two great chains, which run parallel to each other to between lat. 14° and 15° S., where they again unite. The farthest W. of these chains is called the Cordillera of the Coast, or of the Andes; and the farthest E., the Cordillera Real; including the intermediate country, they occupy a breadth of more than 230 m. N. of lat. 18°, and S. of that parallel of upwards of 300 m.; and cover at least 100,000 sq. m. of surface, which, however, is partly in Peru. Many lateral ridges, sent off by the Cordillera Real, cover the depts. of Cochabamba and Chuquisaca, together with a part of those of Potosí and St. Cruz de la Sierra: the principal of these transverse ridges branches off from the Cordillera about lat. 17° 10', and running N. past the city of Cochabamba, terminates within a few leagues of the town of St. Cruz de la Sierra. The summits of the W. Cordillera generally appear in the form either of a truncated cone, or of a dome, and are often volcanic: those of the E. Cordillera, as seen from the W., offer a succession of sharp ragged peaks and serrated ridges, and are not volcanic, but in many parts highly metalliferous. The declivity of the Bolivian Cordillera is rapid on either side, but particularly so on the E.: the principal elevations of both Cordilleras are about lat. 15° 19' S., where that of the E. chain is 24,300 ft. (Illimani); of the W., 22,000 above the level of the sea. Many of the passes across both chains are between 15,000 and 16,000 ft. in elevation, or near the limit, in this region, of perpetual snow; while beneath the peaks of the Illimani there is a gorge, or valley, perhaps 18,000 ft. below the neighbouring summit, probably the greatest difference in elevation that has ever yet been observed between any two similarly contiguous points. (*See ANDRES*.)

In the E. the country, which is, in many parts, very little above the level of the sea, is watered by the Beni, Mamore, Uchuy, Pilcomayo, and other considerable rivers: a few isolated ranges of hills are scattered over it, and in its S. part is the watershed between the sources of the Amazon and La Plata rivers, both of which receive considerable affluents from Bolivia; but neither this last-named tract, nor the isolated hills previously mentioned, appear to rise to any great height above the sea. The whole region is extremely fertile; but it is nearly in a state of nature, and covered with vast primeval forests. The desert of Atacama (*see ATACAMA*) occupies the country between the Andes and the Pacific: it extends for about 250 m. along the coast, having a variable breadth of from 30 to 60 m. It is never refreshed by rain, and is almost as sterile and worthless as the Sahara. The surface, which is undulating, and in parts hilly, is covered with loose sand; the only habitable parts being the narrow strips along the banks of the rivers.

There are numerous valleys in the Andes; the principal is the great valley of Desaguadero, between the two Cordilleras, extending from lat. 12° 5' to 18° 30' S., having an area (including the Lake of Titicaca in its N. part) of 16,000 geographical sq. m.

Rivers, Lakes, &c.—The principal rivers are the Beni, Mamore, and the others which unite to form the Madeira, the largest affluent of the Amazon, and which run mostly in a N. direction; and the Pilcomayo, one of the chief branches of the Plata, which waters the S. part of the country, flowing mostly in an E. direction. Bolivia includes the E. and S. shores of the largest accumulation of fresh water in the S. American continent—the lake Titicaca, which occupies an area of 4,600 sq. m., at the height of 12,735 ft. above the ocean, an elevation superior to that of the highest summits of the Pyrenees. (*See TITICACA*.) It contains numerous small islands, from one of which, celebrated for some Peruvian ruins, it derives its name: the only outlet for its waters is the river Desaguadero, running from its S. W. extremity through the valley to the lake of the same name; which latter, having no outlet, is kept at the same level by spontaneous evaporation. In the E., lakes are nume-

rous, and some of them, as those of Ushay and Grande, 50 or 60 m. in length; but they have been little explored by Europeans.

Climate.—Ruin, as already stated, never, or but very rarely, falls on the coast; in the plains to the E. of the Andes, the rainy season, which is identical with summer, lasts from Oct. to April, during which the rains are almost continuous, and the rivers inundate the country to a great extent. In the plains, the climate is excessively hot, and far from healthy; but in the valley of the Desaguadero, 13,000 ft. above the level of the sea, it is temperate, and snow falls in Nov. and April, at the beginning and end of the summer season. The winter, from May to Nov., in the Desaguadero valley, is extremely dry, and although the nights are cold, the sky is serene and cloudless. Tremendous hail and thunder-storms are frequent on the mountains, and earthquakes on the coast. The reflection of the sun on the snow produces, in the higher regions in winter, a temporary blindness: few remarks as to comparative salubrity have met our eye; but the banks of the Beni have been particularised as remarkably healthy.

Minerals.—Gold is found in many places, especially on the E. declivity of the E. Cordillera, and in the sands of all the rivers which fall from that range into the Beni or its branches. Every one has heard of the riches of the silver-mines of Potosi; but it is supposed that they are nearly exhausted, and at all events, they are now comparatively neglected. See *Potosi*. Copper is found at Corucuro, &c.: ores of lead and tin, salt, brimstone, nitre, and other volcanic products, are also found.

Vegetables.—The mighty forests which cover the banks of the E. rivers abound in the finest timber, fit for every purpose of ship-building, carpentry, &c. The cocoa of Apolobamba, Moxos, &c., is infinitely superior to that of Guayaquil (Ecuador): it is used by all classes, and is celebrated for its nutritious and restorative qualities. Tamarinds, the chirimoya, oranges, lemons, figs, sugar-cane, pine-apples, plantains, &c., flourish in profusion on the banks of the Beni.

Cascarilla, indigo, cotton, rice, coffee, grain, cinchona, copaliba, sarsaparilla, and other valuable drugs; gum-elastic, vanilla, dye-woods, tobacco, and canes of various kinds, are all produced in an extraordinary abundance E. of the Andes. Amongst other products, there is a species of cinnamon, called *canela de clavo*, said to differ only in the greater thickness of its bark, and darker colour, from the true cinnamon. The vegetation of the Desaguadero valley is peculiar: it has no trees; but the lower districts, if uncultivated, are covered with very fine turf. There are here extensive plantations of quinoa (*Chenopodium quinoa*, Linn.) and of potatoes, which are found wild on the adjacent hills; but it does not ripen the drier European grains, nor are there any peculiar seasons for sowing or harvesting, both these operations being carried on contemporaneously. In the narrow strips of land along the rivers that run through the desert of Atacama, maize is raised, with excellent fruits, cotton, sugar-canes, and the plant called *Arundo donax*.

Animals.—The tapir, jaguar, leopard, and six or seven sorts of monkeys, inhabit the banks of the Beni: guanaco, alpaca, a kind of hare, and a small animal of the family of *Rodentia*, whose burrowing often renders travelling on horseback unsafe, are found in the Desaguadero valley. Parrots, a bird of beautiful plumage, as well as a multitude of singing birds, including the thrush and whistler; several kinds of turkeys, &c.; several species of *Amphibia*, and an abundance of fine river fish, are met with in Bolivia: the E. plains are infested with myriads of annoying reptiles and insects. Vast herds of horned cattle feed on the banks of the rivers; horses, asses, and mules, are the other domestic animals: the climate of no plains is too hot for sheep.

People.—More than three fourths of the inhab. are said to be aboriginal Indians; who are divided into a great variety of tribes, presenting considerable differences in their physical and mental endowments, disposition, progress in civilisation, &c. Some, on the Beni, are wild and warlike, and go naked, even the women wearing nothing but a few leaves tied round the waist; another tribe, the Maropis, in the immediate vicinity of the former, although also a warlike and proud race, evince considerable ingenuity and aptness for many sorts of work: they manufacture beautiful cloths; are pretty good carpenters; and are said to show a marked taste for music and painting, in which they were initiated by the Jesuits. The Indians are excellent sailors on their own rivers, and very dexterous in the management of their canoes, which are often 50 or 60 ft. in length, and of considerable burden; in these they frequently make long inland voyages, subsisting wholly on the wild animals and vegetables they may happen to meet with. Some of the Mosetene tribes on the Beni display a remarkable acquaintance with the medicinal qualities of plants, which they administer in cases of sickness. These, as well as some other tribes, are peaceable, friendly to strangers, and free from superstition. Not a few Indians,

especially in the Desaguadero valley, and on the coast, where the Quichua language is spoken, have been converted to the Catholic faith: such as have embraced Christianity, instead of going naked, or leading a roving life, wear a light dress of cotton, have fixed dwelling-places, and apply themselves to agricultural pursuits, though in these they are said to make but little progress. The foreign settlers are mostly of Spanish descent in the mining districts, and the valleys of Cochabamba and Cacha Pilco: those of the pure African race are few; but those of mixed blood are numerous on the coast.

Manufactures chiefly consist of cottons, the best of which are made at Orpesa; woollens, of the hair of the llamas and alpacas, the best at La Paz; hats, of the wool of the vicuña, at St. Francisco de Atacama; glass at Orpesa; vessels of silver wire in the mining districts; fans, parasols, plumes, &c., of the leathers of the American ostrich, by the Indians.

Commerce. The commerce of Bolivia is at present very inconsiderable. This does not arise so much from the low state of industry, or the apathy of the people, as from the difficulties they have to encounter in bringing their produce to market. They have not yet learned to avail themselves of the means afforded by the great rivers of S. America, for opening an intercourse with the ports on its E. shore. At present, nearly all the commodities brought from Bolivia to Europe come through the ports on the Pacific, to reach which they have to be conveyed first by tedious passages up the current of the rivers to the foot of the Cordillera, so fatal by its rigorous climate to the Indians of the plains; and then across the Andes, the passage of which has been considered by Condamine as equivalent to 1,000 leagues of transport by sea. The country W. of the Andes, besides being a desert, has no really good harbours, and is traversed by but one road, that from Oruro to Cobija (the only Bolivian port), and that is practicable only for mules and llamas. Cobija, though it has been made a free port, is, owing to these disadvantages, little frequented; the Bolivians preferring to obtain their small imports of foreign commodities through Arica and Tacna, notwithstanding they are there charged with a transit duty of 3 per cent., imposed by the government of Lower Peru, through whose territory they have to pass. The products of Chiquitos and Moxos are transported over the double range of the Andes to Lima, a distance of more than 200 leagues; or if sent to Europe by way of Buenos Ayres, the distance, not to speak of the difficulties of the road, cannot be calculated as less than 600 leagues. Nothing, but bulion and gems can repay the enormous expense of transport on beasts of burden over such immense distances; and in fact, the exports of Bolivia are nearly altogether limited to the precious metals, and different kinds of woollens, and hats. The imports, which are very few, are chiefly iron and hardware, silk, and a few articles of finery.

But, notwithstanding this unfavourable state of things, the E. and most fertile portion of Bolivia is traversed by the Madeira, and other navigable affluents of the Amazon, on the one hand, and by the Pilcomayo, and other affluents of the Paraguay, on the other; so that, if the extraordinary facilities which these great rivers afford for penetrating into the interior of S. America, be ever made use of, the products of Bolivia will meet with a ready and advantageous outlet; and her all but boundless capacities of production, which, at present, can hardly be said to be in any degree availed of, will receive a stimulus, of the influence of which we can form no adequate idea.

Within the Brazilian dominions, not very far from the Bolivian frontier, a short break, of 3 m. only, separates a tributary of the Amazon from one of the Pilcomayo river: were these streams connected by a canal, there would be a continuous water communication, for the most part navigable, through the heart of S. America, from Buenos Ayres, in lat. 36° S., to the mouth of the Orinoco, in nearly 9° N. In 1835 the Bolivian government were represented as endeavouring to promote internal traffic, by offering grants of land to persons settling, and considerable premiums for the establishment of steam navigation on the S. affluent of the Amazon; but we have not learned whether these have had any considerable success.

The public revenue in 1832 is said to have amounted to 1,700,719 dollars; the public expenditure to 1,586,426 dollars; and the total public debt in the same year to no more than 1,500,000 dollars.

The standing armed force is limited to 2,000 men; the country is divided into three bishoprics, but there is no established church. There is a university in the capital, and other public academies.

History. Constitution, &c.—This country, under the name of Upper Peru, formed, previously to the battle of Ayacucho in 1824, a part of the Spanish viceroyalty of Buenos Ayres. The republicans, under Gen. Sucre, having then defeated the royalists, the independence of the country was secured. Its present name was given to it in 1825, in honour of the liberator Bolivar, who, on being

requested, drew up a constitution, which was adopted in the year following. This constitution, which was exceedingly complicated, vested the executive power in a president for life, with the privilege of naming his successor; and the legislative functions in three bodies, a senate, tribunals, and censors. The code and constitution of Bolivar were soon after abandoned; but the legislative powers are still, nominally at least, vested in the three bodies above named; and the executive power is in the hands of a president. Generals Sucre, Velasco, and Blanco, successively filled this last office, which is at present held by Gen. Santa Cruz, elected in 1829 (*Pendland, Parish, Miller, Haënk, &c. in Geogr. Journal, v. vi. &c.; Mod. Trav. xviii.; American Almanac, 1839, &c.*)

BOLKHOFF, a town of Russia in Europe, gov. Orel, cap. distr., on the Nougra, 36 m. N. Orel. Pop. said to exceed 10,000. It is well built of wood, has numerous churches, with manufactures of hats, gloves, and stockings, and a considerable trade in hemp, linseed oil, tallow, and hides. (*Schmidler, La Russie, &c. p. 352.*)

BOLLENE, a town of France, dep. Vaucluse, cap. cant., 24 m. N. Avignon. Pop. 4,775. It stands on the declivity of a hill, and has filatures of silk and dye-works. Various remains of antiquity have been found in the vicinity.

BOLOGNA (an. *Bononia*), a city of N. Italy, the second in rank in the Papal States, cap. leg. same name, between the rivers Reno and Savona, on the verge of the valley of the Po, and at the foot of the hills forming the commencement of the Apennine chain; lat. 44° 30' N., long. 11° 22' E.; 224 m. S.E. Modena, 35 m. S.W. Ferrara, and 350 m. S.W. Rome. The city is a triangle, its base 13 m. in length (1,500 toises) by 12 m. in breadth (1,073 toises), and 4 m. in circ.; is walled, and divided into four quarters. Pop. 69,000. Except one square, it is indifferently built; streets crooked and narrow; houses mostly three stories high, in a palace style of architecture, chiefly of brick fronted with stucco, with deep projecting roofs, and generally surrounded with arcades. The *Piazza Maggiore*, or principal square, boasts of many fine buildings; amongst them are the *Palazzo Publico*, the residence of the cardinal legate, and seat of the courts of justice; in the centre of the district is a fountain, adorned with a statue of Neptune, reckoned one of the best modern statues in Italy, the work of Giovanni di Bologna.

In the middle of the city stand the two leaning towers, inclining in different directions: that of Asinelli, 320 ft. high, inclines about 34 ft.; Garisenda, 145 ft. in height, 8 ft. It is said that from the top of the former 103 cities may be seen. Bologna has 74 churches, 35 convents for monks, and 38 for nuns. The cathedral, built A. D. 432, has the meridian line by Cassini traced on its floor, and possesses the *luminaria* (the last work of Lodovico Caracci), and other fine paintings. The church of Madonna di San Luca, 3 m. distant, has a covered walk to it the whole way from the city. The university, one of the oldest and most celebrated in Italy, owes its origin to the Emperor Theodosius, A. D. 425, and was restored by Charlemagne; it has a library of 150,000 vols., and was formerly attended by many thousand students; but it has declined in celebrity, and at present is not attended by above 1,000. There is another public library, the legacy of a clergyman, containing 65,000 vols. and 4,000 MSS.; there are also cabinets of mineralogy, natural history, and other physical objects; academies of sculpture, science, music, and the fine arts: the whole city abounds in pictures, statues, and other works of native artists. There is a public school for the poorer classes, where the rudiments of education, with Latin, arithmetic, singing, drawing, &c., are taught gratuitously; 9 hospitals; a *monte di pietà*; and many other benevolent institutions. The manufacture of crape, for which the city has been long famous, and which was at one time very extensive, has now declined, so that not one is worth more than 30,000 crowns a year. There are also manufactures of silk, glass, sulphuric acid, nitric ditto, gold gloves, wax candles, musical instruments, paper, cards, *mortadelle* sausages, celebrated all over Europe, &c. &c., exclusive of preparations of wine, oil, hemp, flax, and other natural produce, as stones, &c. Bologna is an archbishop's see, and has been so since the 4th century. The city and leg. are at present governed by a resident cardinal-legate; the court of appeal for the four provinces of Bologna, Ferrara, Ravenna, and Forlì, sits here, and consists of six judges. The Bolognese are courteous and affable, independent, and remarkable for their love of liberty; industrious, quick, ingenious; ardent alike in their friendships and enmities; the women handsome. The middle classes are well informed; they are fond of the casinos, or reading-rooms, *conversazioni*, and theatres, of which there are three. The higher classes are wealthy; the lower bold, turbulent, and noisy. The prevailing dialect is not in use elsewhere; there is a tendency to pronounce words with unusual terminations, and in other respects it is the conversest in Italy. The proportion of illegitimate births is as 1 to 7. No Italian city, Florence excepted, has produced so many celebrated men in sci-

ence and the fine arts. Bologna always assumed the title of "learned," and had the motto *Bononia docet* on its money and public buildings, as well as the word *libertas*. It has given birth to 8 popes (including Benedict XIV.), nearly 200 cardinals, and to more than 1,000 literary and scientific men and artists; amongst them, the naturalists Galvani and Aldrovandi; the anatomists Mondino and Malpighi; the astronomer Marsigli; the mathematicians Manfredi and Cantarani; the brothers Zanotti, Ghedini, and Cuercino; and the painters Francia, Guido, Albano, Barbieri, Domenichino, the three Caracci, Zambocari, Aldini, &c. The air of Bologna is pure, but subject to sudden changes, which produce frequent inflammatory diseases. Its environs, both on the hills and in the plain, are studded with a number of country residences in a richly productive soil. For the natural productions of this region, see *PAPAL STATES*.

This city, originally built by the Etruscans, was anciently called *Felsina*; it was subsequently occupied by a Gallic tribe, the *Boii*, who designated it *Bononia*. It received a Roman colony A. D. 582. A Christian church was built here so early as the 3d century. Alaric besieged, but did not take it; it escaped Attila, and formed a portion of the exarchate of Ravenna. Pepin gave it to the Holy see, to which it belonged during the Carolingian dynasty; after which it was governed by its own magistrates; it was next governed by feudal nobles; but these having abandoned their pretensions, and been admitted as private citizens, it became a republic, extending its rule over all Romagna as far as Rimini. In the 13th century it fell again under the Holy see, to which it was finally annexed in 1506. In 1796 it was taken by the French, but restored to the Papedom in 1816, to which it still belongs; although at different periods revolts have occurred, especially one in 1831, suppressed by Austrian interference. (*Rampoldi, Corografia dell'Italia, p. 267; Schutz, Allgem. Erdkunde, xxix. 436-440; Bouring's Report on Statist. of Pontif. States, &c.*)

BOLUTANA, a town of Sardinia. Bishopric of Alghero, 16 m. W. Bosa, near the centre of the island. Pop. 2,274. It is situated on a hill, and the air is said to be good. The contiguous country is productive of corn and pasture. (*Singh's Sardinia, p. 330.*)

BOLSEN (an. *Fulsinensis*) a town and lake (*Lacus Fulsinensis*) of the States of the Church, deleg. Viterbo, 11 m. W.S.W. Orvieto. Pop. 2,000. The town stands near the N. shore of the lake, to which it gives its name. It is surrounded by a high wall, flanked with towers and a deep ditch; but is remarkable only for the ruins, in or near it, of the temple of the Etruscan goddess Nortia, a granite sarcophagus, ornamented with bas-reliefs, and other remains of antiquity. This was anciently a place of great wealth and luxury. Pliny says (*Hist. Nat.*, lib. xxxiv. § 7.) that when taken by the Romans, anno 260 B.C., it contained no fewer than 2,000 statues. Having been destroyed by the conquerors and rebuilt it was noted at a later period as the birth-place of Sejanus, the minister of Tiberius.

The lake of Bolsena continues, as of old, to be surrounded by finely-wooded hills—

Aut posita nemorosa inter juga Volatinia.

Juv. Sat. iii. 191.

It is of an elliptical shape, about 12 m. long, by 8 m. in breadth; its depth is various, but near the banks it is generally shallow; it is well stocked with fish. It has two islands, which, in Pliny's days, were believed to be floating. Its superfluous waters are carried off by the river Marta, to which it gives birth. The country round this lake is now become exceedingly unhealthy; a circumstance which has most probably occasioned the decay of Bolsena, as well as the total ruin of several other cities, that once gave life and animation to its banks. (*Cramer's Ancient Italy, l. 221; Conder's Italy, iii. 84, and other authorities.*)

BOLTON, or **BOLTON-LE-MOORS**, a flourishing bor. and manufacturing town of England, co. Lancashire, hund. Salford, par. Bolton, on the Croale, an affluent of the Irwell; 170 m. N.W. by N. London, 25 m. N.E. Liverpool, and 10 m. N.W. Manchester; lat. 53° 38' N., long. 2° 26' W. The progress of pop. has been as follows:—

	1773.	1801.	1811.	1821.	1831.
Bolton, Great	1,568	12,549	17,070	22,037	28,249
Bolton, Little	1,036	4,876	7,073	9,258	12,896
Tonge with Haugh	-	1,158	1,492	1,678	2,201
Total	5,604	18,583	25,551	32,973	43,347
Bolton parish	-	29,896	39,701	50,197	63,034

The appearance of the town scarcely corresponds with its real opulence and importance, a considerable portion of the houses being crowded in narrow irregular lanes, which are but indifferently paved and sewered. Within the last 30 years, however, great improvements have been effected, and are still in progress; flagged footpaths have been formed in most of the streets, and the whole town

has been completely lighted with gas: 3 new squares have been formed; and a considerable number of handsome houses and villas have been erected, mostly near the S. entrance. It is well supplied with excellent water, from a reservoir covering an area of 15 acres, placed at such an elevation as admits of this indispensable fluid being conveyed into the upper rooms of every house in town. This important improvement was effected by a company, under an act obtained in 1824, at a cost of 40,000*l*. The church, on an eminence at the E. end of Great Bolton, is a plain ancient structure with a low tower, built of the dark red sandstone of the district. There are besides this, 3 episcopal chapels of ease; 2 in Little, and 1 in Great Bolton: the last, an elegant Gothic edifice, built by the parliamentary commissioners in 1826, cost 13,400*l*. and has 923 free sittings. The Methodists, of various denominations, have 7 places of worship; the Baptists, Independents, and Unitarians, have each 2; and the Catholics, Friends, and Swedenborgians, 1 each. It has a free grammar-school, founded in 1641, with an annual revenue of about 485*l*. Ainsworth and Lempriere, compilers of the well-known dictionaries that bear their names, were masters of this school. Three other charity schools educate, in all, about 230 children, at an expense of 1,200*l*. a year, defrayed by subscription. The Sunday schools of the different sects educate upwards of 10,000 children. The other charities are—Gosnell's, which consists of lands producing 80*l*. a year, 2-3*ds* of which is appropriated to a church lecturer, 1-6*th* to the grammar-school, the rest to the poor; Hulton's, lands and houses producing 777*l*. a year, for a church lecturer, apprenticing poor boys, and providing a classical teacher; and various smaller ones, amounting in all to 67*l*. a year, distributed amongst the poor. The above all belong to Great Bolton, the charities peculiar to Little Bolton being quite inconsiderable. But all parts of the town participate equally in the munificent donations left by Mr. Poppeler Will, who died in 1823, and his sisters, amounting to 27,000*l*. 3 per cent. consols. for the promotion of religion, learning, and charitable purposes.

Bolton has an exchange; a town-hall in Great, and another in Little Bolton; 2 cloth-halls, a theatre, assembly and concert-rooms; a dispensary, established in 1825, and 3 public libraries, all well-built modern structures. Two weekly newspapers, the *Bolton Chronicle*, and *Bolton Free Press*, are published in the town.

The progress of Bolton has been greatly promoted by its command of coal, and its improved communications. The Bolton Canal, extending to Manchester (12 m.), and a branch from it to Bury; a railway from Bolton to Leigh (8 m.), and thence to Kenyon, where it joins the Liverpool and Manchester Railway, was completed in June, 1831. A railway along the canal banks, *via* Bury, to Manchester, has also been formed since 1833. The weekly market for general provisions is held on Monday, and is well supplied; there is also a market for store cattle, held every alternate Monday, between 6th Jan. and 12th May; and 2 annual fairs, 1 on the 30th and 31st July, the other 13th and 14th Oct. The first day of each is for cattle; the last for hardware and toys. The entire consequence of Bolton is derived from its manufactures, which were carried on at a very remote period. As early as 1837, some Flemish clothiers established themselves in the town; and in the reign of Hen. VIII. it was famous for its cottons, that is, for a peculiar description of *woolens* goods that went by that name. Cotton goods, however, began to be produced in Bolton, in considerable quantities, about the middle of last century. But the real prosperity of the town dates from 1770–1780, when the wonderful inventions of Arkwright, Himsell, and Cartwright, began to be put into operation. From that epoch its progress has been rapid in the extreme; and it is now a principal seat of the cotton manufacture. The articles chiefly produced are—muslins, superfine printing calicoes, quiltings, and counterpanes, dimities, salteens, jeans, cotton shawls, &c. The average quantity of cloth bleached in the parish is estimated at between 6,000,000 and 7,000,000 pieces. The principal manufacturers have warehouses in Manchester, where they generally attend on the Tuesdays, to effect the sale of their goods; but sales are also effected on other days, though not to the same extent. In the town and its immediate vicinity there were, in 1835, 44 cotton-mills, employing in all 7,620 persons, and worked by 41 steam-engines and 10 water-wheels, of the aggregate power of 1,419 horses; with 1,085 power-loom, weaving calico, and 546 weaving fustian; 1 large flax-mill, employing 480 persons, 23 bleacheries; 12 iron-foundries, some of them on a very extensive scale, and employed in the construction of steam-engines, mills, and machinery of various kinds; with paper-mills, flax and saw-mills, and chemical works, &c. In these, and the various smaller ones (of which there are about 30 in work) upwards of 300 steam-engines, having an aggregate power of upwards of 2,500 horses, were employed; besides a number of water-wheels, worked by the river; to increase and equalise the power of which, reservoirs, covering an

BOMBAY (PRESIDENCY OF).

area of 136 acres, have been formed on the adjoining hills; whence, in seasons of drought, the stream is supplied.

There is a joint stock banking company at Bolton; a private banking company, and branches of some other banks.

We have already noticed the fact, that Sir R. Arkwright, the inventor, or at all events the introducer of the spinning frame, was a native of Bolton. He was the youngest of a numerous family, and was brought up to the humble occupation of a barber! With the exception, perhaps, of Watt, there is no individual to whom the manufactures of this country owe so much. Crompton, the inventor of the mule jenny, was a native of Bolton parish.

The Reform Act conferred upon Bolton the privilege of returning 2 mem. to the H. of C. The limits of the parliamentary bor. and municipal bor. coincide, the pop. of both, in 1831, being estimated at 42,358; the number of houses being 7,632, of which 1,612 were worth 10*l*. a year and upwards. At present the pop. of the bor. is probably not under 50,000. Registered electors, in 1837–38, 1,405.

It is governed by a mayor, aldermen, and councillors, assisted by a recorder: the mayor is chosen by the aldermen; these, by the councillors; and the councillors, by such of the burgesses as are qualified to vote for members of parliament. Previously to the municipal act, the government of the two towns was distinct; the police of each having been managed by portreeves and constables, annually elected at the respective courts leet, in Oct.; and the paving, cleansing, and lighting of each, by trustees incorporated under distinct local acts. Petty sessions for the bor. are held every Monday and Thursday. Bolton is the centre of a union under the Poor Law Amendment Act, which comprises 26 other townships and chapels. The poor-rate levied in 1836, in Great Bolton, was 3,570*l*. 7*s*.; in Little Bolton, 1,734*l*. 7*s*.

The parish within which this borough is comprised extends over 31,390 acres, and includes 19 other townships, chapels, and hamlets; the entire population, in 1831, being 63,034. It is geologically situated in a large coal formation, and its surface is for the most part of a peaty nature. It contains numerous quarries, some of excellent flagstones, a few of roofing slate and veins of lead, none of which are worked at present. Three small streams (the Tonge, Croale, and Bradshaw) take their rise in the hills that overlook the town, and contain a few well-wooded and romantic valleys, but its general aspect is barren and cheerless, with scarcely a tree visible. About one fourth part is under the plough; of the rest no inconsiderable portion consists of unreclaimed mosses; and though the land increases in value near the town, such is not the case in its northern townships. Bolton is a place of considerable historical interest: its inhabitants from a remote period were distinguished for their archery, which is still continued as a sport, there being a target-ground near the E. entrance to the town, for the use of a society of archers, who shoot for prizes during the summer. The labouring classes have long been accustomed to settle their quarrels by single combat, or by what is called an "up and down" fight, which includes the right of *kicking and throttling*! Death has often followed from these brutal contests, which used to take place at all races, fairs, and such like occasions; but the practice is now, happily, on the wane, and will, it is to be hoped, be shortly known only as matter of history.

At the commencement of the last civil war, the inhabitants took the parliamentary side, and held out till 1644, when, after a desperate struggle, and several pulses, the town was at length taken by the Earl of Derby, who held it till after the battle of Worcester. He was subsequently taken and beheaded here. (*Baines's Lancashire; Boundary Reports, and Municipal ditto, &c.*)

BOMBA, a village of Naples, prov. Abruzzo Citra, cap. cant., on the Monte Pallano, watered by the Sangro, 18 m. W.S.W. Vasto. Pop. 2,602. Its parish church is said to be one of the handsomest in the province. On the mountain on which Bomba is situated are the ruins of walls, gates, and towers, on the most gigantic scale. They are formed of enormous blocks of stone, united, without cement, after the Etruscan fashion. Large caverns have also been excavated in the rock, and coins of the most renowned cities of Magna Græcia have been found among the ruins. Nothing authentic is known with respect to the history of these extraordinary ruins. (*Del Re Descrizione de l'Abruzzo*, li. p. 421.)

BOMBAY (PRESIDENCY OF), the most westerly and smallest of the three presid. of British India; between lat. 14° 18' and 22° 36' N., and long. 71° 48' and 72° 24' E.; having N.W. and N. the Gulcoar's dom.; N.E. those of Scindia; E. those of the Nizam; S. Mysore and the Madras presid.; W. the ocean and the territ. of Goa, exclusive of the detached territ. around Wyrag and Kurda, surrounded by the Nizam's dom.: area, 68,074sq. m. Pop. 7,000,000. It nearly encloses the territ. of the rajah

of Sattarah, and the distr. of Baroda, Camby, and others belonging to the Gulowar, and at its E. extremity, approaches within 50 m., the ceded Nerbudda distr. of the Bengal presid. It is divided into the following collectorates:

Collectorates.	Sq. m.	Pop.	Collectorates.	Sq. m.	Pop.
Bombay Is- land - - }	28	230,000	N. Concan	6,770	656,857
Poonah	8,281	558,313	N. Concan	5,500	387,264
Ahmednuggur	9,910	666,376	Surat, &c.	1,449	454,431
Candesh	178,397	478,457	Baroch	1,851	239,527
Dharwar	9,182	659,757	Ahmedabad	1,827	528,073
N. Jaghiredar	2,978	778,183	Kaira	1,027	484,755
Sattarah, &c.	6,169	756,284	Total	68,074	6,940,277

Aspect, &c.—The N.W. parts of this presid. are more level than the S. and E.: Ahmedabad, Kaira, and Baroch are well watered, and some parts amongst the best cultivated and peopled lands in India; Surat is more undulating, its E. part hilly and jungly, and much of it waste; Candesh is interspersed with low barren hills; some spots are in good cultivation, but much is covered with jungle; Ahmednuggur abounds in rocks, hills, and waters; Poonah is irregular and mountainous, but with many fertile valleys; Darwar is an elevated table-land; and the Concan a long narrow tract stretching for 225 m. along the sea coast, having E. a chain of rocky hills, formerly crowned by a number of fortresses, and W. a low, straight shore, broken into numerous bays and harbours, till lately affording a resort to pirates, by whom it had long been infested.

The mountain ranges in the S. belong to the W. Ghats: in Candesh, to the Sydaree (a continuation of the former) and Sautpoora ranges; and N. the Nerbudda, they are branches from the Vindhyan chain. The principal rivers are the Nerbudda, Taptee, Mhye, and Saubermutee, falling into the Gulph of Cambay, in the N.; in the central parts the earlier branches of the Godavary and Beemah; and in the S. the Kistnah and Toombudda.

Porphyritic trap, extending as far N. as Bulsaur, forms the inland hill ranges; sandstone, with many shells, and conglomerates containing fossils, are common in N. Concan and the N. parts of the presid. A primitive range of red sandstone formation, extending from Delhi, terminates at the head of the Gulph of Cambay. The great basaltic district of India, which commences at Nagpoor, occupies the whole coast from between Goa and Bombay to the head of the Cambay Gulph; which coast has been the theatre of volcanic phenomena, earthquakes, and tremendous whirlwinds, even within the last few centuries. Basalt and amygdaloid, yellowish porphyry, and green claystone, are found at Salsette and Elephanta, and near Kattampoor an abundance of cornealian stones, imbedded in red gravel. A black soil, well suited to the culture of cotton, is widely diffused throughout the centre of this presidency.

Climate.—The mean temp. at Bombay, about the centre of the presid. is between 81° and 82° Fahr. But though Bombay be rather unhealthy, the Concan and Malabar coast generally is by no means so, except in the marshes below the Ghats. The climate of the N. distr. is reckoned amongst the worst in India: the thermometer in the hot season rises sometimes to 116° Fahr.; and Europeans are affected with fever, ague, and other tropical complaints. Some amelioration must, however, have lately taken place, or greater care been adopted in guarding against it; since, between 1825 and 1832, the number of dead and invalided among the troops serving in the Bombay presid. had decreased from 357 to 126, while the average number of Europeans had been augmented from 3,000 to 3,700 nearly.

Vegetable Products.—Task of very good quality grows on the Ghats and lower hill-ranges, and in some parts poon is plentiful; the district of Surat abounds with the wild date and babool. Cocoa-palms cover an immense tract of sandy land, bordering the coast of the Concan; and various other trees of the same family are abundant. The N. part of this presidency is remarkable for the great variety of fruits it produces; the district of Ahmedabad, in particular, is noted for the size of its mango-trees, and their fruit. Rice, cotton, and the other chief articles of culture, will be mentioned presently.

Animals.—Wild elephants are met with in the Ghats, that is, in the woody chain of mountains running along the W. side of Southern India; and tigers, panthers, leopards, and hyenas, are numerous in the jungles and wooded parts; buffaloes, wild boars, deer, antelopes, jackals, generally so, and in the N. the flying macanoo is found. Birds in great variety inhabit this part of India.

People.—Besides Hindoos, Mohammedans, Parsees, Jews, and Europeans, many distinct tribes, some of whom are supposed to be aboriginal, inhabit this presidency. Divided five E. of the Ghats, from the hills near Poonah to the banks of the Nerbudda and Taptee; the Ramooses

meet these S. of Poonah; W. of the Ghats and around the Gulph of Cambay, Koolies, a very barbarous tribe, reside; Cattle, Aherees, and Jhabrees, are found in Kattawar; Dholees and Koolies in Gujarat, &c. All these are met with in the Bombay British army. The Jain sect is very numerous in the Gujrat districts; and nearly all the Parsees in India have settled within the limits of the Bombay presidency. A tribe, called Boras, reside in the district of Surat and its neighbourhood, who are Mohammedans as to religion; but in all other respects are similar to Jews.

Agriculture and Cattle.—Rice and cotton are the chief articles of culture; compared with these, the other great staples of Indian produce are grown only in insignificant quantities. An important item in the public revenue is the sum derived from the transit duties on opium; but none of this drug is grown within the limits of the presidency, the whole being brought from Malwah, where the soil is peculiarly adapted for its culture, and where the native princes are under engagements to dispose of the whole of the produce to the British authorities. Rice is largely grown in the central parts of the presidency; and in S. Concan it constitutes 4-5ths of the whole crops. The culture of cotton is extensive, and the produce is an important article of export. The cotton of this side of India is decidedly superior to that of the other, which is grown in Baroch is particularly good. Sugar and indigo are cultivated in Candesh, where the first occupies a considerable extent of country, and where late reports speak of an intention on the part of government to erect sugar-mills. The indigo of Candesh has been said to be as fine as that of Bengal, but wanting in depth of colour. The mulberry-tree grows in some parts with immense rapidity, and great exertions are being made by various private individuals to introduce the culture of silk, and to render it important as an article of trade. Wool has lately been imported in considerable quantities from Bombay, and efforts are making by the government to improve the breed of sheep, by importing stocks into the presidency from Canbul, Sinde, and Cutch, and crossing them with Merino and Saxon breeds from the Cape of Good Hope. The cattle of Gujarat are of a remarkably large size, and in great request throughout India; at Surat there is a diminutive species of ox, 2 ft. only in height. S. of Surat the ox supersedes the horse for both draught and carriage: below the Ghats the only other domestic animal is the buffalo. Poultry are not generally kept by the natives.

Land Revenue.—The whole of the Bombay territories, extending Surat and Kaira dist., where the ryotwary settlement is established, are assessed under the village land-revenue system. By this system an arrangement is entered into with the heads of the different villages, to which the various tracts of land belong in common. These heads are called *mouddims* or *potails*, and either by descent, or sometimes by personal influence, have obtained a superiority in the village, and the management of its affairs. They do not, however, hold this power by any hereditary right, but are appointed or removed at the pleasure of the villagers. The village committees are little republics, in which for all their own wants among themselves, and independent, generally, of any relations with other villages; certain rights are possessed by the schoolmaster, accountant, washerman, barber, blacksmith, watchman, &c., in the produce of the soil; some portions are also set aside for certain recognised expenses of the village, and for defraying the expenses of hospitality toward strangers, &c. The land-tax here is higher than in Bengal; and the portion of the produce paid to gov. is besides uncertain, and dependent on the crops, which have often failed extensively in many districts. The assessment is, after inquiring into the productivity of the village—what it has hitherto paid—what it is capable of paying—the state of the village lands—and what assessments they ought to bear with reference to the produce. Should any of the brotherhood fail to pay his portion, it becomes an internal village arrangement, with which government has nothing to do; the rest come forward and pay it for him, and the *mouddim* has no power from the government to enforce the assessment from the individual. In great part of Poonah there are a number of acknowledged proprietors of usually small estates, called *meerassdars*, and generally cultivate their lands themselves, and pay their rent direct to government, unconnected with any village republic: in Surat and Kaira, although another is more general, the village settlement prevails pretty extensively. Col. Sykes (*Rep. Revenue*, li. 164.) thinks that the *moossavar* or village system realises more revenue to government than the ryotwary system; that it occasions the officers little trouble; maintains a class of respectable persons (potails, &c.) in society; prevents speculation; and advances the comfort of the cultivators generally: but, on the other hand, Mr. Campbell (*Rep.* p. 201.) observes, that the potails often oppress

the ryots; shut them out from communication with the government; "in good seasons pocket all the profits, and in bad cast upon them (the cultivators), by extra assessments, or saddling them with the waste land, the greater burden of the losses."

Manufactures are not in a flourishing state; nor can they ever become so, until better means of transit for goods be constructed, to afford a vent for their products: the principal are woollens and cottons. In Poonah city silks, ornamented with gold and silver, are woven. A discriminating duty was formerly laid on Indian sugar imported into Great Britain, but that is now repealed, and its manufacture, as well as the manufactures of silk and indigo, is on the increase.

Trade.—This presid. is much less favourably situated than that of Bengal for commerce and internal communication. It has no large navigable river, like the Ganges, intersecting its richest provinces; the streams of the Deccan are too impetuous for navigation; and, notwithstanding the internal trade is thus wholly dependent on land-carriage, the entire length of all the roads which have been constructed does not exceed 450 m. Most of the roads are impassable for carriages, and merchandise has therefore to be conveyed chiefly by pack-*bullocks*. Indeed, the only good line of road is from Panwell to Ahmednuggur, a distance of 165 m.; and it is both unconnected with the S. of India, and at a distance unavailable for the produce of Candesh and Berar. Government has recently, however, ordered a survey for a road between Bombay and Agra.

For an account of the foreign trade of the presidency, see BOMBAY (City).

The revenue and expenditure of the Bengal presidency, during the year 1835-36, were as follows:—

Revenue.	Charges.
£.	£.
Land revenue	Total civil and political charges
Customs, sea and inland	363,417
406,072	Total judicial and police duties
54,778	238,770
Post-office collections	Total military and naval duties
11,076	1,435,412
Stamp duties	Buildings, roads, and public works
59,165	8,704
Sayer (duties on spirits, &c.)	Allowances, &c., in accordance with treaties, allowances to village officers, &c.
159,691	407,851
Receipts from salt	Charges of collecting revenues
35,752	250,851
Opium	Interest on debt
13,753	51,218
Marine and dock dues	Total charges
Judicial fees, fines, &c.	2,730,253
7,012	Total ordinary revenue
Miscellaneous civil receipts	2,582,033
850	Deficit for 1835-6
Subsidy from the Dutch government	157,220
17,022	
Total ordinary revenue	
2,582,033	

The Government is vested in a governor independent of local control; but subordinate to the authority of the gov.-general of India, in matters of general and internal policy, and the disbursements of the public revenue. He is assisted by three councillors, and the whole administration is conducted by a single board.

Military Force.—The Bombay native army, although the smallest, is the most ancient of the three presid.; sepoys having been disciplined toward the end of the 17th century. The sepoys are said to be brave, patient, capable of enduring fatigue, and bear the highest character for fidelity; still, however, it is very doubtful whether they would oppose any effectual resistance to an army of Europeans. The Bombay army has been always more ready than those of the other presid. to volunteer for distant expeditions. By recent returns the total armed force of this presid. is 30,190, of which number 6,262 are Europeans.

Marine Force.—The whole of the Indian marine is attached to this presid. It has been of late much diminished, with the diminution of piracy, and now (*Martin*, 1839) consists of only one frigate, four 18-gun ships, six 10-gun corvettes and brigs, two armed steamers, and some surveying vessels. These are manned by about 1,800 seamen, with 143 officers; and the whole costs annually £211,124. Measures are now, however, taken for converting this force into an armed steam flotilla.

Church Establishment, &c.—Bombay is the see of a bishop, subordinate to the Bishop of Calcutta, who has under him 14 chaplains: the total ecclesiastical charges in 1837 were 19,038*l*. Roman Catholic Christians are more numerous in this than in either of the other presid., and their religious estab., which receives the aid of the gov., is subordinate to an apostolic vicar at Bombay, with authority direct from the pope. But the most numerous body of Christians within the Bombay gov. are Nestorians.

Education, &c.—Sir Lionel Smith, in his evidence before parliament, 1831, said, with regard to Bombay, "Education is in such extensive progress that I hardly think it

could be more extended;" but this statement is evidently extravagant, and must be received with much modification. The Native Education Society, consisting of a nearly equal proportion of natives and Europeans, disbursed, in 1830-31, nearly 8,000*l*.; and have about 56 schools, educating 3,000 children: at Poonah there is a Hindoo college. The total number of public schools in this presid. is 1,709; scholars, 35,153: in Candesh the boys receiving instruction are, to the whole male pop. of that distr., as 1 in 18.

History.—In 1617 Bombay was created a regency, and made supreme over all the company's establishments in India, but in 1707 Calcutta was declared independent of it. In 1726 a chartered court for penal causes was established; and in 1775 Salsette, Bassein, and the revenues of Baroach, and other places, were acquired by treaty with a Mahratta chief. In 1780 Dohoy and Ahmedabad were taken, but restored to the Mahrattas in 1782. In 1803 Baroach and Ahmednuggur districts were acquired, and the latter, with Poonah and Ahmedabad, were formally ceded in 1817. Concan, Marwar, Candesh, and the remainder of the ex-peshwa's dom., fell to the British in 1818. The seat of gov. was transferred from this city of Surat to that of Bombay in 1686; (*Hamilton's E. I. Gaz. i.; Rep. on E. I. Affairs before the Select Committee, &c., 1830 to 1832; Bombay Calendar, 1838; Reports of the Chamber of Commerce, Bombay, 1838.*)

BOMBAY (*Buen Bahia*, Portuguese, a good harbour), a marit. city of Hindostan, prov. Aurangabad, cap. of the above presidency, and, after Calcutta and Canton, the greatest emporium of the East. It is built at the S.E. extremity of the small island of the same name, contiguous to the Concan coast, 650 m. N.W. Madras, 1,080 m. S.W. Calcutta, and 180 m. S. Surat; lat. 18° 55' N., long. 72° 57' E. Pop. upwards of 230,000. Bombay island belongs to a group, including Salsette, joined to it by a causeway. Caranja, Elephanta, Colabba, Butcher, Woody, and Cross islands, which, being disposed in a crescent manner, enclose its harbour. The island itself is of an oblong shape, 8 m. in length, N. to S., by about 2 or 3 m. wide; it is for the most part low, swampy, and barren, and was formerly very unhealthy; but in this respect it has been much improved, by means of drainage and embankments. The city consists of two portions: the old town, or fort, and the new town, or Dungaree. The fort stands on the S.E. extremity of the island, on a narrow neck of land immediately over the harbour: it is surrounded by extensive fortifications, which, towards the sea, are very strong; it contains some good buildings, but is, generally speaking, close and dirty, and little inhabited by Europeans; its streets are uneven and disagreeable, and the houses mostly built of wood, and mean in appearance. The Portuguese began to build the town within the walls in the same style that has ever since been followed: the verandahs of the houses are supported on wooden pillars, and shut up with Venetian blinds; the upper stories project beyond the lower, and the roofs are sloped and tiled.

Bombay bears no external resemblance to Calcutta or Madras, and its best streets scarcely equal their suburbs. There is no Asiatic magnificence; every thing has an air of dinginess, age, and economy, though the shops and warehouses are built on an extended scale. The government-house, a large but dismal-looking structure, somewhat like a German free-city *stadthaus*, is little used except for holding councils, and other public business; there is a castle, now occupied as an arsenal, and near it are the capacious docks constructed by, and belonging to, the E. I. Company, capable of accommodating ships of any size. These establishments, together with the barracks and the other buildings within the fort, have cost the company very large sums. The supreme judicial court, or *sudder adawlut*, the Protestant church, and the office of the gov. secretary, on the Green, an open irregular area, are amongst the chief edifices; there are many Portuguese and Armenian churches, both within and without the walls, some synagogues, and a vast number of mosques and temples. The new town of Bombay is larger than that within the fort, and in a low, wet, unwholesome situation, N. of the latter, and separated from it by the esplanade; it extends in one part from the harbour, on its E., quite across the neck of land to Back Bay, for seven or eight months of the year the inhab. suffer from inundation or its effects, few of the ground-floors of the houses being above high-water mark. The most remarkable structure in the new town is a pagoda, the largest in Bombay, dedicated to the worship of *Momba Devi*. Substantial buildings now extend to near 3 m. from the fort, outside of which most of the poorer classes live in huts of clay, roofed with mats of palmyra leaf. Ground in the city is very valuable, especially within the fortifications. Most part of the island now belongs to Parsees, who form a wealthy and influential part of the population, and are comparatively more numerous, perhaps, than in any other large town in India. They are the descendants of the

Ghebers, driven out of Persia by Shah Abbas; a comely, tall, athletic, active race; fiercer than the other natives; mild in their manners; bold, enterprising, intelligent, persevering, successful in the pursuit of wealth, and contributing greatly to the prosperity of the place. "There is not a European house of trade in which one of them has not a share; and generally it is the Parsees that produce the larger part of the capital." In every department connected with ship-building and the docks, the Parsees have the chief interest; the whole N. quarter of the fort is occupied by them; their country houses are furnished with European decorations; and they make no scruple to eat, drink, and hold constant communication with Europeans. They have many temples for the adoration of Fire; and morning and evening all the males repair to the esplanade, and prostrate themselves in worship to the sun: the females do not join in these devotions, but of whatever rank, continue, as in patriarchal times, to fetch water from the wells. The Parsees are firmly attached to their original customs; amongst which is that of exposing their dead to be devoured by vultures, in buildings open at the top for the purpose; they are extremely dirty in their persons; but their women, although enjoying more liberty than any others in India, are certainly the chastest. The Parsees provide for their own poor, and not a single courtesan of their sect is to be found. Of the rest of the population, about two thirds are Hindoos, one fifth part Mohammedans, and one thirteenth part Christians, besides about 2,300 Jews: the floating pop., besides the native and British seamen, consists of Arabs, Persians, Goa-Portuguese, Parsees, and the crews of vessels belonging to most other nations frequenting the port. The harbour of Bombay is one of the largest, safest, and most commodious in India; it is 8 m. in diam., and affords good anchorage and shelter for fleets of ships of the largest burden. It is also the only great inlet in India where the rise of the tides is sufficient to permit the construction of wet-docks on a large scale, the spring tides ordinarily rising 14, and occasionally 17 ft. Frigates and ships of the line may be built at Bombay in a very durable manner, and cost, it is said, 25 per cent. less than in England. This comparative cheapness is ascribed to the facility with which supplies of timber are obtained; but whether it be owing to a defect in the building, or to the weight of the timber, it is, we believe, generally admitted that Bombay-built ships are but indifferent sailers. It should also be observed, that if ships really cost more in England than in Bombay, the difference is wholly owing to our timber duties; were those repealed, it may be safely affirmed that British-built ships would be cheaper than those of any other country. Previously to 1819, a considerable fleet of small armed vessels was kept at Bombay, to check the piracy which had prevailed on the Malabar coast ever since the time of Alexander the Great; but at this epoch the nuisance was finally abated, by the capture of the strongholds of the pirates in the Arabian and Persian gulphs.

Bombay has a more extensive trade with China than either of the other presidencies: the rest of its commerce is chiefly with Great Britain, the Arabian and Persian gulphs, Calcutta, Cutch, Sindh, and the Malabar coast. The imports from China consist principally of raw silk, sugar, and sugar candy, silk piece-goods, treasure, &c. The principal articles of export to China are, raw cotton (44,464,364 lbs. in 1836-7), opium (20,882 chests, 1836-7), principally from Malwa, pearls, sharks' fins, fish maws, sandal-wood, &c. The exports to China being much larger than the imports, the returns for several years past have been made to a large extent by bills on London, drawn by American and other houses in China, and in bills on the Indian government, drawn by the agents of the E. I. Company in China. The trade with the United Kingdom has been regularly increasing since the abolition of the restrictive system. The chief articles of import thence are, cotton and woollen stuffs, cotton yarn, hardware, copper, iron, lead, glass, apparel, fur, stationery, wine, &c. The principal exports to Britain are, raw cotton (68,163,901 lbs. in 1836-7), silk, from China and Persia, ivory, pepper, and spices, piece-goods, coffee, and wool; the export of the last has increased with wonderful rapidity of late years; it comes chiefly from Cutch, Sindh, and Marwar. In 1837, 28 ships, mostly owned by native merchants, were employed in the China trade; there are besides many large ships engaged in the trade to England and elsewhere; and a numerous class of native craft, the largest of which make five or six trips during the eight fair months, from Oct. to May, to the chief ports N. of Bombay. They carry thither the produce of Europe, Bengal, and China, and return laden with cotton, ghee, oil, pulse, wheat, cotton cloths, timber, Fre-wood, &c.: the capital employed in this trade, exclusive of cotton, has been estimated to amount to 1,500,000L sterling. In 1836-7 there arrived at Bombay 253 ships (293 under British colours), of the aggregate burden of 104,913 tons: the value of the imports and exports in that year was as follows:—

Countries.	Imports.	Exports.
	<i>Rupies.</i>	<i>Rupies.</i>
Great Britain	1,524,131.10	1,256,251.77
France	5,25,553	2,57,443
Madeira	2,1726	
Cape of Good Hope	97,582	612
Brazil	92,490	
Coast of Africa	3,50,141	6,18,331
Isle of France	1,39,863	1,07,671
America	46,289	2,01,008
China	1,40,79,492	3,86,75,047

Hamburgh		
St. Helena		
Total	4,72,45,571	5,99,05,978

Wages are higher here than in Bengal; palanquin bearers, for instance, receive 7 and 8 rupees each per month; but provisions are also much dearer. The markets are not equal to those of Calcutta, but superior to those of Madras: there are fewer Europeans at Bombay than at the other presidencies, neither are their salaries so high. The Bombay Native Education Society have their central school here, which in 1838 were attended by 1,087 native pupils. Two English newspapers are published here on alternate days, and 10 other periodicals. Several literary societies, and many charitable and religious institutions, have been established. Bombay is the seat of a Protestant bishop. Roman Catholics are numerous, and their religious establishments enjoy the support of the E. I. Comp.; one of the four vicars-apostolic of India, with direct authority from the pope, resides at Bombay, where the Catholic bishop has five different churches, all of which, except one at Colabba Island, are endowed. Sir R. Rice, in his evidence before the lords, in 1830, says, that among a pop. of 150,000 in this city, there was but one execution in three years, which was that of an English sergeant; so that, if the police be not very bad, it may be fairly concluded that crimes of violence are very rare. The jurisdiction of the supreme court is confined to the island of Bombay and to Europeans in the rest of the presid.: the civil and criminal laws are those of England; but this court is not one of appeal from provincial courts, like the *sudder adawlat* at Calcutta. The garrison consists of 3,900 troops, one fourth of whom are Europeans.

Bombay is, next to Madras, the oldest of our possessions in the East: it was founded soon after the cession of the Isl. to the Portuguese, and was ceded to Charles II. as part of Queen Catherine's dowry, in 1661; but the Portuguese governor refused to deliver it up, and it was not until 1664 that it came into our hands. At this period it was extremely unhealthy, and subject to the depredations of the Mahratta pirates. In 1668 the city and island were transferred, by royal letters patent, to the E. I. Comp., at an annual rent of 10L, and shortly after realised to the comp. a revenue of 2,823L a year. The seat of government was removed thither from Surat in 1686, and two years afterwards Bombay was closely besieged by the Moguls. These were ordered to withdraw by Aurungzebe, which they did in the succeeding year; but plague, piracy, and rebellion, continued for many years to devastate and disturb this colony. At present Bombay rules the whole N.W. coast of India, and its influence is felt along the shores also of Persia and Arabia. (*Hamilton's E. I. Gaz.* i. 256-256; *Reports on E. I. Affairs*, 1830-1832; *Evid. of Sir R. Rice and Hon. Mr. Elphinstone; Dictionary of Commerce*, &c., 1839, pp. 135-138; *Mod. Trav.* x. 241-251; *Bombay Calendar and Directory*, 1838.)

BOMST, a town of the Prussian States, prov. Posen, cap. circ., 10 m. N.E. Zullichau. Pop. 2,000. The inhabitants are a motley breed of Germans, Poles, and Jews. There are some manufactures of coarse cloth.

BONA (an. *Apodisium*), called by the natives *Annabab*, i. e. place of jubilee, a marit. city of N. Africa, reg. Algiers, prov. Constantina, on a tongue of land projecting into a spacious bay (Gulph of Bona), near the mouth of the Sebous, in a somewhat unhealthy country; lat. 36° 53' 30" N., long. 7° 40' 30" E. Pop. about 12,000. It is surrounded with walls (erected 1658) 30 ft. in height, and nearly 2 m. in circ., with 4 gates. The town and harbour are commanded by the citadel (*Kasba*) on a hill to the N. of the city, having thick walls and a circuit of about a quarter of a mile. This citadel was much injured in 1837 by an accidental explosion of gunpowder; but it has since been repaired, and made stronger than ever. Bona has been much improved since its occupation by the French. The streets are narrow and crooked, but there are several

• At this period called Goa and the Concan.

good houses, a good market, with shops, reading-rooms, coffee-houses, and even a theatre. The road of Bona is far from being safe, the N.E. and E. winds throwing in a heavy sea. The Selibus was navigable when the Romans possessed Bona; and it might be rendered so again by clearing away a bar which has accumulated at its mouth, where there are but 3 or 4 ft.; whereas, within this, there are 13 ft. water. Bona is the seat of a French judicial court; has manufactures of *bermou* and other garments, tapestry, and saddles; exports corn, wool, ox-hides, and wax. It was formerly the centre of the French trade on this coast, and is at present the principal seat of the coral fishery. (See ALGERIA.) The Kasba was taken March 25, 1832, by a disaffected French soldiers and sailors; the Turks left in it, being dissatisfied with their leaders, having opened the gates to them. Bona was afterwards pillaged and burnt by the Arabs, but the French, having received reinforcements, took possession of it, and captured 115 pieces of cannon. About a mile to the S. are the remains of Hippo Regius, once a residence of the Numidian kings, and afterwards the episcopal see of St. Augustine. It was situated between the rivers Boojer-mah and Selibus, being about 2 m. in circ. Its chief relics are some large cisterns and part of the Roman walls. A swampy tract extends between it and Bona, probably its ancient haven. Hippo was taken by the Goths, and finally destroyed by Othman, the third caliph. Its materials served to build the modern town. (Hozet, iii. 195–208.; Shaw, pp. 47, 48.; *Tableau de la Situation*, &c. p. 58.)

BONAVISTA, one of the Cape de Verde islands, which see.

BONDENO (an. *Padinsem*), a town of the States of the Church, deleg. Ferrara, at the confluence of the Panaro and Po d'Argento. Pop. 2,500. It lies at the mouth of a defile which leads across the Apennines.

BONEFIO, a town of Naples, prov. Sanno, cap. cant., on the declivity of a mountain, 6 m. S.S.E. Larino. Pop. 3,000. It has a fine palace and a magnificent parish church, with four houses of refuge.

BONIFACCIO, a town and sea-port of the island of Corsica, cap. cant., on a small peninsula at the S. extremity of the island, on the strait which bears its name, 45 m. S.S.E. Ajaccio; lat. $41^{\circ}23'11''$ N., long. $9^{\circ}9'16''$ E. Pop. 3,031. It is well built and fortified, but not strongly. Its port, which lies between the peninsula on which the town is built and the main-land, stretches nearly 1 m. inwards, has deep water throughout, and is one of the best in the Mediterranean. Its entrance, however, is not more than from 80 to 90 yards broad, which renders it a little difficult of access. (Hugo, *cap. Corse*; Norris's *Sailing Directions for the Mediterranean*, &c.)

BONIFATI, a town of Naples, prov. Calabria Citra, 4 m. S.E. Bividere. Pop. 3,000. It has several churches, and a convent; and a great number of silk-worms are raised in its environs.

BONDOLU, a country of W. Africa, which, like most others in the same part of the world, has not had its astronomical position precisely ascertained. On Rennell's map to Park's First Journey, it is placed between the lat. of $13^{\circ}45'$ and $14^{\circ}45'$ N., and between long. $10^{\circ}20'$ and $11^{\circ}20'$ W. On the map to Park's Second Journey the long. remains unaltered, but the lat. is removed one degree more to the N., with the whole of the traveller's route, in order to make that route agree with the few observations which were taken. Though powerful among its barbarous neighbours, it is a small state, not exceeding in length, from E. to W., 78 m., nor in width, from N. to S., 70; it is, however, very compact in form, and its area is probably not less than 5,000 sq. m. Its pop. may amount to 1,500,000 or 2,000,000. It is bounded E. by Bamboou, S. by Teneba and the Simbaba, and W. by Wilderness (wooded, not desert); S.W. by the same wilderness and Woolli; W. by Fouta Toria; and on the N. by Kujnaga. (Park's *Maps and First Journey*, 44–57.) Bondou is tolerably elevated among the Senegambian system of mountains, and some parts of its surface rise into considerable peaks. The land slopes towards the N. and W., as is shown by the direction of the rivers, the Fo-le-me holding a N. course to the Senegal, and the Nerivo a S.W. one to the Gambia. The tributaries of these affluents are so numerous, that though neither of the first-class rivers (Senegal and Gambia) pass through Bondou, there are few districts better or more abundantly watered. As a natural consequence, vegetation is of a most vigorous kind; the hills are covered with thick woods, and in native fertility the soil is not surpassed by any in the world. The productions are the same with those of the neighbouring countries. (See BAMBARRA, BAMBOU, &c.) but a winter or dry season harvest, though not quite peculiar to this country, is sufficiently remarkable to attract the attention of travellers. The corn, called by botanists *Holcus cornutus*, from the depending position of its ear, is sowed about November, is in full vigour by the end of December, and is reaped in the early part of January. It is exceedingly prolific, and appears to bear a strong resemblance to the

Arable dhourrah. In climate and division of seasons, Bondou agrees also with the surrounding countries (see *as above*), but it appears to possess the advantage of being more healthy, and (probably from its comparative density of population) it seems to be rather less infested by ferocious animals. Though close to the richest gold districts of Africa, it appears to be poor in metals; gold dust, *in small quantities*, and iron being part of the imports. (Park, 61, 66, &c.) The inhabitants differ essentially in complexion and manners from their immediate neighbours. They belong to the great Foulah family, next to the Mandingoes the most considerable of all the W. African nations. They have tawny or rather yellow skins, with small features, and soft silky hair. They hold the negroes to be their inferiors; and, when talking of different races, always class themselves among *white* people. They have, indeed, most of the distinctive marks of an Arab race; but, though many of them speak a little Arabic, their native tongue bears no resemblance to that language, nor have they any legends that trace their origin farther E. than Fouladoo (literally, "the country of the Foulahs"), near the sources of the Senegal. In industry, energy, and resources they are superior to their negro neighbours; they are tolerably good agriculturists, and are said to be well versed in grazing and dairy husbandry, though they make no cheese. Cattle is their chief wealth, and they possess also a handsome breed of horses. There are, indeed, but few African countries where so many of the necessities, and even conveniences, of life are enjoyed not by the rich only, but by the greater part of the population.

Centrally situated between the Senegal and Gambia, Bondou has become a high road for traffic; the slave dealers from the coast usually pass through it, and by their means a considerable commerce is carried on with the neighbouring and even distant countries. The native exports consist of corn, cotton cloths, some sweet-smelling gums, and probably sometimes cattle. The transit trade consists of slaves, salt, iron, Shea butter, and gold-dust. The government is unarchaic, and the king is often at war with his Mandingoo neighbours, and generally to their loss. When Major Houghton was in the country, he had just stripped the king of Bamboou of a considerable part of his territory.

The Mohammedan religion is very generally professed, but not exclusively; the king himself is a kafir (infidel), and it does not appear that any intolerance is practised by either sect; but the uncharitable maxims of Islamism seem to have had some influence over the Bondou Foulahs, who are less hospitable than the poorer and more ignorant negroes.

Schools are established in the different towns, where children of all persuasions are taught to read and write. The character used is, of course, Arabic, and the instructors the Mohammedan priests; by this means Mohammedanism possesses a strong hold over the people, since the impressions made on the pupils' minds in these schools are seldom eradicated.

Customs and duties on travellers are extremely high. An ass load of goods pays a bar (two shillings) at all places; and at Fouladoo the royal revenue a musket and six bottles of gunpowder, or the value of them, are exacted as the common tribute; besides which, neither the king nor any of his chief officers are delicate in requesting presents, which requests, under the circumstances, are, in fact, demands which cannot be evaded. (Park, p. 44–62.; Houghton's *Afr. Assoc.* cap. xiii. 8, 11, &c.)

BONN, a very ancient handsome town of the Prussian States, cap. circ., prov. Rhine, on the left bank of that river, about 16 m. S. of Cologne. Pop. 18,000. The principal celebrity of Bonn is derived from its university, founded in 1818, and intended to replace that of Cologne, suppressed by the French. Niebuhr, the historian of Rome, was one of its professors; and it has still to boast of some very distinguished names. In 1836 it had 686 students. The electors of Cologne formerly resided here; and their castle, a building of immense extent, is now the university. The library that belonged to the university of Cologne, comprising from 80,000 to 100,000 vols., has been removed thither. In the museum of Rhenish antiquities in the university, is an ancient monument, inscribed *Dea Victoria Sacrum*, supposed by some to be the identical *Ara Ubiorum* mentioned by Tacitus. (*Annal.* lib. i. § 39.) This, however, is doubtful. The cathedral, or metropolitan church, in the older Gothic style, with a high tower, has a statue of the Empress Helena, and is said to be built on the site of a church she had founded. There is also a good town-hall, theatre, &c. A fine avenue of chestnuts conducts to the *Château de Papenhof*, appropriated to the use of the university, containing the museum of natural history, and having attached to it a spacious and well-kept botanical garden. The situation of Bonn is delightful. It is one of the most desirable towns on the Rhine as a place of residence. Beethoven, the musician, was born

here on the 17th December, 1770. (*Cellarii, Notit. Orbis Antiqui*, l. p. 330.; *Schreiber, &c.*)

BONNAT, a town of France, dép. Creuse, cap. cant., on a hill not far from the little Creuse. Pop. 2,738. It is distinguished by the old castle of Beausais.

BONNET-LE-CHATEAU (ST.), a town of France, dép. Loire, cap. cant., 17 m. S. Montbrison. Pop. 2,156. This is a place of great antiquity; it is situated on a Roman road, constructed by Agrippa, and occupies a picturesque position on the summit of a hill, surmounted by a fortress, said to be of the age of the Romans. Part of the ancient walls and towers, by which the town was formerly surrounded, still exist. It has a handsome Gothic church. Locks of various sorts are made here, and some lace; and the place has a considerable trade in timber, forwarded to the building-yards at St. Rambert. (*Hugo, art. Loire.*)

BONNETABLE, a town of France, dép. Sarthe, cap. cant., on the Dive, 16 m. N.E. Mans. Pop. 5,746. It has a castle, constructed in the 15th century. The inhabitants are principally engaged in the cotton manufacture.

BONNEVAL, a town of France, dép. Eure et Loir, cap. cant., on the Loire, in a fertile valley, 19 m. S.S.W. Chartres. Pop. 2,860. Streets broad and well laid out. It was formerly fortified, and had an abbey. The church is surmounted by a very high steeple. It has a cotton mill, with manufacture of delicacies, carpets, coverlets, &c., and some considerable tanneries.

BONNORVA, a town of Sardinia, dioc. Sassari, 18 m. E.N.E. Bosa, in a healthy situation, on the declivity of a mountain. Pop. 4,000. It has two convents, one of them for Jesuits. A haras, or dépôt d'étalons, was established here in 1803. (*Smyth's Sardinia*, p. 330., and *Dict. Géog.*)

BOODROOM, or BODRUN, a sea-port town of Asiatic Turkey, in Natolia, coast of the Archipelago, opposite the island of Cos, 100 m. S. Smyrna; lat. 37° 15' N., long. 27° 28' E. Pop. 11,000. It is beautifully and conveniently situated on a rising ground, at the bottom of a deep bay, commanding a view of the island of Cos, and the southern shore of the Ceraunic gulph, as far as Cape Krio. It has a small but well-sheltered harbour, with from two to three fathoms water, resorted to by Turkish cruisers, and having generally a ship of war on the stocks. In the bay outside the harbour there are from 10 to 20 fathoms. Houses of stone, and irregularly scattered along the shore of the bay, being interspersed with gardens, tombs, and cultivated fields. Streets narrow and dirty, and the bazars wretched. The castle or fortress, situated on a projecting rock on the E. side the harbour, was built by the Knights of Rhodes in 1402: it is still in tolerably good repair, and mounts 50 pieces of cannon. The serai, or palace of the moussellim or governor, and some small mosques, stand along the western margin of the harbour.

It is supposed that Boodroom occupies the site of the ancient *Halicarnassus*, the country of Herodotus, and of Dionysius the historian. Above the town are the remains of a theatre, 280 ft. in diameter, and which seems to have had 36 rows of marble seats. Old walls, exquisite sculptures, fragments of columns, and other relics, evincing its ancient splendour and importance, abound in the town and its vicinity. (*Beaufort's Karamania*, p. 55.; *Turner's Tour in the Levant*.)

BOONDEE (BUND), a rajahship of Hindostan, prov. Rajpootana, distr. Haratec, under protection of the British; area (*Switzerland*), 2,291 sq. m. It was formerly much more extensive, but Kotah and its territory have been separated from it: in 1817 more than half the revenues were usurped by Scindia and Holkar, and the peasantry, impoverished by endless exactions; but in 1818 the rajah received a considerable accession of dominion, and the town of Patun, from the hands of the British. Although small, this state is important, as it contains the principal passes from the S. into Upper Hindostan. The natives are of the Hara tribe, which has produced many celebrated men, and amongst others one of Aurangzeb's best generals.

BOONDEE, a town of Hindostan, prov. Rajpootana, cap. of the above rajahship, and residence of its sov., on the S. declivity of a long range of hills, 90 m. S.E. Ajmeer, 200 m. S.W. Agra; lat. 25° 28' N., long. 75° 30' E. It is divided into New and Old Boondee: the former is surrounded by a high stone wall, which extends up the acclivity to some fortifications which crown the hill; the houses are mostly of stone, and two stories high. The palace is half way up the hill, and is a very striking stone edifice, supported partly by a perpendicular rock 400 feet high, but principally by solid piers of masonry. This city is also rendered picturesque by its numerous temples, magnificent fountains, and spacious main street opening to the palace, at the lower extremity of which stands a great temple, dedicated to Krishna, with many groups in bas-relief, and other sculptures. Old Boondee is W. of the former, covers a considerable surface, and contains some fine

fountains and pagodas, but is in a state of general decay. The passes N. of Boondee are strongly defended, and abound in natural beauties, in royal and religious edifices, and other works. (*Hamilton's E. I. Gaz.* l. 268, 269.; *Mod. Trav.* x. 82.)

BOORHANPOOR (*Barhanpura*), a town of the Deccan India, prov. Candesh, of which it was the ancient cap., in the dom. of Scindia; built in a plain, on the N.W. bank of the Tuptee, 135 m. S.S.E. Oojein, and 215 m. E. of Surat; lat. 21° 19' N., long. 76° 18' E. This is one of the largest and best built cities in the Deccan, though, as a whole, devoid of architectural beauty. Most of the houses are of brick, many 3 stories high, with neat façades, framed in wood, as at Oojein, and universally roofed with tiles; but the fort and palace of its ancient sovereigns, and many Mohammedan mosques, chapels, and tombs, are heaps of ruins. Some of the streets are wide, regular, and paved with stone; and there is a square of considerable extent; the finest building is a mosque, called Jumma Musjud, a pile of grey-stone, with a handsome façade, and octagonal minarets, but destitute of a cupola, the usual appendage to Mohammedan structures. The Tuptee is a clear and beautiful stream, but here of no great breadth, and easily fordable in the dry season. Boorhanpoor is supplied with water by aqueducts, which bring it a distance of 4 m., and distribute it through every street below the pavement, whence it is drawn up by leathern buckets. 500 of the best houses, are occupied by Bokhrs, a Mohammedan sect, who are the great merchants in this part of Hindostan, wear the Arabian costume, and call themselves Arabs by descent. This city was conquered by the Mahrattas in 1760, since which it has progressively decayed. It was captured by the British in 1803, but afterwards restored to Scindia. The grapes grown in its vicinity are said to be the best in India. (*Hamilton*, l. 269, 270.)

BOORHANPOOR, a town of the E. Archipelago, 4th div. (*Crawford*), between lat. 3° and 4° S., and long. 126° and 127° E., 50 m. W. Ceram; length, E. to W., 75 m., breadth 38 m. Rice, sago, a protusion of aromatic and other woods, tropical fruits, and the best cajuput oil, are found here; the interior is peopled by Hloraofoars, who subsist on sago and the chase. Some of the other inhabitants are Mohammedans. Chinese junks and S. Sea whalers visit it, and the Dutch have a settlement on the island.

BOORHOURD, a town of Persia, prov. Irak-Kermanshaw, cap. governr in a fine and fruitful valley, 190 m. N.W. Isfahan. Pop. 12,000. (*Kinney*). It has a fine castle and several mosques. The town and dist. attached to it belong to the tribe of *Lack*, who do not wander far from the spots to which they are partial, but settle in villages, and employ themselves in the improvement of their estates.

BOOTAN, or BHOTAN, an indep. state of N. Hindostan, between lat. 26° 30' and 28° 30' N., and long. 88° 30' and 92° E., having N. the Himalaya, which divides it from Tibet; E. and S. Assam and Bengal; and W. the river Teesta, which separates it from Sikim; length, E. to W., about 350 m., by from 90 to 100 in width; but its limits would greatly exceed this estimate were it described as comprising all the country immediately adjoining the Himalaya, on both sides, from Cashmere to China, which is termed by the Hindoos *Bhot*, and its inhabitants *Bhotyas*. Assuming it to include the districts now referred to, its area has been estimated at about 54,500 sq. m., and its pop. at 1,600,000. The external appearance of Bootan is the very reverse of that of Tibet, which is a level table-land, whereas it is almost entirely mountainous or hilly.

Mountains.—Its N. portion, which is the S. declivity of the Himalaya, constitutes an almost impassable frontier, consisting of lofty mountains, either covered with snow, or black and destitute of all verdure excepting towards their base, where short and scanty herbage, a few bushes of holly, and occasionally a stunted pine, are all the signs of vegetation existing in this region.

About 10 m. from this boundary the aspect of the country changes, becoming, although still bold and lofty, more picturesque and smiling: the hills are cultivated to a considerable height, or covered with verdure often to their summits, having on their slopes luxuriant forests. The valleys are mere wedge-shaped intervals, or water-courses, between the hills, and their vegetation is similar to that of the temperate parts of Europe. The country continues of this character for about 80 m. from N. to S., gradually becoming less striking in its features as it approaches the *terrace*, which divides it from Bengal. This is a tract of marsh-land, 25 m. in width, and covered with jungle, being the only plain belonging to Bootan; its climate is most pestilential.

The principal river is the Tchinchien, which intersects the country N. to S., passing through the valley of Tassudon, receiving the waters of the Patchien and Hat-chien, and after a turbulent course of about 150 m., during which it forms several cataracts, and rushes over vast

masses of rock, falls into the Brahmaputra, a few miles below Rungamatt, where it is called the Gadawhar. There are several rivers of less consideration, supposed tributaries of the Brahmaputra; but the violence of their course prevents the simplest form of navigation being practicable.

The primary rocks in the mountains are chiefly granite and an imperfect quartz, having the appearance of marble, but employed in the manufacture of a species of porcelain; good limestone is abundant, but not used either for agricultural or other purposes. It is conjectured that the mountain ranges contain much mineral wealth, but they remain almost wholly unexplored. Iron and copper are the only metals hitherto discovered, and the former alone is applied to any purpose by the natives.

The climate exhibits every variety, according to elevation, and summer heats and winter cold are severally felt in places within sight of each other. In the mountainous regions it is not unhealthy, and resembles the climate of the S. of Europe, not being subjected either to the burning suns or periodical rains of Bengal. Snow prevails during a great part of the winter, except in some few districts; showers are frequent in summer, and in consequence of the exhalations arising from the numerous springs and cataracts, a certain humidity pervades the atmosphere, even at this season. Panukka, although but a few miles distant from Tassiludon, has a climate so much milder than the latter, that it has been chosen as the winter residence of the sovereign.

The mountain forests abound with beech, ash, maple, birch, yew, pine, fir, cypress, &c., but contain no oaks. Numerous fruits common to Europe flourish; as apples (though of an inferior quality), pears, apricots, peaches, walnuts, melons, mulberries, strawberries, raspberries (the two latter fruits growing wild), cranberries, and pomograntes, which are excellent. In the colder districts, the cinnamon-tree, and a species of rhubarb, are found.

The marshes of the S. abound with elephants, rhinoceroses, tigers, buffaloes, and other formidable wild animals; but, excepting in these parts, they are not abundant. Captain Turner speaks only of a kind of monkey, which inhabits its vicinity, and the yakk, or grunting ox, which is found among the mountains of the N. boundary, but descends into the lower country for pasture during the winter months. The Tamu horse, a species peculiar to Bootan, about 13 hands high, well-formed, short-bodied, clean-limbed, deep in the chest, extremely active, and well-suited to mountainous countries, is an object of considerable traffic with Bengal. These have a tendency to become piebald; those of one colour amongst them, although rare, and less valued by the natives, are much more esteemed by the British merchants.

People.—The Bootans have been already noticed (see p. 192.) In physical formation they differ greatly from the Bengalees, being hardy, robust, strong, and occasionally, in the mountain districts, attaining a height of more than 6 ft. Their skins are smooth, and often not darker than those of the inhab. of the S. of Europe; faces broad, and cheek-bones high, from which point the face rapidly narrows downwards; the eye is small and black, with long pointed corners, looking as if extended in width by artificial means; they have scarcely any eye-lashes, beard, or whiskers. They are often greatly afflicted with gutta, especially those who live near rivers subject to inundation. Though not deficient in courage, they are peculiarly inclined and unexpert in the arts of war; the bow and arrow (in the use of which they are skilful), sword, and falchion, are their chief weapons. No military discipline whatever is maintained, and ambush is more frequently resorted to than open conflict. They dress in woollen cloth; use animal food and spirits. Tea is the usual beverage, but so prepared as to suit few palates but their own. Their dwellings seldom exceed one story in height; the palace of the rajah, at Tassiludon, consists of several, and is magnificent, as compared with the other edifices. Much ingenuity is displayed in the construction of their bridges, which are composed either of timber or chains of iron: there is one of the latter kind across the Tchinchen, at Chuka, deserving of admiration; the founder of which is unknown. Their aqueducts are formed of the trunks of trees hollowed for the purpose. Both polygamy and polyandry are in practice; marriage is not ratified by any religious form, and it frequently happens that one female becomes the joint property of several members of a family; the dead are burnt, and their ashes plunged into a river, on which occasion certain ceremonies are performed by the Gylongs, a numerous sect of recluses, who apply themselves exclusively to administering the duties of religion. There are two annual festivals; one in the spring, called the *kooli*, consisting of different sports, in which those of all ranks, sex, and age, mix with unrestrained freedom; and an autumnal festival, called *mudlam*, embracing a multitude of Hindu allegories.

Agriculture.—In the culture of the land the natives

display industry and care. Rice, wheat, barley, and a species of triangular seed bearing an affinity to the polygonum of Linnaeus, are the chief agricultural products. The valley of Tassiludon, and some of the lands skirting the river, yield two crops annually; the ground on the slopes of the hills is levelled by cutting it into shelves, to enable it to be irrigated by the mountain streams. The most laborious offices of husbandry fall to the lot of the females. Notwithstanding the climate affords great advantages for the production of culinary vegetables, the turnip is the only one cultivated with much success; cucumbers, shallots, melons, &c., are grown; but potatoes have failed, and are now totally neglected.

The trade with the surrounding countries is a monopoly in the hands of the government. Coarse woollen cloths, horses, wax, ivory, gold-dust, silver ingots, musk, the various fruits of Bootan, and Chinese manufactures, form the chief articles of export to Bengal; and the same articles, with the addition of rock salt, leather, tobacco, paper, rice, &c., to Tibet. An annual caravan is sent by the deb-rajah into the Bengal presid., which returns laden with indigo (composing half the cargo), English woollens, linen cloths, cottons, sandal-wood, spices, assafoetida, sheet-copper, tin, gunpowder, otter-skins, musk, hides, &c., the whole usually amounting in value to about 30,000 rupees. A small traffic with the E. division of the Rungpoor district is also maintained. A base silver coin, worth about 10d., struck in Cooch Bahar, is current throughout Bootan, where there is no mint.

Manufactures.—The principal is paper, made from the bark of a tree, from which material a kind of silk and satin is also made. Parsi is the only market in Bootan, and here are manufactured idols, swords, daggers, and the buttons of arrows; the latter are dipped in a poison procured from a tree unknown to Europeans, which, however, seldom proves mortal.

Religion.—Buddhism, of the Lama sect, is the prevalent religion; but a difference of opinion exists on certain points, one sect permitting the use of food considered impure by the Brahmans. No interruption whatever, of a diplomatic or other character, is allowed to interfere during the period of the celebration of sacred rites: there are many similarities in religious customs here with those of Tibet.

Government.—The sovereign power, though vested in the hands of the dharma-rajah, who is regarded as possessing divine attributes, is exercised only by the deb-rajah, who resides at Tassiludon. The several passes into the country are under the jurisdiction of officers called *sabhas*, who usually inhabit the fortresses of their peculiar districts, except in winter, when they visit the lower country, to escape from the rigour of the season, and for the purpose of establishing their authority, which is uncertain in its extent.

The interior part of the country are divided into different domains, each controlled by a resident functionary, whose duty consists in the exaction of the gov. dues, and general administration of his distr. The most subordinate of the public officers are called *mooks*, as, which situation, however, affords an opportunity for considerable preferment. The revenues of the rajah are paid mostly in articles of produce and merchandise. Tassiludon, Wandipoor, Tamuikka, Ghassa, and Muri-chon, are the chief towns; but, with the exception of the first two, they are no better than small villages.

History.—Of this country, called by the ancient Brahmans Madra, no early record has been transmitted, nor was public attention much directed towards it until the deb-rajah's invasion of the neighbouring territory of Cooch Bahar, in 1772, which the British government opposed; but, through the intervention of the lama of Tibet, a peace was effected; the disputed district being awarded to the Bootanese.

It is extremely difficult, and in some parts impossible, to determine the exact boundary of the country; a regular system of encroachment on the surrounding states having been long practised by the Bootanese, who have at different periods appropriated to themselves considerable possessions belonging to Bengal and Assam. Great alarm was created in 1816 by a supposed threatened invasion of the Chinese, who had entered Nepal; and the deb-rajah was excited by his fears to declare himself amenable towards the British, in the hope of gaining assistance, if required. A treaty was concluded in 1775, for carrying on the traffic of the E. I. Company with Tibet, through Bootan; by means of the native merchants, no other mode of communication being allowed. (*Hamilton's E. I. Gaz. i. 270—276; Turner's Embassy to Tibet, passim.*)

BOOTON, an Isl. of the E. Archipelago, 2d division; lying off the S.E. extremity of Celebes; length, N. to S., 85 m.; average breadth about 20 m.; between lat. 4° and 6° S., long. 123° E. It is high and woody, but well cultivated, yielding rice, maize, an abundance of tropical fruits, poultry, &c. The Dutch had formerly a settle-

ment here, and sent an officer annually to destroy all the clove trees on the island. (*Hamilton's E. I. Gaz.*)

BOPPART (an. *Basodriga*), a town of the Prussian States, prov. Rhine, on the left bank of that river, 9 m. S. Coblenz. Pop. 3,800. This is a very ancient town, its walls appearing to be built on the foundations of a fort constructed by Drusus. In the middle ages it was an imperial city, and several councils have been held in it. The houses are mostly of wood and plaster, with projecting upper stories; and the streets are narrow, ill-paved, and filthy. The large convent of Marlenburg, founded in 1123, and some similar establishments, have been converted into the more useful purpose of cotton factories. The parish church and the old church of the Carmelites are worth notice. (*Schreiber; Barrois's Tour.* &c.)

BORDEAUX, or **BOURDEAUX** (an. *Burdigala*), an important commercial city and sea-port of France; cap. dép. Gironde, in the centre of an extensive plain, on the left or W. bank of the Garonne, 55 m. S.E. from its embouchure, 102 m. N.N.E. Bayonne, and 307 m. S.W. Paris; lat. 44° 50' 25" N., long. 0° 33' 35" W. Pop. (ex com.) 96,114. The Garonne here describes a semicircle, along the outer side of which the city extends for about 2½ m., with a branch of almost equal length, in breadth, length, and appearance, not dissimilar to Portland Place, and has many elegant shops, and some noble edifices, as the Bourse, and Grand Theatre. The Allées and Cours de Tourny, the Cours du Jardin Public, the Cours d'Albret, and several other streets; and the *Places*, or squares, entitled Louis Philippe 1^{er}, Royale, Dauphine, &c., may be particularised for their beauty or size. The Faubourg des Chartrons, which contains the Jardin Public, was spoken of as perhaps the finest suburb in Europe, till the extension of building made it part of the city. The approach to Bordeaux by water is very striking. The river, in its narrowest part, opposite the Place Royale, is 720 yards across, with a depth of 16 ft. at low, and nearly 5 fathoms at high water; the length of the port from one end to the other of the city, is reckoned at upwards of a league; it is capable of accommodating 1,200 ships; and such as do not exceed 500 or 600 tons may enter it at all times of the tide. The Garonne is skirted along the city by a succession of quays, which descend, by a gentle inclination, to the water's edge, and, besides their utility, are amongst the principal ornaments of the town, being lined with handsome buildings, whose facades have an imposing effect. "On viewing," says Mr. Inglis, "this magnificent crescent from any opposite point from which the eye may embrace its whole extent, one cannot hesitate in ascribing to it a decided superiority over any *coup-d'œil* presented to us either in the French or the English metropolis." (*Switzerland*, &c. p. 315.) On the opposite side of the river there is only one small suburb of La Bastide. The communication between the city and its suburb is maintained by the famous bridge of Bordeaux, one of the noblest structures of the kind that is anywhere to be met with. It is 532½ yards in length (or 1204 yards longer than Waterloo Bridge), by 48 ft. broad; has 17 arches, the piers being of stone, and the upper parts partly of stone and partly of brick. It was commenced in 1810, and completed in 1821, at a cost of 24,000. Owing to the depth and strength of the current, it was a most laborious undertaking. The road to Paris passes over this bridge. The public buildings most worthy of notice are the cathedral, the churches of St. Michel, St. Croix, St. Seurin, Paul, Bruno, and others; the Bourse (Exchange), Custom Ho., Grand Theatre, Hall of Justice, Palais Royal, Fort de Ha, synagogue, public baths, &c. The cathedral is a fine, but unfinished, Gothic edifice, commenced, according to Hugo, in the 11th, and continued, by several different architects, in that and the succeeding centuries, from which circumstance, although beautiful in parts, it wants harmony and regularity. It is 413½ ft. in length; the height of its nave is 85 ft.; that arm of the cross in which its grand entrance is placed is adorned with two spires, each nearly 160 ft. in height. At a short distance from it stands the ancient belfry, formerly nearly 320 ft. high; but having been much dilapidated during the Revolution, it is now reduced to little more than 100 ft. high, and serves as a shot tower. The church of St. Michel, built in the 12th century, is in a more perfect architectural style than the cathedral, but, like several churches in Bordeaux, it is dark and gloomy. It also has a isolated belfry, which was 320 ft. high until mutilated, and in part destroyed, by a

tempest in 1768. On its summit is now a telegraph, forming part of the line between Paris and Bayonne; and beneath it is a cavern in which dead bodies have been preserved for a lengthened period. The church of St. Croix is the most ancient of all, having been built before the middle of the 7th century, and restored by Charlemagne. The churches of Notre Dame, St. Paul, and the College Royal, are of much later date. The synagogue is a handsome building, erected in the time of Napoleon. There are 2 Protestant churches, but they present nothing worthy of remark. The Bourse is a large edifice, with a splendid staircase, and a hall in its centre, 94½ ft. in length, by 65½ ft. broad, lighted by a large glazed dome, 78½ ft. high, and adorned with a gallery supported by a double rank of arcades. In the upper part of the building are the Council Chamber, Tribunal of Commerce, and rooms used for other public purposes. The Custom House, built on the corresponding side of the Place Royale, is, externally, like the Bourse. The Grand Theatre, built in the reign of Louis XVI., at an expense of 170,000l., has, without exception, the handsomest exterior in France, and perhaps in Europe. It will accommodate 4,000 persons, and has a fine concert-room, a spacious hall, café, and other apartments. The Palais de Justice is a most magnificent, and particularly distinguished. The Palais, or Châteaun Royal, built in 1778, and formerly the residence of the archbishop, is an extensive and fine structure, with a large quadrilateral court in its centre. Napoleon made it an imperial palace. The Palais de Justice, the seat of the royal court, and civil tribunal, has a marble statue of Montesquieu. The modern town-hall is of Gothic architecture; of the ancient one, built in the 13th century, nothing at present remains but an oval tower, surmounted by a dome, flanked by two turrets, called the *Tour de l'Horloge*.

Bordeaux was for a long period fortified; but the new streets planned by M. de Tourny for the most part occupy the sites of the former works: the Fort de Ha, constructed by Charles VII., is now converted into the prison; the Châteaun Trompette, built by the same sovereign in 1453, was demolished in 1817; and its site, which now forms the Place Louis Philippe, laid out as a promenade, and planted with trees. There are some remains of antiquity in Bordeaux; the principal is what is called the "Palace of Gallienus," a vast amphitheatre of brick and stone, believed to have been erected about A.D. 260, but now much dilapidated. It stands in the N. half of the city, about ½ m. from the ancient Roman town. It appears to have been of an elliptic form, 144½ yds. long, by nearly 115 yds. wide, and capable of accommodating 15,000 spectators; it suffered greatly during the revolutionary phrenzy in 1792 (when the Palais d'Ombricre, or Castrum Umbrarie, another Roman edifice, was also, for the most part, destroyed); but its two principal entrances, 28½ ft. high, by 191-6 ft. wide, and a part of its circumference, are still nearly perfect. Most other relics of the Roman dominion have disappeared. The Temple of *Tutela*, supposed to have been dedicated to the tutelary divinity of the place, and to have been erected early in the first century, was 84 ft. in length on each side, and contained 24 enormous columns, 17 of which were standing towards the end of the 17th century. It was much mutilated in 1649, and totally demolished under Louis XIV., in 1677, to make room for the glass, constructed by Vauban, round the Châteaun Trompette. No trace is found of the Temple of Diana and Fountain of Divona; and the stream *Drivita*, now La Devise, mentioned by Ausonius (*Clara Urbes*, xiv. B.).

Per machinam clavis tentant flumina alveum:
Quem pater Oceanus refluxu cum impleverit æstu,
Adibit totum spectus huc classibus æquor —

Instead of supporting fleets, is now arched over, and no vestiges are extant of its dock.

Bordeaux has many structures, &c. devoted to trade, arts, and manufactures. There are several building-docks, in which brigs, frigates, &c., and even ships of the line are constructed, though not so many of either as formerly. The *Ateliers General* (slaughterhouse), commenced in 1827, is, like the Entrepôt for colonial produce near it, a large building well adapted for its purpose. There is a very extensive snuff manufactory near the Fort de Ha, employing from 400 to 500 hands, and containing a warehouse capable of holding 30,130 cwt. of tobacco. There are numerous brandy distilleries, sugar refineries, vinegar, glass-bottle, shot, and cordage factories, iron and steel forges, potteries, and tanneries, with manufactures of cottons, woollens, kid gloves, bonnets, corks, playing-cards, liqueurs, musical instruments, barrels, turpentine and other drugs, soda, alum, vitriol, mineral waters and other chemical preparations; and in the neighbourhood of Bordeaux some gunpowder factories.

The trade of the port is considerable in the produce of these manufactures, and in grain, cattle, and timber; but the chief articles of export are the famous red wines of the

Gironde and brandy. A large portion of the inhab. of the Quartier de Chartrons are wine merchants, and a great part also of that quarter is occupied with cellars, some of which are capable of containing 1,000 tons of wine. The exports of wine from Bordeaux amount at present to from 50,000 to 60,000 tons a year, and would doubtless be much greater were it not for the heavy duties imposed on most foreign articles. The trade of the port has also suffered severely from the depressed state of the French colonies, owing to the preference given to the growers of beet-root sugar. Besides wines and brandies, which are furnished to every country with which Bordeaux has any trade, the chief exports are liqueurs, walnuts, chestnuts, dried fruits, vinegar, tartar, skins, flour, cork, and various drugs to England. Spirit of wine, tartar, molasses, and colonial produce to the N. of Europe; fruits, verdigria, and a few manufactured articles to the U. States; to Spanish America and the W. India colonies of France, French manufactures, furniture, cattle, and flour; to the S. Seas, the E. Indies, and China, all sorts of manufactures, furniture, silver, &c. Bordeaux is the chief port of Southern France for colonial produce; it receives from America, India, and Africa, coffee, sugar, pepper, cigars, cancella bark, indigo, quinquina, tea, rice, cocoa, skins, dye-wood, &c.; iron, lead, and other metals are imported, especially from England; fish, glue, and tallow from Russia; timber from the Baltic; metals, oil, liquorice, saffron, &c. from Spain; zinc and steel from Germany; cheese and stock-fish from Holland; livers from England, and the two last-named countries, &c. In 1836, 3335 vessels, including their repeated voyages, arrived at Bordeaux; of which 688 were from foreign ports, and 2,667 from French ports. Of the foreign vessels entering the port, 94 were English. There belonged to the city, on the 1st of January, 1837, 357 vessels, of the burden of 66,385 tons; of these 230 vessels, of the burden of 57,500 tons, were employed in foreign trade, and the others in coasting trade and river navigation. The trade with the interior, is greatly facilitated by the Canal du Midi (*See FRANCE*.) The custom duties at Bordeaux, in 1831, amounted to 550,478*fr.*

Bordeaux possesses several charitable institutions. "The New Hospital, erected to replace that of St. André (built in 1390), is," says Mr. Inglis, "upon a scale of magnificence and comfort beyond what is to be found in any other town in Europe. I dedicated the second of my days at Bordeaux to visit to this hospital, and was equally surprised at its extent, and delighted with the admirable arrangements that pervade every part of it. There is nothing that this hospital does not contain. It includes 710 beds for sick persons, and 18 chambers for the accommodation of persons who pay for the attentions they receive. It contains baths, bakehouses, courts, an apothecary's shop, water-reservoirs, gardens, and accommodation for medical men. There are also in the hospital 34 reserved beds, and a provision against fire, containing 1,410 lbs. I need scarcely add, that, in the cleanliness of every department, the hospital is perfect; and that in the smallest minutie, every thing is found that can contribute either to health or to comfort. The Bordelais are justly proud of this noble institution." (*Switzerland*, &c., p. 318.) There are, also, hospitals for aliens, foundlings, the aged, insane, &c., *bureau de charité*, a *dépôt de mendicants*, and other similar establishments. There are two buildings near the river, each 36 yards square, devoted to public baths; their exterior is crowned with an agreeable terrace, and the interior of both is fitted up with all the various kinds of baths, medicinal and otherwise. The vineyard of the former monastery of the Carthusians is now converted into a public cemetery: there are three others in Bordeaux, two belonging to the Protestants, and one to the Jews.

Bordeaux is the seat of an archbishopric, of a royal court and court of assize, and tribunals of primary jurisdiction and of commerce. It has numerous scientific and scholastic institutions. The Museum occupies a large extent of ground, and comprises the public library, cabinet of natural history and antiques, a picture gallery, schools of design and painting, observatory, &c. The public library contains 110,000 vols., amongst which are some rare works, and several valuable MSS.: the other departments are not very rich; the picture-gallery, however, boasts of some good paintings of the French, Italian, and Flemish schools. There is a botanic garden, at which a course of lectures, recognised by the University of France, is annually delivered; a university academy, royal academy of arts, sciences, and belles-lettres, a royal college, a faculty of theology, with schools of navigation and medicine, a normal school, a school for deaf and dumb, &c.; an Athenæum; Linnean, philomathic, and medico-chirurgical societies, a royal society of medicine, a society of commercial emulation, &c. In the vicinity of the city is an experimental farm, and a race-course or hippodrome: the country round is chiefly appropriated to the culture of the vines; but, from its fertility, is devoted to much picturesque beauty. There is a joint-stock bank with a capital of 3,000,000 francs, and

a *mont-de-piété*, in Bordeaux. Since 1825, this city has been lighted with gas. The inhabitants are generally opulent, and live in a style superior to that common in any other French city, Paris excepted. The jurisdiction of the royal court of Bordeaux extends over the *déps.* Gironde, Charente, and Dordogne; its archbishopric, which originated in the third century, has for suffragans the bishops of Agen, Angoulême, Poitiers, Périgueux, La Rochelle, and Luçon. Bordeaux sends 4 deputies to the chamber, 3 for the city, and 1 for the *arrondissement*.

History, &c.—The epoch of the foundation of Bordeaux is unknown. It was the capital of the *Bituriges Finices*, a Celtic nation of Gaul, and a celebrated commercial city in the time of Strabo. It was taken by the Romans in the reign of Augustus; and Hadrian made it the metropolis of the second Aquitaine. In the reign of Gallienus, Tetricus, the governor of this prov., one of the so-called thirty tyrants, assumed the purple here, and it is most probable (*Hugo*) that it was he who built the celebrated amphitheatre. In 417 the Visigoths, in 609 Clovis, and in 729 the Saracens, possessed themselves of it; under Charlemagne, it was governed by a count of its own; in the ninth century it was ruined by the Normans. It subsequently became the cap. of Guienne, and fell with the rest of that duchy under the kings of England, to whom it almost uninterruptedly belonged till the English were finally expelled from France in the reign of Henry VI. Generally speaking, this city has in later times been attached to the interests of the Bourbon family; but in 1830, on the publication of the *ordonnances* of Charles X., the standard of revolt was hoisted here before news arrived of the same occurrence in Paris. Bordeaux and its vicinity have, in all ages, produced celebrated men: amongst others, Montesquieu and Montesquiou, the Latin poet Ausonius in the fourth century. Clément de Buch, Edward the Black Prince, Jay, Desèze, &c.; Pope Clement V., and Richard II. of England, were also natives of this city. (*Hugo, France Pittoresque*, li. 63—72; *Guide du Voyageur*, &c., 1837, p. 158—162.)

BORGIA, a town of Naples, prov. Calabria Ultra, cap. cant., in a plain 6 m. W. Catanzaro. Pop. 3,000. Having been almost totally destroyed by an earthquake in 1783, it was rebuilt by Ferdinand IV. Its environs produce highly-esteemed wines, and large quantities of silk.

BORGO, a sea-port town of Russia in Europe, princip. Finland, gov. Nyland, at the bottom of a bay of the Gulph of Finland, 35 m. E.N.E. Helsingfors; lat. 60° 22' N., long. 25° 45' E. It is the seat of a bishopric, and has a gymnasium. The harbour is indifferent, and it has but little trade. It was here that the eueporer Alexander received the oath of fidelity tendered by the states of the principality.

BORGOMANERO, a town of the Sardinian states, prov. Novara, 18 arovi. N. on the Gontale, 18 m. N.N.W. Novara. Pop. 6,000. It is surrounded by walls, and is well built; has a fine square, several convents, an hospital, and a *mont-de-piété*.

BORGO-SAN-DONINO, a town of the duchy of Parma, cap. distr., on the Strone, 22 m. S.E. Placentia. Pop. 4,000. It is surrounded by walls, has a ducal palace, a cathedral, 4 parish churches, a college, a seminary, a workhouse, and some labrics of silk and linen. It owes its name to St. Donino, who was beheaded here in 304.

Borgo is prefixed to the name of various small towns in different parts of Italy.

BORISSOF, a town of Russia in Europe, gov. Minsk, on the left bank of the Bérézina, 45 m. N.E. Minsk. Pop. 1,000. Borissof would be unworthy of notice in a work of this sort, but for the celebrity it has acquired from the disastrous passage of the Bérézina, effected near it, by the remains of the French army under Napoleon, on his retreat from Moscow, in 1812.

BORISOLEBSK, a town of European Russia, gov. Jaroslavl, on the right bank of the Wolga, opposite to Romanof. Pop. 4,000. It is picturesquely situated on a hill declining towards the Wolga, and surrounded with dense forests. It is also the name of another small Russian town, gov. Tambof, on the left bank of the Vorona.

BORKHUM, a small isl. in the North Sea, belonging to Hanover, off the mouth of the Ems, about 9 m. from the nearest point of the mainland. It is included in the bailiwick of Friesland, is about 13 m. in circ., and has about 500 inhab. It is so low that at high water it is divided by the sea into two pretty equal parts. The inhabitants are mostly seamen, several of them being employed as harpooners in the ships engaged in the northern whale-fishery. They also raise corn, fruits, and cattle. It is an established custom, that a third part of all articles saved from shipwreck goes to the individual on whose land the disaster took place. Borkhum is a par., with a church and a school. The spire of the church serves also as a lighthouse. The lantern, which is furnished with reflecting lamps, is 150 ft. above the level of the sea, and

is in lat. $53^{\circ} 35' 20''$ N., long. $6^{\circ} 40' 20''$ E. (*Dict. Géographique*, &c.; *Coulter, sur les Phares*, 2d edit. p. 61.)

BORMIO, a town of Austrian Italy, prov. Valteline, at the confluence of the Predosso with the Adda, 30 m. N.E. Sondrio. Pop. 5,500. A large cattle fair is annually held here, from the 22d to the 25th of October; and in its vicinity, on the declivity of Mount Braglio, are celebrated mineral springs, much frequented by patients from the Valteline and the Grisons. This town was formerly much more considerable; but being sacked, burnt, and its inhab. put to the sword, in 1621, it has never recovered from the disaster. (*Rampoldi*.)

BORNEO (called by the natives *Tasau Klemantan*), the largest island in the world, Australia being reckoned a continent, occupying nearly the centre of the E. Archipelago; between lat. $4^{\circ} 10'$ S., and 7° N., and long. 109° and $119^{\circ} 20'$ E.; having N. the W. the China Sea; E. the Celebes Sea and Straits of Macassar; and S. the Sea of Java: form compact; length, N.E. to S.W., 750 m., breadth 350 m.; area, 260,000 sq. m. Pop. probably from 3 to 4 millions. The coasts are less indented by deep bays, or creeks, than those of most islands of the Archipel.; notwithstanding which, it has several fine and spacious harbours. The shores consist usually of mud banks, with numbers of minute and rocky islets around them; the land for several miles towards the interior continuing marshy and alluvial, interspersed with gentle acclivities, covered with underwood. In the maps a chain of mountains, running N.E. to S.W., have been represented as passing through the centre of the island; but Mr. Earl, who visited the interior in 1824, saw no traces of these, nor does he believe in their existence. Excepting the volcanic chain of mountains passing through Java, and the S. parts of the archipelago, to the E., all the hill ranges of those islands run N.W. and S.E., and seem to be continuations of the great ranges which run in that direction through the ultra-Gangetic peninsula, and of which the rocky island Pulo Condor and the Natunas seem to be connecting links. They are all of the same geological character—granitic; and in Borneo probably terminate in a range which lines the S.E. shore for 90 m., called the Hundred Mountains. There are many isolated hills in Borneo, and a range stretching along the N.W. coast, of about 3,000 ft. in height. (See *Earl's Map*, &c.) There are numerous and extensive plains, especially in the N.; but the most important yet known to Europeans is that of Montrado, near the W. coast. There are said to be upwards of 100 rivers, many being navigable, and some of considerable size. The principal is the Banjarassin, which has a S. course nearly throughout the whole island, and falls into the sea not far from the town of the same name on the S. coast. The Passir, C. ti, and many others, are met with on the E. coast; on the W. the Sambas, Puntiana, Landak, Succadan, &c., are the principal; the first is 1 m. wide at its mouth, and much more a little farther inland. It has been ascended in small vessels by the Dutch for 80 m., and beyond that is said to be available for canoes to within two days' walk of Borneo Proper. The larger rivers, which come from the centre of the island, appear not to have their origin in any mountainous region, as they rise no higher during the rainy season: they seldom contain any sandbanks or rapids.

Nothing satisfactory has been communicated respecting the geology of Borneo, except the granitic character of its primary mountains; its soil, in the neighbourhood of the European settlements vies in richness with that of any other island of the Archipel. In the N.E. it is said to be superior to all other parts. Borneo is rich in valuable minerals: it is the only island of the Archipel. where diamonds are found; the chief of which are from Landak, in the Chinese territory: one, in the rough state weighing 367 carats, and worth, according to the common but absurd method of estimating such articles, 269,378*l.*, has been found there, and was, in 1815, the property of a petty chief. Diamonds are most numerous in the alluvial soils, in which gold is also found; and are of good water, though usually small. The plain of Montrado is said to have formerly yielded 88,462 oz. annually of pure metal (*Hemilton*); the soil in which it is found is stiff, and the veins lie from 8 to 15 ft. below the surface. It is met with chiefly in small particles, nearly as fine as sand, although sometimes in irregular pieces of the size of a spicence. There are inexhaustible mines of ore of antimony of very superior quality at Serawak; 1,400 tons of which, at 16*s.* to 20*s.* per ton, are annually exported to Singapore: tin is plentiful in some parts, and a little iron is procured from the interior.

Climate.—The climate of the N. is similar to that of Ceylon, and not subject to the hot land winds that prevail on the coast of Coromandel: the W. coast has no rainy season in particular, but is refreshed by showers all the year round. Europeans have had but little intercourse with the eastern parts, and little respecting them is known.

Borneo is generally very fertile; but, except in Borneo Proper, the grain produced is not sufficient for home consumption. Timber is often very large; but not generally of the kinds suited for ship-building. No trank has been yet discovered: mangrove and rattans are plentiful on the banks of the rivers: iron-wood, ebony, camphor, dammer, and *tankamem* trees (from the latter of which wood-oil is obtained), cocca-palm, betel, cinnamon, sago, &c., are amongst the principal trees. The camphor-tree grows to 15 or 16 ft. in circ., and proportionally high: it is cut down, split into pieces, and the produce (which is probably the best found in the fissures; none of either the Borneo or Sumatra camphor is imported into England, which is supplied with that article from China only. Rice is excellent; but the Dutch are very jealous of its exportation, except through themselves. Maize and the sugar-cane are cultivated, as well as the plantain and many other tropical fruits.

Animals.—The elephant, rhinoceros, and leopard, are confined to the N.E. corner of the isl.; the ox and wild hog are natives of the forests; and the jungles furnish an endless variety of the ape and monkey tribes; amongst which are the orang-outang, and a species of baboon, thought by Mr. Earl to be hitherto undescribed, 3 ft. in height, tailless, with short, glossy, brown hair, and an aquiline nose projecting 14 in. from the face. The tapir, numbers of deer, and small bears, no larger than badgers, but with shaggy hair, inhabit Borneo.

Mr. Earl saw a small amphibious animal from 2 to 8 in. in length, with large pectoral extremities, leaping about in vast numbers on the mud of the W. coast, which very rapidly buried itself on the approach of an enemy: these are thought great delicacies, and caught in a singular manner by the Malays, who obtain a thin plank several ft. long by about 1 ft. broad, with spikes projecting from the end, and then, with the right knee resting on the plank, they push it rapidly forward, by means of the left foot, against the mud, and transfix the little animals before they have time to escape. The Sooloo Sea is much frequented by English whalers for the spermætic whale. The seas abound with turtle, and plenty of fish, oysters, and other *Isaaca, kauldaria*, &c. **People.**—The interior and part of the N.W. coast are peopled by Dyaks, and it is said, by a race with woolly hair, like the Papuan negroes; the W. coast by Malays, Chinese, and Dutch colonists; the N.W. by half-caste descendants of the Moors of W. Hindostan; the N. by Anamese (Cochin China); N.E. by Suluks; E. and S. coasts by Bugis, of Celebes. Besides these, three tribes live in small craft, in a wandering manner, about the shores; viz. the Lamuns, from Magindano; the Orang-Badja, and Orang-Tadong; source unknown.

Dyaks.—The Dyaks (Orang-Benua), a savage race, believed to be the aborigines, are scattered all over the island in different small tribes. They are of a middle size, and, except when cramped up by being constantly in a canoe, are invariably straight-limbed and well-formed, muscular, though inferior to the Chinese in ability to carry burdens; feet short and broad; toes turned rather inwards; cheek-bones high; forehead broad and flat; eyes rather long, and the latter higher than the inner angle; faces prominent, with a pleasant expression, and more like that of the Anamese than other Asiatic nations; hair straight and black; no beard. The women are interesting, often good-looking, and sometimes even fair; many are married to Chinese, and make unexceptionable wives and mothers. Their manners are mild and prepossessing, but as they dread the Malays, from whom they have suffered formerly, they commonly avoid strangers; yet it is said that there is no Eastern people more apt to make progress in arts. (*Earl*.)

In the N.E., and near Banjarmasin, their condition is the most ameliorated. At the latter place, and on the S. coast, they are said to possess a written character, and they are there ashamed to avow certain of their usages; such as that of seeking for and preserving human heads, &c. Rice is their chief food, with pork, fish, deer, and other wild animals, which they shoot by means of arrows blown through a tube. This is their general weapon, but they sometimes use crooked bows and arrows, the latter of which are tipped in poison. They spend much time in ill-built, shallow canoes, about 10 ft. long, and made by hollowing out a single tree; but on shore inhabit thatched bamboo houses, elevated on posts, and entered by a ladder, which is always drawn up at night: these habitations are often collected in small villages, and defended by stockades. The men wear but little clothing; the women much more, and are bashful and modest: both sexes love finery, especially beads and feathers. Tattooing is in use among some of the tribes.

Upon the banks of the larger rivers many tribes often unite together, under the rule of one stronger than the rest; but in the forests they keep separate, and speak dialects so different as to be often unintelligible to each other. The more civilised have adopted Mohammedanism; others less civilised believe in a Supreme Being and

a future state, but suppose that, in the latter, the owner of a human head will have the former washer of it as his slave! a belief which has naturally led to a widely-extended system of human sacrifice. No one can marry without the head of some one having been first obtained by himself or his friends; and at the funerals of persons of consequence, or treaties of peace between chiefs, slaves or prisoners are decapitated to obtain these trophies: the heads are dried and hung up in the houses; and piratical expeditions are often undertaken with no other object than to obtain them. Some Dyaks are occupied in washing gold, and dispose of the gold-dust to the Malays for red and blue cotton cloths, beads, brass wire, salt, and other necessities of life, and tobacco, of which they are extravagantly fond. To avoid more intercourse than necessary with the Malays, they oblige them always to dispose of their merchandise at the nearest Dyak town. Next to human heads, which appear to them the most valuable of all articles, China jars are valued, and from some superstitious motives are so highly prized that they have been known to fetch 2000, or more. A circumstance, stated by Mr. Earl, which may be of use to individuals trading with Borneo, is, that if any one drink the smallest quantity of the blood of a Borneo in a cup of water he, by doing so, binds him by ties closer than those of consanguinity. The Lanuns are a piratical people, who infest the N.W. coast for 300 m., and cruise in other parts of the Archipelago, plundering villages, and often carrying off their whole population into slavery. Sometimes the Dyaks join with them in these predatory expeditions, and bring away the iron and human heads, while the Lanuns appropriate the rest of the spoil. The Orang-Badju are a kind of sea gipsies, in person like the Malays; living at the mouths of most rivers on the E. border, in families of about a dozen or fifteen, in boats of from 8 to 10 tons each, covered when in harbour, with a roof of matting. They are employed chiefly in fishing, taking tripaug, and making salt from burnt sea-weed. They are generally Mohammedans, but by no means rigid in their tenets. The Orang-Tidong live to the N. of the latter, and cruise among the Philippines and Sooloo isles, where they dispose of sago, on which they chiefly subsist. They are a hardy race, and are said to be occasionally cannibals.

The Dutch have two small stations on the W. coast, Sambas and Pontiana, about 90 m. apart. The town of Sambas is meanly built, and contains a habitation of stone, or other substantial material; the houses of the government officers are low wooden, thatched buildings; the huts of the natives are chiefly raised on posts, ascended by ladders, but many are built on floats on the river, as in Siam. The Chinese *campung* is the only street; the fort is a mere embankment, surrounded by a stockade of poles, and mounted with a few nine-pounders; it contains the barracks, with a garrison of 40 men, half of whom are Europeans. Before the Dutch settled here, the place was a nest of pirates, destroyed by the British in 1812; the climate is unhealthy, though the coast is covered with swamps and jungle. Sambas has the better river, but Pontiana is the better town. Between the two are the Chinese settlements of Montradoak, Landak, &c. The gold mines near the former place are generally worked by companies of merchants clubbing together. Spades and mattocks are the only mining instruments in use: the ore is brought up in baskets, then washed (for the Chinese have no other method of treating it), and the gold-dust made into little packets, each weighing two Spanish dollars. About 3,800 oz. troy a year are sent to Singapore, which Mr. Earl thinks may be about 1-10th of the present produce of the island. The Chinese appear to be of a class like the lowest at Canton: previously to the Dutch settlement here in 1823, 3,000 of them arrived annually as settlers; but emigration has now ceased, owing to the treatment they have received from the Dutch. Mr. Earl reports that, in 1834, the Chinese expressed a great desire to trade with the British at Singapore, but the Dutch have interdicted all communication between them and foreign nations, except through the medium of Sambas and Pontiana; and, being in possession of the coast line, they are enabled to prevent it. The consequence is, that the Chinese refuse to hold communication with the Dutch, and the whole trade of the W. coast has been much diminished through their illiberality. The W. coast was ceded to the Dutch by the King of Bantam in 1780; but the cession, for some time afterwards, was resisted by the Sultan of Succadan. In 1823, the Dutch settled at Pontiana, and purchased the monopoly of some diamond mines from the Malay sultan. Finding these unprofitable, they endeavoured next to take forcible possession of the Chinese mines, but being repulsed, they blockaded the Chinese between their two settlements, obliging them to trade by their ports, and guarding the coast by several vessels. The Dutch revenues are chiefly derived from monopolies of salt and opium, the former of which is imported from Java, &c., in vessels chartered by government, and sold at seven times the import price, the interior being entirely dependent on the coast for its supply:

other resources are from capitation taxes on the Chinese, and imposts on their entering or leaving the Dutch settlement. The pop. (1834) of the Chinese and Dutch territories was estimated by Mr. Earl as follows:—

Chinese	-	-	150,000
(90,000 in the Dutch settlement.)	-	-	
Malaya	-	-	50,000
Bugis	-	-	10,000
Arabs	-	-	400
Javanese and Amboynese soldiers	-	-	150
Dutch	-	-	80
Dyaks	-	-	250,000
Total	-	-	460,630

Exports.—The principal exports of the W. coast are gold, diamonds, antimony, camphor, bees' wax, deers' horns, dammur, ebony, wood oil, rattans, pepper, bezoar-stones, and iron, to Java, for the manufacture of *krises*. The iron of the interior is either exceedingly good, or the Dyaks are able to temper it astonishingly well, for their steel scimitars are capable of cutting through an iron nail or wire without difficulty. (Earl.)

BORNEO PROPER.—The state next in importance to the colonies is Borneo Proper, a Malay sovereignty in the N.W., probably the most ancient of all in the island, and from which the latter has derived its name: it is bounded N.E. by the Sooloo, and S.W. by the Dutch territory, and extends from 100 to 150 m. inland. The Malays here are distinguished for their haughtiness and indolence; and the sultan, who enjoys a high veneration, maintains more state and dignity than most Malay princes. The chief town has been much reduced by piracy and lawless commotion, which have driven away foreign settlers: it is on a river, and in appearance like other Malay towns, but not so large as either of the Dutch settlements: the inhab. are chiefly Mohammedans. The exports are camphor, sea-shell, tortoise-shell, birds' nests, clove-bark, pepper, gold-timber, sandal-wood, rattans, &c.; there is much fine timber on the banks of the rivers. There was formerly an extensive trade between Borneo Proper and China, as well as some commerce with the English in piece goods. Since the establishment of the Singapore colony, the British trade has recommenced; and it cultivated, Mr. Earl says, affords a fair prospect of a large consumption of our manufactures. The Malays are not destitute of some arts, among which is that of casting cannon: in this they are skilful, and arms and ammunition would be good articles for the British export trade.

Pappal, Malluda, Mangedara, Paitan, Tirun, &c., in the N.E., are mostly Suluk settlements. The country here abounds in forests of lofty trees, extensive plains covered with herds of large cattle, from breeds introduced by the Spaniards two centuries ago; many rivers, and much mineral wealth. Gold and diamonds are collected with little trouble; tin ore is sometimes picked up on the surface. Sago, rice, betel-nut, coconut oil, camphor, wax, a little pepper and cinnamon, pearls, rattans, clove-bark, and grain, in Malluda; birds' nests, lacka-wood, and tortoise-shell, in Mangedara; timber, lime, stone, eaglewood, and sea-slug, in Paitan; are the chief products. Tirun yields more birds' nests than any other region of the E.: its coast is generally a low swamp overgrown with mangroves; its rivers are numerous, large, and often navigable; its interior is covered with sago-trees, which form the chief subsistence of the people; and yields, besides, canna, rattans, wax, honey, bezoar, gold, and, it is said, saltpetre. Many Annamese have settled on the N.E. coast; emigration from Cochinchina, in consequence of national disturbances, having prevailed lately to a great extent. Voyages hence, to and from Anam, may be made at any time of the year.

The chief state on the E. coast is that of Cotti, or Cotti-Lama, belonging to Bugis, from Celebes. Cotti town stands 50 m. up the river of that name, the banks of which are inhabited by nearly 300,000 people. It is the chief place on this coast: its people are commercial, and many annually visit Singapore in their *prahns* or trading vessels. Basil stands on a large river a little S. of the former: it is a den of pirates. Banjar-massin, on the banks of the river of that name, is surrounded by a territory producing rattans of the best description in abundance, as well as gold, diamonds, and pepper. The pop. are mostly Bugis, who occupy nearly every river and creek on the E. and S. coasts. They have had some trade with Singapore, but which is discountenanced by the Dutch authorities; all the S. coast being claimed by the latter, who, in 1747, established a factory at Banjar-massin. On this coast there are said to exist the remains of temples, images, &c., relics of a more civilised people formerly inhabiting it, but no detailed history of these has been given.—(Earl's *Eastern Seas*, &c., in 1833-34, pp. 282-342.; *Lycden's Sketch of Borneo*; *Cranford's Ind. Archipelago*; *Hamilton's E. I. Gaz.* i. 278-285.)

BORNHOLM, an Isl. belonging to Denmark, in the

Baltic, about 24 m. E. by S. from the nearest point of Sweden, and 90 E. from Zealand. It is of a rhomboidal shape, being about 20 m. in length by 14 in breadth. Pop. in 1834, 24,546. Bornholm differs considerably from the other Danish islands: it rises high above the level of the sea. Its shores are formed for the most part of steep lofty rocks, surrounded by reefs, which render their approach not a little dangerous. It is well supplied with freestone, which is largely exported to Copenhagen and other places; and with limestone, blue marble, various species of clay, ochres, and coal. The clay is suitable for the making of coarse and fine pottery, and is used in the china factory at Copenhagen. Hitherto the coal has not been profitably wrought. Climate drier and more salubrious than that of Zealand. The centre of the island is occupied by an extensive heath; but elsewhere the soil is moderately fertile, producing all sorts of grain, but especially oats, with flax, hemp, &c. Cattle inferior to those of the other Danish islands, but the horses are strong and active. Timber is scarce; large trees being, however, frequently found in a state of perfect preservation imbedded in moss. There are a great many rivulets well stocked with fish, which are also very abundant round the coast. Exclusive of agriculture and fishing, brewing and distillation, tile and brick making, the manufacture of coarse and fine earthenware, &c. are carried on to a considerable extent. An ingenious native of the island having accidentally taken to pieces a wooden clock imported from abroad, took it for a model, and set about making another. This example was followed by others; and such was their success, that wooden clocks soon began, and still continue, to be a principal article of export! Linens, spun and prepared in the houses of the peasantry, are also exported. Coffee, sugar, tobacco, and spices are the principal articles of import. Rønne, the capital, and the residence of the governor, is situated at its S.W. angle. It is defended by batteries, has a considerable trade, and a number of vessels and boats engaged in the fishing; but its harbour is shallow, having only 6 or 7 f. water. Nexø, on the S.E. shore, is famous for its beer. A lighthouse, having the lantern elevated 272 ft. above the level of the sea, stands on the point. Cape Hannerus, the most N. point in this island. The feudal system never obtained any considerable footing in Bornholm. Persons accused of political offences used to be banished thither. (*Callicau, Tableau de la Mer Baltique*, i. pp. 277—284.)

BORNOUT, a kingdom of Central Africa, in from 100 to 150° N. lat., and from 120° to 140° E. long.; it is bounded on the N. by Kaem and the S.E. corner of the desert; on the E. by Beghara; on the S. by Mandara; and on the W. by various small tribes extending to Houssa and the Mandara country. Bornout appears to have been formerly more extensive, both in lat. and long.; at present it may, perhaps, be about 400 m. in length, from E. to W., the same in extreme width, from N. to S., and its area is probably not less than 120,000 sq. m., of which however, certainly more than 20,000 are covered by the waters of Lake Tchad. (*Denham and Clapperton*, p. 314, &c.; *Lucas, Afric. Assoc.* i. 131, &c.) The surface of Bornout is an immense plain, the greater portion of which is subject to annual overflow, from which circumstance, joined to the great heat of the climate, the soil has every capability of abundant production; owing, however, partly to the want of industry in the people, and partly to the state of warfare in which the internal countries of Africa seem constantly to live, little advantage is taken of this favourable state of things, and the Bornouse are not much superior as agriculturists to other negroes. Clapperton (*Journeys from Kouka to Sokkato*, p. 19.) found the natives of Houssa raising a second crop of wheat, by irrigation; but such instances, while they prove the natural fertility of the land, are extremely rare in Bornout. The principal rivers are the Shary and the Yeou; the former apparently rising in the mountains of Mandara, the latter in those of Houssa. The smaller streams are very numerous, but all are received into Lake Tchad, and unless that lake have an outlet on its E. shore, which, if not impossible, is very improbable, the whole water system of Bornout yields no supply whatever to the ocean. (*See LAKE TCHAD*.) Upon this point, however, it must be observed that something more than a suspicion is entertained of an indirect communication between the Shary and the Niger. The Tchadda, which falls into the latter river between 7° and 8° of N. lat., and between 8° and 9° of E. long., is positively affirmed by the natives to be connected with the lake of the same name. Lander, in his last expedition, sailed up this stream to 150 m. from its mouth, and found its upward bed constantly bearing towards the Mandana mountains. (*Travels of R. and J. Lander*, p. 769.) Major Denham also received information, on the Mandara frontier, of a river running W. through a country which his informant called Adomowa. (*Trav.* p. 144.) In addition, likewise, to its identity of name with the distant lake, the Tchadda (river) has the second name of Shary given to it by the natives; and Capt. Allen, who ascended its stream in 1833, has given many reasons

for supposing that it is connected also with the Yeou, the other great river of Bornout. (*Geog. Journ.* vol. vii.) From all these circumstances, the asserted communication appears to be highly probable, and indeed it is not easy, on any supposition, except that of its truth, to account for the prevalent belief on the banks of the Niger. The very considerable space of intervening country (600 m. direct distance) being considered, it is not very likely that the natives of that district should have even heard of the Tchad, unless its connection with their river had really existed; but, at the same time, it is certain that the Bornouse waters and the affluent of the Niger flow in different directions. (*Denham*, p. 236, &c.; *Lander*, p. 769.) so that the possibility of a passage from the one system to the other implies the common origin of some of their branches to lie among lakes on elevated plains, from which the streams descend on different sides with a very gradual fall, and in considerable volume. Such a communication between independent basins was first established by Humboldt and Bonpland, with regard to the rivers of S. America. It will form an interesting feature in physical geography, should it be found existing also in interior Africa. (*See NIGER*.)

The climate of Bornout is one of very great but not uniform heat. In summer, that is, from March to June, the thermometer stands at 105° to 107° at noon, and even at night is rarely lower than 100°, except before sun-rise, when it sinks to 86° or 88°. The winter temperature is, however, lower than the lat. would warrant the expectation of; rarely higher than 74° or 75°: it frequently falls in a morning as low as 58° or 60°. The N.W. wind is cold, the S. and S.E. hot and suffocating; which, considering that the first blows over the Sahara, and the others over the high mountains of Koung, is a remarkable fact, which seems to require explanation. The seasons may be divided into wet and dry, but the first can scarcely be denominated rainy, in a tropical sense. About April or May, indeed, a short period, varying from 3 to 9 days, is marked by violent tempests, rain, thunder, lightning, and wind; but the remainder of this wet period, extending to October, by no means interferes with out-door labour, except in June, when there is another burst of falling weather, attended with a most oppressively salubrious atmosphere. At this time it is that the lakes and rivers overflow their banks, flooding the land in their neighbourhood for many miles. The dry and cold season usually commences in October. (*Denham*, pp. 181—225, 314.; *Lucas*, p. 131.)

In a country devoid of mountains there are, of course, no minerals. Iron is procured from the neighbouring state of Mandara, in the hills of which it is very abundant, and gold dust is a principal article in Bornouse trade; but whether the last be brought down by the rivers or procured from a distance, does not appear. (*Denham*, pp. 146, 317.; *Lucas*, p. 155.) Trees are extremely scarce throughout the country, except here and there upon the banks of rivers; though the neighbouring states, Kaem, Mandara, Houssa, &c., appear to be well wooded. The soil, which is chiefly alluvial, is highly productive, but its productions are by no means varied, consisting chiefly of millet, barley, beans, Indian corn, cotton, and indigo. The flooded lands on the shores of Lake Tchad are peculiarly well adapted for the growth of rice, but none is cultivated; and there is no tropical country nor desert so destitute of fruits and edible roots. (*Lucas*, p. 134.; *Denham*, pp. 50, 102, 316, &c.; *Clapperton*, pp. 6, 15, &c.)

The wild animals of tropical Africa are all common in Bornout; and the ferocious kinds, lions, panthers, jackals, &c., which in the wet season approach the walls of the towns, are particularly dangerous. The buffalo, giraffe, elephant, hippopotamus, and crocodile, are animals of chase; the flesh of all of them is eaten, and that of the last three accounted a great delicacy. The civet cat is common, and the animal itself, as well as its secretion, is an important article of trade. Of domestic animals the number is immense: cattle and horses are of fine breeds, and plentiful; camels are rare, and sheep have a hairy instead of a woolly covering. Pelicans, spoonbills, cranes, snipes, ducks, geese, and, in short, almost every species of water fowl, are abundant in the extensive marshes; the ostrich traverses the plains, and partridges, grouse, guinea fowl, and other game, are also very numerous, as are the domestic fowls, which constitute the cheapest kind of animal food that can be purchased. Reptiles are numerous, consisting, besides crocodiles, of scorpions, centipedes, enormous toads, and many varieties of serpents, one of which, measuring 14 or 16 ft. in length, though said to be harmless, is probably of the box or python species. In such a climate insect life is naturally abundant; bees are so numerous, that Lucas (p. 138.) affirms the wax is often thrown away, as an article of no value in the market; and Den-

* In an Arabic MS. geography of interior Africa, composed by Sultan Bello, of Houssa, Bornout is described as "a country which contains rivers," but no mention is made of the lake. (*Denham and Clapperton, Appendix*, xii. 159.)

ham remarks (p. 320.) that the honey is only partially collected. The curse of tropical countries, the locust, is a frequent visitor; and though a favourite article of food, is regarded with dread, since desolation always follows in its train. The rivers and lakes abound in fish, of many different species, most of them peculiar. (*Lucas*, p. 137.; *Denham*, 320, 324, 319, 321, &c.)

The inhabitants of Bornou consist of two classes,—the Shouas, descendants of Arab settlers from the N.; and Kanowry, as the native race is called, who are true negroes. The former, as in all similar conjunctions, are the dominant people; they have fine, open, aquiline countenances, large eyes, a light copper complexion, and bear a strong personal resemblance to the best specimens of English gypsies. They are divided into tribes, and still bear the names of some of the most powerful Bulolun hordes. Their language is Arabic, and to them is owing the introduction of the arts of writing and reading. They are shrewd, active, and courageous, but these are almost the only good traits in their character. Deceitful, arrogant, cunning, and dishonest, their superior attainments are used by them only as a means to rob and oppress their black neighbours. These last present, in their physical appearance, all the usual negro peculiarities—large noses, large mouths, and inexpressive countenances. They are peaceable and orderly, but destitute of energy, cowardly, and appear to regard the Shouas as a superior race of beings. Nine different languages, or dialects (ten with the Arabic), are spoken in Bornou: Lucas says thirty, (p. 132.); but as he makes the limits of the country much larger than Denham, it is probable he included those spoken in some of the surrounding states. No estimate can be made of the population of this kingdom; but as towns possessing 30,000 inhab. are met with, and markets are said to be sometimes attended by 80,000 or 100,000 persons, and the Shouah population alone can raise an army of 15,000 men, the number of inhabitants must be very considerable. (*Denham*, pp. 79, 80, 329., &c.) The religion of the court is, of course, Mohammedanism; but no disabilities appear to attend the profession of feticism, which is the faith of the bulk of the negroes. The government is absolute, and is lately elective. The laws are arbitrary, and punishments summary, but usually administered with justice; and there is a kind of insolvent act, which relieves a man from his debts on proof of his poverty, leaving any future property he may acquire at the mercy of his creditor, without further process. In other respects the Bornouese resemble the negroes generally; their arts are few, and apparently introduced, in most cases, by the Arabs. But the Arabs also introduced the slave-trade, which was unknown before their arrival, and is said to be reluctantly submitted to. The Moors of Barbary, however, prefer slaves to anything else; and as Bornou is dependent upon them for all the comforts and many of the necessities of life, the slave-trade is carried on to a great extent. It is said that the natives are very anxious for a direct trade with England; but considering that their country is situated full 600 m. from the coast, and in a climate destructive to Europeans, we confess we are not of the number of those who entertain a sanguine expectation that any such trade will ever be carried on to any extent, or to any profit. (*Denham*, p. 321–335. *et pass.*; *Lucas*, p. 146–159. &c.) The name Bornou is Arabic. It is literally *Ber-Nou*, “the Land of Noah,” the Arabs believing that the mountains in its neighbourhood received the ark after the deluge, and that the patriarch first established himself in its extensive plains. (*Lucas*, p. 131.) The negro name appears to be *Kanowra*. (*Denham*, p. 316.)

BORODINO, a village of Russia in Europe, gov. Moscow, on the Kologa, 10 m. W. Mojaisk. This village will be for ever memorable from its being the scene of the most sanguinary conflict, perhaps, that has taken place in modern times. On the 7th Sept. 1812, the French army under Napoleon, in its advance upon Moscow, attacked at this point the entrenchments of the grand Russian army, 120,000 strong, under Kutousoff. The Russians made desperate resistance, but in the end their position was carried. The slaughter was immense; the Russians having lost above 40,000 men killed and wounded, and the French nearly 30,000! Few prisoners were made on either side.

BOROFSK, a town of Russia in Europe, gov. Kalouga,

* Mr. Lucas's account of Bornou was derived from the reports of Sheriff Mohammed of Bornou, confirmed by the governor of Meudra, and remarkably corroborated by the independent statements of Ben Ali, a Morocco merchant, to the African Association, about 1793. These are therefore the Arab descriptions of Bornou; and it is gratifying to remark how closely they agree, in general, with those of Denham and Clapperton. It is singular, however, that none of them mention the great Lake Tchad, nor either of the great rivers which fall into it; though to the natives of a dry climate these would be supposed to form the most interesting features of the country. This is the more remarkable, since, from the notices of Begharmi, it is clear that the Arab merchants must have reached the E. shore of the lake, and consequently been acquainted with its extent both in lat. and long. (*Afric. Assoc.* pp. 73, 80, 142, 146. &c.)

cap. distr., on the Prorva, 55 m. S.W. Moscow; lat. 55° 10' 30" N., long. 36° 32' 15" E. Pop. 5,000. It is an old town, celebrated in Russian history for its defence by Prince Volkonski, in 1610, against the pretender Dimitri. It has 4 churches, a manufacture of sail-cloth, and its environs produce excellent onions and garlic. At a short distance is the convent Pseoutief-Borofski, founded in 1444, containing 5 churches and a considerable treasure. (*Schmidler, La Russie*, &c. p. 139.)

BOLDITCH-BRIDGE, a bor., market-town, and township of England, W.R. co. York. Claro wapentake, par. Aldborough, on the S. bank of the Ure, 17 m. S.E. York. Pop. 950. It has some good houses and inns, its consequence being principally derived from its situation on the great road from York to Edinburgh. It enjoyed the privilege of sending 2 mem. to the H. of C. from 1553 down to the passing of the Reform Act, by which it was disfranchised. It has several fairs; of these the most important is held in June, for the sale of hardware, and, though much fallen off, is still attended by dealers from Sheffield, Birmingham, &c. The others are principally cattle fairs. Many remains of British and Roman antiquities are found in this town and its immediate vicinity. Of these, the most celebrated are the obelisks, called the Arrows, about ½ m. S. from the town. A beautiful tessellated pavement was discovered in 1831, a little to the W. of the town. At this town, on the 16th of March, 1322, the army of the rebel barons, under the Earl of Lancaster, was defeated by the troops of Edward II., in an attempt to cross the river; and their leader, being taken prisoner, was immediately beheaded.

BOROVITCHI, a town of Russia in Europe, gov. Novgorod, cap. distr., on the Msta, 100 m. E.S.E. Novgorod; lat. 58° 16' N., long. 33° 50' E. Pop. 3,000. It has 4 churches, a convent, and a good deal of trade. In the neighbourhood are cataraacts that interrupt the course of the river; but the obstacles to its navigation, thence arising, have been successfully obviated by works undertaken for that purpose.

BORROMEAN ISLANDS, a group of small islands in the Lago Maggiore, Continental Sardinia, which see.

BORROWSTONNESS, or **BO'NESS**, a burgh of barony, and sea-port of Scotland, co. Linlithgow, on the S. side of the Frith of Forth, 17 m. W. by N. Edinburgh. Pop. 2,809. It is one of the oldest Scottish sea-port towns, and its name often occurs in history. The harbour is safe and commodious; but the revenue which it yields is insufficient to keep it in repair, even though an impost of 2d. Scotch has been levied for the purpose for nearly a century (17 Geo. II.) on every Scotch pint of ale or beer brought into the town. Bo'ness carries on ship-building to a small extent, and has some little trade with the Baltic. It engages pretty extensively in the herring fishery, and has not unfrequently, of late years, sent one, two, or more vessels to the N. whale fishery. The town is the seat of the most extensive salt works on the Frith of Forth; and it exports about 30,000 bushels of salt a year. Here are two distilleries, an earthenware manufactory, and vitriol and soap works. Productive collieries abound in the immediate neighbourhood, and have been wrought for centuries. The mines extend nearly a mile below the bed of the frith, so as almost to meet those of Culross on the opposite side, which run in a S. direction to the distance of 2 m. Near Bo'ness is Kinnell House, a seat of the duke of Hamilton, and long the residence of Dugald Stewart.

BOSA, a sea-port town on the W. coast of Sardinia, div. Sassari, near the mouth of the Terno; immediately opposite to the latter is the islet of Bosa, lat. 40° 16' 40" N. long. 8° 25' 31" E., between which and the shore small vessels lie in tolerable security. Pop. 3,500. It is beautifully situated in a fine valley between two hills; is tolerably clean, and has several paved streets; but in summer it is ill supplied with water, and is then, also, very unhealthy. It is a bishop's see; has 9 churches, a convent of Capuchins and one of Carmelites, with a seminary for the study of philosophy and theology. On a hill immediately above the town are the remains of a castle or acropolis, where the principal families used formerly to reside. The natives are very active, carrying their produce all over the island; and most part also of the travelling pedlars belong to the town. (*Smyth's Sardinia*, p. 287.)

BOSCO-TRE-CASE, a village of Naples, prov. Naples, cap. cant., at the foot of Vesuvius, 12 m. E.S.E. Naples. Pop. 5,000. It is one of four villages situated at a little distance from each other, comprised under the general term *Bosco*; has several churches and convents, a royal manufactory of arms, a powder-mill, and an extensive fabric of *pile di Italia*.

BOSNA-SERAJ, or **SERAJEVO** (an. *Tiberiopolis*), a city of Turkey in Europe, cap. prov. Bosnia, on the N. bank of the Miglajza, 246 m. S. Buda, and 675 m. N.W. Constantinople; lat. 45° 54' N., long. 18° 26' E. Pop. 60,000. It is well built, and has an agreeable appearance owing to the number of minarets, towers, and gardens which it encloses. It contains a *serai*, or palace, built

by Mahomet II., to which the city owes its name; about 100 mosques, some of which are elegant structures, several Greek and Roman Catholic churches, with colleges, bazars, &c. Most of the houses are of wood; the Miglizza is here crossed by a massive stone bridge. The city was formerly encompassed with walls, but these are now decayed, and its only defence consists in a large citadel, built on a rocky height at its E. extremity, and mounting 80 cannon. The inhabitants are industrious, and employed in the manufacture of arms, iron, and copper articles, horse-hair bags, morocco, and other kinds of leather, and cotton and woollen stuffs. Near Bosna-Sera are the principal iron mines in Bosnia. It is the chief mart in the prov., the centre of the commercial relations between Turkey and Dalmatia, Croatia and S. Germany, and has considerable trade with the cities of Saloniki and Yanina. The most wealthy families in Bosnia reside in this city; 2-3ths of the pop. are said to be Turks, but the Jews monopolise the chief part of the trade. (*Cannabach, Ritter, Matic-Brun, &c.*)

BOSNIA, or BOSNA, the most westerly pchalic or eyalet of Turkey in Europe, comprising Bosnia Proper, Turkish Croatia, and Herzegovina. It lies between lat. 42° 30' and 45° 15' N., and long. 15° 40' and 21° 2' E., having N.W. and N. the Austrian prov. of Croatia and Slavonia; E. Servia, and S. and W. Albania and Austrian Dalmatia, the latter separating it from the Adriatic, to which, however, it approaches in certain parts very closely, if it do not actually come in contact with it. Area variously estimated at from 16,000 to 22,000 sq. m. Pop. from 800,000 to 1,000,000. It is almost entirely occupied by the Dinaric and Julian Alps, which, with their offshoots, separate it into several well-marked divisions. Principal river the Save, forming the N. boundary of Bosnia, with its affluent the Unna, which in part separates Turkish from Austrian Croatia, Verba, Drina, and Tara forming its E. boundaries. The Bosnia traverses Bosnia Proper, the Saima, Croatia, and the Narenta, Herzegovina. It has numerous fertile valleys, but no lakes of importance, and only one plain of any size, that of Livno in Herzegovina. This country is supposed to be rich in minerals; but the Turks permit only the iron mines and a lead mine near Zvornik to be wrought. The former employ about 2,000 individuals. Gold and silver are said to exist in various places, and mines of the first of these metals were worked under the Romans: most of the large alluviums of the Save bring down gold-dust; but its collection by the inhabitants is prohibited. Quicksilver is also found; and there are quarries of millstone, freestone, alabaster, and marble; coal mines, and numerous mineral springs, some of which furnish salt, though not in sufficient quantity for the supply of the country. The climate is generally cold, but not unhealthy; the winter snows lie on the ground for a long time, and the spring is short. In the S. violent winds prevail in winter, and the summer is extremely hot. The mountain chains, especially in the N., are covered with dense forests of pine, oak, beech, linden, chestnut, &c.; but the S. branches of the Dinaric Alps present a remarkable deficiency of vegetation. The best soil in the valleys is devoted to pasture; and Bosnia is generally better adapted for the feeding of cattle than for agriculture. The Bosniaks, however, seem to prefer the chase to more settled pastoral occupations; and as the woods abound with wild animals, as deer, wild bears, bears, wolves, foxes, &c., they have every facility for carrying it on. The inhabitants consist of several races distributed perhaps nearly as follows:—

Nation.		Religion.	
Turks	246,000	Mohammedans	450,000
Bosniaks	550,000	Greek Church	250,000

It is only in the valleys that any cultivation is carried on. Wheat, barley, maize, and legumes are grown in sufficient quantity for home consumption; and flax and tobacco near Zvornik and Novibazar. A great variety of fruit is met with. A liqueur is made from pines, and a sweet drink called *pekmez* from pears. The olive and vine are both cultivated; but the wines are strong and fiery, and in order to be relished should be drunk while young. Bosnia has a breed of strong horses, but it is much neglected, except by the Turks: there are large herds of fine cattle, and flocks of sheep, the wool of which is greatly esteemed in the markets of the Levant. Goats, hogs, and poultry are everywhere plentiful; and in Croatia many bees are kept, which

yield good honey, but inferior wax. The manufactures of Bosnia are limited to iron articles of common use, leather, coarse woollen stuffs, saltstret at Jaleza, cannon balls at Kamenigrad; gunpowder, fire-arms, and other weapons. The principal exports are leather, hides, wool, goats' hair, honey, cattle, dried fish, timber, mineral waters, &c.; the chief imports, henna, woolens, silks, lace, glass, and metallic wares; paper, colonial produce, salt, oil, dried fruits, and silver coin from Dalmatia. The transit-trade in Levant produce is not inconsiderable; the chief seats of commerce are the towns of Bosna-Sera, Novibazar, Zvornik, Bagna Lonka, Mostar, and Gradiska. The wares are generally very bad, and impracticable for a western market. The total government revenue derived from this prov. is estimated at 700,000, or 800,000, a year, but not half this sum is said to reach the treasury of the sultan.

Bosnia is under the government of a pacha of three tails; it is divided into six *sajaks* or circles, and again into forty-eight subdivisions, each of which is subordinate to a military governor and a *cadi*, or judicial officer. Bosna-Sera is the capital of the prov.; but Trawnik is the residence of the pacha. This officer is changed every three years; he has under his order a military force of from 3,000 to 4,000 men. The Bosniaks are of Slavonic origin; though mostly Mohammedans, they yield but an unwilling obedience to the Porte, and differ from the Turks in many usages—having but one wife, and treating their women with consideration.

Bosnia was anciently included in Lower Pannonia. In the middle ages it first belonged to the Eastern empire, and afterwards became a separate kingdom, dependent upon Hungary. The Turks conquered it in 1493, after a war of 17 years; but it was not till 1522 that Solymann the Magnificent finally annexed it to the Turkish dominions. (*Cannabach, Leichbach der Geog.* pp. 743, 746; *Von Zedlitz, Brief Survey of Bosnia, &c.*)

BOSPHORUS (more properly BOSTRUS) OF THRACE, or CHANNEl OF CONSTANTINOPLE, the strait which connects the Black Sea with the Sea of Marmara, and separates the E. corner of Thrace from Asia Minor. The length of this remarkable channel is about 17 m.; its width varying from $\frac{1}{2}$ m. to 2 m.; its course slightly winding; its direction very little W. of S., and its embouchure in the Sea of Marmara is in 41° N. lat. 29° E. long.

A current sets constantly from the Black Sea through the Bosphorus, but, though generally very strong, it is subject to considerable modifications; a long-continued wind from the S.W. renders it sometimes almost imperceptible; while, on the other hand, a breeze from the N.E. so adds to its force, that it is almost impossible for a vessel, under such circumstances, to make head against it. The inequalities of coast cause several changes of direction in the set, as the water is thrown from side to side by the numerous bold promontories that project from both shores; but these do not affect the general course, except by making it more tortuous, that it runs trending constantly towards the S. and the Sea of Marmara. The depth of water is considerable; there is but one bank in the channel; consequently there is no danger in its navigation, nor any difficulty, except in an upward passage against its current; this is, however, sufficiently baffling to the unskilled Orientals. At its N. mouth, on the Black Sea, are two groups of islets, one on the European, the other on the Asiatic shore; these are the famous Cyanus Isles or Symplegades of the ancients, which it was once believed no vessel ever passed in safety, except by miracle. (*Arab. Acad.* vi. 438, &c.) They are now quite harmless, being, in fact, nothing but low continuations of the respective shores; they are in a continual state of decay, and might easily be overlooked, did not their ancient celebrity induce the modern navigator to search for them. In its freedom from all danger, its narrow channel, the strength and constant set of its current, and, in short, in most of its characteristics, the Bosphorus resembles a magnificent river more than an arm of the sea, and this resemblance is by no means impaired by the branch which it gives off at its S. end, and which, enclosing Constantinople on the N., forms what is justly called the Golden Horn, one of the finest harbours in the world. The country through which the Bosphorus flows is unrivalled for beauty; animals and vegetables of almost every variety abound, and the scenery is peculiarly interesting, from the unequivocal evidences it exhibits of igneous action. The cliffs, which are stately and abrupt, consist of jasper, agate, coralline, calcedone, porphyry, trap, and calcareous spath, in very great but picturesque confusion. They are all more or less in a state of decomposition, and traces of metals are seen in the colouring of the various stones. Appearances seem to warrant the conclusion that this strait was opened by a convulsion of nature, and this belief was very generally entertained by the an-

clients. (*See* BLACK SEA.) At about half way between the two seas, or rather nearer to that of Marmara, at the narrowest part of the channel, stand two castles, one on each bank, named, from the Turkish provinces, Anadolu and Kumeli (Asia Minor and Thrace). They form almost the only defence to Constantinople on the N., and, if well manned, would be very difficult to pass. These appear to be almost the only public buildings, but private houses and gardens extend along nearly the whole length of the straits, especially on the European side. (*Chevalier Voy. de la Prop.* pp. 43-49; *Oliver, Voy. dans l'Empire Ott.* i. 120-124; *Jones's Trav.* ii. 444-451.)

The name Bosporus (*Bosphorus*), which has been improperly corrupted by modern orthography to Bosphorus (*Bosphore*), is indicative of the narrowness of this channel, and comes from *bos*, an ox, and *poros*, a ford. The passage across it of Europa, borne by Jupiter in the form of a bull, is a well-known Greek legend, and thence the ancients called these channels Bospori, which were narrow enough to allow of kine swimming across them. Two especially were so distinguished, namely, the strait now under consideration, and the Chimmerian Bosporus (Strait of Yemeliç), between the Euxine and the Palus Mæotis. Over the Thracian Bosporus, Darius Ilystaspes threw a bridge of boats when he passed from Asia to his disastrous war with the Scythians; and the pillars of marble which he erected to commemorate that event are supposed, with great reason, to have stood upon the spots now occupied by the Turkish castles. (*Herodotus, Melpom.* pp. 65-68; *Strabo*, vii. 320; *Pliny*, iii. 11; *Pliny*, vi. 1, &c.)

BOSSINEY-WITH-TREVENA, a bor. of England, co. Cornwall, hund. Lemanth, par. Tintagel, 208 m. W. by S. London. Its area is 350 acres; its pop. is returned with that of the par., which, in 1831, was 1,006: houses, 210. It is on a rugged exposed part of the N. coast of the county, and consists of two small villages $\frac{1}{2}$ m. apart. There is a town-hall, now occupied as a charity school: an annual fair is held the first Monday after 19th Oct. It claimed to be a bor. by prescription, and returned 2 mem. to the H. of C. under a charter of 7 Edw. VI. till disfranchised by the Reform Act: the elective right was in burgesses holding freehold property in the bor.; of whom there were 24. The area of the whole parish is 3,960 acres: annual value of property, in 1815, 3,674*l*. The remains of King Arthur's Castle are on the table summit of a huge rock, protruding into the sea, and connected, by a narrow isthmus, with the rest of the parish.

BOSTAN (EL) (an. *Comana*), a town of Turkey in Asia, Natolia, pach. Marasch, at the N. foot of Mount Taurus, in a fine plain, on the Syboun (an. *Sarus*), 60 m. N. from the bottom of the bay of Iskenderoon, and 115 m. S. by W. Sivas. Lat. 38° N., long. 36° 28' E. Pop. 8,000 or 9,000. (*See* *Appendix to Kinneir's Travels*, p. 560.) says of El Bostan that "it has 40 dependent villages in the adjacent plain, surrounded with fine trees and cultivated fields and meadows. Few spots in Asia Minor offer a sight more agreeable. There is a great trade in wheat, sold to the Turkmans, who carry it even as far as Aleppo. When fearful of being attacked, the inhab. lay the environs of the town under water. It has four mosques, one of which is supposed to be very ancient."

In antiquity Comana was famous for the worship of Mâ, the Cappadocian Bellona. The population consisted, in a great degree, of soothsayers, priests, and slaves belonging to the high-priest, and employed in the service of the temple. The latter, in the time of Strabo, are said to have exceeded 6,000 of both sexes. It received a Roman colony in the reign of Antoninus Pius, and, perhaps, also, in that of Caracalla. (*Cramer's Asia Minor*, ii. 139.)

BOSTON, a sea-port, m.-to., and bor. of England, co. Lincoln, on the Witham, 90 m. N. London, and 28 m. S.E. Lincoln: lat. 53° 10' N., long. 0° 22' W. Pop., 1801, 5,926; 1831, 11,240. The town is supposed to have, from antiquities found in its neighbourhood, to have been a Roman station, and to have taken its name from a monastery built by St. Botolph, A.D. 654, destroyed by the Danes in 870. That it became a place of considerable mercantile importance, after the Norman conquest, appears from the fact that, in 1204, its assessment towards a tax of a fifteenth, imposed on the ports, amounted to 780*l*., while that of London, the only port taxed higher than it, was but 886*l*. In 1281 it suffered by fire, and in 1296 by an inundation. Under an act of 27 Edw. III. it became a staple for wool, woollens, leather, and lead. About the same time its mercantile prosperity was much increased by several Hanseatic merchants settling in it, who, however, emigrated about a century after, in consequence of a quarrel with the townsmen, which terminated in bloodshed. During the intermediate period its shipping was so considerable that it furnished 17 ships, and 360 men, towards an armament for the invasion of Brittany, and ranked the twelfth, as to number of vessels, among the 82 ports which were assessed; but it fell off rapidly after

the departure of the Hanseatic merchants. The dissolution of the monasteries by Hen. VIII. injured the town, though compensation, in some degree, was made to it by a grant of 511 acres of the sequestered lands. It afterwards suffered by the plague, and by inundations, to which this flat country was particularly liable. During the civil wars, it was for some time the head-quarters of Cromwell's army.

The town, situate on the Witham, called by Leland the *Lindis*, about 5 m. from its mouth, and divided by it into two nearly equal parts, connected together by an iron bridge, of a single arch of 864 ft. span, opened in 1807, consists of two long streets, one on each side the stream, from each of which others diverge. It is well built, contains many good dwelling-houses and shops, and extensive granaries and warehouses: the part within the borough is well paved and lighted under the provisions of a local act; but these advantages are not enjoyed by a small part, which has extended itself into the neighbouring parish of Skirbeck. It suffers much from the want of good water, that used being rain-water, collected in cisterns, or water raised from pits, or the river. The attempts made to procure spring-water have been unsuccessful, though borings have been carried to a depth of more than 600 ft. Its most remarkable building is the parish church of St. Botolph, erected in 1309. It is the largest church without aisles in the kingdom, being 245 ft. by 98 ft. within the walls. Its tower, 300 ft. high, built on the same plan as that of Antwerp, is capped with an octagonal transparent lantern, of very beautiful construction, and forms a remarkable landmark on this low coast, being visible at 40 m. distance. A chapel of ease was erected in 1822. The only traces of St. John's Church, taken down about two centuries ago, are found in its cemetery, still used as a place of burial. The other places of worship are those of the Unitarians, Wesleyan New Connexion, and Primitive Methodists, General and Particular Baptists, Independents, and Catholics. Each has a chapel, to most of which a Sunday-school is attached. A free grammar-school was founded in 1544; Laughton's, for the sons of poor freemen, in 1707; a blue-coat school in 1718, for 80 boys and 25 girls; and a national High school, infant school, for educating about 560 pupils of both sexes: there is also a dispensary and a very handsome Union house, this being a "union" under the new Poor Law. The other public places are—three subscription libraries, assembly-rooms in the market-house, a theatre, and a public promenade at Vauxhall Gardens. A weekly newspaper is also published. The new municipal borough contains about 1,100 acres, 2,780 houses, and a pop. of 12,183. Since the passing of the Municipal Reform Act the town has been divided into 2 wards, and is governed by a mayor, 6 aldermen, and 18 councillors. It has returned 2 mem. to the H. of C. since the reign of Edward VI. Previously to the Reform Act the franchise was vested in the members of the corporation, and in the freemen who resided in and paid scot and lot in the bor. The number of houses charged with house-duty in 1833 was, of 10*l*. and under 20*l*, 310; of 20*l*. and under 40*l*, 161; of 40*l*. and upwards, 79: total annual value of houses, 36,184*l*. For electoral purposes it includes the whole parishes of Boston and Skirbeck, and the hamlet and ten allotment of Skirbeck quarter, extending in all over 7,923 acres. Registered electors, 1837-38, 749. It is a polling-place for the co. There were several guilds, both religious and civil, all of which have fallen into desuetude; the hall of that of the Blessed Virgin Mary, which was one of the most important, is used by the corporation for their municipal meetings. Petty sessions are held on Friday. A court leet for the borough sits annually: its principal duty is to present nuisances. A court of record, which decides pleas in all actions, real, mixed, and personal, sits on Wednesdays and Saturdays. A court of pie-poudre is held at each of the fairs; a court of the clerk of the market has jurisdiction similar to that in London; and a court of requests sits for the recovery of debts under 5*l*. The police consists of a chief and 11 petty constables, wearing a uniform similar to the London police. The gaol, though sufficiently spacious, is ill-arranged for classification; all the female prisoners, except debtors, being confined in the same ward.

The corporation has no concern in the management of the poor.

The assessments to which the inhabitants are liable, are—1. *Rate*; 2. *paying*; 3. *lighting and watching*; 4. *assessed taxes*; and, 5. *parochial taxes*. The following statement gives the amount of each for three years: the first includes fines on convictions:—

Years	Borough Rates.	Paving.	Lighting & Watching.	Assessed Taxes.	Parochial Taxes.	Total.
	<i>l.</i>	<i>l.</i>	<i>l.</i>	<i>l.</i>	<i>l.</i>	<i>l.</i>
1830	874	893	653	2,979	8,811	11,190
1831	1,354	889	892	2,953	8,451	11,449
1832	1,079	1,202	922	3,005	9,098	15,500

The parochial assessments increased from 4,127*l*., in

1825, to 8,579½, in 1833. The ann. val. of real prop. in the borough in 1815 was 30,403½, and in 1833, 40,774½. Its manufactures are mostly confined to sailcloth, canvass, and sackings; there are two iron and brass foundries, and three ship-yards, with patent slips, where vessels of 30 tons are built. Markets, well supplied with poultry and sea and river fish, are held on Wednesdays and Saturdays, in the new market-house, to which a corn-market is attached; fairs for cattle and sheep are on May 4. and 5.; for fat cattle, on Aug. 11.; for horses about Nov. 14. and 3 days after; and for horned cattle only on Dec. 11. Immense numbers of the finest cattle and sheep are sold at these fairs, the town being in the centre of one of the richest grazing districts in the kingdom. The banking establishments are — the National and Provincial Bank of England; a branch of the Stamford, Spalding, and Boston Bank; with two private banking houses. The principal drainages in the vicinity are those of the Holland fens made by a cut of 12 m. from the town to Dogdyke, near Tattersall, by which 22,000 acres were reclaimed; and the Wildmore fens, 41,000 acres, drained in a similar manner. Owing to the neglect of keeping the river clear, the trade fell off so as to be almost extinct. In 1721 vessels of 250 tons could discharge at the town; in 1751 sloops of 6 ft. draught could not come up, except at springs. The drainages, already mentioned, revived attention to the state of the river, and under special acts of parliament, have improved it so far that vessels of 120 tons come up to town, whence the navigation is continued to Lincoln by small steamers and barges. A sluice was also erected to retain the water above the town; but, owing to the scanty supply in the upper part, it can seldom be opened for scouring and deepening the river, as was intended. The navigation to Lincoln is extended by the Fosdyke Canal to the Trent, at Torksey, and thence, either by still water or river navigation, to Gainsborough, Nottingham, and Derby, thus opening a vent for the export of the manufactures of the midland counties. The foreign trade is chiefly confined to the importation from the Baltic of timber, hemp, tar, pitch, and iron. The coasting trade is chiefly in the export of oats, wool, and wood, of which large quantities are grown in the neighbourhood, the return cargoes consisting of coal and manufactured goods. There is a good custom-house, and a pilot establishment of a master and 12 pilots. Extensive powers are vested in the mayor and burgesses by two local acts for improving the port and harbour, under which they are empowered to collect tonnage, wharfage, and lading, from vessels that enter; the receipts to be applied to its improvement. They are also empowered to make bye-laws, to which all vessels are to be subject. The expenditure, under these acts, for 21 years, commencing 1812-13, was 88,450. The fund was involved in a considerable debt, now in process of liquidation, a considerable portion of which was contracted on account of the works, planned and carried on under the direction of the late Mr. Kennie, and his son, Sir John Kennie, chiefly consisting of a cut, commenced in 1824, about 1 m. long, and 3 m. from Boston. Its execution was extremely difficult, as it was carried through a shifting sand; but it has proved very beneficial both in deepening the harbour and draining the country. Another cut at the town, with a wall from the bridge to the quay, has since been executed on an effective plan, by the corporation. Part of the port dues are collected at Spalding and at Wainfleet, to each of which the jurisdiction of the corporation extends. The former, a river port, is situate on the Welland, which unites with the estuary of the Witham, at the Scalp. Its inhabitants complain of the heavy duties imposed on them, for no advantage but that of the beacons and buoys below the Scalp. The following table shows the state of the shipping trade during a period of 7 years.

(Dugdale's Hist. of Embanking and Draining; Noble's Gazetteer of Lincoln; Thompson's History of Boston; Britton's Beauties of Eng.; Municipal Rep.; Boundary Rep.; Seasonal Papers.)

Boston, a principal city of the United States, the principal place in New England, and the cap. of Massachusetts; on a small peninsula at the bottom of Mass-

achusetts Bay, connected with the mainland by a narrow isthmus, called Boston Neck, 210 m. N.E. New York; lat. 42° 21' N. long. 71° 5' W. Pop. in 1820, 43,298, in 1837, 80,325; but including the suburbs of Charlestown, on the N., and Dorchester on the S., with each of which Boston communicates by bridges, and that of E. Boston, on an island, with which an intercourse is kept up by steam ferry-boats, its pop. may be estimated at above 105,000.

The bay, which is very extensive, is studded with numerous small islands, which protect the harbour from the winds, and afford convenient situations for forts commanding the approaches to the city by water. The harbour is excellent, being of great size, with water sufficient to admit the largest ships, and so completely landlocked, that the vessels in it are almost as secure as if they were in dock. At the outer entrance to the bay is a lighthouse, 65 ft. high, with a revolving light. The bridges, some of which are of great length, connecting the city with its adjacent suburbs and the continent, are all of wood; but it is joined by a causeway of earth to Brooklyn, and the W. Avenue, as it is called, leading across the bay to Roxbury, is also of earth, but is partly only artificial, being fenced on each side by walls of stone. This avenue serves the double purpose of a bridge and a dam, and, with the addition of a cross dam of a similar construction, forms two large basins; one of which being filled with every flood, and the other emptied with every low tide, a perpetual current for the use of mills, &c. is established. The wharfs are very extensive: the Long Wharf is 1,650 ft. in length, by 200 ft. wide, and contains 76 large warehouses; the Central Wharf is 1,250 ft. long, by 150 ft. wide; and there are others nearly as extensive. The wharfs, as well as many other parts of the city, have been built on sites formed by raising ground originally covered by the tide. Most of the streets are narrow and crooked, but the houses, which are generally of brick, though many of them are of granite and slentir, are large and well-built. The principal public buildings are the state-house; co. court-house; the Faneuil hall, in which public meetings and public assemblies are held; the Massachusetts General Hospital; and the market-house. The state-house, a brick building, fronts the common, a fine park of 75 acres, and the principal public square in the city, of which it occupies the most elevated part, 100 ft. above the bay. The market-house is a handsome granite edifice, two stories high, 540 ft. in length, and 50 ft. wide; the court-house is also of granite, 176 ft. long, 57 ft. high, and 54 ft. wide, adorned with massive Doric porticos. A general hospital is a handsome granite building, surrounded by open grounds of four acres in extent. Tremont-house, the front of which is built of grey sienite, in the Doric order, and several of the bank buildings, are rendered deserving of notice by their architecture. There are above 50 churches, two theatres, an odeon, &c.; an eye and ear infirmary; with houses of industry, reformation and correction; a county gaol, &c. Boston, with the small town of Chelsea, constitutes the county of Suffolk, which is represented in the senate of the state by six senators. The city is divided into 12 wards; the municipal government is vested in a mayor, a aldermen, and a common council of 48 members, all of whom are chosen annually by the citizens. There is a police court of three justices, for the trial of minor offences, and the examination of criminal charges; as well as a municipal court, held by a single judge, with jurisdiction in all criminal causes not capital. The annual expenditure of the city amounts to about 300,000 dollars.

Boston is connected with the interior both by canals, railways, and river navigation; and she has a very extensive trade both with foreign countries and also with the S. states of the Union. She is wholly indebted to the latter, and principally to New York, Maryland, and Pennsylvania, for supplies of flour and wheat, and for large quantities of oats, rye, barley, and other grain; as well as for cotton, tobacco, rice, staves, coal, &c. Of these, the imports of flour amount, at an average, to about 400,000 barrels a year; all sorts of grain to about 2,000,000 bushels; cotton 90,000 bales; staves 3,000,000; coal 150,000 tons, &c. Her returns are made partly in native raw produce, as beef, pork, lard, &c.; partly in the produce of her manufacturing industry in which Massachusetts is decidedly superior to every other state in the Union; and partly in the produce of her fisheries and foreign trade. On an average, she sends annually to the S. states 45,000 barrels beef and pork; 170,000 barrels mackerel, herrings, and other fish; 20,000 cwt. dried and smoked fish; 3,500,000 pairs of boots and shoes; 600,000 bundles of paper; besides a very large amount of cotton and woollen manufactured goods, hardware, furniture, cordage, &c.; so as, in fact, to leave a large balance in her favour. Her exports to foreign states consist principally of the same articles she sends to the S. states; but she also re-exports a large amount of the foreign produce she had previously imported. Her imports from foreign countries consist principally of cotton, woollen, and

silk goods; hardware; sugar, tea, coffee, wines, and brandy, indigo and other dye stuffs, spices, &c. During the year ended 30th Sept. 1837, the value of the foreign produce imported into the state of Massachusetts amounted to 19,984,668 dollars; whereas the value of the exports of native produce, during the same year, only amounted to 4,871,501 dollars, and of native and foreign together, to 9,728,190 dollars. This balance, to a greater or less extent, always exists against Boston in her trade with foreign countries; and is met by bills drawn on New York, Baltimore, and other S. ports which are uniformly and largely indebted to Boston.

There belonged to Boston, on the 30th Sept. 1837, 201,065 tons shipping, being a larger amount than belonged to any other American port, excepting New York. Of this shipping, 53,296 tons were employed in the coasting trade; 15,047 tons in the mackerel fishery; and 4,300 tons in the cod fishery. During 1838 there entered the port 1,313 ships from foreign ports, of which 831 were American, and 461 British; the arrivals coastwise during the same year were 4,018. Of the foreign arrivals in 1838, 538 were from British America, 234 from Cuba, 111 from Great Britain, 68 from the N. of Europe, &c. There are an immense number of banking and insurance companies in the city; and business is transacted with facility and despatch.

Boston has always been favourably distinguished, by her attention to education and literature. The North American Review and other valuable works are published here. Harvard University is established about 3 m. from the city, which contains its medical department. It has also a Latin and a high school; numerous public grammar and writing schools, in which arithmetic, geography, and history are taught; many primary schools, and an African school; all of which are under the direction of a school committee, consisting of the mayor, aldermen, and 12 other members, elected annually. It had, in all, in 1837, 91 public schools, attended by an average number of 9,680 pupils, besides many private schools for children of both sexes. There is also an Athenaeum, with a library of 30,000 vols., a picture gallery, public hall for lectures, &c. The school for the instruction of the blind, founded in 1833, is said to be extremely well managed. The American Academy of Arts and Sciences, the Historical and Natural History societies, are amongst its learned associations: it has also a humane society, orphan asylums, and numerous other charitable establishments. Many daily, tri-weekly, weekly, monthly, and other periodical journals, are published.

Boston was founded in 1630, and so named from the town in England previously described, whence many of its inhabitants had emigrated. Throughout the whole period of its history, its inhab. have displayed great energy in asserting popular rights, and took the lead in opposing the taxation of the American colonies in the reign of George III.; in consequence of which, the port of Boston was closed, by an act of parliament, in 1774. A British garrison was also stationed in the city, but being besieged by the American army, in 1775-76, the British were at last obliged to evacuate it. Boston is the birthplace of Dr. Benj. Franklin, who was born here on the 6th of January, 1706. (*Murray's Encycl. of Geog. American ed.* iii. 478, 479; *Official Papers, published by Congress*, &c.)

BOSWORTH (MARKET), a par. and town of England, co. Leicester, hund. Sparkenhoe. Area of par. 8,040 acres. Pop. of par. 1821, 2,677; 1831, 2,530; of the town only, 1,049. This neat little town is on an eminence, in the centre of a fertile district, 95 m. N.W. by N. London. It has a well endowed grammar-school, in which Dr. Johnson was once an usher, but by his property, above 700*l.* a year, has been the subject of a long chancery suit. It has 3 fellowships and 4 scholarships in Emanuel, Cambr. There are 2 cattle fairs held annually, May 8. and July 10. The Ashby Canal passes within a mile, and conveys coals, &c. The knitting of worsted stockings employs many persons in the town and neighbourhood. It is the central town of a poor law union of 28 parishes; has 2 guardians, and its average annual poor-rates are 75*s.*

The decisive battle between Richard III. and the Earl of Richmond, afterwards Henry VII., in which the former lost his crown and his life, and which terminated the long-continued struggle between the houses of York and Lancaster, takes its name from this town, in the vicinity of which it took place, on the 22d of August 1485. In the battle-field is a well, named from Richard III., with an inscription by the late Dr. Parr; and an elevation, called Crown Hill, where Lord Stanley is said to have placed Richard's crown on the Earl of Richmond's head. (*Nichol's Leicestersh.*; *Hutton's Dorset Field*.)

BOSZRA, a town of Syria, formerly the cap. of the Auranites; 50 m. S. Damascus, 80 m. N.E. Jerusalem; lat. 32° 40' N., long. 36° 20' E. Though now almost deserted, the ruins are extensive and magnificent: the principal of these, or at least the most sacred, in Mohammedan estimation, is the Detr-Bohaira (House of Bohaira), so called from being consecrated to a monk of

that name, who is said to have proclaimed the sacred character of Mohammed, when the prophet, in his 13th year, visited Syria with his uncle. The great mosque, a very ancient temple, a triumphal arch, a castle of great strength, remnants of the city walls, and a reservoir 500 ft. long, 300 wide, and 20 deep, are among the remains of ancient grandeur; in addition to which the whole town and its environs are covered with pillars and other ruins of the finest workmanship. *Bosra* is very ancient: it is mentioned in the Sacred Writings as one of the cities which the half tribe of Manassah, beyond Jordan, gave to the Levites (*Josh. xxi. 27.*). At this time, and for ages subsequently, it was celebrated for its vineyards, which are commemorated on the Greek medals of *Kalasia Bosterea*, but of these no vestige now remains. After the establishment of Christianity, it was an archbishop's see, with 19 bishoprics under its jurisdiction. Its strong castle was built by the Saracens, between whom and the Latin kings of Jerusalem it several times changed masters, and under Baldwin IV., A.D. 1180, it was entirely ruined and depopulated. (*Abul-Fida, Fit. Mah. c. 4.*; *Tah. Syr. pp. 51. 99.*; *Arichionius, Ter. Sanc. 79, 80.*; *Burchard, Trav. Syr. pp. 224-236.*)

BOTANY BAY. See AUSTRALIA and NEW SOUTH WALES.

BOTHNIA (GULPH OF), the N. arm of the Baltic, which see.

BOTHWELL, a par. and village of Scotland, county Lanark, on the N. side of the Clyde. The village lies on the road from Glasgow to Hamilton, 8 m. E. of the former, and 3 N.W. of the latter. About 1 m. further on towards the S.E., the road to Hamilton is carried over the Clyde by Bothwell-bridge, the scene of one of the most memorable events in Scottish history. The covenanters, to the number of 4,000 or 5,000, having taken possession of the bridge, the much more numerous army present, were attacked, on the 22d of June 1679, the bridge forced, and their army totally routed by the royal forces, under the Duke of Monmouth. (*Lang's Scotland*, iv. 101.) Near the village is the magnificent ruin of Bothwell Castle, once an important Scottish fortress. The par. is well wooded and well cultivated.

BOTZEN, or **BOLZANO** (an. *Pons Drusi*), a town of the Austrian states, Tyrol, cap. circ. in a pleasant, well-sheltered valley, at the confluence of the Eisach and Taffer, a little above where their united waters fall into the Adige, 30 m. N.N.E. Trent. Pop. 9,000. It is a thriving, well-built town, in the Italian style; has a castle, several convents, a college, and some manufactures of silk stockings, &c. A strong dyke of masonry, nearly 2 m. in length, and in parts 24 ft. thick, has been constructed to defend the town from the irruptions of a neighbouring mountain torrent. Being intersected by high roads leading to Switzerland, Austria, and Italy, Botzen has an extensive transit trade. It is also celebrated for its fairs, commencing the 18th March, 14th June, 9th September, and 30th November, continuing each 14 days, which are attended by a great concourse of French, Germans, and Italians. "Though still in Germany, the approach to Italy has become perceptible, in the falling off of cleanliness, the use of the Italian language, which now begins to be spoken, the southern vegetation, and the change of the climate." (*Murray*.) The country round produces excellent wine, and fruits in abundance. Botzen is supposed to occupy the site of the ancient Roman citadel, *Pons Drusi*.

BOUCHAIN, a fortified town of France, dép. du Nord, cap. cant., on the Scheldt, by which it is intersected, 12 m. S.E. Douai. Pop. 1,148. The fortifications are of very considerable strength, and the adjacent country may be laid under water. The Duke of Marlborough took it in 1711, after a memorable siege, but, being retaken by Marshal Villars in the following year, it was finally ceded to France at the treaty of Utrecht. It was one of the frontier fortresses occupied by the allies after the peace of 1815.

BOUCHES-DU-RHONE, a marit. dep. S. of France, situated, as its name implies, at the mouths of the Rhone. It is bounded E. by the dep. of the Var; N. and W. by the Durance, Rhone, and the W. arm of the latter, which separate it from the depts. of Vaucluse and Gard; and S. by the Mediterranean. Area, 819,991 hectares. Pop. 362,325. Soil and surface very various, but the former is generally inferior. The last offsets from the maritime Alps occupy the E. parts of the dep.; but they are not remarkable either for their height or appearance. The highest summit, that of St. Victoire, is 1,042 mètres (3,420 ft.) above the sea. The plain of Le Crau and the Isle of Camargue, occupy a large portion of the surface. The first is of great extent, stretching from Arles to the lagoon of Berre. It has very little vegetable mould, and is formed principally of flints and other small stones; during winter it furnishes pasture to large flocks of sheep and goats; the former being driven in summer, when it is arid and waste, to the mountains. It is supposed by many that this plain was formerly a gulph of the sea, and various circumstances conspire to strengthen the sup-

position. The island of Camargue is the delta or alluvial land lying between the E. and W. arms of the Rhone, and is partly cultivated and in pasture, and partly occupied by marshes and lagoons. The latter, indeed, make one of the principal features of the dep. The principal are the lagoon of Vulcaris in the island of Camargue, and that of Berre or Marthe, 12 m. N.W. Marseilles. They and the contiguous marshes occupy a great extent of land, and in summer are very unhealthy. Principal rivers, Rhone and Durance; the latter rushes along with great violence, frequently overflowing its banks, and causing great damage. There are also some smaller rivers, and the department is intersected by several canals. Climate generally hot and dry, and the country in summer has a barren, parched appearance. Agriculture bad, a consequence ascribable, partly to the minute division of property, and the attachment of the little proprietors to routine practices; but more, perhaps, to the unfavourable nature of the soil and climate. In the mountainous parts in the E. and N.E. there is a good deal of spade husbandry; in the S. and N.W., mules are employed in field labour, and horses in the W. and the island of Camargue. The produce of corn is insufficient for the consumption; but the produce of wine is estimated at about 820,000 hectolitres, leaving a large surplus for exportation. The produce of silk in 1835 was estimated at about 330,000 kilog. Olives are largely cultivated; and the gathering of kermes continues to be a good deal attended to. The dried fruits of the dep. are much esteemed. Horses and cattle are few in number, and not of good quality. The great wealth of the dep. consists in its sheep, of which it possesses about 800,000. From 400,000 to 500,000 of these sheep are annually driven, about the beginning of spring, to the mountains of the Drome, the Berre, and the high and low Alps, where they are depastured during the summer. When the period for setting out arrives, several proprietors join their flocks together, to the number sometimes of 25,000! Previously to the Revolution, the migratory flocks enjoyed privileges somewhat similar to those of the *Mesta* in Spain, but they were then abolished. The lagoons are resorted to in winter by myriads of aquatic fowl; which, when the frost sets in, are taken in vast numbers. Minerals, of little importance. There are brine springs, and salt is made in several places. This is more of a commercial than of a manufacturing dep. With the exception, indeed, of factories of soap and *sauces*, *factice*, hosiery, sugar refineries, some establishments for the manufacture of cutlery, coral-works, oil-mills, and silk filatures, and with distilleries, tanneries, &c., manufactures are of little importance. The commerce of the dep. is, however, very extensive, Marseilles having been for several years past at the head of the commercial cities of France. (See Marseilles.) The herring and anchovy fisheries are extensively carried on. Principal towns, Marseilles, Arles, Aix, Tarascon, Aubagne, &c. Public revenue in 1831, 39,262,854 fr., of which the customs produced 25,813,000 fr. The dep. sends 6 mem. to the Chamber of Deputies, is divided into 3 arrondis., and has above 2,500 electors. (*French Official Tables*; *Hugo, France Pittoresque*, art. *Bouches-du-Rhone*; *Dict. Géographique*, &c.)

BOUIN, an island on the coast of France, between the depts. of Loire Inférieure and La Vendée, belonging to the latter, from which it is separated by a narrow channel. It is of a triangular shape, low and marshy. Area, 3 sq. leagues. Pop. 2,700. It produces corn and cattle, but especially salt, obtained in large quantities from the salt marshes that surround the village of Bouin, in the centre of the island. According to some historians, it was here, in 820, that the Normans made their first descent on the coast of France. (*Hugo*, art. *Vendée*; *Dict. Géographique*, &c.)

BOULOGNE, or, as it is sometimes called, BOULOGNE-SUR-MER, a sea-port town of France, ddp. Pas du Calais, cap. arrond., on the Liane, near where it falls into the English Channel, 20 m. S.S.W. Calais; lat. 50° 43' 31" N., long. 1° 36' 59" E. Pop. 25,732. It is divided into the upper and lower towns. The former is pretty well built, but is irregularly laid out. It has two squares, ornamented with fountains, and contains the cathedral, the ancient episcopal palace, the Hôtel de Ville, and the courts of justice. It also contains the house where Le Sage, the immortal author of *Gil Blas*, lived and died. The fortifications, by which the upper town was formerly defended, have been mostly demolished, the old castle and the walls only remaining. The ramparts have been planted with trees, and afford a delightful promenade, commanding a view that extends to the coasts of England, which are distinctly visible. The lower, or new town, is situated at the bottom of the hill, and is intersected by the Liane: it is the most populous, most commercial, and best built. It is regularly laid out, and has several public buildings, among which may be specified the baths, the general hospital, founded in 1692, the barracks, a public library containing 22,000 volumes, a theatre, &c. A magnificent column, dedicated

by the grand army collected here in 1805 to Napoleon, but not finished till 1821, stands on a hill nearly a mile from the town: it is crowned by a gallery surmounted by a dome, and is 164 ft. high. The harbour, which was formerly dry at low water, and nearly shut up by the bar at the river's mouth, has been vastly improved, though it still labours under a deficiency of water. It is formed of two large basins, connected by a quay. Ships may anchor at from 4 to 1 m. off the harbour. In from 6 to 9 fathoms. Boulogne is the seat of tribunals of primary jurisdiction and commerce, and has societies of agriculture, commerce, arts, and sciences; a museum of antiquities and natural history; a free school for navigation, &c.; with manufactures of coarse woollen stuffs, sailcloth, earthenware, and bottle-glass; and tanneries, rope-works, tile-works, &c. A good deal of trade is carried on from the town, and the herring, mackerel, and cod fisheries, all vigorously prosecuted. Notwithstanding the large quantities of fish that are constantly being sent to Paris, the supply in the town is always abundant and cheap.

Boulogne has been much resorted to since the peace by English visitors and families, and many of the latter have made it a permanent residence. A constant communication is kept up with London, Brighton, and Dover, by means of steam-packets; and the route from London to Paris by Boulogne is now frequently preferred to that by Calais. In consequence of this influx of English visitors and residents, the population of the town has nearly doubled since 1815, and it has now much of the appearance of an English town. Numerous boarding-schools have been opened, and balls, horse-races, &c., have been established for the instruction and amusement of the English. In 1837, 25,542 passengers entered, and 30,217 left, Boulogne.

Boulogne is a place of great antiquity. During the dominion of the Romans it bore successively the names of *Gesoriacum Navale*, and *Bononia*, whence its modern name is derived. During the middle ages, and in more modern times, it has undergone many vicissitudes, having been frequently besieged and taken. In the early part of this century it rose into great celebrity, from Napoleon having collected a large flotilla in its port, and made it the head-quarters of the army avowedly intended to invade England. (*Hugo*, art. *Pas du Calais*; *Prior, Ingénieur*, &c.)

BOULON, a vil. of France, dep. Seine, between the Seine and the wood of Boulogne, 4 m. W. Paris. Pop. 6,016. The vil. is handsome; the adjoining wood is, in the fine season, the favourite promenade of the Parisian fashionables. The *Château de Madrid*, in this wood, built by Francis I., was demolished in the reign of Louis XVI.; and only a small part now remains of the *Château de la Muette*, some time occupied by Louis XV.

BOURBON (ISLE OF), an island belonging to France, in the Indian Ocean, between lat. 20° 50', and 21° 24' S., being 90 m. W.-S.W. the island of Mauritius, and 440 m. E. Madagascar. Shape oval, greatest length, N.W. to S.E., 40 m.; greatest breadth, 27 m.; area near 900 sq. m. (231,650 hectares). Pop. (1836) 106,099. It is geologically formed by two systems of volcanic mountains, one at either extremity: the central point of the most northerly system, the *Piton des Neiges*, the highest summit in the island, is 3,150 metres, or 10,355 ft. above the level of the sea; the highest point of the southerly system is the *Piton de Fournais*, an active volcano, 7,218 ft. in height. These two volcanic centres are connected by a chain of mountains running N. and S., which divides the island into two parts, that on the E. side being called the windward, and that on the W. the leeward division (*Parities du Vent and sous le Vent*), in consequence of the prevailing winds in Bourbon being from E. to S. There are no plains of any size: although the island is watered by many small rivers, none of which are navigable: there are several lakes, one occupying an extent of about 40 acres. The shores are not generally high; but the island has no safe roads, nor any harbour, — circumstances which have always been felt as serious drawbacks. The climate is healthy and agreeable, especially that of the E. part: the air is pure, and the sky clear, though this tranquillity is sometimes broken by violent hurricanes. From Dec. to May is the hot and muggy season, when the mean temperature is 80° Fahr.; during the remaining or temperate months, the mean is 76° Fahr. The soil is very fertile, particularly in the vicinity of the shores, where there are extensive alluvial deposits, which, like the soils in other parts of the island, consist largely of volcanic matters. The surface, in 1836, was supposed to be distributed as follows: — cultivated lands, 65,702 hectares; pasturage, 14,040 ditto; woods and forests, 55,921 ditto; waste lands, 95,887 ditto. — Total, 231,650 ditto.

The cultivated lands form a girdle round the island, and in some parts ascend the mountain slopes to considerably more than 3,000 ft. above the level of the ocean: in 1836, they were estimated to be divided as follows: —

Articles of Culture.	Hectares in Culture.	Product.
Sugar-cane	14,530	Raw sugar 25,384,116 kilog. Molasses, &c. 1,658,840 Mann 153,812 litres. Coffee 928,200 kilog. Cloves 193,500 Cacao 103,000 Tobacco 82,000 Grain (value) 2,656,917 fr.
Coffee	4,179	
Cloves	2,980	
Cacao	28	
Tobacco	471	
Grain, &c.	45,514	
Total	65,702 hect.	

The sugar-cane is mostly of the Batavian variety; it was not very extensively cultivated before 1818; but is now largely grown, especially in the E. division of the island, where it has almost entirely superseded coffee. The coffee-plant was introduced from Mocha in 1717, and was subsequently much cultivated; but having been found to suffer severely from hurricanes and insects, its culture has been in great part discontinued: the best coffee is produced on the leeward side of the island. The cloves are chiefly sent to India, where they are exchanged for rice: the tobacco obtained is not enough for home consumption, and the wheat, rice, maize, and other grain raised in the island, does not exceed 4th part of the required supply. Potatoes, beans, and other leguminous plants, a great variety of fruits, &c., succeed remarkably well. The culture of cotton has been all but abandoned: manioc, introduced into the island by the celebrated M. de la Bourdonnais, forms the staple food of the blacks. In 1837, there were 32,240 hogs, 6,500 deer and goats, 5,370 horses; and mules, sheep, and oxen, nearly 5,000 each. Pasturage being deficient, oxen are imported from Madagascar; a great number of the cattle are fed for six months of the year upon the leaves of the sugar-cane. At the period at which Bourbon was first occupied by the French, the sides of the mountains were covered with forests, which reached even to the shores; the whole of the lower lands have been cleared, but the centre of the island is still covered with its primitive vegetation, which affords forty-one different species of woods serviceable for arts and manufactures. The coasts abound with fish and large turtles, and furnish also coral and ambergris. The fisheries occupy about 460 individuals, who take about 150,000 kilog. of fish annually. 2-5ths of which are consumed by themselves and their families, and the other 3-4ths sold in the island realising about 300,000 francs a year. The pop. in 1836 consisted of 36,803 free colonists, and 69,206 slaves, of whom 57,346 were employed in agricultural labour. The colonists are, in general, humane and kind to their slaves, who are mostly blacks, with only a few individuals of mixed blood. In 1829, about 3,000 Hindoo emigrants from Orissa came thither to settle; but the majority of them have returned to their native country. The island is divided into two arrondissements, six cantons, and thirteen communes; and contains two towns, those of St. Denis and St. Paul, and eight market-towns, heads of cantons, most of which are built on the coast. The chief manufacturing establishments are brick and lime-kilns, tanneries, forges and foundries, tin-ware factories, a brewery, and manufactories of bags of palm-leaf (*sacs de vannerie*). The annual value of the products of these establishments is estimated at 41,170*l*. Most other European trades are pursued in the towns, the whole occupying about 200 masters, and 2,160 workmen. The following is a statement of the quantities and value of the principal articles of export in 1836:—

Exports.	Quantities.	Value.
Sugar, Raw	18,175,092 kilog.	12,721,164 fr.
Coffee	990,015	1,386,018
Cloves	566,650	1,401,575
Dye Woods	105,303	21,061
Woods for Cabinet	112,811	39,498
Work		
Salt-petre	79,879	43,933

The chief imports are rice, wheat, oil, wines, cattle, timber, salt, glass, porcelain, &c., with cottons and other manufactured goods. The total value of the imports in 1836 was 13,769,541 fr. (560,780*l*.); and that of articles exported of the growth and produce of the island, 16,743,899 fr. (670,000*l*. nearly). The government is administered by a governor and a council of 30 members, elected by the domiciliated French colonists paying a direct contribution of 200 fr. annually, of whom, in 1837, there were 1,145, composing 8 electoral colleges. There is a royal court, with 2 courts of assize, 2 tribunals of primary jurisdiction, and a justice of the peace in each canton. The military force, in 1837, consisted of 6,593 individuals, 378 of whom were officers. In the same year, the budget of the colony gave, as follows, the

BOURBON-VENDE'E.

Expenses in 1837	-	-	2,932,428 fr. = 117,257 <i>l</i> .
Receipts ditto	-	-	2,149,563 fr. = 85,982 <i>l</i> .
Deficit	-	-	782,865 fr. = 31,215 <i>l</i> .

Bourbon contains a college and numerous schools, 16 churches, 2 hospitals, 2 establishments for the relief of the poor, and 2 prisons. Four newspapers are published in it, and there is a public library at St. Denis. This island was discovered in 1545 by Mascarenhas, a Portuguese navigator, whose name it bore, till the French took possession of it in the next century. The English took it in 1810; but it was restored to France in 1815. The principal towns are St. Denis, St. Paul, St. Denis, &c. St. Denis, the cap., is situated on a plateau on the N. coast of the island, at the mouth of the river of the same name; lat. 20° 51' 30" S., long. 55° 30' E. It has about 900 houses, and 12,000 inhab. (*Hugo*, iii. 278.) It is mostly of wood, the *Hôtel du Gouvernement* being the only public building of any importance. It is the seat of a royal court, and of a court of primary jurisdiction, and has a college with about 160 pupils, an hospital, an arsenal, a celebrated botanical garden, &c. St. Paul, the second town in the island, on its W. coast, has 10,000 inhab. with a fine church, a tribunal, an original jurisdiction, an hospital, &c. Neither St. Denis nor St. Paul have harbours, but only open and exposed roadsteads. (*Notices Statistiques sur Les Colonies Françaises*, &c. p. 1—140.; *Etats du Population des Colonies Françaises*, &c. 1838.)

BOURBON-LANCY, a town of France, dép. Saône et Loire, cap. cant., on the declivity of a hill near the Loire, 27 m. W.N.W. Charolles. Pop. 2,814. It is commanded by an old castle on the summit of a steep rock. This town is celebrated for its mineral springs, of which there are 7 (some say 9), 6 cold and 1 hot. They are employed in nervous affections and rheumatisms. These springs were known to the Romans by the name of *Aqua Nascut*; and remains of the baths they had erected are said still to exist, while numerous Roman medals and an entire and beautiful statue have been dug up. The present baths were begun by Hen. III. and finished by Hen. IV. and Louis XIII. (*Hugo*, art. *Saône et Loire*.)

BOURBON-L'ARCHAMBAUD, a town of France, dép. Allier, cap. cant., 13 m. W. Moulins. Pop. 3,017. It is situated at the bottom of a valley, in a rich and finely variegated country. The towers are all that now remain of the Château de Bourbon, rebuilt in the 13th century. The Holy Chapel, erected in the 15th century, by Anne of France, and so much admired, was destroyed at the Revolution. The town is now celebrated only for its mineral springs and baths, said to be of great efficacy in cases of paralysis, rheumatism, gun-shot wounds, &c. They are frequented from May to September. There is good accommodation for visitors, and a hospital for the indigent.

This town had for a lengthened period lords of its own, who bore the title of barons. Aimar, who lived in 921, in the reign of Charles the Simple, is the first of these barons of whom there is any authentic account. Having been succeeded by his son Archambaud, his name became that of all his successors in the seignory. Archambaud IX., the last of the name, having accompanied St. Louis to the East, died in Cyprus. Batrix de Buginidy, his grand-daughter, married Robert of France Comte of Clermont, one of the sons of St. Louis, bringing to him in dowry the lordships of Bourbon, Charolais, and St. Just, in Champagne. Their posterity, according to the custom of the house, took the surname of Bourbon; and now fills the thrones of France, Spain, Naples, and Lucera! (*Dict. Géographique*.)

BOURBONNE-LES-BAINS, a town of France, dép. Haute-Marne, cap. cant., at the confluence of the Borne and the Aube, 21 m. E.N.E. Langres. Pop. 3,551. It is agreeably situated on the plateau and acclivity of a hill; and having been nearly burnt down in 1717, has been rebuilt on a regular plan, and has some fine promenades and fountains. It owes its entire celebrity to its hot baths, which occupy the site of a thermal establishment of the Romans. The modern buildings connected with the baths, including the Hôtel de Ville, a recent erection, most part of which is appropriated to the use of the company using the waters, are the finest of the kind in France. An hospital, founded here in 1732, for the use of the military attending the baths, has been much enlarged, particularly since 1815, and is now capable of accommodating 500 soldiers and 100 officers. The heat of the water varies from 40° to 52° Reaumur, or from about 120° to 150° Fahrenheit. They are principally employed in cases of paralysis and rheumatism, spasms, ill-reduced fractures, &c. (*Hugo*, art. *Haute Marne*.)

BOURBON-VENDE'E, a town of France, dép. Vendée, of which it is the capital, on the right bank of the Yeu, nearly in the centre of the dép.; lat. 46° 44' N., long. 10° 22' W. Pop. 5,257. This town occupies the site of Roche-sur-Yeu, a strong feudal castle, having

near it a miserable little town. The castle, after undergoing many vicissitudes, was dismantled by Louis XIII., and finally destroyed in 1753. After the establishment of the imperial government, and the pacification of Vendée, it became necessary to select a place for its capital, and Roche-sur-Yon was fixed upon. Napoleon gave the town, which had to be entirely created, his own name, which it bore till 1815. Large sums were expended in the construction of a prefecture and other public offices, an elegant parish church, &c. The most imposing, however, of the public buildings, is the barracks; a large and noble structure, occupying the hill on which the old castle formerly stood. Streets broad, and well laid out; but though the population has increased rapidly within the last half-dozen years, still many of the streets are merely laid out, and exist only by name. The old town, which is small and *assez tracé*, occupies the ravine between the barracks and the new town. The town has a tribunal of primary jurisdiction, a departmental college, a society of agriculture, sciences, and arts, a public library with 5,000 volumes, an hospital, and a theatre "*fort laid et fort petit*." (Hugo, art. *France*, &c.)

BOURBOURG, a town of France, dép. du Nord, cap. cant., on the canal of Cologne, communicating with Dunkirk, 9 m. S.W. Dunkirk. Pop. 2,537. Its name is derived from the many nature of the soil (bourbeux) on which it is built. It has fabrics of tobacco, potteries, and tile-works. Previously to the revolution there was here an abbey for noble ladies, of which the unfortunate Marie Antoinette was patroness.

BOURG, or **BOURG-EN-BRESSE**, a town of France, dép. Ain, of which it is the cap., on the Keyssone, 21 m. F.S.E. Mâcon; lat. 46° 12' 31" N., long. 5° 14' 10" E. Pop. (ex cant.) 8,818. Situation pleasant; streets narrow and crooked; formerly almost all the houses were built of wood, and many of them are so still, but within the last half-century the use of stone has become more general. It is traversed by the little rivulet Cône, and has several fine fountains. The ditches by which it was surrounded, were dried in 1771, and have been converted into gardens. Principal public buildings—the cathedral or high church, the *halle-au-bé* or grenette, theatre, Hôtel de Ville, prefecture, a monument in honour of Gen. Joubert, &c. It has a court of primary jurisdiction, a departmental college, a primary normal school, a public library with 18,000 volumes, a society of emulation and agriculture, a departmental museum, a botanical garden, and several gratuitous courses of instruction in different departments of science and art. Six high roads meet here; but being situated in an agricultural district, it is not distinguished either for trade or manufactures. The celebrated astronomer Lalande was a native of Bourg.

Adjoining Bourg is the church of Brou, a vast edifice, begun in 1511, and containing some fine tombs. There is attached to it a diocesan seminary, with 140 scholars.

Bourg is very ancient, being supposed by Dr. Thou to occupy the site of the *Forum Segusanorum* of the Romans; but according to l'Avauille, Fours on the Loire is identical with the *Forum Segusanorum*. After being long subject to the house of Savoy, Bourg was united to France in 1601. (Hugo, art. *Ain*; *Dict. Géographique*, &c.)

BURG, a town of France, dép. Gironde, cap. cant., on the Dordogne, near its confluence with the Garonne, 15 m. N. Bordeaux. Pop. 2,466. It has a small port, where the corn, wine, and other products of the environs, are shipped.

BOURGANEUF, a town of France, dép. Creuse, cap. arrond., agreeably situated on the Thorion, 18 m. S.S.W. Gueret. Pop. 2,940. It has two porcelain-works, and a paper manufactory. This town was, for a considerable period, the residence of Zizim, or Zizem, the younger brother of Bayazid II., emperor of the Turks, who was confined in it and other places in France, in consequence of a dishonourable treaty negotiated in 1482 between Bayazid and Pierre d'Aubusson, grand master of the Knights of St. John, lord of Bourgaenuef, who had given Zizim a safe conduct. A large tower, in which the latter is said to have been confined, still exists. Having been liberated from his imprisonment in this place, the unfortunate prince was carried to Italy in 1487, where he is said to have been poisoned in 1495, by an agent of his brother and the infamous Pope Alexander VI. (*Malte-Brun*; *Biographie Universelle*, art. *Zizim*.)

BOURGAS, or **BOURGHIAN**, a sea-port town of Turkey in Europe, Roumelia, on the Black Sea, at the bottom of the gulph of the same name, 70 m. N.E. Adrianople; lat. 42° 29' 30" N., long. 27° 25' E. Pop. 6,000. It is built on a promontory of a moderate height, and has a neat clean appearance. Its fortress is in ruins. It has a celebrated manufactory of pottery. "A fine clay is found in the neighbourhood, which is formed into pipe bowls, cups, and other utensils. These are unglazed, but highly polished, and ornamented with

gilding. In this state they are exposed for sale in the shops of the bazar, which forms the principal street of the town; and as these shops are metted, and kept clean and neat, the whole has a rich and showy appearance. They pride themselves on this little manufacture, and sell it proportionally dear." (*Walsh's Journey*, p. 120., 4th ed.) The town has also some trade in corn, wine, butter, cheese, iron, and other productions of the contiguous country. The Gulph of Bourgas is open to the E.: the anchorage is to the S. of the town, and has a depth of from 12 to 5 fathoms.

BOURG-DE-PEAGE, a town of France, dep. Drôme, cap. cant., on the Isère, 10 m. N.E. Valence. Pop. 3,602. The river separates it from Romans, of which it is properly a suburb. It is neat and well built; and has manufactures of hats and coarse silk, with dyeworks, rope-works, tanneries, &c. (*See ROMANS*.)

BOURG-D'OYSSANS, a town of France, dep. Isère, cap. cant., on the Rive, near where it falls into the Romanche, in a deep valley at the bottom of a steep hill, 18 m. S.E. Grenoble. Pop. 3,019. It principally consists of two long streets, with ill-built houses, many of which have their windows fitted up with oiled paper instead of glass. The valley in which the town is situated seems to be on all sides enclosed by mountains, and was for a while completely submerged and formed into a deep extensive lake. This inundation was occasioned by the course of the Romanche having been obstructed, in the 11th century, at the point where it escapes from the valley, by rubbish brought down from the adjoining mountains. This natural mound, having been gradually undermined, at length gave way, and the waters of the lake made their escape on the 15th Sept. 1219, sweeping all before them as far as Grenoble, which was laid under water. (Hugo, art. *Isère*.)

BOURGES (an. *Avaricum*), a city of France, dép. Cher, of which it is the rap., in an extensive plain at the confluence of the Auron and the Evre, 124 m. S. Paris; lat. 47° 4' 58" N., long. 2° 23' 40" E. Pop. (ex cant.) 19,646. It is agreeably situated on the declivity of a hill, and is surrounded by a thick wall flanked at regular distances with lofty towers in good preservation. (*Malte-Brun*.) Streets sufficiently broad*, but dirty; houses mean-looking, being low and having their gables to the streets. Large tracts, occupied by gardens, nurseries, promenades, &c., are enclosed within the walls, so that the streets have a deserted aspect, though less so at present than formerly, the population having increased rapidly during the last 10 years. Bourges contains some fine old public buildings. At the head of these is the cathedral, one of the noblest Gothic edifices in France, begun in 145, but not finished for some centuries after wards. It is 348 ft. in length by 123 in breadth, and has several towers, the highest of which has an elevation of 221 ft. The palace of the archbishop is also a fine edifice; its garden, laid out by Lenotre, has an obelisk in honour of the Duc de Charost. The Hôtel de Ville, built by Jacques Coeur, famous alike for his skill and success as a merchant and financier, his immense wealth, and the injustice of which he was the victim, is a splendid Gothic mansion, that cost a vast sum. Besides the mayoralty, it furnishes accommodation for the courts of law. The prisons are built on the ruins of the ancient palace of the ducs de Berry; and the remains of the old tower that formerly commanded the town, and which was demolished in 1651, serve to enclose the courts of the prison. There are also the Hôtel de Prefecture, formerly the Hôtel de l'Intendance, barracks, a small but elegant theatre, a college, two large hospitals, a public library with 13,000 volumes &c. Bourges is the seat of an archbishopric, of tribunals of primary jurisdiction and commerce, of a royal college with about 240 pupils, a primary normal school, a diocesan seminary with above 100 pupils, and a secondary ecclesiastical school; it has also a society of agriculture, commerce, and arts; a course of geometry and mechanics applied to the arts, and a school of midwifery. It has manufactures of fine and coarse cloths, hosiery, &c., and its culture has been long in high estimation. There are in the town two mineral springs.

Bourges was formerly the seat of a celebrated university established by Louis XI. in 1463; but this having been suppressed at the Revolution, its place has been supplied by the royal college already alluded to. Louis XI. was born in this town; and it is also the birth-place of the celebrated preacher Bourdaloue, Jacques Coeur, and other distinguished persons. The house occupied by the famous jurist Cujas has been purchased by the city authorities for a barrack for *gens d'armes*.

To mark his respect for his native place, Louis XI. not only gave it a university, but also conferred on its mayors and magistrates the privilege of nobility. This, however, was any thing but an advantage, inasmuch as it served only to fill the town with poor gentlemen, and to discourage manufactures and commerce. The clergy were also exceedingly numerous. But most of the

* This is the statement of Hugo. Malte-Brun says they are narrow.

religious establishments were suppressed at the revolution, when the privileges and distinctions of the nobility and gentry were also abolished.

Bourges is one of the most ancient cities of France. It was taken by Cæsar, anno 52 B.C., and was for 475 years the capital of Aquitaine. It has suffered much at different periods from war, fire, and pestilence. Several councils have been held in it; and here, in 1483, the ecclesiastical constitution, denominated the Pragmatic Sanction, was accepted by the French clergy. (*Martinière, Grand Dictionnaire Géographique; Malic-Brun; Hugo, art. Cher; Dict. Géographique, &c.*)

BOURGNEUF, a sea-port town of France, dép. Loire Inférieure, cap. cant., 23 m. S.W. Nantes. Pop. 2,689. The port dries at low water: and the bay, which is extensive, is gradually filling up with sand. To such an extent is this the case, that above 500 hectares of land are now under cultivation in the single commune of Bourgneuf; that 25 years ago, were under water; and the channel between the town and the opposite island of Bouin, formerly 2,700 yards across, is now narrowed to less than 100 yards! There were formerly in the vicinity very extensive salt marshes, the produce of which was largely exported; but these, though still very considerable, are now materially diminished. There are on the coast large beds of oysters. (*Hugo, art. Loire Inférieure.*)

BOURGOIN (an. *Bergusium*), a town of France, dép. Isère, cap. cant., on the Bourbre, in a fine situation, surrounded by beautiful hills, 9 m. W. La Tour-en-Pin. Pop. 4,326. It is neat and well built; has a tribunal of original jurisdiction, and manufactures of calicoes, bagging, &c., with paper-mills and flour-mills. It is favourably situated for commerce, being traversed by the roads from Grenoble to Lyons, and from the latter to Chambéry.

BOURG-ST.-ÂNDEOL, a town of France, dép. Ardèche, in an agreeable situation on the Rhone, 9 m. S. Viviers. Pop. 4,290. It has several good buildings, and neat well-kept streets; a quay along the river, and a handsome suspension bridge over it, with some trade in corn, wine, and silk. It is named from St. Andeol, who suffered martyrdom in the Vivarais, in the beginning of the 3d century. Within a short distance of the town is a remarkable monument of antiquity, sculptured on the face of a rock, but now a good deal decayed. It has been very variously interpreted; some antiquaries having supposed it to be Diana in chase of a stag, and others that it represents a sacrifice in honour of the god Mithras. The latter is believed to be the correct explanation. (*Hugo, art. Isère; Mullin, Voyage dans le Midi de la France.*)

BOURGUEIL, a town of France, dép. Indre-et-Loire, cap. cant., in a fine valley on the Poingt, 9 m. N.W. Chinon. Pop. 3,600. It has a communal college, and is surrounded by fruitful gardens, where quince, coriander, liquorice, and other plants, are cultivated to such an extent as to supply materials for a pretty extensive trade. Its vicinity also produces fine red wine. (*Hugo, art. Indre-et-Loire.*)

BOUILLOS, or BOORLOS, a lake or lagoon of Egypt, between the Damietta and Rosetta branches of the Nile, parallel to the Mediterranean, from which it is every where separated by a narrow neck of land, except at one point where it communicates with the sea by a narrow channel, anciently the Silebentic mouth of the Nile. It is about 38 m. in length, and 17 m. in its greatest breadth. It is connected with the Nile by several canals; and is mostly shallow and marshy, being navigable only along its N. shore.

BOURNE, a par. and town of England, co. Lincoln, parts of Kesteven, wapentake Aveland, 91 m. N. London. Area, 8,190 acres. Pop. of par., 1821, 2,242; 1831, 2,589; of which the town had 2,355. It is situated in a level district adjacent to the fens, the town consisting chiefly of one long street of well-built modern houses; the church is the remaining portion of a much larger structure, in the Norman style, with 2 towers. There are Baptist and Wesleyan chapels; an endowed free school for 30 children; 2 almshouses, one supporting 6 old men, the other 6 women; and a town-hall, a handsome modern edifice on the site of one built by Lord Burleigh in the reign of Elizabeth: it has a market-place under. The weekly market is on Saturday. Annual fairs are held April 7, May 7, and Oct. 29. A navigable canal extends from the town to Spalding and Boston, by which coal, timber, and other commodities, are supplied. The chief trade of the place is in leather and wool. There are several large tan-yards. The ann. value of real prop. in 1815 was 10,139*l*. It is the central town of a union of 37 parishes; its own average poor-rates are 1,843*l*. and it has 5 guardians. Petty sessions for the parts of Kesteven are also held in the town, and it is a polling place for that district and Holland. The name is derived from a small stream of remarkably pure water, which gushes from a source near Bourne. Roman coins and tessellated pavements have been found on the site; trenches and mounds of a Saxon castle are

traceable: a priory of Augustine monks was founded in Wm. II.'s reign, whose revenue, at the general suppression, was 197*l*. 17*s*. 6*d*. Wm. Cecil, Lord Burleigh (Elizabeth's minister), was born in this town in 1520. Dr. Dodd, once celebrated as a popular preacher, but now principally remembered by his disgraceful death, was also a native of Bourne.

BOUATANGI, a fortified town of the Netherlands, prov. Groningen, in the extensive morass of the same name, 31 m. E.S.E. Groningen. The morass, though it increases its strength, renders it unhealthy. It was taken by the Spaniards in 1593, and by the French in 1795.

BOUSSA, a city of Interior Africa, and cap. of a prov. of the same name, on an isl. of the Niger; lat. 10° 14' N., long. 6° 11' E. Pop., according to Clapperton, 10,000 or 12,000; but, according to Lander, 16,000 or 18,000. The country in the neighbourhood is bold and rocky, which renders Bousa a place of considerable strength, for its walls (which are tolerably well built and kept in good repair) extend to, and are united with, the two extremities of a rocky precipice which skirts the W. branch of the enclosing river. The houses are, however, built in detached patches, and do not occupy more than a tenth part of the walled area, presenting the appearance of several small villages, rather than of one continuous town. The prov. of Bousa extends about 50 m. N. of the river, and is about the same length from N. to S., the city lying about 15 m. from its S. extremity. The soil is very fertile, especially that of the isl., producing corn, yams, cotton, rice, timber trees, and other African vegetation, in great abundance: it also abounds in the usual African animals: elephants, hippopotami, lions, tigers, &c. Bousa is considered, politically, as part of the great kingdom of Borgoo; but it appears as if the different states were perfectly independent of each other, though all speaking the same language; at all events, the communications of the sultan of Bousa with Clapperton and Lander seem to have had no reference to any controlling power. Of the Borgoo states, Bousa is, if not the largest, the most populous and most powerful. (*Clapperton's 2d Exped.* pp. 96–106; *Lander's Records*, i. 141–143.)

Bousa possesses a melancholy interest for Englishmen, from its being the spot where the enterprising Munro Park met his death. It is well known, that after his first successful expedition in the service of the African Association, that adventurous traveller was employed by government to complete his own partial discovery of the course of the Niger. This commission he did not live to effect; after traversing a far larger portion of Africa than had before been traversed by any European, his boat was attacked by a native army at this place, where the river is shut in by two high rocks, leaving barely passage room for the current, *as through a door.* (*Adam Fatooma's Journal*, p. 214.) Assailed from the top of these rocks, Park defended himself for a long while, throwing all his provisions overboard to lighten his boat; till, finding all hope of successful resistance at an end, he, with his remaining companions, leaped into the water, in a last attempt to escape by swimming, and was drowned, or, as is perhaps more probable, dashed to pieces by the missiles hurled down upon him. The boat subsequently drifted on a reef of sunken rocks, not half a stone's throw from Bousa; and a slave of Park, the only living remnant of his unfortunate expedition, was made prisoner. The cause of this murderous attack is represented by Isaac and Adam Fatooma, Park's native friends, to have been owing to the knavery of a chief, who, secreting the presents entrusted to him by Park for the king, excited the indignation of the latter, by telling him "the white men had left nothing for him." The explanation given to Lander on the spot, twenty years later, however, was, that the natives took the adventures for a party of Fellatahs, which nation had just then commenced that series of usurpations which they have since carried to an extreme height. Be this as it may, the destruction of the traveller was signalled by feastings and rejoicings; but before the revelries were ended, it so chanced that an infectious disorder broke out among the Boussians, sweeping off the sultan and a great number of his subjects, among whom, it is reported, the murderers of the party were included. The effect of this upon a superstitious people may be conceived; prayers and sacrifices were offered to the white man's god, and an expression grew into use among the surrounding nations, of which subsequent travellers have felt the full benefit, "*Do not hurt the white men, unless you would perish like the people of Bousa.*" The Boussians themselves share fully in this feeling; they are overwhelmed with shame at a recurrence to the subject, and plead their youth at the time, or their personal innocence, without attempting the slightest exculpation of their fathers. The death of Park involved the loss of his papers. This was to be the more regretted, as he had passed far beyond Timbuctoo, that native city of which such marvels had been re-

ported in ancient times, but of which no European had ever obtained a glimpse. The recovery of these papers was long attempted by every means that could be used; and Lauder in his second expedition thought he had succeeded: an old man was found who possessed a book and papers taken from the river at the time of the murder, but, on inspection, the former proved to be an old nautical publication of the last century, and the latter a few memoranda of no consequence, such as rough observations on the height of water in the Gambla, a tailor's bill, an invitation to dinner, and the like. Great anxiety was displayed on this occasion by the sultan and his subjects to restore the journal; but, in all probability, it either sank with Park to the bottom of the Niger, or was dispersed upon its surface among the other ruins of the time: in either case, it was irretrievably lost. (*Isaaco and Adam Fatouma; Park's 2d Journal**, pp. 173-219; *Clapperton*, p. 100; *Lauder's Records*, i. 144-149; *Travels*, pp. 591, 595.)

BOUSSAC, a town of France, dép. Creuse, cap. arrond., on a steep rock, near the confluence of the Veron, and the Little Creuse, 21 m. N.E. Guérol. Pop. 552. "Boussac," says M. Malte Brun, "contains fewer inhabitants than the capital of any other arrondissement in France. It stands on a rock, and is almost inaccessible to carriages; surrounded with walls flanked with bastions, commanded by an old embattled castle, from which the view extends along a defile formed by arid and wild mountains. The town is as gloomy a residence as can well be imagined." (Vol vii. p. 329. *Eng. Trans.*)

BOUXWILLER, a town of France, dép. Bas Rhin, cap. cant., near the Moder, surrounded by mountains and forests, 20 m. N.W. Strasburg. Pop. 4,476. It is commanded by a fine old Gothic castle, and has manufactures of cotton, linen, arms, and braziers' ware, hats, &c., with breweries and bleachfields.

BOYA, an inland town of Naples, prov. Calabria Ultra, cap. cant., on a mountain, 17 m. E.S.E. Reggio. Pop. 3,500. This town suffered severely from an earthquake in 1783, but was rebuilt in better taste under the patronage of Ferdinand IV. It is the seat of a bishopric; has a cathedral, and several churches, a seminary, an hospital, and 2 *monis-de-piété*.

This, as well as several other towns in the Neapolitan states, is believed to have been founded, or at all events to have been occupied, by fugitives flying from Cyprus and the Morca to escape the cruelty of the Turks. The foundation of Boya is ascribed to the great immigration which took place in 1477, when John Castriot, son of the famous George Castriot, or Scanderbeg, was expelled from his hereditary dominions by the Turkish conqueror, Mahomet II. At later periods similar immigrations took place from Corona, Malina, &c. The immigrants and their descendants have continued to be a distinct race, and have preserved the language and dress, though not the religion, of their forefathers. They occupy several towns and villages in different parts of the kingdom, their total number being at present supposed to amount to about 52,000. (*Stanhurst's Two Sicilies*, i. 350. 4to. edit.; *Craven's Tour in Naples*, p. 311; *Biographie Universelle*, art. *Scanderbeg*.)

BOVEY TRACEY, a par. and town of England, co. Devon, hund. Teignbridge, 166 m. S.W. by W. London. Area, 6,480 acres. Pop. of par., 1821, 1,085; 1831, 1,697. The town stands on the slope of a hill, at the base of which the Bovey flows, and is crossed by an ancient bridge of 3 arches. There is one main street, which branches off at the ancient market-place like a Y, one part continuing up the ascent, the other extending to the bridge. There are a few respectable modern houses, but the greater part are ancient, and meanly built. The church is a Gothic structure, with a good tower, at the E. end of the town; there are also Baptist and Wesleyan chapels, and an endowed free school for 24 children. Annual cattle fairs are held on Easter Mon., Holy Thurs., 1st Thurs. July, 1st Thurs. Nov. The market (granted in 1259) has been discontinued within the present century. There are 2 potteries, which employ many of the inhabitants; the remainder are engaged in agriculture; serge weaving and wool combing were once carried on to a considerable extent, and have become extinct only within a recent period. The ann. value of wool prod. in 1815 was 5,714*l*. The average poor-rates amount to 8*s*. 2*d*. A portreeve and bailiff are annually appointed at a court leet held by the lord of the manor.

The Bovey headfield, extending at the base of the town is a low moory tract, between 7 and 8 m. in circ., surrounded by hills which open to the S.E., in which direction the Teign flows after being joined by the Bovey. The granite hills on the outskirts of Dartmoor rise on the W. side, and the green sand range of Haldon on the E. The Bovey coal and clay formations traverse this plain in a S.E. direction, their outcrop being at the foot of the hill on which the town stands.

* The portion of Park's observations which is published was introduced to Isaac's care at Sansandring, before the departure of the traveller for Timbuctoo.

There are 7 beds of lignite, in all forming continuous strata of about 70 ft. in thickness, and dipping at an angle of 23 ft. at the part where they are worked for the use of the pottery, which stands on the spot, and which is almost the only purpose to which the fuel is appropriated, the imperfect combustion and large proportion of ashes rendering it unsuitable for general purposes, though occasionally used in the cottages of the neighbouring poor. The clay beds overlie the lignite: there are 5 in all, running parallel with each other, and alternating with beds of sand and gravel; the 4 western beds are potter's clay; the other pipe clay; shafts are sunk on and through them, at intervals, for 6 or 7 m. along their course, at such parts as are found sufficiently pure for the market; they vary in depth from 40 to 90 ft., the lignite being always arrived at in sinking through the 4 western beds, and a fine sand under the eastern one. From 30,000 to 40,000 tons of this clay are shipped annually at the port of Teignmouth for the Staffordshire potteries, the greater portion of which is excavated in the parish of Kingstenton, and conveyed thither by the Stover Canal, formed through this inland basin, and leading into the Teign about 3 m. above the place of shipment. This canal effectually drained the greater part of what had previously been an unhealthy morass, and fitted it for cultivation; a railway from the Haytor granite quarries traverses the headfield, and terminates at the head of it: both were creations of the Templer family, whose mansion and property have since been transferred to the Duke of Somerset.

BOVINO (an. *Vibinum*), a town of Naples, prov. Capitanata, cap. distr., on the declivity of a mountain, watered by the Cervaro, 19 m. S.S.W. Foggia. Pop. 5,000. It is fortified, is the seat of a bishopric, and the residence of a judge of primary jurisdiction; it has a cathedral, 2 parish churches, and several convents. A battle took place near this town in 1774, between the Spaniards and the Imperialists, in which the former were defeated.

BOXTEL, a village of the kingdom of Holland, prov. Brabant, on the Dommel, 7 m. S. Bois-le-Duc. Here was fought, on the 11th Aug. 1794, an obstinate action between the French and the allied British and Dutch troops, under the command of the Duke of York. The latter were defeated with considerable loss, and obliged to retire behind the Maas.

BOYLE, an inl. town of Ireland, co. Rosecommon, prov. Connaught, on the Boyle, 94 m. W.N.W. Dublin. Pop. (1821) 3,407; (1831) 3,433: pop. parish (1834) 11,410, of whom 1,042 were of the estab. church, 5 Prot. diss., and 10,763 Rom. Cath. The river divides it into two portions, which are connected by a fine modern bridge; and there are two other bridges near the town. The public buildings are the parish church, two Rom. Cath. chapels, and Baptist and Methodist meeting-houses; a new market-house, a lecture-room, and large barracks. It is a consular station; and has a dispensary, brewer's, well, savings' bank, and loan fund. The chief articles of trade, which is wholly carried on by land carriage, are grain, butter, and flax: some coarse woollens are manufactured. The butter-market is on Mondays, but the principal market-day is Saturday: fairs on March 6, April 3, May 9, and 30., July 9, and 25., Aug. 16., Oct. 1., and Nov. 25.

The corporation, under a charter granted by James I. in 1613, consists of the borough-master, 12 burgesses, and an indefinite number of freemen. It returned 2 mem. to the Irish H. of C. until the Union, when it was disfranchised. General sessions are held every nine months, and petty sessions on Mondays. A senechal's court in the town has jurisdiction in several adjoining baronies, but none in the borough. Branches of the Belfast and Agricultural banks were opened here in 1835 and 1836. The post-office rev. in 1830 was 36*s*., and in 1836, 636*l*. The mail coach from Dublin to Sligo passes through thrice a week, and a mail car rplies every day to French Park. (*Stat. Surv.; Railway Rec.*)

BOYNE, a river of Ireland, which has its source in the bog of Allen, near Carberry, in Kildare, 225 feet above the level of the sea. It flows N.E. by Trim, Navan, and Slane, to Tulloughbeg, whence it follows an E. course to Drogheda, uniting with the sea about two miles lower down. The bar at its mouth has only 2 ft. water at low spring-tides, and from 9 to 10 feet at high water: hence only the smaller class of vessels can come up to Drogheda. It has been rendered navigable for barges as far as Navan.

The Boyne will be ever memorable in British history for the important victory gained on its banks, about 3 m. above Drogheda, on the 1st of July, 1690, by the forces under our great deliverer, William III., over those of James II. This victory, by securing the triumph of the liberal principles of government established at the Revolution, may be said to have been the great cause of the subsequent progress of the British empire in wealth, power, and population. In 1736, an obelisk, 150 feet in height, was erected in commemoration of

this great event, on the point facing the ford at Old-bridge, 2 m. W. Drogheda, where King William was wounded in the arm on the evening previous to the battle.

BRA., a town of the Sarlinian States, prov. Alba, cap. mand., near the N. bank of the Stura, 22 m. N. Mondovì. Pop. 7,000. It has 3 parish churches, an hospital, with fabrics of silk and linen, and a considerable trade in corn and cotton. It is reckoned particularly healthy.

BRABANT, N. and S., provinces of the low countries, the first making part of the kingdom of Holland, and the latter of that of Belgium, which see.

BRACCIANO, a town (an. *Sabate*) and lake (an. *Lacus Sabotinus*) of the Papal dominions, 25 m. N. Rome. Pop. 1,746. The town is situated on the W. side of the lake, is well built, has a flourishing paper manufactory, and an appearance of prosperity. It has a magnificent feudal castle belonging to the Torlonia family, now dukes of Bracciano.

The lake is nearly circular; its circumference, without following all the windings of the shore, being about 20 m. It is not generally deep, but is well stocked with fish. The Monte Iloca Iomana, covered with wood, rises on the N.E. side of the lake, and it is in must parts bordered by hills. Besides Bracciano, it has on its margin Trivignano (an. *Trivignanum*), Anguillara (an. *Angulara*), Vercello (an. *Vicus Jurelli*), San Stefano, near which are the ruins of several Roman villas, &c. It gives rise to the river Arone (an. *Aro*), which falls into the sea about 8 m. N. from the mouth of the Tiber. The scenery round the lake is of the most pleasing and sylvan kind. Without being positively unhealthy, the air of Bracciano is, in summer, what the natives call — “suspected.” (*Gell's Rome and its Vicinity*, i. 222.)

BRACKLEY, a bor. and town of England, co. Northampton, hund. King's Sutton, 66 m. N.W. London. Area of par., 2,790 acres. Pop. of par., 1821, 1,851; 1831, 2,107. The town stands on a slope, on the N. bank of the Ouse, which is here crossed by a two-arched bridge. Houses, mostly rude buildings of unburnt stone. There are two churches of great antiquity; a national school; almshouses founded in 1663; and a good town-hall. A weekly market is held on Wednesday, and an annual fair on St. Andrew's day. Under a charter of 2 James II. it had a mayor, 7 aldermen, and 26 capital burgesses; and these, until the passing of the Reform Act, when it was disfranchised, had the exclusive privilege of returning 2 mem. to the H. of C. The charter authorised courts of record and of quarter sessions, but they have long been disused. The borough comprises 2 distinct parishes, only ecclesiastically united, Brackley St. James, and Brackley St. Peter; the poor-rates of the former, in 1836, were 552*l.*; of the latter, 696*l.* 15*s.* It is the union town of 30 parishes. (*Bridge's Hist. Northamptonsh.*; *Baker's ibid.*)

BRADFORD, a par., market town, and parl. bor. of England, W. riding co. York, wapentake of Morley. The par. contains 33,710 acres, and had, in 1831, 76,976 inhab. The township of Bradford, comprising 1,690 acres, had, in 1801, a pop. of 6,363; in 1821, of 13,064; and in 1831, of no less than 23,233; and it has increased even more rapidly since 1831. But, in addition to the township of Bradford, the townships of Manningham, Bowling, and Horton, including the hamlets of Great and Little Horton, are included in the parl. bor., which has an area of 6,230 acres, and had, in 1831, a pop. of 43,527.

Bradford is situated on an affluent of the Aire, at the junction of three extensive valleys, 163 m. N.N.W. London, 31 m. S.W. by W. York, and 8 m. W. Leeds. Though the streets in the older parts be in general narrow, those of a more recent date, which are by far the most extensive, are sufficiently broad, and they are all well paved and lighted. Hence the wholty of stone, and well supplied with water. The town has an evidently thriving appearance, indicative of its really flourishing condition. The parish church of St. Peter is a structure in the pointed style of architecture, built in the reign of Henry VI.; the other churches are Christ-church; St. James's, built and endowed at the sole expense of John Wood, Esq.; and a new church, now erecting at the cost of — Berthon, Esq. The Wesleyan and Primitive Methodists, Unitarians, Independents, Baptists, Roman Catholics, and Society of Friends, have all places of worship. A free grammar-school, chartered and liberally endowed by Charles II., was rebuilt in 1820. It is open to all boys belonging to the par., and has attached to it a library and a writing-school; it does not, however, appear to be very popular, and at present (1839) there are only 30 boys attending the grammar-school. There are, also, schools on the systems of Bell and Lancaster, a school of industry, and an infant school. The Baptists and Independents have each a college or academical institution within ½ m. of the town, for the preparation of candidates for their respective ministries, and the Me-

thodists have a school for the sons of their preachers at Woodhouse Grove, 4 m. distant. A philosophical society has been established. The Exchange, a handsome new building, has attached to it a library and news-room. A mechanics' institute, founded in 1835, had, in 1839, 512 members and subscribers; a hall for this institute is now (1839) being erected; it is to cost 3,000*l.*, and will contain a library, reading-rooms, lecture-rooms, &c. A dispensary is liberally supported; and there are numerous other charitable institutions. The poor-rates in Bradford township amounted, in 1838, to 5,545*l.* 2*s.* 4*d.* It may be worth mentioning, that the first temperance society in England was established here.

The town is governed by two constables, elected at a vestry meeting, one of whom retires annually. Four overseers are chosen annually, 2 for the E. and 2 for the W. end. A court for the honour of Pontefract is holden on the first Wednesday of every month, for the recovery of debts under 15*l.*, in the new court-house, a commodious and elegant building; a court of requests is also holden in its own court-house. The Reform Act made Bradford a parl. borough, and conferred on it for the first time the privilege of returning 2 mem. to the H. of C. Its boundaries, as fixed by the Boundary Act, have been already specified. It had, in 1831, 1,083 houses of 102 a year and upwards. Registered voters, 1837-38, 1,348. The returning officer is named by the co. sheriff. It is also a station for receiving votes at elections of members for the H. of C.

The present importance and rapid growth of Bradford are wholly owing to the spirit and success with which it has engaged in manufacturing industry. The production of worsted yarn and stuffs constitutes the staple business of the town. The spinning of the yarn employs a great number of hands, and when spun, it is now mostly woven in power-loom factories. There were in the town, in 1839, above 1,500 power-loom looms, producing, at an average, from 3 to 4 pieces each per week; each piece being 30 yards in length, and from 20 to 24 inches in width. Norwich was formerly the great seat of the worsted manufacture, which, indeed, is supposed to have derived its name from the par. of Worsted in Norfolk into which it had been early introduced. But the superior facilities for the prosecution of the manufacture enjoyed by Bradford, chiefly in consequence of the unlimited command of coal, have given it, in this respect, a decided advantage over Norwich; and in fact, the greater part of the yarn wrought up in the latter is now made at Bradford. The stuffs, when finished at the loom, are partly bought by traders from Leeds, to be dyed there; this, however, is not nearly the case so much now as formerly, some very extensive dye-houses having, been recently, erected in and near the town. Sales are effected at the Cloth Hall, a building of two stories, each 114 by 36 ft. Thursday is the sale day, and during business hours the hall presents a most animated scene. But of late years, the hall has been used as a place of deposit and sale principally by the smaller class of manufacturers; and a much larger amount of goods is sold at the rooms and warehouses of the leading manufacturers.

The hands engaged in the woollen manufacture in the parish were estimated, in 1831, at 7,900. The following table shows the number of resident families engaged in agriculture, manufactures, and trade, and in other avocations in the township, according to the pop. returns of 1821 and 1831:—

Occupations.	1821.	1831.
Agriculture	17	39
Manufactures and trade	2,492	3,867
Other occupations	50	606
Total	2,519	4,512

There were in the par. of Bradford, and principally in the town, in 1839, 142 worsted mills, employing 10,896 hands; 9 woollen mills, employing 681 do.; and 2 cotton mills, employing 98 do.; making in all, 153 mills, and 11,675 hands. Of 120 engines belonging to these mills, 96 were wrought by steam, and 24 by water. The average rate of wages in the principal employments in the same year was,—men, from 15*s.* to 35*s.* a week; women, 8*s.* to 15*s.*; and children, 2*s.* 6*d.* to 7*s.*

The entire par. of Bradford is very densely peopled, and along all the principal roads there is almost uninterrupted succession of towns and villages. Besides the woollen trade, which is the principal employment, and others more recently introduced, the iron trade has existed from time immemorial, as is proved by the discovery of a number of Roman coins, in the midst of a mass of scoria, the refuse of an ancient bloomery in the neighbourhood of the town. The supply of ore is abundant; the principal works, in which articles of the largest and most complicated description are manufactured, are at Bowling and Lowmoor. There were connected with the iron trade, in 1831, in Bradford town, 351; and engaged

in the mines in Bradford, Bowling, and N. Bierley, 1,178 individuals.

A festival, numerously attended, and celebrated with much gaiety, is held at Bradford every seventh year, in honour of Bishop Blaise, said to be the inventor of wool-combing. The manufactures produced here are conveyed to all parts by means of the Leeds and Liverpool canal, which communicates with the town by a branch, 3 m. long, and by the Aire and Calder canal to Hull, and thence to all parts of the world. Markets are held on Thursdays; fairs, on March 3, 4, July 17, 18, 19, and Dec. 9, 10, 11, the last is a great mart for fags. The banks are the Bradford Banking Company, Bradford Commercial Banking Company, branches of the Leeds and W. Riding and of the Yorkshire district banks, a private banking house, and a savings' bank, established in 1818, which had, on the 29th Nov. 1838, a gross sum of 51,238*l.* 13*s* 10*d.*, deposited by 1,860 subscribers.

In modern times, Bradford has been chiefly remarkable for having (in 1812) been a principal seat of *Luddism*, or of those misguided individuals who supposed that their interests would be promoted by the destruction of that machinery to which, more than any thing else, Bradford, in common with other manufacturing towns, is indebted for its wonderful prosperity. The outrages committed by the Luddites were, however, firmly suppressed, though not without some severe examples. It is to be regretted that the most authentic of sounder information on such subjects may prevent a recurrence of such *folie de se* enormities.

In 1825 the trade of Bradford was completely stopped, for nearly the whole year, by a most obstinate *strike* on the part of the workmen; but since then the business of the town has been prosecuted without interruption. (*Atkin's Hist. of Yorkshire; Barnes's Hist. and Direct. of Yorkshire; Part. Reports; and Priv. Inform.*)

BRADFORD (GREAT), a par. and town of England, co. Wilts. bound, on the Avon and the W. by London. Pop. par. 1821, 10,251; 1831, 10,102; houses at the latter date, 2,294. The river divides the town into 2 parts (called the New, and Old towns), and is crossed by 2 bridges, one ancient, with 9 arches; the other modern, with 4. The old town consists chiefly of 3 streets, each above the other, on the slope and brow of a hill, rising abruptly from the N. bank; most of the streets are very narrow, but in this respect many improvements have been made within a recent period. The houses are all of stone, and many of them very respectable structures; the church is an ancient building at the foot of the hill. Six of the principal sects of dissenters have places of worship in the town: there is a charity school for 60 boys, founded in 1712; and 2 sets of almshouses, one for men, one for women. A weekly market is held on Saturday, and an annual fair on Trinity Monday. There is also a cattle fair at Bradford-leigh, a hamlet in the par., the day following that of St. Bartholomew. The chief manufactures of Bradford are fine broadcloths and kersycines, for these it has been noted for a very long period; there are several manufactories in the town; and in 1838 it had 4 woollen mills, employing 118 hands. The stone quarries in Winsley tithing employ above 100 men. It enjoys an extensive water communication with the towns to the R. and W., by means of the Avon and Kennet Canal. A court of requests for debts under 5*l.* is held every third Tuesday: its jurisdiction comprises 3 adjoining hundreds, and it is held on the intermediate Tuesdays, at Trowbridge and Melksham. Bradford is a union town, under the Poor Law Act; its own rates average 5*s* 4*d.* The ann. value of real prop. of the parish in 1815 was 26,847*l.* The area of the whole parish 11,740 acres, comprising, beside the town, 4 chapueries and 1 tithing. There is much picturesque scenery along the windings of the river and the dells of its wooded hills, and many fine old mansions. About one third of the entire pop. reside in the town, which must have been of some consequence in the Saxon period, for St. Dunstan was elected bishop of Worcester at a synod held in it. Bradford sent members to our parliament in Edward I.'s reign, but never since; nor is there any record of its having ever been incorporated.

BRADING, a par. and marit. bor.-town of England, co. Southampton, div. Isle of Wight, liberty E. Medina, 73 m. S.W. London. Pop., in 1821, 2,423; 1831, 2,227; houses at the latter date, 338. It is situated at the head of Brading Haven, at the E. extremity of the island, and consists of one long street of irregular buildings. The church is said to have been built in 704, but it must have undergone extensive alterations and repairs: there are also two dissenting chapels, a national school for 60 children, and a small town-hall, under which is a market-place, but the market has ceased to be held; there are still annual fairs, May 1, September 21. There is a quay for the accommodation of small vessels, the place being approachable by such at high water; but the tract which forms the estuary (about 900 acres) is uncovered at every tide. An attempt to embank it, and shut out the sea,

was made by Sir H. Middleton (the projector of the New River), but unsuccessfully. The town was incorporated, and a market and fair granted in 11 Edw. I.; there was another in 6 Edw. VI., under which the town was governed by two bailiffs and two magistrates, the former elected annually; the latter were the bailiffs of the preceding year.

BRAIDENFCH, a par. and bor. of England, co. Devon, hund. Hayridge; 150 m. W. by S. London. Pop., 1821, 1,511; 1831, 1,524; houses, 324; area, 4,320 acres. It is pleasantly situated on an eminence, surrounded by higher hills, except on the S., and consists, for the most part, of a collection of neat thatched cottages. The church is an ancient structure; and there is a guldhall, with a gaol under, built subsequently to a fire that nearly destroyed the place a few years since. There are three paper-mills in the parish, which employ 80 or 90 hands; the rest are mostly engaged in agriculture. It once had a considerable woollen trade, but this has ceased, and its ancient weekly market has been discontinued. There are still two annual fairs held, May 6 and Oct. 2. It had a charter of incorporation, granted by Reginald, Earl of Cornwall, which was renewed and extended by James I. and James II.; under it were appointed a mayor, recorder, 12 masters, 24 inferior burgesses, &c.; and courts of quarter sessions and record were held, which have been abolished by the Municipal Reform Act. It returned 2 mem. to the H. of C. for the reign of Edw. II. to that of Hen. VII., when inability to pay their wages was pleaded, and admitted, on paying a fine of 5 marks.

BRAGA (an. *Augusta Bracara*) a city of Portugal, cap. prov. Entre Douro e Minho, and of the comarca of the same name, on a hill in the middle of a large and fertile plain, between the Cavado and the Douro, 32 m. N.N.E. Oporto, lat. 41° 42' N., long. 8° 20' W. Pop. 14,500. It is defended by a citadel, and is surrounded by walls flanked with towers. The skirts are rather narrow, and the houses old; it is the seat of an archbishopric, and has a large cathedral, several parish churches and convents, an archiepiscopal palace, and seminaries, 78 fountains, some of which are highly ornamented. It has great numbers of silversmiths, harness-makers, and hatters, who supply with their wares all the fairs in the adjoining Portuguese districts, as well as most of those in Galicia in Spain.

Braga is a very ancient city, its foundation being ascribed to the Carthaginians. Down to a recent period it had the ruins of a Roman amphitheatre and an aqueduct, but these are now nearly obliterated, and it possesses few memorials of its ancient grandeur, except some coins, found in the vicinity, and some Roman millstones. About 1½ m. E. from the city, on a hill, is the renowned sanctuary of *do Senhor Jesus do Monte*, annually resorted to by crowds of pilgrims. (*Milano; Dict. Géographique.*)

BRAGANZA, a town of Portugal, prov. Tras-os-Montes, cap. comarca, in a fertile plain, on the *Fernza*, 35 m. N.W. Miranda. Pop. 4,000. It is particularly noted for a good citadel, and the seat of a bishopric, has two churches, a college, and some manufactures of silk and velvet. It was erected into a duchy in 1442; and in 1640, John II., 8th duke of Braganza, ascended the Portuguese throne under the title of John IV. His descendants continue to enjoy the crown of Portugal, and have also acquired that of Brazil.

BRAHILOW or BRAILOFF, a town of Turkey in Europe, in Wallachia, on the left bank of the Danube, 12 m. S.S.W. Galatz, and about 105 m. by water from the Black Sea. Pop. 6,000. This may be said to be the sea-port of Wallachia, and in it all the foreign trade of the province centres. All vessels capable of entering the Danube may ascend to Brailoff; and its port, on one of the arms of the river, being defended by a small island from the drift ice carried down by the current in the spring, ships may winter here in perfect safety. Houses regularly built, principally from the ruins of the castle, which has been demolished; and the importance of the town having increased with the independence of the province, and the increasing commerce and navigation of the Danube, several handsome new streets and edifices have been recently erected. The warehouses are capable of containing above 200,000 cethwets of corn. The great articles of export are the raw products of the country; as corn (particularly wheat), tallow, hides, bees, wool, salt, timber, staves, &c. In 1833 the exports of corn amounted to from 250,000 to 300,000 cethwets, and those of tallow to about 60,000 poods. In 1832, 280 ships of different burden sailed from Brailoff, and the number has since increased. In 1824, 185 vessels arrived at the port from the Black Sea, by the South-east mouth of the Danube. The trade has been principally managed by Greek houses; but merchants from England and other foreign countries are now beginning to establish themselves here and at Galatz. (*See Haggmiller's Report on the Trade of the Black Sea*, Eng. Trans. p. 89. and *passim*; and the arts, DANUBE, GALATZ, and WALLACHIA, in this work.)

BRAHMAPUTRA (*the son of Brahma*), vulg. **BURAMPUTRA**, one of the largest rivers of Asia, forming the proper E. boundary of Hindostan; the peninsula beyond which should, therefore, rather be called "India beyond the Brahmaputra," than "beyond the Ganges," since the former separates two regions, for the most part unlike, not only in their topographical features, but also singularly so in the races of people who inhabit them, their religion, customs, &c. The Brahmaputra has three separate sources, viz. the Dihong, Dibong, and Lohit rivers, which unite in Upper Assam; the first has been traced by Capt. Bedford and Wilcox, and Lieut. Burlton, through the Himalaya chain to lat. $28^{\circ} 15' N.$, and long. $95^{\circ} 10' E.$, and is in all probability a continuation of the great Sam-po of Tibet. (See **SAN-PO**.) The Dihong, at the point to which Lieuts. Wilcox and Burlton penetrated, was 300 ft. wide, had considerable depth, and contained many rapids; one of which being found impassable, and the adjacent country wild and difficult in the extreme, prevented the future prosecution of the survey. The Dihong carries twice as much water as the Lohit into the Brahmaputra. The Dibong is the central and smallest of the three rivers; it rises N. the Himalaya, near lat. $28^{\circ} 10' N.$, and long. 97° , and passes through the mountains into Assam, near lat. $28^{\circ} 15'$, and long. 96° . The Lohit, called by the Assamese "holy stream," and considered by the Brahmins as more especially the origin of the Brahmaputra, is formed by the union of the Taluka and Talindig, two streams rising in the high mountain region of Tibet, between lat. 28° and $29^{\circ} N.$, and long. 97° and $98^{\circ} E.$, which having joined, the river thence resulting takes a S.W. course, penetrating the Lang-tan chain of mountains (a continuation of the Himalaya), and passing through a remarkable basin of rocky hills, a place of pilgrimage often frequented by Brahmins, in which it is augmented by the waters of the Brahmakund, a holy pool fabled to owe its origin to an intrigue between Brahma and the wife of a sauton. At its exit from this basin the river receives the name of Brahmaputra, and is 200 ft. broad: for the next 60 m. its course is mostly W.; 15 m. below Suddya, in lat. about $27^{\circ} 50' N.$, and long. $93^{\circ} 30' E.$, at a height of 1,150 (Paris) ft. above the level of the sea, the streams of the Dihong and Dibong join it. It now flows in a S.W. direction through the centre of Assam, with a very variable width, since its channel is continually subdividing to enclose a prodigious number of islands, the largest of which, that of Majuli, in central Assam, is nearly 70 m. long, and 10 m. in its greatest breadth. While in Assam the Brahmaputra is said to receive as many as 60 tributary rivers. It enters Bengal in the Rungpore distr., and soon after changes its direction, flowing at first S. and S.E., encircling the W. extremity of the Garrow mountains, and finally, S.S.W., to fall into the Bay of Bengal by a mouth 5 m. wide, in lat. $22^{\circ} 50' N.$, long. $90^{\circ} 40' E.$, in conjunction with the largest branch of the Ganges. The chief tributary streams it receives in Bengal are, the Soormah, Barak, and Goomty, on the left, and the Gadada, Neclemer, Teesta, and Megna, on the right hand; the latter of which rivers, though not one tenth part its size, communicates its own name to the Brahmaputra after their junction. The affluents of the Brahmaputra bringing down vast quantities of mud, its waters are usually extremely thick and dirty, and its surface, during the floods, is covered with foam, intermixed with logs of wood, large masses of reeds, and carcasses of men and cattle. Its rise commonly begins in April; it attains its greatest elevation at the beginning of August, towards the end of which month its inundation subsides. Some rise, but no overflow, is experienced in September and October. In Bengal it is not fordable at any season, but it is by no means so readily navigated as the Ganges; the direction of the wind, which blows for so many months contrary to the course of the latter river, is commonly coincident with the direction of the Brahmaputra, and adverse to all progress upwards. Its banks are mostly covered with jungle or marsh-land, and in many places quite destitute of tracks; and its current is so strong, that 1 m. a day against the stream is, for a canoe, considered a tolerable advance (*Bates's Excursion voy. Asien*, vol. iii. *Hamilton's E. Gaz.* i. 286-288).

BRANTREE, a par. and town of England, co. Essex, hund. Hinkford, 36 m. N.E. London. Area, 2,500 acres. Pop. of par. in 1821, 2,983; 1831, 3,422. The town is built on an eminence, and consists of several narrow irregular streets, in which a few good houses, of modern date, are dispersed, but the greater part are ancient mean buildings, many of them wood: the village of Bocking, in the parish of that name, is a continuation of this town on its N. side, and consists of one long street, in which are three dissenting chapels, and many well-built houses. Bocking parish includes 3,800 acres, and had, in 1831, a pop. of 3,128, mostly in the village. Brantree church is a spacious Gothic structure, with a tower and spire, on the elevated site of a still older encampment. There are four dissenting chapels; an endowed school for 10 boys

(in which Ray, the naturalist, was educated); and several charities: the principal one produces 360*l.* a year, which is shared by the poor of this and two adjoining parishes. A weekly market is held on Wednesday; and two annual fairs, each lasting three days, which commence May 7, and October 2. The manufacture of silk and crape forms the chief employment of the inhabitants. These have latterly been a good deal extended, and have superseded the woollen manufacture, previously carried on. There are several manufactories on the course of the Blackwater, which flows N. of the town. Ann. val. of real prop. in 1815, 4,493*l.*: of Bocking, 6,957*l.* Brantree is the central town of a poor law union of 14 parishes: its own rates average 2,187*l.*: it has four guardians. Those of Bocking average 3,210*l.*: it has a like number of guardians. The former is also a polling town for the N. division of Essex. (*Wright's Hist. of Essex; Parl. Papers and Rep.*, &c.)

BRÄKEL, a town of the Prussian States, prov. Westphalia, reg. Minden, cap. circle, on the Brucht, near its confluence with the Netze, 32 m. N.N.W. Cassel. Pop. 3,000. It has a Catholic parish church, an hospital, a workhouse; and fabrics of linen, tobacco, and a glass-work.

BRAMBER, a par. and bor. of England, co. Sussex, hund. Steyning, on the Adur, which is navigable for small vessels, 45 m. S. by W. London. Pop., 1831, 97; houses, 27; area, 870 acres. It claims to be a bor. by prescription, and was of sufficient importance to give its name to the rape, in which it is situated. It sent 2 mem. to the H. of C. from the 23 Edw. I., with occasional omissions between that date and 7 Edw. IV.; and subsequently, without interruption, till it was disfranchised by the Reform Act: the right of election was in burgrave tenure voters, paying scot and lot, of which there were about 20.

BRAMPTON, a parish and market town of England, co. Cumberland, Eskdale Ward. Area of par., 16,970 acres. Pop. 3,345; pop. of township of Brampton, 2,842. The town is situated 10 m. N.E. Carlisle, in a deep narrow valley. It has a town-hall, built by the Earl of Carlisle in 1817, in which courts are held for the barony of Gil-land. The par. church, now in ruins, is at the village of Irthington, about $\frac{1}{4}$ m. distant; but it has a parochial chapel, built in 1789, and repaired and enlarged in 1827: it has also 4 dissenting chapels, a grammar-school, a national school, erected by the Earl of Carlisle, an infant school, and 12 almshouses for 6 old men and as many women. At the E. end of the town is the moat, a conical mount, rising 360 ft. above the level of the streets. The weaving of checks, gingham, and other descriptions of cotton goods, on account of the Carlisle manufactures, is carried on to a considerable extent. Market-day, Wednesday.

BRANDENBURG, an important prov. of the Prussian states, consisting principally of the ancient mark or margravate of Brandenburg, having N. Mecklenburg and Pomerania, E. the provs. of Prussia and Posen, S. Silesia and the kingdom of Saxony, and W. Prussian Saxony, Anhalt, and Hanover; between $51^{\circ} 10'$ and $53^{\circ} 37' N.$ lat., and $11^{\circ} 13'$ and $16^{\circ} 12' E.$ long. Area, 15,500 sq. m. Pop., 1837, 1,634,042, of whom 1,666,232 are Protestants, 15,258 Catholics, and 12,552 Jews, &c. It is divided into two regencies and 34 circles. Principal towns, Berlin, Potsdam, Frankfurt, Brandenburg, &c. It consists principally of an immense sandy plain, watered by the Oder, Spree, Havel, Warta, Netze, and other rivers, and by numerous lakes. Soil generally poor: in many parts, indeed, it consists of vast tracts of barren sand, diversified with extensive heaths and moors; but in other parts, particularly along the rivers and lakes, there is a good deal of meadow, marsh, and other comparatively rich land. Forests very extensive. Estimating the whole extent of the prov. at 15,800,000 morgen, it is supposed to be distributed as follows:—water, 300,000 morgen; woods, 3,500,000 do.; arable lands, 6,700,000 do.; gardens, 65,000 do.; waste lands, 3,250,000 do.; buildings, roads, &c., 560,000 do. Corn of all sorts is raised. Buckwheat, however, succeeds better than any other sort of grain on the sandy soils, and next to it rye and potatoes are now very extensively cultivated. The other principal products are wool, hemp and flax, tobacco, timber, hops, &c. Agriculture, though backward, has made great advances since 1815. The breeds of horses and sheep have been materially improved; particular attention is paid to the raising of wool, which has become a most important product. In 1837 the stock of black cattle amounted to 554,000 head; horses, 180,000; sheep, about 2,500,000; hogs, 178,000. The average rent per Prussian morgen of cultivated land of a medium degree of fertility may be about 2*½* rixdollars (7*s.* 6*d.* sterling). Agricultural labourers receive from 7*s.* to 9*s.* a day in summer, but in winter they are seldom employed by the day. With the exception of lime and gypsum, the minerals are of no importance. Manufactures were introduced by the refugees from France, subsequently to the revocation of the edict of Nantes, and

are pretty extensive. They are principally carried on at Berlin (which see, and Prussia). Breweries, distilleries, glass-works, brick-kilns, tanneries, potash, charcoal, and lime manufactories, are very numerous, and employ a great many hands. The internal trade of the prov. is very considerable, and is much facilitated by the rivers and navigable canals by which they are united. The roads, also, have lately been very greatly improved. (See Prussia.) "Whether," says an intelligent traveller, "it is owing to the extreme rigidity of the soil, which is for the most part sandy and unproductive, the Brandenburgers are in general extremely abstemious; bread, butter, and potatoes being the principal articles of consumption. The latter with the lower classes; and the former I have seen all ranks partake of half a dozen times a day. If you visit a friend, it is more than probable the lunch will be *butter-bread* (bread and butter): if you go to an inn and order refreshment, without specifying any thing particular, this will certainly be brought. Still, however popular, it divides its empire with potatoes, which a stranger taking notes might with every justice enter in his pocket-book as the national food. They are served up in an immense variety of forms." (*Germany and the Germans*, i. 97. Lond. 1836.)

BRANDENBURG, a town of Prussia, prov. same name, reg. Potsdam, cap. circ. W. Havelland, on the Havel, 35 m. W. S. W. Berlin, and 38 m. N. E. Magdeburg; lat. 52° 27' N., long. 12° 32' E. Pop. 13,000. The river divides it into three parts; the old town on the right, and the new on the left bank; while on an island between them is built the "Cathedral Town," which, from standing on piles, is also called "Venice." Streets of the old town narrow and crooked; but those of the new town are comparatively broad and straight; both are walled, and connected by a bridge. On the island is the cathedral, a structure of the 14th century, the castle, and an equestrian academy. It has 8 churches, 5 hospitals, a council-house with a public library, a gymnasium, a citizens' school (*Bürger-school*), a superior female school, with numerous elementary and charity schools; a workhouse, a theatre, and three public squares, in one of which stands the Roland-saule, a column hewn out of a single block of stone. The font and monument in St. Catherine's church are worthy of notice, as are also the works of art in the cathedral. There are manufactories of woollens, fustians, lins, stockings, paper, &c.; with numerous breweries, distilleries, tanneries, and some boat-building; and it has a brisk trade both by land and water. It has been several times besieged—by Henry the Fowler, Albrecht the Bear, Gustavus Adolphus, &c. It was the birth-place of Julius von Voss. (*Lon. Zeititz, Der Preussische Staat*, 1836, i. 186, 187, &c.)

BRANDENBURG (NEW), a town of the grand duchy of Mecklenburg Steitz, on a rivulet which falls into the lake Tollen, 17 m. N. by E. New Strelitz. Pop. 6,000. It is walled, and well built; has a castle, a grammar school, schools for the sons and daughters of townspeople, a workhouse, and some woollen and cotton fabrics; and the business of distillation is the most important carried on in the town.

BRANDON, a par. and town of England, co. Suffolk, hund. Iackham, 73 m. N. N. E. London. Pop. 1821, 1,770; 1831, 2,065; houses, 408; area, 5,570 acres. It is on the S. bank of the Little Ouse, or Brandon river, which forms the N. boundary of the county, and is here crossed by a neat stone bridge; about a mile below which is a ferry, where goods are deposited for conveyance by the river, to and from the Isle of Ely. Gun-flints are made in the town and sent to various parts of the kingdom: they are procured about a mile W. of it, from beds traversing a chalk stratum, and alternating with others of pipe-clay: many labourers are employed in quarrying the flint. There is also some traffic carried on in corn, malt, coals, timber, &c. In the neighbourhood are some extensive rabbit warrens, which, in part, supply the London markets. Fairs are still held, Feb. 14., June 11., Nov. 11.; but the market has been discontinued. There is an endowed free school. Brandon camp, a sq. earth-work in the vicinity, is supposed to be the *Bravonium* of the Romans. The Duke of Hamilton and Brandon derives his English title from this town.

BRANTOME, a town of France, dép. Dordogne, cap. cant., on the Dordogne, near its confluence with the Garonne, 12 m. N. W. Périgueux. Pop. 2,800. It is agreeably situated, and is a neat handsome town. The walls and ditches by which it was formerly surrounded have been demolished. It has some fabrics of woollen stuffs, hosiery, and cotton. Near the town is an abbey of the Benedictines, the foundation of which is ascribed by some to Charlemagne, and by others, to Louis-le-Débonnaire. This abbey was held *in commendam* by the historian Brantome, who retired thither after the battle of Jarnac, and composed in this retreat a part of his works. (*Hist. art. Dordogne*.)

BRANZBURG, a town of Prussia, prov. E. Prussia,

cap. circ. on the Pasarge, about 3 m. above where it falls into the Frische Hafl. Pop. 7,600. The river is navigable as far as the town by vessels of small burden, and it has some shipping, and exports corn and timber. It is the residence of the bishop of Ermland, the seat of a royal court of justice, and has several churches, a monastery, a normal school, and 4 hospitals. But it derives its principal claim to notice from its seminary, the *Lyceum Hosianum*, for the education of Catholic clergymen. It is so called from its having been founded and endowed by the learned Stanislaus Hosius, bishop of Ermland. It has six professors, and had, in 1837, 27 students.

BRAY, a township of England, co. Berks, hund. Bray. Pop. 1,000? This place would be unworthy notice in a work of this sort, were it not that it has attained a proverbial notoriety. The parson who held the living, a vicarage, in the reigns of Henry VIII., Edward VI., Mary, and Elizabeth, appears to have been gifted with a most accommodating conscience. He commenced a Papist, then became Protestant, next Papist again, and then Protestant again! On being taxed with inconsistency, he defended himself by saying that he had always adhered to his principle, which was "to live and dye Vicar of Bray!" The well known song represents this worthy vicar as living in the reign of Charles II. and his successors; but the above is Fuller's account of the matter. (vol. i. 79. ed. 1811.)

BRAY, a marit. town of Ireland, cos. Wicklow and Dublin, prov. Leinster, on the Bray or Dargle, 12 m. S. E. by Dublin. Pop. in 1821, 2,029; in 1831, 3,681; pop. in 1834 of the parishes of Bray and Old Comaught, in which the town is situate, 5,176, of whom 1,184 are of the estab. church, 29 Prot. diss., and 3,963 Rom. Cath. The town, which takes its name from Bre, or Bree, a headland at the foot of which it stands, is divided into two portions by the river, which also separates the counties of Wicklow and Dublin. The part on the N., or Dublin side, is called Little Bray: the communication between the two divisions is kept up by an old bridge. It has a parish church, a large and elegant Rom. Cath. chapel, a Presbyterian meeting-house, and several schools, one of which, an infant school, is a spacious building; it has also a savings' bank, a loan fund, an hospital, and a dispensary. An old castle in Little Bray has been converted into a barrack. A constabulary and a coast-guard force are stationed here, and near the town is a martello tower. The town is neatly built, and is become a fashionable watering-place. It was formerly incorporated, and parliaments were held here, but its chartered privileges have fallen into desuetude. A manorial court is held monthly, and petty sessions on alternate Mondays. It manufactures small quantities of linen and coarse woollens; there is also a brewery and flour-mill. Markets are held on Tuesdays and Saturdays; fairs for freizes on Jan. 12., May 4., Aug. 5., and Nov. 12.; and for cattle on March 1., May 1., July 1., Aug. 15., Sep. 20., and Dec. 14. Post-office revenue in 1830, 5432; in 1836, 5851. A mail coach, several stage coaches, omnibuses, and cars, pass daily through the town, or ply from it to neighbouring places, chiefly to Kingstown. The harbour is barred by a bed of shingle, which has to be cut through annually, in order to admit vessels of any size. The imports are equal to the amount of 5,000 tons, and freestone and limestone of 7,000. A considerable fishery of cod, haddock, and herring, was formerly carried on, which has been completely annihilated. The salmon fishery has also declined. Trout, caught in the Bray river is abundant, and highly esteemed.
